A critical discussion of some experimental work on physicochemical analysis of binary systems. V. F. Ust-Kachintzev. *J. Gen. Chem.* (U. S. S. R.) 5, 892-8 (1935)—A discussion of the exptl. work of Kendall, Howell and Houdford, Usanovich and of Terpugov, diagrams of compn. properties, at various temps., of binary systems of the rational and irrational types. It is concluded that electrically conducting systems may not necessarily show a deviation from additivity in the measurement of other properties. In irrational systems there is displacement of max. and min. of various properties and deviation from additivity. Inflection points on curves of temp. coeff. vs. properties of irrational systems cannot serve as guides for detn. of compn. of compds. formed in a binary system. S. L. Madorsky

Internal friction of binary systems in critical zones (of layer formation). R. V. Mertzlin. *J. Gen. Chem.* (U. S. S. R.) 5, 899-903 (1935)—A crit. discussion of Tsakalotos' theory (*C. A.* 4, 402) in regard to the relation between the geometric form of viscosity isotherms and the nature of the zone of layer formation of binary systems near the crit. temp. of layer formation. It is concluded that this theory is wrong in assuming that the nature of viscosity isotherms is independent of the zone of layer formation. S. L. Madorsky

Form of curves of critical temperatures of binary mixtures. R. V. Mertzlin. *J. Gen. Chem.* (U. S. S. R.) 5, 1073-6 (1935); cf. *C. A.* 29, 5002^a—It is shown geometrically, on the basis of Stakhovskii's formula (cf. *C. A.* 22, 2302), $\sigma = \sigma_1 \sigma_2 / [\sigma_1(1-x) + \sigma_2 x]$, where σ_1 and σ_2 are surface tension of the mixt. and the 1st and 2nd components of the binary mixt., resp., and x is the mol. fraction of the 1st component, that the polytherms of crit. temps. could be either concave or convex to the compn. axis, the form depending on the relation of σ_1 and σ_2 and the temp. coeffs. of the two components. The linear formula of Pavlevskii and Straus does not give a general soln. and is true only for special cases. S. L. Madorsky

The melting curve of mixtures of heavy and ordinary water. The solubility equilibrium in the system. Mladen Deželić. *Z. anorg. allgem. Chem.* 225, 173-4 (1935)—Thermal analysis of the system $\text{D}_2\text{O-H}_2\text{O}$ indicates a continuous series of solid solns. The graph is a straight

line, indicating impossibility of sepg. heavy water from ordinary water by fractional freezing. J. H. Reedy

Determination of the melting points of calcium, strontium and barium. F. Hoffmann and A. Schulze. *Z. Metallkunde* 27, 155-8 (1935).—See *C. A.* 29, 7165^a.

G. Dege

Allotropy of phosphorous pentoxide. A. N. Campbell and A. J. R. Campbell. *Trans. Faraday Soc.* 31, 1567-74 (1935).—The d, soln. tensions, and soly of amorphous, vitreous, and one cryst. form of P_2O_5 , were investigated. The only homogeneous form, vitreous, has the lowest soly and highest d., and is most stable. The vitreous forms from amorphous and forms with it a true soln. of vitreous in amorphous. It is prepd. by heating amorphous for 3 weeks in a sealed tube at 450°. The cryst. is formed with vitreous on heating amorphous at 350-600° for not too long a period. It is not considered possible to prep. pure cryst. because it arises from the heating of amorphous and then passes into the more stable vitreous form. C. E. P. Jeffreys

The melting curve of oxygen. J. H. C. Lissman and W. H. Keesom. *Physica* 2, 839 (1935)—For pressures from 48.2 to 167.7 kg. per sq. cm. O_m 54.90-56.25° abs. B. J. C. van der Hoeven

Solubility of cobalt nitrate in aqueous solutions of nitric acid and transition points of $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ into $\text{Co}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$. A. Valdmann and L. L. Klyachko-Gurvich. *J. Gen. Chem.* (U. S. S. R.) 5, 791-4 (1935)—The soly of $\text{Co}(\text{NO}_3)_2$ in aq. solns. of HNO_3 was studied at 25° and 80°. In the case of the 25° isotherm, concns. of HNO_3 and $\text{Co}(\text{NO}_3)_2$ varied from 0 to 39.59% and from 50.57 to 21.68%, resp., and the solid phase consisted of $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$. In the case of the 80° isotherm, concns. of HNO_3 and $\text{Co}(\text{NO}_3)_2$ varied from 0 to 10.27% and from 67.86 to 63.68%, resp., and the solid phase consisted of $\text{Co}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$. Points of transformation $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O} \rightarrow \text{Co}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$ were studied also by the dilatometric and thermometric methods, also the effect of HNO_3 concn. on the displacement of these points, by the thermometric method, in the interval 37-56°. In a neutral soln. the transition point is 54-5°, in acid solns. the points are 52°, 50°, 48°, 43° and 41° for HNO_3 concns. of 1, 3, 10, 16.05, 26.75 and 35.87%, resp. HNO_3 affects considerably the ratio of $\text{Co}(\text{NO}_3)_2$ and H_2O in solns., particularly at 25° and has a salting-out effect on the hydrate. On satg. the soln. at 80° and then cooling to 25°, the entire soln. becomes cryst., and contains 39.5% $\text{Co}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$ and 60.5% $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$. On satg. the soln. at 80° and then cooling to a little above 56°, 39.5% of the $\text{Co}(\text{NO}_3)_2$ crystallizes as a trihydrate. To obtain crystn. of $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ free from $\text{Co}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$, a soln. conrg. 62.88% $\text{Co}(\text{NO}_3)_2$ is prepd. at 80° and on cooling the entire mass crystallizes as $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$. Another way is to sat. the soln. with $\text{Co}(\text{NO}_3)_2$ at 56° (m. p. of the hexahydrate) and then cool the soln. S. L. M.

The iron-oxygen diagram. D. P. Bogatskii. *Metallurg* 10, No. 4, 64-75 (1935)—The differences in the results of various investigators, particularly in regard to soly of Fe in FeO and O_2 in Fe, are discussed. H. W. Rathmann

Thermal analysis of the system $\text{POCl}_3\text{-SO}_2\text{Cl}_2$. G. P. Luchinskii and A. I. Likhacheva. *Z. anorg. allgem. Chem.* 225, 175-6 (1935)—F-p measurements on mixts. of POCl_3 and SO_2Cl_2 show a eutectic conglomerate at -73.8°, consisting of POCl_3 + $3\text{SO}_2\text{Cl}_2$. No definite compds. are indicated. J. H. Reedy

Equilibrium in the system water-magnesium bromide. Frederick H. Getman. *Rec. trav. chim.* 54, 886-72 (1935)—The soly. of MgBr_2 in H_2O was detd. from -42.7° to 100° and the m. p. of $\text{MgBr}_2 \cdot 6\text{H}_2\text{O}$ found to be 172.4°. The temp. of equl. between $\text{MgBr}_2 \cdot 10\text{H}_2\text{O}$, ice, soln., and vapor is -42.7°. $\text{MgBr}_2 \cdot 10\text{H}_2\text{O}$ and $\text{MgBr}_2 \cdot 6\text{H}_2\text{O}$ are the only hydrates that exist and the transition temp. is 0.83°. The $\text{MgBr}_2\text{-H}_2\text{O}$ equl. diagram is plotted. Arthur A. Vernon

Physicochemical properties of some amine-water systems capable of separation. R. V. Mertzlin. *J. Gen. Chem.* (U. S. S. R.) 5, 888-91 (1935); cf. Ust-Kachintzev, *C. A.* 29, 7759^a—The existence of chem.

comps and their thermal decompn in the systems of β -collidine-water and Et_3N -water was disclosed by the method of surface tension. The polytherms of surface tension of some amine-water systems capable of sep show properties analogous to those of tautomeric comps. This may be explained by the rapid thermal decompn of the compd and the conversion of the pseudoternary system into the binary. The 2 systems are typically anomalous, because the isotherms show a sharply displaced active branch and 2 faintly developed maxima shifted with increase of temp toward the amine. C. B.

Homogenization with amines of some amine-water systems with higher critical temperature of separation into layers R. V. Merzhan and V. F. Ust-Kachintzev. *J. Gen. Chem. (U. S. S. R.)* 5, 904-19(1935).—The homogenizing effect of the amines capable of giving inseparable mixts with H_2O on amine-water systems was studied with PhNH_2 - H_2O of the crit. temp. 167-8° and PhNHNH_2 , H_2O of crit. temp. 55° at a temp. interval of 0-50° in the following ternary systems: H_2O - PhNH_2 - $\text{C}_6\text{H}_5\text{N}$, H_2O - PhNH_2 - $\text{C}_6\text{H}_5\text{N}$, H_2O - PhNH_2 - PhCH_2NH_2 , H_2O - PhNHNH_2 - $\text{C}_6\text{H}_5\text{N}$, H_2O - PhNHNH_2 - $\text{C}_6\text{H}_5\text{N}$, H_2O - PhNHNH_2 - PhCH_2NH_2 , and H_2O - PhNHNH_2 - PhNH_2 . The homogenizing ability of the amines decreases in the order $\text{C}_6\text{H}_5\text{N}$, $\text{C}_6\text{H}_5\text{N}$, PhCH_2NH_2 , PhNHNH_2 . With increasing temp. (40-50°) the homogenizing ability of $\text{C}_6\text{H}_5\text{N}$ and PhCH_2NH_2 increases, while that of $\text{C}_6\text{H}_5\text{N}$ decreases. No direct connection exists between the homogenizing action of compds at an arbitrarily selected temp and their phys. consts. On the basis of the results of homogenization of the mixt. PhNH_2 - H_2O , the existence of a lower crit. temp. in the system is assumed. The existence of considerable retrograde soly and the arrangement of crit. points on the binodal curves accord well with the previous supposition of the existence of highly placed false lower crit. temps. for a series of nonstratifying amine-water systems. Chas. Blanc.

System water-potassium thiocyanate Andre Chretien and Oscar Hoffer. *Compt. rend.* 201, 1131-3(1935).—A satd soln of KCNS has no p., the curve rising steadily to the m. p. of the anhyd. salt (177.2°). There are 2 hydrates: KCNS \cdot 0.5 H_2O , stable -29.5° to 6.8°, and KCNS \cdot 0.8 H_2O , metastable, -30.1° to -17.75°; and 3 eutectic points at -20.2° (51.2%), stable, and at -33.2° (54.4%) and -30.05° (51.8%) metastable. C. A. Silberrad.

Tertiary system potassium nitrate-nitric acid-water V. I. Nikolaev, S. K. Chirkov, and A. G. Kogan. *Kali (U. S. S. R.)* 1935, No 7, 23-7.—The field of crystal of KNO_3 was studied and the melting curve of the binary system KNO_3 - HNO_3 is given. The fields of crystal of ice, KNO_3 , 2HNO_3 (potassium trinitrate (I)), HNO_3 , and hydrates of HNO_3 were studied. The tertiary diagram is given. I is very stable, in the presence of excess HNO_3 , to the disoc action of H_2O , it can be transported long distances in sealed containers at a temp. nearing 0°. I can be used to obtain pure KNO_3 and highly concd HNO_3 (by heating to 100-120°). HNO_3 of 99.8% was obtained. A. Pestoff.

The comparative action of mixed catalysts when used for the simultaneous dehydration of ethyl alcohol and ammonia J. N. I. Shufkin, A. A. Balandin and Z. I. Plotkin. *J. Phys. Chem.* 39, 1197-1205(1935).—See C. A. 29, 3584. II Catalytic preparation of monethylamine N. I. Shufkin, A. A. Balandin and F. T. Dumov. *Ibid.* 1207-16.—See C. A. 29, 3585. G. G.

The oxidation of carbon monoxide catalyzed by nitrogen dioxide R. H. Crist and O. C. Roehling. *J. Am. Chem. Soc.* 57, 2190-2203(1935); cf. *Science* 80, 338 (1934).—The oxidation of CO catalyzed by NO_2 in a Pyrex vessel was measured at 527°. The rate-dep reaction at low concn. of the catalyst appeared to be a chain mechanism, and at higher concn. to be the trimol oxidation of NO. The rate is first-order with respect to O_2 at high concn. of NO_2 and at low concn. it is proportional to the O_2 concn. and also to the second power of the CO concn. The initial rate is approx. proportional to the square of the H pressure and is infinite with the H pressure

greater than 0.53 mm. The effect of H_2O on the rate was measured. H. H. Rowley.

Decomposition of chloral catalyzed by nitric oxide. F. H. Verhoek. *Trans. Faraday Soc.* 31, 1521-6(1935).—The decompn. of chloral by NO is first-order with respect to chloral, and the rate increases in direct proportion to the concn. of NO. N_2O and O_2 have no catalytic effect. A heat of activation of 37,100 cal. was calcd., the use of 2 squared terms seems to account for the catalyzed reaction. CHCl_3 decompn. is nearly first-order with respect to initial pressure at 512° above 50 mm. The decompn. is catalyzed by NO and the products. C. I. P. Jeffreys.

Decomposition of acetaldehyde catalyzed by nitric oxide. F. H. Verhoek. *Trans. Faraday Soc.* 31, 1533-6 (1935).—Decomposition of AcHl is catalyzed by NO homogeneously, but the reaction is complicated by the apparent superposition of two effects: (1) an induced catalysis initiated by an oxidation and (2) a simple collisional catalysis. At 480° the reaction is approx. of the 3/2 order with respect to AcHl , and the rate becomes proportional to NO concn. when NO is in excess. A value of 37,300 cal./g. mol. was calcd. as the energy of activation. C. E. P. Jeffreys.

Decomposition of acetaldehyde catalyzed by nitrous oxide I. H. Verhoek. *Trans. Faraday Soc.* 31, 1527-33 (1935).—The decompn. of AcHl is catalyzed by N_2O , but in clean silica vessels the decompn. is complicated by a surface reaction. At 480° it appears first-order with respect to AcHl and rises to a max. with increasing pressure of N_2O . With the vessel walls covered with C the reaction is of the 3/2 order for a single expt., and the rate is proportional to $[\text{N}_2\text{O}]^{1/2}$. An activation energy of 39,800 cal./g. mol. was calcd. The N_2O is assumed to form an intermediate which acts as a catalyst or chain initiator. AcHl decompn. catalyzed by O_2 is first-order with respect to O_2 concn. The amt. of AcHl decomposed in the presence of a given amt. of O_2 is greater the greater the excess of AcHl . C. L. P. Jeffreys.

The thermal decomposition of sugar and its catalytic acceleration E. H. Ruesenfeld and Fr. Muller. *Ber.* 68B, 2052-4(1935).—The thermal decompn. of sucrose during 3 hrs. heating at 150° was detd. by dissolving the product in water and observing the intensity of color of the soln. (caramelization) and the amt. of carbonaceous residue. Pure sugar showed little caramelization and no residue. When 5% NaCl was mixed with the sugar caramelization increased and there was a moderate amt. of residue. Addn. of FeCl_3 along with the NaCl failed to increase the decompn. until it amounted to 0.005% of the mixt. (sugar + NaCl + FeCl_3). Greater quantities of Fe decreased caramelization but greatly increased the carbonaceous residue. In the well-known expt. of making a lump of sugar burn by spreading cigar ashes over it, the Fe in the ash probably is less important as a catalyst than the alk. salts in the ash. F. L. Browne.

Catalytic properties of rhenum and of some of its compounds S. B. Anusimov, V. M. Krasheinnikova and M. S. Platonov. *J. Gen. Chem. (U. S. S. R.)* 5, 1059-65(1935).—With metallic Re as a catalyst, expts. were performed on hydrogenation of maleic acid in aq. soln. and cyclohexane in EtOH soln. at 15-20°, of cyclohexane at 150° and 250°, of C_6H_6 at 100°, 150° and 200°, of PhNO_2 at 250° and 300° and of NO at 200°, 250°, 300°, 350° and 400°. Expts. were performed also on dehydrogenation of EtOH at 200-600°, and on oxidation of NH_3 at 500°, in the presence of metallic Re, and of CH_4 at 300-400° in the presence of Re and K perchlorate. Re is a weak catalyst for hydrogenation, but active for dehydrogenation of EtOH. Catalytic action of Re on oxidation at high temps. is hindered by the formation of highly volatile Re oxides. S. L. Madorsky.

Catalysis with organic fibers H. G. Bredig, I. Gersinger and H. Lang. *Biochem. Z.* 282, 88-98(1935), cf. C. A. 26, 5110.—A catalyst such as Et_3NHCl , which contains no asym. atom, produces only optically inactive nitriles, but coupled with an optically active cellulose fiber it acts stereochemically in a relatively sp. manner on the substrate. Fibers of diethylamino-cellulose con-

dense not only benzaldehyde with HCN to optically active hydroxy nitrile, but also various other aldehydes. 1 ber catalysts were made from cellulose and different bases and the results obtained with them are discussed.

S Morgulis

Catalytic decomposition of hydrogen peroxide on different metals Joseph Weiss. *Trans. Faraday Soc.* 31, 1547-57 (1935)—The initial process in the catalytic decompn of H_2O_2 by metals involves a transfer of 1 electron from the metal to adsorbed H_2O_2 forming the radicals OH and HO_2 . The 2 principal reactions are $H_2O_2 + e_{metal} = OH^\cdot + OH_2^\cdot$ and $HO_2^\cdot = HO_2 + e_{metal}$. This mechanism is favored by the fact that the decompn is definitely increased through cathodic polarization, which decreases the work function of the metal.

The catalytic decompn on Au, Pt, Pd, Ag and Zn was investigated and discussed from this point of view. Poisoning by KCN, Na₂S and CO is explained on the assumption that coordination surface compds are formed with electron shells of the inert-gas type, which practically prevent electron transfer from Pt or Pd. C. E. P. J.

Catalytic action of Japanese acid clay I. Condensation of benzyl chloride and benzene. Tsutomu Kuwata. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 503-b (1935)—Japanese acid clay is an effective catalyst in the condensation reaction $PhCH_2Cl$ and *p*-dibenzylbenzene were found in the condensation products, and the presence of *o*- and *m*-compds was suspected. The activity of the clay was decreased when Fe_2O_3 and Al_2O_3 were removed from it with HCl. Prep. Fe_2O_3 and Al_2O_3 was an effective catalyst. Five references. Karl Kammermeyer

Exchange of heavy hydrogen atoms between hydrogen and ammonia K. Wirtz. *Naturwissenschaften* 23, 721-2 (1935)—Exchange of D from HD to NH_3 is catalyzed by a Pt wire at 300°. The results are detd. from the D content of the H_2 after the NH_3 has been frozen out (Parkas method, C. A. 28, 3657). The const. $K = [NH_2D][H_2]/[NH_4][HD] = 1.9$ at 300°. From spectroscopic data 1.82 was estd. B. J. C. v. d. H.

Measurement of specific heat of iron at high temperatures. K. Mehss. *Arch. Eisenhüttenw.* 9, 209-12 (1935).—The methods of detn used at present are discussed as to accuracy and the sp. heat is detd. for an Fe contg. 0.06% C with an accuracy of 0.05%. It is recommended to make sp. heat measurements relatively instead of directly, and to refer sp. heat to a standard material, preferably sinter-corrundum, which is particularly suitable for this purpose because of its mech. properties.

M. Hartenhem

The specific heat of Ag_2HgI_4 in connection with its crystal structure J. A. A. Ketelaar. *Z. physik. Chem.* B30, 53-60 (1935), cf. C. A. 28, 7098⁴.—The true sp. heat of Ag_2HgI_4 was measured between 20° and 100° by a modified Nernst method. The curve begins to show anomalies at 37° with a transition point at $50.7 \pm 0.2^\circ$, where the sp. heat is three times normal. The heat of transition is 0.29, kg.-cal./mol. for the homogeneous transition and 1.04 kg.-cal./mol. for the heterogeneous part. The "averaged structure" previously described is the best explanation for both sp. heat and cond. changes.

G. M. Murphy

Second virial coefficient and specific heats of oxygen J. A. van Lameren. *Physica* 2, 833-9 (1935)—Previous detns. were extended (cf. C. A. 26, 889) at liquid- $C_{60}H_{12}$ temps. from sound-velocity measurements. At 86.27° and 83.80° abs., resp. the values of the S function are $5 \times 10^3 = -7.613$ and -8.214 , c_p/c_v for $p = 0$ is 1.406 and 1.404, resp. An empirical equation for B , the second virial coeff., is given. The calcd. values for sp. heat of O_2 at 90.00°, 80.27° and 83.80° are at zero pressure $c_p = 6.86$, 6.87 and 6.90 cal. per mole. B. J. C. v. d. H.

Entropy of heavy hydrogen Klaus Clusius and Ernst Bartholomé. *Z. physik. Chem.* B30, 258-64 (1935); cf. C. A. 29, 7169⁴.—The entropy of D at 298.15°K., obtained from thermal data is 33.91, cal./mol./degree. Calcn. of this quantity from statistical mechanics and spectroscopic data gives 38.08. The difference of 5.06,

can be explained by assuming that para-D can rotate freely in the solid state up to 10°K. with $J = 1$, where J is the rotational quantum no. and in addn, the nuclear spins of the ortho and para mols. are preserved. The entropy term is $R \ln 9 + 1/2 R \ln 3 = 5.09$, which agrees well with the thermal calcn. For practical calcs., the abs. value of 34.63 entropy units is used, this being corrected by the term $R \ln 9$ for the entropy of nuclear spin. At low temp, the chem. const. for ortho-D, $s'_1 = -0.68$ and for normal D, $s'_1 = -0.622$. The vapor pressure const., $s'_p = -0.67$, for normal D. At high temp, $s'_1 = -2.01$ and $s'_p = -2.76$. G. M. Murphy

Caloric and thermal properties of condensed heavy hydrogen Klaus Clusius and Ernst Bartholomé. *Z. physik. Chem.* B30, 237-57 (1935)—App. is described for making certain thermal measurements on D. The following results were obtained, the second figure in each case being the corresponding value for H, which was not measured in this investigation but is given for comparison. Heat of vaporization at 194.6 mm Hg, 302.3 \pm 0.6 cal., 210.7, heat of fusion, 47.0 \pm 0.4 cal., 28.0, heat of sublimation at 0°K., 274.4 cal., 183.4, θ value of Debye, (C_p) 89°, 01°, triple point, 18.65°K., 13.95, slope of the fusion curve at the triple point, 40.5 kg./sq. cm., 30.3; mol. vol. of liquid at triple point, 23.14 cc., 20.15; mol. vol. of solid at triple point, 20.48 cc., 23.31; zero-point energy of lattice, approx. 215 cal., 305. The differences can all be explained on the basis of the difference of the zero-point energies and anharmonicity const. in the lattice vibrations, by assuming the same intermol. forces for each.

G. M. Murphy

The critical data of light and heavy water and the density-temperature diagrams E. H. Riesenfeld and T. L. Chang. *Z. physik. Chem.* B30, 61-8 (1935); cf. C. A. 29, 4648².—The crit. temp. of H_2O - D_2O mixt. is an almost linear function of the const. for the pure liquids and is given by $t_c = 374.2 - 2.7n$, where n is the mole fraction of D_2O . For the latter, $t_c = 371.5^\circ$, $p_c = 218$, atm., $d_k = 0.363$ g./cc. The d_s of H_2O and D_2O are equal at 49.5°, where the satd. vapors have equal d_s , and at 370.0°, where the liquids have the same d .

G. M. Murphy

Phase equilibria in hydrocarbon systems IX. Specific heats of butane and propane. B. H. Sage and W. N. Lacey. *Ind. Eng. Chem.* 27, 1484-8 (1935); cf. C. A. 29, 4650¹.—The sp. heat at atm. pressure and at 500 lb./sq. in. was detd. for the range 60° to 220°F. The value C_p , defined as the heat required to raise the temp. of the satd. liquid by 1°F., was detd. for the range 50° to 200°F. X. Thermodynamic behavior of liquid mixtures of butane and crystal oil. *Ibid.* 28, 106-11 (1936).—The data cover the pressure range from below atm. to 3000 lb./sq. in. and the temp. range 70° to 220°F. Data are reported for the relation of sp. vol. to pressure and temp., compressibility and thermal expansion of the liquid as functions of compn., effect of temp. and compn. on bubble-point pressure, sp. heat at const. pressure for bubble-point liquid as functions of temp. and compn., isothermal change in entropy and in heat content with pressure at 220°F., temp.-heat content diagram for liquid contg. 40.0% butane and partial sp. heat and sp. vol. for each component of bubble-point liquid as functions of compn.

F. L. Browne

The heats of formation and solution of potassium dithionate. H. Zeumer and W. A. Roth. *Z. anorg. allgem. Chem.* 224, 253-6 (1935).—For the decompn., $K_2S_2O_8(s) \rightarrow K_2SO_4(s) + SO_2(g)$ the heat absorbed is 5 kg.-cal./mole. The heat of formation of $K_2S_2O_8$ from the elements is calcd., from this heat and the known heats of formation of K_2SO_4 and SO_2 , to be 118.9 kg.-cal. At 20° the heats of soln. (in kg.-cal. absorbed) of 1 mol. of $K_2S_2O_8$ in 400, 800 and 1600 mols. H_2O are, resp., 12.9, 13.1, and 13.1.

L. E. Steiner

The heat of formation of zinc sulfide. Critical remarks on Mixer's sodium peroxide method. H. Zeumer and W. A. Roth. *Z. anorg. allgem. Chem.* 224, 257-64 (1935); cf. C. A. 29, 7779¹.—The heat of formation of regular 7n blende ($d_2^2 = -4.088$), detd. by Mixer's Na_2O_2 method,

is 41.5 ± 0.9 kg.-cal. The sources of error of the method are pointed out. All heats of formation of oxides, determined by this method are uncertain, owing to variation in composition of the various melts obtained as end products.

L. E. Steiner

Solubility relationships of water solns. satd. with respect to sucrose and dextrose in relation to the storage

of sherbet and water ice (Leighton, Leviton) 12. Absorption law for slow neutrons (Rasetti, *et al.*) 3. 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

The natural philosophical foundations of quantum mechanics Grete Hermann *Naturwissenschaften* 23, 718-21(1935).

Problems of the new quantum theory of the electron Viktor Weisskopf *Naturwissenschaften* 23, 631-7, 647-53, 669-74(1935).—A review discussing Schrödinger's equations, relativity, spin, Dirac's theory, positron theory, etc.

The neutrino theory of light H. R. de L. Kronig *Physica* 2, 854-60(1935).—Continuation of a previously developed theory (C. A. 29, 7175). B. J. C. v. d. H.

The Born theory of the electron Arthur Bramley *Science* 82, 438-9(1935).—The Born theory of the electron (Born, *Proc. Roy. Soc. A* 143, 410(1934), Born and Infeld, *Proc. Roy. Soc. A* 144, 425(1934)) is discussed.

Exchange forces and the structure of the nucleus James H. Bartlett, Jr. *Phys. Rev.* 49, 102(1935).

A quantum mechanical discussion of orientation of substituents in aromatic molecules G. W. Wheland and Linus Pauling *J. Am. Chem. Soc.* 57, 2086-95(1935), cf. C. A. 29, 3599.—By use of the method of mol. orbitals, a quantum discussion of the charge distribution in aromatic mols. undergoing substitution reactions is carried out, with consideration of the inductive effect, the resonance effect, and the polarizing effect of the attacking group. It is shown that, with reasonable values for the parameters involved, the calculated charge distributions for pyridine, toluene, phenol, the halobenzenes, etc., are in qualitative agreement with the experimental results regarding position and rate of substitution, the auxiliary hypothesis is made that the rate of substitution of the group R' for H on the *i*th C atom increases with increase in the negative charge on the *i*th C atom when R' is in position to react.

Ground state of (H₂), the molecule ion (H₂⁺) and wave mechanics O. W. Richardson *Proc. Roy. Soc. (London)* A152, 503-14(1935).—The agreement between values of the fundamental constants such as dissociation energy of the ground state of the H₂⁺ as determined by observation and as calculated, by wave mechanics is discussed critically. The properties of H₂⁺ predicted empirically from a comparative study of various excited states of H₂ are compared with those predicted by wave mechanics.

The three center problem I. G. S. Goudas Z. *Physik* 96, 542-5(1935).—A quantum-mechanical treatment of the H₂⁺ ion, one electron in the field of 3 fixed protons, is given. A variation method is used, in which the allowable proper functions are linear functions of 3 H-like proper functions. In particular 2 models are considered, (1) with the 3 protons in a line (2) with the 3 protons forming an equilateral triangle. The numerical calculations will be published later.

Calculation of the self-consistent field with exchange for lithium V. A. Fok and M. I. Petrashen *Compt. rend. acad. U. R. S. S. (N. S.)* 3, 295-6(1935), cf. C. A. 29, 13.—The wave functions for the normal and 4 excited states of neutral Li were constructed by the generalized self-consistent field method (electron exchange was taken into account) and the corresponding term values and the transition probabilities for the principal series of Li were calculated. A comparison of the observed term values of Li and Na with those calculated with and without exchange,

shows that in some cases 90% of the discrepancies of the latter are due to the neglect of the quantum exchange. The transition probabilities calculated with the functions including exchange gave a satisfactory reproduction of the observed intensities of the Li principal series.

Morris Muskat. Absorption in mercury high-pressure discharges W. Elenbaas *Physica* 2, 763-8(1935).—Recent results of Fabrikant and Pulver (C. A. 29, 3231) on absorption of Hg light in the Hg arc were checked. Absorption of 5461, 5770, 5790 and 5791 Å, in a Hg tube was measured. The absorption increases with increased *c* d in the absorbing tube and with decreasing *c* d in the emitting tube. A different interpretation is given to the incomplete results of F. and P. The filling up of 2P levels is not constant, but increases with the *c* d in agreement with temp. equl. requirements.

Temperature and gradient of the mercury arc W. Elenbaas *Physica* 2, 757-62(1935).—The energy used, in a high-pressure Hg arc is expressed by $L = A + Bm$, where *m* = the amt. of Hg per cm. of tube length (C. A. 29, 6930). *A* represents the conduction loss, *Bm* the radiation loss. By assuming *A* to be independent of *L* and *m* and using a mean excitation level of *V_m* volts the relations between *L* and *T* are evaluated. For *V_m* a practical value of 7.8 v. is obtained and the gradient *G* is found proportional to $L^{1/2} m^{1/2} d^{-1/2} (L - A)^{-1/2}$ with *d* the tube diam. This leads to a min. of *G* depending on *L* for $L - A = 28$ w. per cm. The *G* values at higher *L* agree well with experimental data. In different form the derived temp.-input relation is $T = 40,400 / [k - \log(L - A)/m]$ with *k* = 7.5. This relation is, however, not in agreement with the similarity law and an empirical equation $T = 6025 [L/(8.5 + 5.75 m)]^{1/2}$ follows the data somewhat better.

The gradient of the mercury high-pressure discharge as a function of pressure, diameter and current density W. Elenbaas *Physica* 2, 787-92(1935), cf. C. A. 29, 7683.

Total radiation of super high-pressure mercury discharge W. Elenbaas and W. de Groot *Physica* 2, 807-10(1935).

Magnification of photocurrents by emission of secondary electrons F. M. Penning and A. A. Kruthof *Physica* 2, 793-804(1935).

The ionization of a gas at different pressures under the influence of photons and corpuscular radiation J. Clay *Physica* 2, 811-16(1935).—In a gas filled vessel the no. of ions *I* produced by corpuscles depends on *p*, the pressure required to limit the path of the corpuscles to the vessel dimension and on *p₀* required to limit the path of the wall particles to the vessel. For pressure *p* smaller than *p₀* and *p₀*' the value of $I = (Ap/p_0) + (Bp/p_0')$, for $p_0 < p < p_0'$, $I = Ap + (Bp/p_0')$; for $p > p_0$ and $p > p_0'$, $I = Ap + B$. These equations hold for photons. For corpuscular radiation a term proportional to *p* is to be added. Exptl. values on satn. current in several gases by γ-rays or cosmic rays at different pressures confirm the theory (graphs).

Ionization measurements in air at high pressures J. Clay and M. A. van Tijn *Physica* 2, 825-32(1935).—The ionization current of air under pressure in a steel vessel was measured. At 20° and 30° with 95 atm. air pressure no temp. effect was found. The pressure rela-

tions are completely expressed by sepn. of space and wall radiation combined with the theory of column ionization. The satn. value obtained for fields higher than 800 v. per cm. agrees with the theory (cf. preceding abstr.). At satn., difference between neg. and pos. charging disappears. Even at 500 v. per cm. the satn. is incomplete for 1 atm. pressure; the field required for satn. increases with pressure. B. J. C. van der Hoeven.

A short method for determination of saturation current by the Jaffe theory of column ionization. H. Zanstra. *Physica* 2, 817-24 (1935).—A rapid graphical method is described to find from the measurement of ionization current for finite fields values for the satn. current. The method is based on the Jaffe theory (C. A. 8, 1541).

B. J. C. van der Hoeven.

The effective cross section of helium and the charged area of the helium ion. Antonio Rostagni. *Ann. Physik* 24, 543-4 (1935).—The discrepancy found by Wolf, cf. C. A. 29, 6832⁷, 7787⁸, is due to a high value for the area of the charge. Measurements of the cross section agree. R. E. DeRight.

Effect of light on diamagnetic susceptibilities. H. C. Bhuyan. *Nature* 136, 872 (1935).—The effect of light on paramagnetic susceptibilities has been reported by Bose and Raha, *Phil. Mag.* 20, 145-66 (1935). When Cl, Br and I vapors were exposed to light, a slight increase in the diamagnetic susceptibility was obtained. This is evanescent at the red end and remains very small until the violet end is reached. The shift of equilibrium is temporary, and the dark deflection is reproducible. The susceptibility of an air tube was unaffected by light. G. M. P.

Temperature dependence of free electron susceptibility. Edmund C. Stoner. *Proc. Roy. Soc. (London)* A152, 672-92 (1935).—The various formulas required in the application of the Fermi-Dirac statistics to calcn. of magnetization are given, and calcns. made of magnetization, M , as a function of H and T for the spin and diamagnetic effects considered separately and for the resultant effect both at low and at high temp. C. E. P. J.

Determination of the saturation ionization current from high-speed electrons in air. Lauriston S. Taylor. *Phys. Rev.* 48, 970 (1935).—G. Jaffe's theory of columnar ionization (C. A. 8, 1541) was successfully applied to expl. data on the ionization of air at normal pressure by a beam of electrons with a max. energy of 150 e. kv. G. M. P.

"Extra" rings in electron diffraction patterns. G. I. Finch and A. G. Quarrell. *Nature* 136, 720 (1935); cf. C. A. 29, 2443⁷.—"Extra" rings in electron diffraction patterns from metal films may be due either to grease or to amalgamation. The detection of "extra" rings due to amalgamation is difficult. Photographs and measurements are given for 6 sets of "extra" rings. G. M. P.

Characteristics of the adsorption of indium and thallium atoms on tungsten oxide. C. F. Powell and R. L. Mercer. *Trans. Roy. Soc. (London)* A235, 101-24 (1935).—An app. is described for measuring the atoms that are adsorbed on the surface of a metallic oxide, such as is formed on W when it is heated in air. If the W is in the shape of a strip or filament the oxide may be heated uniformly to various temps. with an elec. current through it. From elec. furnaces contg. In or Ti streams of atoms are emitted and of those that reach the filament a const. fraction is adsorbed, and this fraction (probably equal to 1) is independent of the temp. and the total no. of atoms adsorbed over a wide range. The filament when heated will drive off a current of pos. ions which are collected by electrodes in the app. A state of dynamic equl. ensues in which the no. of atoms arriving at the hot filament is balanced by the emission of neutral atoms and pos. ions. From the ratio of the pos. ion emission to that of neutral atoms can be detd. the electronic work function of the surface when free from adsorbed atoms. This is 6.13 v. for In and 6.25 v. for Ti. The ratio of the emission of neutral atoms to that of pos. ions increased with the surface concn. of adsorbed atoms in a manner corresponding to a linear decrease of the electronic work function. The characteristics of an oxide necessary for its use as a base for

the thermionic emission of pos. ions are discussed, and these are described for several oxides. Those of Ni, Fe, U and Mo. C. C. Kiess.

The structure and physical properties of thin films of metal on solid surfaces. E. N. da C. Andrade and J. G. Martindale. *Trans. Roy. Soc. (London)* A235, 69-100 (1935).—Thin films of Ag and Au, of from 20 to 100 atoms thick, were deposited on glass and other solid surfaces by the method of cathodic sputtering for the purpose of studying their color and other optical properties. The variations in these properties reported by others under apparently identical conditions of prepn. are due to uncontrolled heating. Uniform and reproducible films are obtained if the sputtering is done slowly and the base is kept cool. Such films are apparently amorphous when microscopically examd. with the highest powers. When films of the order of 50 atoms in thickness are maintained at high temps. which are, however, well under the m. p. (230° for Ag, 400° for Au) a flow of the atoms in the upper layers of the film occurs, with condensation into aggregates. On prolonged heating at somewhat higher temp. the aggregates develop into crystals with the cubic lattice structure, the (111) face being parallel to the surface of the supporting base. The flow of atoms into the crystals leaves the film blotched with large irregular patches only a few atoms thick. These areas can also begin to form crystals with a further increase in temp. until at about 600° perfect cubic crystals are formed on a background of very thin film. Heated films on glass and quartz, but not on the cleavage faces of mica, exhibited characteristic alignments of the crystals, the patterns of which were repeated after several cleanings and sputterings. These linear arrangements do not follow the course of minute polishing scratches and are, therefore, attributed to submicroscopic surface cracks. C. C. Kiess.

The diffraction of electrons by metals and organic polymers. J. J. Trillat and H. Motz. *Ann. phys.* [11], 4, 273-304 (1935).—Expts. on electron diffraction of nitrocellulose and cellulose acetate, synthetic resins and rubber indicate a striking analogy which is attributed to a very thin film of heavy substance such as satd. acid, paraffin or wax. The first diffraction diagram alters and is replaced by an amorphous type after about 10 min. and if the material is washed with ether or benzene a new ring diagram appears which is very different from the first. The same phenomenon is evident with metallic films of Au, Pt, Ag, Al and Ni. Thin deposited films of $C_{18}H_{38}$, stearic acid, tristearin, ceryl alc., oleic acid and beeswax gave no supplementary pattern, hence it is concluded that the layers formed naturally on metal and org. polymers are due to the crystn. of long-chain mols. of C atoms. The mols. are oriented perpendicularly to the surface and the method of electron diffraction can be used to study the structure of such thin layers. The formation of such layers is very common and many diagrams previously published are the result of a ring superimposed on another diagram. Some previous interpretations in terms of amorphous layers due to polishing and adsorption of gases may be wrong. In working with org. polymers the best method is to det. the pattern after the electron stream has been directed at a certain point for 15 or 30 min. By examg. the patterns at the beginning and later, it is possible to det. whether the layer was present or absent. If present it will be destroyed by the bombardment of the electrons. The theoretical interpretation is applied to perpendicular and oblique incidence and can be used to study the structure of org. compds. of long chain. Several diffraction patterns are shown. Arthur A. Vernon.

The photoeffect in thin adsorbed layers of alkali metals. V. Gei and I. Truten. *Physik Z. Supplementum* 8, 342-51 (1935).—Explanations (cf. Fleischer, C. A. 21, 1223) of selective max. in curves of the photoelec. yield at metal surfaces were investigated. Measurements were made with ad. layers of alkali metal, free from oxides and hydroxides, deposited on well-dried SiO_2 gel. The prepn. of the SiO_2 gel, deposition of the metal, detn. of its purity and thickness, and technic of measurement of the elec. cond. and photocurrent are described in detail.

The gel is colored blue by the adsorbed layer of alkali metal. The color is attained rapidly with Cs, more slowly with Rb, and most slowly with K. The rate depends on the temp. of the gel, its distance from the metal, and the width of the tube connecting the metal with the gel. A yellow deposit is formed above 60° which possesses neither an elec. cond. nor a photoeffect. The elec. cond. of the alkali metal layers follows Ohm's law up to potentials of 4 to 5 v., beyond which reproducible results are not obtained. Since saturation of the photocurrent occurs at high potential differences, all measurements were made at 300 v. The red limit of the photoeffect for such layers appears at 78.0 and 95.0 Å. for K and Cs, resp. The relative photocurrent curves are normal and have no selective max. No temp. dependence, characteristic of composite photocathodes, could be established. These results indicate that the metal layers were essentially free from oxides and hydrides. The large displacement of the long wave limit of the photoeffect in the alkali metal layers is ascribed to the absorptive power. The normal course of the photocurrent curves indicates that the absorption power alone cannot lead to the appearance of selective max. as de Boer and Teves (C. A. 26, 915) assumed. It is probable that the appearance of selective max. is determined by the presence of oxides, hydrides and other substances in an intermediate layer.

Alvin S. Smith

A magnetic electron lens without rotation of the image. G. Stuebenow. *Z. Physik* 96, 634-42 (1935).—An arrangement of two magnetic lenses can be made, by a suitable choice of currents, to give an inverted image in the same way as an optical lens.

B. Swirles

Interaction of light nuclei. II. Binding energies of the nuclei of ${}^2\text{H}$ and ${}^3\text{He}$. H. S. W. Massey and C. B. O. Mohr. *Proc. Roy. Soc. (London)* A152, 693-705 (1935), cf. C. A. 29, 2537.—The accuracy of the variation method in dealing with short-range interactions was studied by comparison with exact solns. for ${}^2\text{H}$. Trial functions in great variety were used in calcn. of the binding energy of ${}^2\text{H}$ on the assumption of zero interaction between neutrons. No function was found which gave a binding energy greater than 3.4×10^6 e. v. (observed value 8.1×10^6). When an interaction is introduced between neutrons, the observed binding energy can be obtained if this attraction is even $1/3$ of that between neutron and proton, on the assumption that the ranges of interaction in the 2 cases are comparable. This precludes the possibility of existence of a stable nucleus ${}^4\text{He}$. Similar calcs. for ${}^3\text{He}$ show that an anomalous attraction between 2 protons at small distances of the same order as that between 2 neutrons will give the observed binding energy, and consequently the nucleus ${}^4\text{He}$ must be unstable. C. E. P. J.

Photographs of cosmic rays with a Wilson Blackett chamber under special conditions. Pierre Auger and Paul Ehrenfest. *J. phys. radium* 6, 255-6 (1935).—Results of these experiments agree with A's theory, i. e., the existence of 2 kinds of corpuscular radiations (M and D) of nearly the same energy, but having different penetrating powers (especially in the elements of high atomic no.). The group having the least penetrating power is the source of most of the numerous rays observed in the Jungfrau station and at sea level. The other group, having greater penetrating power, produces very rarely secondary radiation of great energy. But to those rays are perhaps due the feeble photons and delta rays that are observed along certain penetrating trajectories.

Antibos

Analysis of corpuscular cosmic radiation under twenty-eight meters of soil. Pierre Auger and Albert Rosenberg. *Compt. rend. 201*, 1, 17-20 (1935); cf. C. A. 29, 2537.—Measurements were made of corpuscular radiation that had passed through 28 m. of soil (sand or calcareous, d. 2.2) by means of 3 counters vertically above each other and which were 10 and 10 cm. Pb. Under these conditions the M group does not exceed 37%. The coeff. of absorption of the corpuscles attaining this depth is about 0.4×10^{-12} cm⁻¹/g.

C. A. Silberrad

Absorption in matter of particles of great energy. Jacques Solovine. *Compt. rend. 201*, 1119-12 (1935).—The correction to be introduced into the ordinary quantum-mechanics formulas for the loss of energy of an electron by radiation or of a photon by production of pairs when the energy of the colliding particle approaches $137mc^2$ is calculated. For Pb and electrons of energy $20mc^2$ or $40mc^2$ it is of the order of 5% (cf. Bethe and Heitler, C. A. 28, 7145).

C. A. Silberrad

Sign and nature of ultrapermeating particles of cosmic radiation. Louis Leprince-Ringuet. *Compt. rend. 201*, 1184-6 (1935).—Corpuscular cosmic radiation was passed first through a Wilson chamber 55×15 cm. in which it was subjected to a magnetic field of 13,000 gauss, then through 2 counters, 7 cm. of Pb and finally through a third counter. About $1/3$ of the 60 odd trajectories recorded in the third counter were practically straight, indicating particles of very great energy; in the rest (with energies of 7×10^6 e. v.) there were approx. 2 pos. to 1 neg. These results, while not excluding other explanations, are consistent with existing views (cf. Auger, C. A. 29, 5345).

C. A. Silberrad

The theory of internal pair production. Hideo Yukawa and Shochi Sakata. *Proc. Phys.-Math. Soc. Japan* 17, 397-407 (1935).—The probability of internal pair production induced by radiationless S - S transitions of a radioactive nucleus was calculated and its ratio to the probability of K electron emission by the same nuclear transition was compared with expn. in the case of RaC' . The comparison shows that this process for internal pair production will provide only a very small part of the experimentally observed pair productions.

Morris Misak

The deuteron theory. D. I. Blokhintsev. *Fizik. Zh. Sozvetianin* 8, 270-4 (1935).—Math. The present conception concerning the binding forces between the proton and neutron requires an application of the relativistic theory of the reciprocal effect of ponderable particles in order correctly to calc. the motions of particles in the deuteron.

Allen S. Smith

The theory of atomic nuclei. W. Heisenberg. *Z. Physik* 96, 473-84 (1935).—The mass defects of light nuclei are calculated with the assumption of an exchange force between proton and neutron of the form $J(r) = ae^{-\mu r}$, and the use of a simplified Hartree approximation, instead of the Thomas-Fermi method used by Majorana (C. A. 27, 5099). The agreement of the relation between a and μ with that calculated by Wigner (C. A. 27, 2576) is much better than Majorana's; the causes of the residual discrepancy are discussed.

B. Swirles

A system of masses of light atoms deduced from nuclear reactions alone. L. Isakov. *Compt. rend. Acad. Sci. U. P. S. S. (N. S.)*, 3, 391-4 (1935).—A least-square soln. has been obtained for the masses of the light elements, including B^{10} , from the 19 best-established equations for their nuclear reactions. With these masses the resulting residuals in the reaction equations do not exceed 3 units in the 4th decimal place (in mass units), and the probable errors of the masses are within the 5th decimal place. The values obtained for H^1 , H^2 , He^3 , Li^6 and Li^7 are in good agreement with the mass-spectroscopic values if the latter are increased by 1.8 parts in 10^4 for the effect of the error in the ratio He^3/He^4 . The differences from Bethe's values are within the probable errors of the latter.

Morris Misak

The theory of nuclear masses. C. F. v. Weizsäcker. *Z. Physik* 96, 431-58 (1935).—According to Majorana's theory of the nucleus (C. A. 27, 5099), the mass defect per particle is constant for all nuclei. This is not in agreement with observation for the lighter elements and the discrepancy is traced to a "surface tension" effect. It is shown how this effect can be derived by a modification of the Thomas-Fermi method. A method of interpolation is given for deriving the mass defects of nuclei with an odd number of particles from those of nuclei with an even number. A half-empirical classification of the mass defects of the nuclei is made.

B. Swirles

The structure of the light atomic nuclei. S. Flügge. *Z. Physik* 96, 459-72 (1935).—v. Weizsäcker's treatment (preceding abstract) is modified to a form suitable for very light nuclei, on the assumption of a law of exchange force between proton and neutron of the form, $ae^{-\mu r}$.

The values of the constants a and b calculated from different nuclei other than He show good agreement with each other, but not with Wigner's values; it appears that this agreement cannot be reached by using the Thomas-Fermi approximation. The constants are also made for a law of force $a'e^{-b/r}$. A modification of the \sqrt{Z} law for the nuclear radius is derived for light elements and the influence of Coulomb forces is discussed. B. Swirles

Energies of nuclear reactions. H. A. Wilson. *Proc. Roy. Soc. (London)* A152, 497-502 (1935), cf. C A 29, 5012. The energies of 17 nuclear reactions are discussed, and some of the values revised, making the 17 reaction equations consistent. The energies are nearly equal multiples of $q = 0.000115$ in at. wt. units. The at. wt. of 13 light elements are calculated from the reaction energies and values obtained nearly equal to those of Bethe and of Oliphant, Kempton and Rutherford (cf. C A 29, 4618). C. P. P. Jeffreys

Emission of positrons from radioactive sources. A. I. Alkhanov, A. I. Alkhan'yan and M. S. Kozlov. *Nature* 136, 719-720 (1935), cf. C A 29, 7790. A spectrum of positrons from Rn is given, and is compared with one from Th. The spectrum is continuous up to about 1700 e. kv., plus discontinuities at 770 and 1160 e. kv., due to the internal conversion of 2 strong Ra γ -rays with energies of 1700 and 2200 e. kv. The ratio of positrons to Ra C β particles is 2.3×10^{-4} . An approx. equal no. of positrons was produced in Pb by Ra C γ -rays from the source. When Pb and Al were irradiated by both γ - and β -rays, most of the pair production was due to Ra C γ -rays. G. M. P.

Creation of electron pairs by fast charged particles. H. J. Rihl. *Proc. Roy. Soc. (London)* A152, 550-561 (1935).—The creation of electron pairs in the collision of particles moving with relative velocity near that of light is calculated. The effect of screening and the variation of probability of pair creation as a function of impact parameters are considered. C. P. P. Jeffreys

Scattering of neutrons by protons. M. Bronshteyn. *Compt. rend. acad. sci. U. R. S. S.* 3, 75-81 (1935).—Math. An extension of the derivations of Wigner (C A 28, 4019). The conclusions of Peierls (cf. C A 29, 3909) have been verified. W. J. Peterson

Radioactivity of some rare earths induced by neutron bombardment. J. C. McLennan and W. H. Kann. *Nature* 136, 821-2 (1935).—These elements of the rare earth group for which the results of other workers disagree were reinvestigated. The compounds were bombarded with slow neutrons from Ra + Be. The half-lives obtained were: Nd_2O_3 , 35 = 6 min., $\text{Ce}_2(\text{C}_2\text{O}_4)_3$, 6.4 = 0.3 hr. $\text{Dys}(\text{C}_2\text{O}_4)_3$, 2.5 = 0.1 hr., Er_2O_3 , 5.8 = 0.2 min., 2.7 = 0.2 hr., Ho_2O_3 , 2.6 hr., $\text{Lu}_2(\text{C}_2\text{O}_4)_3$, 1.6 = 0.4 hr. The quantities used and initial intensities are also given. G. M. P.

The velocities of slow neutrons. G. A. Fink, J. R. Dunning, G. B. Pegram and D. P. Mitchell. *Phys. Rev.* 49, 107 (1935); cf. Dunning, et al., C A 30, 375. A frequency-velocity curves are given for slow neutrons from a Ra-Be source at 90°K. The small deviations from theory are discussed. G. M. P.

The absorption law for slow neutrons. G. B. Pegram, F. Segre, G. A. Fink, J. R. Dunning and G. B. Pegram. *Phys. Rev.* 49, 104 (1935).—The absorption of slow neutrons by Ag follows closely the $1/v$ law (v = velocity of the neutron); that of Cd does not. G. M. P.

Excitation of nuclei by neutrons. W. L. Hurens. *Nature* 136, 870 (1935).—The activation observed by Danysz, Rothbarth, Wretenstein and Zyw (C A 29, 1692) was observed, with a Ag cylinder, with Si, $-23 = 4\%$, Al, $-19 = 3\%$, Ag, $+40 = 5\%$, Fe, $+19 = 17\%$, Pb, 0 = $\pm 2\%$. The decrease of activation of Al and Si gives directly the cross section for the total absorption of fast neutrons: 3×10^{-24} sq. cm. Collisions of neutrons with Ag nuclei can lead either to an excitation without capture or to capture with the formation of a radioactive element. The activity induced in Ag and in Rh is very differently affected by the absorber although these substances show

almost the same increase when the neutrons are slowed down by paraffin. G. M. P.

The disintegration of deuterium by deuterons. K. D. Alexopoulos. *Naturwissenschaften* 23, 817 (1935).—Expts with coincidental counters indicated that in the process of destruction of D nuclei by rapid deuterons, (A) $\text{D}^2 + \text{D}^2 = \text{H}^3 + \text{H}^3$, or (B) $\text{D}^2 + \text{D}^2 = \text{He}^4 + \text{ne}^0$ rapid γ rays are emitted, 1 e., less than $1 \frac{1}{2}$ quantum per 1000 neutrons made. For a deuteron current of 2 μ amps, $140 \text{ e.} \times 1.7 \times 10^7$ neutrons are produced. A He-filled Wilson chamber gave the same order of magnitude in results. The yields of reactions A and B (A yields from Oliphant, et al., C A 28, 4670) coincided perfectly at different values of deuteron energy (0-130 e. v.). B. J. C. van der Hoeven

A particle yield from lithium under proton bombardment. N. P. Heydenburg, C. T. Zahn and L. D. P. King. *Phys. Rev.* 49, 100-1 (1935).—The yield of α -particles (from Li) per proton is plotted against voltage for the range 42-225 kv. The data agree with those of Herby, Parkinson and Kerst (C A 29, 7178) and extend to lower voltages. G. M. P.

The occurrence of radium in north and central German waters. Otto Hahn and Hans-Joachim Born. *Naturwissenschaften* 23, 729-30 (1935). On the basis of the He content ofylvinites (C A 28, 3654) it was expected that the water in contact with these salts would have a high Ra content. The Ra content was determined in several subterranean water sources, particularly from oil well drillings. As compared with max. known Ra contents of 7 and 1.9×10^{-12} g. Ra per cc. (Kruznach and Heidelberg) many samples from salt and oil wells in Hannover and Thuringen gave from 0.7 to 5.5×10^{-12} g. per cc. The He theory is thereby supported. The waters high in Ra also contain Li, the Ra content varies up and down with the Ca content (0.5 to 2.0%). B. J. C. van der Hoeven

The γ radiation emitted in the disintegration of Be^8 by α rays. Simone Franchetti. *Nuovo cimento* 12, 516-21 (1935).—Increasing the range of the bombarding α -rays from 1.4 to 3.9 cm. air produces no measurable change in the absorption coefficient of the γ rays emitted. Conclusion. The γ -rays are emitted by C^{12} formed in the reaction $\text{Be}^8 + \text{He}^4 = \text{C}^{12} + \text{ne}^0$. J. B. A.

K^{44} and the radioactivity of potassium. H. J. Walke. *Nature* 136, 755 (1935).—Bittie has suggested that the radioactivity of K is due to K^{44} (C A 29, 7705). Isotopes containing the most neutrons are the least stable, and have the shortest half-lives. The period of K^{44} is 16 hrs., that of K^{45} would be shorter. Evidently this isotope cannot be the source of the radioactivity of K. The isotope K^{44} , proposed as the source of the radioactivity of K by Newman and Walke (C A 29, 2437, 5734) and by Klempner (C A 29, 2428) has been detected by Nier (C A 29, 6501) and by Brewer (C A 29, 7797) in "normal" K. Nier stated that K^{44} and K^{45} are present at all, had an abundance less than $1 \frac{1}{100,000}$. This evidence confirms W.'s selection of K^{44} as the source of the radioactivity of K. G. M. P.

Radioactivity of samarium. H. J. Taylor. *Nature* 136, 719 (1935), cf. C A 29, 5731. α -Particles from Sm were found to have a range of 1.13 ± 0.02 cm. in air. About 1% of the tracks observed had longer ranges, up to 7.5 cm. These long-range particles are not α -particles, but are probably protons. G. M. P.

Induced radioactivity by bombarding magnesium with α -particles. C. D. Ellis and W. J. Henderson. *Nature* 136, 755 (1935). When Mg is bombarded by α -particles, the chief product has a period of 137 sec., $^2\text{Mg}^{24} + \text{He}^4 = \text{Al}^{27} + \text{H}^1$, $^2\text{Mg}^{24} + \text{He}^4 = \text{Si}^{28} + \text{e}^-$. Two other reactions occur to small extent, $^2\text{Mg}^{24} + \text{He}^4 = \text{Al}^{27} + \text{H}^1$, $^2\text{Mg}^{24} + \text{He}^4 = \text{Si}^{28} + \text{e}^-$, with a period of 11 min.; $^2\text{Mg}^{24} + \text{He}^4 = \text{Si}^{28} + \text{ne}^0$, $^2\text{Mg}^{24} + \text{He}^4 = \text{Al}^{27} + \text{e}^-$, with a period of 6.7 min. $^2\text{Mg}^{24}$ has a strong resonance level for α -particles of less than 5.4×10^6 v., and either Mg^{24} or Mg^{26} , or both, have a resonance level for α -particles of 5.4 to 6.1×10^6 v. By using α -particles of energies up to 6.6×10^6 v. to bombard a thick layer of Mg, the cross

sections for proton emission from Mg^{24} , Mg^{23} and Mg^{26} have the ratio 1 300 10

Energy of disintegration of radiophosphorus C D Ellis and W J Henderson *Proc Roy Soc (London)* A152, 714-23 (1935).—The max energy of positrons emitted from radio P(P^{30}) was detd by measuring the end point of the absorption curve in Cu. The value obtained $2.9 \pm 0.1 \times 10^6$ agrees well with previous detns. No γ -rays accompanied the disintegration other than annihilation radiation of the positrons. The energy value 2.9×10^6 v detns the difference in energy of the ground states of P^{30} and Si^{29} . This value combined with other data shows difference in mass to be the same between Al^{27} and Si^{28} when calcd from $Al^{27} + {}^1H^1 \rightarrow {}^{28}Si + {}^1H^1$ or $Al^{27} + {}^1He^4 \rightarrow {}^{28}Si + {}^1H^1$ and $Al^{27} + {}^1He^4 \rightarrow {}^{28}Si + {}^1H^1$

Isotope abundance in platinum B Venkatesachar and L Sibaiya *Proc Indian Acad Sci* 2A, 101 3 (1935), cf C A 29, 6129.—The relative abundance of the Pt isotopes is estd from the structure of the pattern of the Pt band at 3408 13 Å. The values for mass nos 196, 195, 194 and 192 are 16, 13, 10 and 2, resp. This assumes a pos shift and is not consistent with the suggestion of a neg shift. The computed at wt is approx 195

The escape of radon from cells which contain radium J M A Hoflake and A E Korvecze *Rec trav chim.* 54, 768-78 (1935).—Ra, surrounded by Ag gauze and by a thin layer of paraffin ($15 \times 8 \times 2$ mm), is used in prep. an aq soln of Rn, which is used medicinally. The escape of Rn from this cell was found to be irregular, and to depend on the temp

The effect of alteration on the lead-uranium ratio and the calculated age of Wilberforce, Ontario, uraninite Chester M Alter and Egbert M Kipp *Science* 82, 464-5 (1935).—Sep detns of Pb, U and Th are reported for the outer and middle layers and the core of a crystal of uraninite which was altered to some extent. In the alteration of uraninite, Pb is lost less rapidly than U and Th. To calc accurately the age of a mineral by the Pb method, the analysis must be made on fresh, unaltered specimens. Alteration causes the calcd age to be too high. The Th/U ratio may vary in different zones of an unaltered single crystal of uraninite, owing to a change in the concn of these elements in the surrounding medium, during the growth of the crystal. Disregarding the outer layer, an age of 1.42×10^8 years was found for the specimen. A method is suggested for calcd the relative Pb producing power of U and Th from the analytical data on sections of single crystals of minerals in which the Th/U ratio varies, owing to some other process than alteration

Radioactivity of ferromanganese formations in seas and lakes of the U S S R L M Kurbatov *Nature* 136, 871 (1935).—Ferromanganese concretions from the bottoms of 9 lakes and seas were found to contain $1.2-31.8 \times 10^{-10}$ Ra. Th is absent. The activity is more concd in the surface of the concretions

Radioactive minerals H Buttgenbach *Rev universelle mines* 11, 449-58 (1935).—Radioactive minerals contain Th or U, which disintegrate spontaneously into a series of products of which Ms-Th and Ra are the most important industrially. Th is produced mainly from monazite sands, U from pitchblende, phosphates from Portugal and vanadates from Colorado, and lately especially from ores from the Congo. Deposits, modes of treatment and measurement of radioactivity are described

Emanation content of soil air and tectonics of subsoil H Israel Kohler and F Becker *Naturwissenschaften* 23, 818 (1935).—The emanation content of the soil is derived from a special form of the Graham-Fick diffusion equation. Three cases are distinguished: homogeneous soil, active layers and active cracks. From measurements at Nauburn an approx figure of 0.65 sq cm per sec is derived for the diffusion coeff of Rn in soil air

The radiative collision between fast charged particles

C Møller *Proc Roy Soc (London)* A152, 481-96 (1935).—A relativistically invariant correspondence method generalizing a previous method for treating non-radiative collisions is applied to the problem of the radiative collision between two particles. In the limiting case, where one of the particles becomes infinitely heavy, the formula for the differential cross section goes over into that of Bethe and Heitler. The same results are derived by using the quantum electrodynamics of Heisenberg, Pauli and Dirac

The collisions of very fast heavy particles Werner Braunkopf *Z Physik* 96, 600-6 (1935).—In view of the suggestion that the primary penetrating radiation may consist of heavy particles of high energy, an investigation is made of the collisions of heavy particles with free electrons at rest, by an approx method appropriate to particles of infinite mass and applicable to protons up to 10^{11} v. The cross section for collisions is obtained from the Rutherford scattering formula by a Lorentz transformation

Intensity of dispersive radiation in x-ray irradiation Otto Vaupel *Arch Eisenhüttenw.* 9, 213-14 (1935).—In order to be able to employ and lay out satisfactory protective measures against x-ray radiation the magnitude of the dispersion of rays in the arrangement used must be known exactly, especially in the now frequent use in industrial operations. Expts are described which were made to det the required dose of x-ray radiation and the dispersion in a definite arrangement, and a formula was developed which permits a quick calcd of the dispersive radiation at any place surrounding the source of radiation

Occurrence of the reversed absorption edges of the long wave lengths of x-rays M Bačkovsky and V Dolejšek *Nature* 136, 836-7 (1935)

Excitation potential of the x-ray satellites in the L series D Coster, H H Kuipers and W J Huizinga *Physica* 2, 870-83 (1935).—The doubly ionized state $L_{II} M_{IV}$, responsible for the weak satellites on the short-wave side of the $L_{\alpha 1}$ line is due to radiationless transitions $L_{II} L_{III}$ with ejection of an M electron (Auger process). The x-ray spectrum of Cb (41), $L_{\alpha 1}$ line, was studied. The excitation function of the satellites was different from that of the parent line. A value of 2700 v, the excitation level of L_{II} is required to produce the satellites. Below 2700 v traces of satellites are left which may be due to a direct double ionization process ($L_{II} M_V$).

The absorption of monochromatic x-ray beams, of wave length in the region 50 to 20 X units, in lead, tin, copper and iron John Read *Proc Roy Soc (London)* A152, 402-17 (1935), cf Read and Lauritsen, C A 28, 3299.—Filtered x radiation, reflected from a NaCl crystal and limited by slits to a beam width of 5 X U, was passed through two ionization chambers between which the absorber could be inserted. A graphic relation of the absorption coeff, μ , to the wave length was obtained for Pb accurate to 2%. The calcd photoelec coeffs, τ , are 7-20% higher than those obtained from Gray's law (cf C A 25, 2049), they may be related to Allen's value at 102 X U (cf C A 20, 1942) by τ (cm $^{-1}$) = $0.01377 \lambda + 0.0003326 \lambda^2 + 0.00003474 \lambda^3$ (λ in X U). The relation $\tau \propto Z^4$ holds closely for Pb, Cu and Fe, but for Sn it is more nearly $\propto Z^{3.8}$. The observed μ 's agree closely with those calcd from the curves of Hulme, McDougall, Buckingham and Fowler (cf C A 29, 3905), except for Pb for $\lambda < 20$ X U, for which the observed are high

Effect of pressure and of other gases on absorption of chromyl chloride Michael Kantzer *Compt. rend* 201, 1020-1 (1935); cf C A 28, 3303.—Passing the light examd through the same amt of CrO_2Cl_2 but at different pressures the lines observed fall into the same 3 series, A, B and C, as pressure increases absorption increases in series A, but decreases in B and C, more rapidly in C. Addn of H_2 increases the absorption, by about 50% for addn of an equal no of mols. Other gases, e g, A , N_2 , CO_2 , SO_2 , and SF_6 , show similar effects, decreasing

as the density increases until with CO_2 it is very slight. SF₆ has almost the same effect as increasing the density of CrO_2Cl_2 . C. A. Silberrad

"Extra" electron diffraction rings L. H. Germer *Nature* 136, 832 (1935) — Extra electron diffraction rings are due to surface contamination, not to diffraction from two-dimensional gratings made up of the atoms in the crystallographic faces through which electrons might leave the foil ("exit faces"). Cf. Litch and Quarrell, *C. A.* 29, 2445; Litch, Quarrell and Wilman, *C. A.* 30, 17.

"Extra" electron diffraction rings G. I. Litch *Nature* 136, 832 (1935) — Cf. preceding abstract. — The exptl. data, the ring radii attributed to scattering from a (110) exit face, and the values calculated by Litch *et al.* and by Germer, are compared. G. M. P.

Absorption coefficients and hydrogen line intensities Donald H. Menzel and Chaim L. Pekeris *Monthly Notices Roy. Astron. Soc.* 96, 77 (1935) — Theoretical C. C. Kiess

Fine structure of D_α with increased resolution Robt. C. Williams and R. C. Gibbs *Phys. Rev.* 48, 971 (1935) — The first member of the Balmer series of D_α (D_α) is a doublet with an interval of 0.134 cm^{-1} between centers. This deviates considerably from the theoretical interval of 0.108 cm^{-1} . The Shane and Spedding value of 0.142 (C. A. 29, 2307) is discussed. G. M. P.

The fine structure of the metastable levels of nitrogen R. Stejneger *Physik. Z. Supplement* 8, 352 (1935) — Spectrograms of the CO emission with a small admixt. of N₂ obtained for other purposes, led to the disclosure and measurement of the sept. of the lines 1742.740 and 1745.240 Å. The values 2.16 or 2.13 cm^{-1} were obtained for the magnitude of the sept. The sept. of the metastable levels of N predicted by Compton and Boyce (C. A. 23, 2654) is considered to be proved. A term diagram is given. Allen S. Smith

The nuclear spin of iodine II. Fine structure in the α spectrum and a fine structure perturbation effect S. Tolansky *Proc. Roy. Soc. (London)* A152, 663 (1935); *C. A.* 29, 5912a — An analysis of the fine structure of 13 of the class of 1 Å lines ($\lambda\lambda$ 6300–4740), emitted by a water-cooled hollow-cathode discharge and measured with a silvered Fabry-Perot interferometer, confirm the nuclear spin value (5/2) previously found from the first spark spectrum. The $6s^2P_{1/2}$ term is found to be perturbed by a term with $J = 3/2$, causing a breakdown in the interval rule, the interval factor for this term is 2.17 times that of $6s^2P_{3/2}$, but is exceeded by those of some of the $5p^2P$ terms. This shows that the p electrons make important contributions to the fine structure coupling factors even in the presence of an s electron. M. M.

Hyperfine structure and the gross structure analysis of the spectrum of doubly ionized antimony J. S. Radami *Nature* 136, 826 (1935) — The gross structure analysis of Sb III (C. A. 27, 1423) is modified, in order to obtain satisfactory agreement with Coulomb's formula for nuclear magnetic moments (C. A. 27, 3139). G. M. P.

A determination of the profile of the calcium line λ 4227 in the solar spectrum, using a prism spectrograph and monochromator, R. O. Redman *Monthly Notices Roy. Astron. Soc.* 95, 742 (1935) — It was found from measurements on high-dispersion prism spectrograms of sunlight that the central intensity of the Ca I line at 4227 Å. is 26% of the adjacent continuous spectrum. C. C. Kiess

Spark spectra of cadmium, Raymond Kernal and Antoine Saunier *Compt. rend.* 201, 1115–16 (1935) — By means of the electrodeless discharge through Cd vapor at about 250° 56 nm or revised lengths of old lines in the Cd III and 75 nm Cd IV have been measured between $\lambda\lambda$ 4951 and 3468, with an accuracy of ± 0.05 Å. for lines of λ less than 4500 Å., and ± 0.1 for those above. C. A. S.

Relative f -values for lines of Fe I from electric furnace absorption spectra Robert R. King and Arthur S. King *Astrophys. J.* 82, 877–93 (1935) — The total absorptions of lines of Fe I in the region 3400 to 4400 Å. were measured

microphotometrically on spectrograms for which the electric furnace at 2100° was the source. From these measurements the relative f -values of the lines, i. e., their oscillator strengths, were then derived from the curve of growth of the lines which expresses the functional relation between the total absorption (equivalently width) of a line and the no. of atoms active in absorbing it. C. C. Kiess

The variable spectrum of γ Cassiopeiae Wm. J. S. Lockyer *Monthly Notices Roy. Astron. Soc.* 96, 2–4 (1935) — The spectrum of γ Cass. already known as variable, has recently displayed the sudden appearance of a strong absorption line nearly coincident in position with H δ . It is probably due to the He I line at 5885.6 Å. C. C. Kiess

The energy distribution in the continuous spectrum of the sun G. I. W. Mulders *Astrophys. J.* 132, 44 (1935) — The relation between Rowland's intensities of lines in the solar spectrum and their equivalent breadths (C. A. 29, 7849) has been used to estimate the total energy that has disappeared from the sun's continuous spectrum as a function of the wave length. The new results are in good agreement with those found by Abbot with the bolometer and are found to differ notably from the black-body radiation. From the energy distribution the coeff. of absorption is determined as a function of the wave length. C. C. Kiess

Bolometric measurement of line contours in the infrared solar spectrum A. Dahme *Z. Astrophys.* 11, 93–7 (1935) — A quantitative evaluation of the total absorption and the no. of atoms over 1 sq. cm. of the photosphere has been carried out for the H lines 5, 6, 7, 8 of the Paschen series, and the Ca II lines at 8498, 8542, 8642 Å., as observed bolometrically in the solar spectrum by Abbot (C. A. 27, 18) and Green (C. A. 23, 1057). The results are in good accord with those obtained from photographic observations by others and, therefore, justify the use of bolometric observations for this problem in those spectral regions not accessible photographically. C. C. Kiess

Fluorescence phenomena and central intensities in Fraunhofer lines A. Pannekoek *Monthly Notices Roy. Astron. Soc.* 95, 725 (1935) — It is shown theoretically that the fluorescence light, superposed on a Fraunhofer line, has the character of an emission line. But owing to lack of resolving power in most spectrographic app. this light is diffused into a general moderate brightening of the dark central parts of the absorption lines so that their central intensities will be greater than zero. C. C. K.

Observations of intensity with a spectrohelioscope R. v. d. Wooley and H. W. Newton *Monthly Notices Roy. Astron. Soc.* 96, 5 (1935) — An auxiliary app. attached to the spectrohelioscope at Greenwich is described with which it is possible to measure the light intensity of the Pöschel and Brunner's of the sun with reference to the intensity of the solar disk outside the lines H_α and H_β . In particular the profile of H_α has been determined without photographic plotting, the result being in close agreement with that obtained photographically by Flackery (C. A. 29, 3239). C. C. Kiess

The spectrum of Nova Herculis $\lambda\lambda$ 5150 6550 Å. Paul W. Merrill *Astrophys. J.* 82, 413 (1935) — In the visual region of the spectrum of Nova Herculis absorption lines of Na, Ba II, O I, Si II, Fe II, Ti II, Sc II, Cr II, Y II and He I were measured, and the emission lines of Fe I, O I, Si II, Na I and H. These lines may be divided into several distinct groups according to the displacements from their normal positions. C. C. Kiess

Ionic dispersion in the extreme infrared, C. Hawley Cartwright *Phys. Rev.* 49, 101 (1935) G. M. P.

Dissociation of diatomic molecules in the stars abundant in hydrogen Yoshino Umu *Japan. J. Astron. Geophys.* 13, 21–42 (1935) — Theoretical C. C. Kiess

The spectra of van der Waals molecules, W. Finkelburg *Z. Physik* 96, 199–213 (1935) — A theoretical discussion is given of the properties of "van der Waals" or "polarization" molecules and their spectra, special emphasis being laid on the differences between their behavior and that of valence-bound molecules. In considering transition-

probabilities for van der Waals molecules the Franck-Condon principle must be applied in its quantum-mech form. Line resonance-fluorescence and the question of excited van der Waals states in liquids are discussed. B. S.

The spectrum of the cadmium van der Waals molecule, Cd, W. Finkelburg *Z. Physik* 96, 714-19 (1935).—A theoretical interpretation of the exptl data for the Cd mol spectrum. It is based on the results of the preceding paper. B. Swirles

Aspects of gross intensities in electronic bands with special reference to C_2 (Swan) and N_2 (second positive) systems. N. R. Tawde *Proc. Indian Acad. Sci.* 2A, 67-81 (1935).—The development of the subject of spectral intensity in relation to gross intensity of bands has been reviewed. The transition probabilities, the temps, and the centers of intensity have been discussed in relation to each other. An attempt has been made to explain unusual intensity features of bands excited by different sources particularly in A . The Swan bands of C_2 and N_2 have been treated with reference to conditions of excitation. James H. Hibben

The rotational structure of the band system (b'') of the nitrogen molecule in the Schumann region. V. M. Chulanovskii *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 3, 155-6 (1935) (in German).—Analysis of v'' progression (from $v' = 0$) shows only P and R branches and shows that the upper state is not $^1\Pi$ but $^1\Sigma$. B'_0 is calcd to be 1.144. Extrapolation of B'_0 shows that the lower level of the system (b'') is the normal state of N_2 . Four bands of a $v' = 1, v''$ progression ($v' = 18, 19, 20, 21$) were observed. B'_1 is calcd to be 1.141. Conclusion.—The band systems of Watson and Koontz (C A 28, 5757²) are v'' progressions with $v' = 2$ and 3. $\omega_e = 754.42 \text{ cm}^{-1}$ and $x'_e \omega_e = 4.16 \text{ cm}^{-1}$. A. B. F. D.

Absorption bands of gaseous HI. D. E. Kirkpatrick *Phys. Rev.* 49, 104 (1936).—The centers of the $1 \leftarrow 0$ and $2 \leftarrow 0$ absorption bands of HI lie at 2260 ± 30 and $4416 \pm 75 \text{ cm}^{-1}$, resp. Cf. Czerny (C A 21, 3553), Salant and Sandow (C A 25, 3568), and Nielsen and Nielsen (C A 29, 4672²). G. M. P.

Absorption spectra of the vapors of the monoxides of copper, iron, nickel and cobalt, and the determination of their heats of sublimation. Hrishikesh Trivedi *Proc. Acad. Sci. United Provinces Agra Oudh, India* 5, 27-33 (1935).—FeO and CuO show 1 region of continuous absorption, while NiO and CoO show 2. The wave lengths of the beginnings of absorption are: FeO 2500, NiO 3270, 2380, CoO 2750, 2100, and CuO 2410 Å. The differences between the 2 regions of absorption for NiO and CoO were approx 32 kg.-cal, which may be due to disson. of the oxides into the metal atom and either $O(^1P)$ or $O(^1D)$. The heats of vaporization were calcd to be FeO 97.5, CoO 101.5, NiO 111.5 kg.-cal. C. E. P. Jeffreys

Interference spectroscopic examination of the gold hydride band spectrum in search of the isotope effect due to the suspected gold isotopes. Sunao Imamishi *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 28, 129-34 (1935); cf. C A 29, 7793².—The high resolving power afforded by a reflection echelon was applied to the rotational lines of several bands belonging to the $^2\Sigma \rightarrow ^2\Sigma$ system of AuH in an effort to find the fainter lines due to the theoretical isotope Au¹⁹⁹, the existence of which is inferred from the at. wt. 197.21 of Au. No fainter lines were found, although the precision of the expt. was sufficient to detect them if their intensities conformed to the abundance ratio 1.8 derived for the isotopes from the adopted at. wt. The neg. results of the expts. confirm other exptl. evidence on the singleness of the Au atom and cast doubt on the reality of the decimal part of the at. wt. C. C. Kiess

Rotational analysis of the S_2 bands. E. W. van Dijk and A. J. Lamers *Physica* 2, 785-6 (1935).—New spectrograms of the 4th order of bands of S_2 (0.6 Å per mm dispersion) indicate a sym. wave function like that of O_2 . The B values obtained agree better with Morse's rule (C A 24, 1020) than with Badger's (C A 29, 2996²). B. J. C. van der Hoeven

Emission spectrum of tellurium oxide. Choong Shim-

Piaw. *Compt. rend.* 201, 1181-3 (1935); cf. C A 30, 380².—The spectrum of TeO between 3190 and 3820 Å (that for greater λ is masked by that of Te) consists of 30 bands, and closely resembles those of SO and SeO. Of the bands 27 have simple and 3 double heads. The simple bands and the component of smaller λ of the double-headed are given by $\nu = 29499.0 + [372.9 (\nu' + 1/2) - 5.36 (\nu' + 1/2)^2] - [796.1 (\nu'' + 1/2) - 3.40 (\nu'' + 1/2)^2]$, whence the fundamental frequencies of the TeO mol in the normal and excited states are deduced as 796.1 and 372.9 cm^{-1} , resp., and the energy of disson. in the normal state as 5.70 v. C. A. Silberrad

The absorption spectra of the vapors of the monosulfides of iron, nickel, cobalt and copper, and the determination of their heats of sublimation. Hrishikesh Trivedi *Proc. Acad. Sci. United Provinces Agra Oudh, India* 5, 34-40 (1935).—The absorption spectra of FeS, NiS, CoS and CuS show a continuous region, a region of retransmission, and a second continuum. The wave lengths of the onset of the continua are: FeS 3100, 2325, CoS 3190, 2400, NiS 2810, 2170; CuS 3400, 2400. The long wave continuum is ascribed to the process $MS + h\nu_1 = M + S(^1P)$ and the second to $MS + h\nu_2 = M + S(^1D)$. The heats of vaporization were calcd to be FeS 79.3; NiS 69.3; CoS 81.7; CuS 70.25 kg.-cal. The difference $h\nu_1 - h\nu_2 = 1.31 \text{ v.}$ is attributed to the difference $^1P - ^1D$ of S. No bands characteristic of the transition group were obtained, but it is possible this failure was due to the obscuring of the weak bands by the strong continuous radiation coming from the heated furnace. C. E. P. Jeffreys

Interpretation of the vibrational spectrum of organic molecules by means of the isotope effect. E. Bartholome and H. Sachse *Z. physik. Chem.* B30, 40-52 (1935).—Infrared absorption spectra were obtained for MeOH and MeOD. Comparison of all available data for MeOH shows that the results are discordant. Qual. considerations of the isotopic spectrum help in detg. the fundamental frequencies. Some of the vibrational frequencies are displaced only slightly from the corresponding MeOH frequencies and in these cases the D atom takes no part. Where the D atom also vibrates the differences are much greater. In this way, the fundamental frequencies of MeOH are established. Similar considerations on the isotopic spectra of C_2H_4 clear up some disputed points for the bands at 827 and 1400 cm^{-1} . G. M. M.

Study of atmospheric ozone by visual spectroscopy. J. Gauzit. *Ann. Phys.* [11], 4, 450-532 (1935).—The construction and standardization of a high-precision visual spectrophotometer are described. The app. is used to det. the atm. O_3 and more generally the spectrophotometry of the sun, sky and moon. Two methods are employed, viz., direct vision of the sun and direct vision of the blue sky. A table is given showing 156 detns. between Jan., 1933 and March, 1934. A great variation in the amt. of O_3 was observed having a max. during March and April and a min. during Aug. and Sept. Five night detns. are given obtained by spectroscopy of the moon. Direct observation of the sun at the horizon shows the inequality of distribution of O_3 in the same horizontal layer. The av. altitude of the "thin layer" of O_3 was found to be 33 km. The values varied from 20 to 50 km, which indicates that the altitude increases with its thickness. The spectroscopy of the sun shows clearly the insufficiency of the preceding hypothesis and gives an approx. value for the quantity of O_3 in the troposphere. Sixty-six references. W. George Parks

The rotation vibration spectrum of acetylene in the photographic infrared. Costa W. Funke and Gerhard Herzberg *Phys. Rev.* 49, 100 (1936).—Nine new absorption bands are reported for C_2H_2 . The bands are interpreted according to the plan of Herzberg and Sparks (C A 29, 1010²). G. M. P.

Near ultraviolet absorption bands of SO_2 . R. K. Asundi and R. Samuel *Proc. Indian Acad. Sci.* 2A, 30-45 (1935).—The absorption bands of SO_2 have been measured and analyzed for the near ultraviolet. Preference is given to an arrangement of SO_2 bands by which the

sym. valence vibration of excited SO_2 gains almost exactly the same values as that of excited SO . J. H. H.

Temperature dependence of the methyl iodide absorption spectrum in the quartz ultraviolet. A. Henrici and H. Griener. *Z. physik. Chem.* B30, 1-59 (1935).—The ultraviolet absorption spectrum of MeI was photographed between pressures of 240 and 10^{-4} mm Hg and a temp. between 400° and room temp. Flowing gas was used in an absorption cell 20 cm long. The quartz spectrograph had a dispersion of 4.4 Å. per mm at 1945 Å. A large no. of new bands were found and analyzed. Fundamental vibrational frequencies are 525, 580 and 1237 cm^{-1} with corresponding frequencies of 508, 780, 1090 and 1230 cm^{-1} in the excited electronic state. The most intense bands are considerably broadened by increasing pressure but the apparent broadening of some other bands is due to unresolved rotational structure. An addnl set of bands has fundamental frequencies of 495, 805 and 985 cm^{-1} and they probably belong to a new electronic band system since they are very sensitive to temp.

G. M. Murphy
The infrared absorption spectra of water and alcohols in nonpolar solvents. E. L. Kansey and J. W. Ellis. *Phys. Rev.* 49, 105 (1936).—Absorption spectra are given for H_2O , H_2O + 300 CS_2 , atm H_2O vapor, MeOH vapor, MeOH liquid and 1MeOH + 7.9 CCl_4 in the region 0.8-2.4 μ .

G. M. P.
The absorption spectra of certain trivalent halides dissolved in ether and their dissociation products. Sechi Katō and Fujiko Someno. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 28, 95-111 (1935).—The absorption spectra of solns. in ether of the trivalent halides of As, Sb, Bi, Fe and Ti were observed in the region from 2000 Å in the ultraviolet to 7000 Å in the red. Each of the salts was also volatilized in a vacuum quartz tube and its absorption observed to det. the effect of the solvent. Another set of observations was made on the Raman spectra of ether solns. of AsCl_3 , AsBr_3 and SbCl_3 . From the wave lengths of the max. of the absorption bands and the beginnings of their long-wave edges the energies available for the photochem. dissociation of the mols. were derived. It was found that for the Fe salts only 1 halogen atom is sep'd. from the mol. by absorption of radiant energy, whereas for the Ti, As, Sb and Bi salts, also 2 and 3 halogen atoms may be sep'd. from the comp'd. The effect of the solvent, indicated by a shift of the absorption toward shorter wave lengths, is to deform the mols. without, however, exciting them from the deepest energy state of the normal mol.

C. C. Kiess
Remarks on the investigation of Bullroth—"Absorption of substituted benzenes VI." Erwin Steurer. *Z. physik. Chem.* B30, 157-8 (1935), cf. C. A. 29, 6142.
Absorption spectra were measured for *p*-xylene, 1,2,4- and 1,3,5-trimethylbenzene and the results compared with those of B.

G. M. Murphy
The ultraviolet absorption spectra of some complex aromatic hydrocarbons. I. W. V. Mayneord and E. M. F. Roe. *Proc. Roy. Soc. (London)* A152, 299-324 (1935).—The ultraviolet absorption spectra in the region 2000-4000 Å. are given for the alc. solns. of benzene (I), neoergosta-triene (II), -tetraene (III), and -pentaene (IV), naphthalene (V), 4,5-benzobicyclopentadiene (VI), dimeride of 1-isopropynaphthalene, *cis*- and *trans*-9,10-dimethyl-9,10-dihydro-1,2,5,6-dibenzanthracene (VII, VIII), anthracene, 1,2-benzanthracene and its 6-Me-, 7-Me-, 6,7-di-Me-, 6,7-cyclopentene-, 5,6-cyclopentene- and 10-isopropyl (IX) derivs, methylcholanthrene (X), phenanthrene (XI), 1,2-cyclopentene-phenanthrene (XII), 2,1'-naphtha-1,2'-fluorene, 5-methyl-8-isopropyl-2,1'-naphtha-1,2'-fluorene, chrysene, 1,2,5,6-dibenzanthracene and its 9,10-di-Me, and 9,10-dihydro (XIII) derivs, 1,2,5,6-dibenz-9,10-anthraquinone, pyrene (XIV), 2-methylpyrene (XV) and 1,2-benzopyrene and for picene in CHCl_3 . Some of the comp'ds. are structurally related to the carcinogenic hydrocarbons. The curves of II, III and IV are similar to that of I but with suppressed detail. The effects of addn of various groups and the importance of the structure of the mol. as a whole in

detg. the form of the spectra (e. g., the curve of XIV is similar to that of XV but displaced toward the red) are noted. VII and VIII with the central ring sat'd. behave as though consisting of 2 fairly sep. portions and the curves are similar to those of V and VI, but XIII, although the central ring is also sat'd., is entirely different. The curves of IX and X are very similar, although X is strongly carcinogenic and IX inactive. The facts that the frequency differences between neighboring bands of XI alternate between 650 and 750 cm^{-1} and that addn of a 5-membered ring (XII) emphasizes or depresses alternate bands suggests that the long-wave system of XI is double.

Janet E. Austin
Origin of the wing accompanying the Rayleigh line in liquids. S. C. Sirkar. *Nature* 136, 759-60 (1935).—Cross and Vuks (C. A. 29, 2448⁵, 3913⁴, 5744⁴) have suggested that the "wings" which accompany the Rayleigh line in the Raman spectrum of certain org. liquids are due to lattice oscillations of quasicrystalline groups in the liquid, and that only the portion closest to the Rayleigh line which increases in intensity with temp. is connected with mol. rotation. On dissolving benzene in cyclohexane (which gives only a feeble "wing"), the intensity of the portion of the wing close to the Rayleigh line diminishes; that at about 50 cm^{-1} from the center of the line increases slightly, the total width of the "wing" is practically const. In benzene, the intensity of the portion of the "wing" nearest the Rayleigh line diminishes with rising temp. (C. A. 29, 6143⁵). These data contradict the Gross-Vuks hypothesis. The lines are not due to lattice oscillations, but may be due to oscillations of very small groups of mols. Groups of polar mols. would be more stable than groups of nonpolar mols.

G. M. P.
The Raman spectra of light and heavy phosphine. Marc de Hemptinne and Jean-Marie Delfosse. *Bull. sci. acad. roy. Belg.* 21, 793-9 (1935).—The lines of PH_3 and PD_3 were photographed in the liquid and gaseous states. The observed frequencies of liquid PD_3 are 1664, 807, 740 cm^{-1} . The frequencies in the gas are about 20 cm^{-1} greater. The frequencies of PH_3 and PD_3 are corrected for anharmonicity by a valence force calcn. Some of the force consts. of PH_3 are calc'd.

A. B. F. D.
Raman spectrum and benzene symmetry. K. W. F. Kohlrausch. *Naturwissenschaften* 23, 624-5 (1935).—A previous conclusion that the frequency of 1000 in the mono-, *m*-di- and sym. tri-substituted derivs. corresponds to the 992 frequency of C_6H_6 and indicates trigonal symmetry of the latter is incorrect. Further work on the Raman spectrum of 250 derivs. indicates that the C_6 ring has hexagonal symmetry D_{6h} , the mono-, *o*- and *m*-derivs. C_{2v} , the *p* derivs. C_{2h} . An investigation of the flat vibration possibilities of the C_6 ring from the Trenkler mech. model (C. A. 29, 3562⁷) indicates 3 possible deformational vibrations, 6 valency vibrations. Two of them have trigonal symmetry; one corresponds to $\omega = 1000$. From the models the expected frequencies of the vibrations are calc'd. by the method of van den Bossche and Masnebeck (C. A. 29, 2409⁸) and found in fair agreement with observed values.

B. J. C. van der Hoeven
Raman effect and organic chemistry. Raman spectra of ethylenic compounds of the general formula $\text{CH}_2\text{:CHR}$. Maurice Bourguet and Léon Piaux. *Bull. soc. chim.* [5], 2, 1958-69 (1935); cf. C. A. 26, 4232, 27, 26; 28, 93; 29, 5805⁹, 4870⁹.—The Raman spectra of propene (I), 1-butene, 1-heptene, 1-octene, 1-nonene, 3-phenyl-1-propene, vinyl bromide (II), allyl bromide, allyl alc., acrolein (III) and acrylic acid are given and compared with the spectra of comp'ds. of the same general formula already published (cf. C. A. 27, 3192⁹, 29, 2499⁹, 7936⁹, 7937⁹). There are 5 bands characteristic of the group $\text{CH}_2\text{:CH}$ 1295, 1417, 1642, 3004, 3083 (for 1-butene). The line 1642 corresponds to the double bond and is the same for all hydrocarbons of the form $\text{CH}_2\text{:CHCH}_2\text{R}$ but varies from 1647 for I to 1598 for II. In general for $\text{CH}_2\text{:CHR}$ the radicals Me, OH, COOR, etc. increase the frequency (strengthen the bond) but neg. radicals and atoms (COOH, Ph, CHO, Cl, Br) lower the frequency. The radicals CH_2Br , CH_2Cl and CH_2Ph all lower the fre-

quency slightly. Conjugation of C-C or C=O with the double bond of CH₂CHR also lowers the frequency. J. E. A.

The effect of imprisonment of resonance radiation in the decomposition of ammonia and deuterioammonia. H. W. Melville. *Proc Roy Soc (London)* A152, 325-41 (1935).—A reexam of the photosensitized decompn of NH₃, ND₃, PH₃, and PD₃ under conditions where the reabsorption of the resonance radiation is negligible, has resulted in smaller velocity coeffs than previously reported. The disson is interpreted as being due to collisions between NH₃ (ND₃) and metastable atoms, derived in turn from quenching collisions between ³P₁ atoms and NH₃ (ND₃). The former collisions are almost equally efficient for NH₃ and ND₃. This mechanism also explains the abnormally high inhibitory effect of H₂, which is 20-40 times as great as that computed from the relative radii of NH₃ and H₂ and ND₃ and D₂. The more rapid decompn of NH₃ than of ND₃ is attributed to secondary reactions unconnected with Hg atom processes. This is confirmed by the fact that in the direct photodecompn NH₃ also reacts more quickly. Morris Muskat.

Free radicals in the photodissociation of gaseous metal alkyls. N. Prilezhayeva and A. Terenin. *Trans Faraday Soc* 31, 1483-7 (1935).—The method of detecting free radicals based on the disappearance of metal layers under their action was improved by detn of the thickness of the film by measurement of light transmitted through it with a photocell. The method was applied to the detection of alkyl radicals produced by illumination of Me₂Co, Me₂Hg and Et₂Pb with ultraviolet light from a spark. By use of various electrodes and filters the range of most effective radiation for Me₂Hg was found to be 2000-2100 Å. This is exactly the region of a diffuse band absorption (Terenin and Prilezhayeva, *cf. C. A.* 28, 5758). The assumption that the diffuse spectrum is due to a predissociation process liberating free Me radicals is confirmed. C. E. P. Jeffreys.

Asymmetric photochemical decomposition of complex salts. Ryutaro Tsuchida, Akira Nakamura and Masahisa Kobayashi. *J Chem Soc Japan* 56, 1335-8 (1935).—The optical rotatory power of K₂[Co(ox)₂] is -5725° (λ = 0.97 mμ) (ox = oxalate radical). On illumination by dextro circularly polarized light of 589 mμ, the aq soln of racemic K₂[Co(ox)₂] becomes levorotatory. The power increases with time, reaches a max and then decreases. T. Katsurai.

Fluorescence spectrochemistry of the chlorophyll pigments. I. C. Dhéré and Anne Raffy. *Bull soc chim biol* 17, 1385-7 (1935).—App and methods are described. Visible fluorescence spectra of α- and β-chlorophyll in solution. *Ibid* 1388-96.—The fluorescence spectra of α- and β-chlorophyll in various solvents were examd and the results compared with those of other workers. Infrared fluorescence of chlorophyll in living plants.

Ibid 1397-1408.—See *C. A.* 29, 4408^g, 6273⁴. Fluorescence spectra of pheophorbides. *Ibid* 1409-13.—See *C. A.* 29, 4474¹. L. E. Gilson.

The decomposition of ozone by alpha particles. P. C. Capron and R. Cloetens. *Bull soc chim Belg* 44, 441-66 (1935).—The decompn and formation of ozone at 25° have been investigated in the absence of Hg and org matter. In the range of intensity of radon of 5-35 millicuries, the decompn was proportional to the concn of ozone. The ratio of mols O₃ formed to pairs of ions produced is of the same order as that found by Lewis (*cf. C. A.* 27, 5249), but is const for a given intensity of radiation. This yield increases with the intensity of radiation, the reverse of which has been found in the radiochem decompn of H₂S and NH₃. R. E. DeLight.

The possibility of igniting chlorine detonating gas by high-velocity electrons. A. E. Malinovsky and K. A. Skrumnikov. *Fizisk Zh Sovetskijunon* 8, 289-93 (1935).—The soln of this question was sought in expts with a Cl and H₂ mixt. which requires less energy for reaction than do the gas mixts previously used (*C. A.* 29, 3916¹), the strength and concn of the electron current were not increased. The explosion mixt consisted of equal parts of Cl and H₂; its pressure was varied from 7.5 to 750 mm. The app was that previously used, potentials in the Coolidge tube varied from 35 to 45 kv and the current intensities from 0.6 to 1.0 ma. In all cases without exception no explosion was observed. The electron stream in the explosion chamber attained a d of 5.83 × 10⁻¹ amp/sq mm. With certain assumptions the electron concn was calcd to be 0.62 × 10¹⁶/cc corresponding to an ion concn of about 10¹⁶. The ion concn in a flame with linear velocity of about 1 cm/sec is of the order of 10¹⁴, this indicates that the possibility of ignition can be detd by increasing the ion concn 10⁴ times with the use of a c. d. of about 6 × 10⁻⁴ amp/sq mm. A. S. S.

The stability of Lenard light centers in zinc sulfide. N. Richl. *Ann. Physik* 24, 536-42 (1935).—The sensitivity to α rays shows a definite loss with time, the percentage loss being greatest for strongest radiations. These centers are thermodynamically unstable. R. E. DeRight.

The ultraviolet radiation of chemical reactions. Otakar Viktorin. *Chem Listy* 29, 245-9 (1935).—Ultraviolet radiations accompany the oxidation of pyrogallol in air, pyrogallol by H₂O₂, EtOH by Cr₂O₃, glucose by KMnO₄, Na₂S₂O₄ in an alk medium, the action of Br upon K oxalate, the formation of LiBr, and the neutralization of HNO₃ by NaOH. In a 10% NH₄H₂PO₄ soln the anodic oxidation of Al yielded strong and almost quantitative ultraviolet radiations. Frank Marsh.

Bequerel cells (Athanasu). 4. Primary process of photochem and thermal decompn of azomethane (Patat). 2.

4-ELECTROCHEMISTRY

COLIN G. WINK

Production of ferroalloys directly from minerals in the electric furnace. Alfred Salmony Karsten. *Quim e ind* 12, 231-5 (1935).—Some large com installations for the production of ferro-Si, ferro-Mn, ferro-Cr, ferro-Mo and ferro-W are briefly described. L. E. Gilson.

Heat balance in electric furnaces during production of aluminate slags. P. B. Golubkov. *Legkie Metali* 4, No. 2, 16-22 (1935).—Stones contg Ti are formed in the elec furnaces at the Dnieper Aluminum Plant (*cf. C. A.* 29, 4267⁷), because the charge, consisting of a CaO-Al₂O₃ agglomerate, melts at the same or lower temp than the Al slags. This prevents superheating the slag sufficiently to dissolve the Ti compds. G suggests using raw Al₂O₃ and CaO as charge and making slag of eutectic compn to prevent this stone formation. H. W. Rathmann.

The use of cast aluminum shields in large electric arc furnaces. A. v. Zierler. *Aluminium* 17, 529-30

(1935).—The concentric shields of nonmagnetic material in the Miguet furnace, usually made of cast bronze, were successfully replaced by cast Al plates 2.5 m high and 4.6 m in diam., they carry up to 80,000 amp and weigh 5300 kg against 15,000 kg for the bronze shields. The Al shield has been in steady use since 1930. M. H.

Electric furnaces installed in the Pans Mint. Anon. *Electrician* 115, 9 (1935).—For the annealing of the com blanks 3 horizontal rotary furnaces have been installed. Each furnace absorbs 50 kw and is fed with three phase current. The temp of the furnaces is self regulated. Heating is by induction. The system is shown in the accompanying diagram. A is a solenoid coil fed by a c. In the center of this solenoid is a muffle B of magnetic iron. Near the muffle there is an envelope of nickel steel (C) and around the outside of the coil are a no. of sheet-iron cores (D), which complete the magnetic circuit.

E is lagging. The current flowing through the solenoid sets up an induced current in the envelope, which forms, in fact, a winding of one turn per cent. The envelope, therefore, heats up and transmits its heat to the

muffle until this latter reaches the point at which it loses its magnetism. The flux in the magnetic core is then reduced to the point at which the heat produced is exactly equal to that lost by radiation. C. G. F.

Comparison of methods of operating an aluminum electrolytic cell. Ya. A. Bernshon and G. I. Khviltzki. *Lehne Metal* 4, No. 4, 19-23 (1975). The output and energy consumption of an Al fused-cryolite cell operating under conditions of const. current, voltage, or power input (ρ), resp., were compared. The output per cell per day and the elec. energy consumed per kg of Al were. For $I = \text{const}$: 149 kg, 19.4 kw-hr, for $V = \text{const}$: 118 kg, 17.5 kw-hr, and for $\rho = \text{const}$: 138 kg, 18.8 kw-hr. H. W. Rathmann.

The preparation of oxygen by electrolysis of baryta. Eric M. Stoddart. *Proc. Roy. Soc. (London)* A152, 271-7 (1975). The electrolysis of baryta with Ni electrodes does not always give pure O at the anode. After a time H also appears at the anode, probably being due to the reaction $2\text{OH} = \text{H}_2 + \text{O}$. The liberation of H can be prevented by coating the electrode with a layer of the black oxide of Ni. Morris Muskat.

Investigating the solubility of solvents and the electro-deposition of iron from these solutions. R. Müller and L. Harant. *Berg und Huttenmännisches Jahrbuch* 83, 97-102 (1975). The practical possibilities of direct electrolytic production of Fe from the ore are discussed. Two principal cases are distinguished: (1) refining of raw Fe, whereby Fe is usually dissolved anodically and cathodically deposited in very pure form; (2) an electrolyte is obtained by direct action of solvents on the ore, and the pure Fe is deposited from this soln. by electrolysis with an insol. anode. Work of other authors is reviewed.

Cathode polarization during deposition of copper from sulfate solutions. O. Evin and A. Levit. *J. Gen. Chem. (U. S. S. R.)* 5, 1262-15 (1975). Measurements were made of deposition potentials of Cu at 25° from solns. contg. various concns. of CuSO_4 (0.3, 0.4, 0.5, 0.6, 0.7 and 1.0 N) in 2 concns. of H_2SO_4 , 0.1 and 0.2 N, with c.d.s. of 1 ma per sq. cm and up. Gordon's equation $E_p = E_0 + \frac{b}{a} \log(1 - ED)$ (C. A. 19, 3432), where E_p is polarization, E_0 , b and K are const. and D is c.d., is in fairly good agreement with exptl. results down to the point where $E_p = E_0$. E_0 should not be considered here as expressing the low limit of polarization, but merely as an indicator of the low limit of applicability of this equation. In the interval $D = 1$ to 10 ma per sq. cm polarization behaves irregularly, showing an increase in electrode potential with rise in c.d., then again rising regularly, above 10 ma in electrode potential. The so-called "chemical" polarization E_c in Cu deposition follows more correctly Ertley-Gritz-Volmer's equation $E_c = 1/(a + k \log D)$ (C. A. 25, 1197), where a and k are const. and D is c.d. S. L. Madorsky.

Nickel and chromium plating, progress and present situation. M. Ballay. *Unne* 44, No. 46, 27; *Res. met.* 32, 494-500 (1975).—A brief review of present practices in different countries. M. Hartenbeum.

Alkaline plating baths containing ethanalamines. II. A study of baths containing triethanolamine for the direct nickel-plating of zinc. C. J. Brockman and J. P. Nowlen. *Trans. Electrochem. Soc.* 69, 11 pp. (preprint) (1975).—The following solns. examd. contained either just enough triethanolamine to give a clear soln. or they contained an excess of triethanolamine: (1) Ni NH₄ sulfate soln.; (2) Ni NH₄ sulfate-NiSO₄ soln.; (3) Ni NH₄ sulfate-boric acid soln.; (4) NiSO₄ soln.; (5) NiCl₂ soln.; (6) Ni NH₄ sulfate-NiCl₂ soln. The plating conditions of the 6 solns. were detd. at different temps., concns. and c.d.s. C.d.s. potential measurements were made during the plating processes. Good deposits of bright Ni were obtained from the 3 sulfate baths. III. Cobalt plating from triethanolamine solutions. From solns. of CoSO₄ contg. triethanolamine it is possible to plate Co successfully on Cu, steel, Ni and Zn at c.d.s. ranging from 0.5 to 25 amp. sq. dm. at room temp. or slightly above. Cathode efficiencies were as high as 98%. The plates are slightly darker than the corresponding Ni plates. The bath was electrolyzed for 1 hr. at a c.d. of 2 amp./sq. dm. after which satisfactory deposits were obtained. The temp. rose from 21° to 24° during electrolysis. C. G. F.

Control of the quality of tin electroplating. Ya. L. Vertman. *Zashchita Lab* 4, 737-9 (1975).—The test is made with 5 cc of HNO₃ (d 1.4) in 15 cc H₂O by the procedure previously described for Zn electroplating (C. A. 29, 2457). Chas. Blanc.

Electrode dispersion of noble metals. Andr. Voet. *Trans. Faraday Soc.* 31, 1488-91 (1935). d. C. A. 29, 2978.—On electrolyzing with noble-metal electrodes at a high c.d. and a high voltage in alk., acid, and neutral solns. a disintegration of the anode is observed which results in, generally unstable, suspensions. Every electrode dispersion is accompanied by frequent pulsations of current, which were measured with an oscillograph. A min. concn. of electrolyte is necessary to obtain dispersion for every potential difference. The Wehnelt effect is not the cause of the dispersion but it may be explained as the result of the repulsion of a periodically formed oxide layer on the surface of the anode. C. E. P. Jeffreys.

The dependence of the electrochemical properties of an element on its state of aggregation. I. Research on the potential of gallium and gallium amalgam in gallium salt solutions. Otto Stelling. *Z. Elektrochem.* 41, 712-21 (1975).—Amalgam electrodes were prepd. by passing liquid Ga through a capillary tube into Hg in an atm. of H₂. A slight coat of oxide which appeared in 10-20 hrs. did not affect the results. All the work was done in an atm. of H₂. The potential of the Ga amalgam in contact with GaCl₃ came to equil. slowly at -0.887-0.888 v. In a soln. of 0.1 M NaGaO₂, which was also 0.36 N with respect to NaOH, the amalgam electrode showed a potential of -1.512 and its potential changed markedly for any change in ρ . Addn. of 35.5% EtOH to a Ga amalgam electrode in 0.0077 M GaCl₃ and 0.54 N HCl raised the potential from -0.976 to -0.867. Addn. of NaCl to a similar system had little effect. Ga metal for electrodes was freed from oxide by passing it through a capillary tube, the Ga metal electrodes were kept in an atm. of H₂. The potential of the Ga electrode in contact with GaCl₃ and HCl came to equil. quickly. However, 2 electrodes in the same soln. gave potentials which sometimes differed by as much as 10-20 mv. The potential of the Ga electrode in Ga salt soln. was near that of the Ga amalgam in Ga salt soln. The liquid Ga electrode showed a passivity effect. In contact with an alk. NaGaO₂ soln., a super-cooled liquid Ga electrode showed a potential of about -1.4 v. vs. a potential of about 1.5 for the solid electrode. In acid soln. a similar though smaller effect was noticed. F. H. Moser.

Electrolysis of zinc, nickel and cobalt bromides and iodides in aqueous-alcoholic solutions. Claude Charmentant. *Compt. rend.* 201, 1174-6 (1935), cf. C. A. 29, 5749*.—With a similar arrangement and 0.5 M solns. of ZnBr₂, Br is liberated at the anode and diffusing to the cathode forms HBr and acetaldehyde in amt. increasing with concn. of EtOH. With ZnI₂, I is similarly

set free, but does not react further. The Zn deposited is adherent with low concn of EtOH, but is at least partially not adherent for concns of EtOH exceeding 450 g/l. Yield (max 97%) decreases with time and increased concn of LiOH. NiBr₂ and NiI₂ behave similarly, but with NiBr₂ less HBr and acetaldehyde are formed. As with NiCl₂, NiO is deposited at the cathode with disengagement of H₂ when soln is basic, but if the soln is acid (0.01-0.025 N in HBr or HI) Ni is deposited. The yield increases with concn of EtOH, and is always greater with NiBr₂ than with NiI₂ (max 93 and 90%, resp.). With CoBr₂ and CoI₂ results are very similar save that no oxide is deposited and yield is slightly better (max. 99.5%).

C. A. Silberrad
Relations among fundamental electrochemical quantities III. Itsuro Uehara. *J. Chem. Soc. Japan* 56, 1364-71 (1935). cf. *C. A.* 29, 6145⁷.—By consideration of a reversible cycle between nonmetallic substances such as F, Cl, Br, I, O and their ionic solns, the relative values of the standard electrode potential of the nonmetallic substance have been calculated.

Electric storage batteries in recent patents. L. Juma. *Revue électrique* 38, 335-48, 367-82 (1935).—Recent improvements in storage batteries to facilitate the chem. reactions, assembling and dismantling are reviewed and many improvements are described.

M. Hartenhein
An electron tube and instrument for use with the glass electrode and a description of a rugged type of glass electrode. Lyle D. Goodhue. *Iowa State Coll. J. Sci.* 10, No. 1, 7-15 (1935).—The instrument is a simple resistance-coupled direct amplifier using 2 vacuum tubes. A condenser is used in the grid circuit of the first tube, which is charged and discharged by a switch of special design. The substitution of a milliammeter for a galvanometer prevents drift, secures equal in a few sec and permits a precision of 0.5 mV with resistances up to 500 megohms. Drawings of the app. and detailed directions for assembly and operation are included. The glass electrode consists of an elongated bulb on the end of a 10-mm tube of Corning glass No. 015, filled with 0.2 N HCl, into which extends a AgCl electrode. With this set the walls need not be thin, for large resistances do not interfere with accurate readings.

F. E. B.
Photoelectric colorimeter with logarithmic response. Ralph H. Muller and Gilbert F. Kinney. *J. Optical Soc. Am.* 25, 342-6 (1935).—Since the light transmitted by a colored soln is a log function of the concn according to the Lambert-Beer law, a device which possesses log response is sought. This instrument consists of a vacuum photoelec. cell feeding into a vacuum tube voltmeter. This has a type 6D6 tube, which with properly chosen resistance gives a plate current proportional to the log of the input voltage. The output meter can thus be calibrated directly in concn. units. Details of the circuit and optical arrangements are shown, and some measurements obtained with the instrument are given.

Helen S. Hopfield
Photoelectric cells with barrier film artificially deposited. W. Ch. van Geel and J. H. de Boer. *Physica* 2, 892-900 (1935).—The photoelec. qualities of artificial barrier cells with Se as semiconductor and cresol-formaldehyde resin, CaF₂, SiO₂ or MgO as barrier film were studied. The Se film (10 μ) was sublimed onto an Fe or a brass plate, baked at 200° to a grayish film, then a 10⁻⁴-cm film of barrier material applied either as soln or as vapor. A thin transparent metal film (e.g., Sb) is then volatilized onto the barrier film as electrode. For a cell of 4 sq cm, MgO barrier, the rectifying ratio was 25; the photocurrent for Sb negative 65 × 10⁻⁸ amp. At 24 v with Se negative a 75 × 10⁻⁸-amp photocurrent resulted from radiation of 3000 luxes, for 4.5 v, Sb positive, current 10⁻⁸ amp; without potential the current was 0.5 × 10⁻⁸ amp. The current light relation is $i = AL^{1/2}$ for all types of barrier

material used. The internal photoeffect of the Se used followed $i = BL^{1/2}$ independently of the potential used (10-100 v). The photoelectrons are liberated in the Se semiconductor; the barrier material need not have any internal photoeffect.

B. J. C. van der Hoeven
Bequerel cells. G. Athanasu. *Ann. phys.* [11], 4, 377-449 (1935); cf. *C. A.* 20, 1005.—The effect of the H⁺ and OH⁻ concns on the magnitude and direction of the photovoltaic effect was carefully investigated for the following electrodes: Ag-AgI, Hg-Hg₂I₂, Ag-AgBr, Cu-CuI, Cu-CuBr, Cu-CuO, Hg-HgS, Ag-AgS and Cu-Cu₂O. The effect was greatest with Ag-AgI and Hg-Hg₂I₂, where the pos. photovoltaic effect is increased by H⁺ and may be reduced to zero or even reversed by OH⁻. The results may be explained as due to the electrode functioning as an "acceptor" of the OH⁻ of the electrolyte, i.e., the I⁻ liberated by the light on the electrode may temporarily form IOH, which interferes with recombination with the Ag or the Hg. The photovoltaic $e.m.f.$ decreases with rise in temp. in all cases. This is explained on the basis of two opposing reactions, one photochemical and the other purely thermal. Sensitivity curves in the spectrum and the thresholds of sensitivity were detd. With Ag-AgI maxima were found at λ 0.4225 μ and λ 0.30 μ, which correspond with the max. adsorption of AgI. The max. at 0.4225 μ coincides with the max. photoconductance. With Hg-Hg₂I₂, the max. was found at λ 0.400 μ and the threshold toward the red at λ 0.530-0.540 μ. With Cu-CuO a max. was found at λ 0.400 μ and the sensitivity extended as far as 1 μ in the infrared. Electrodes of Cu covered with a layer of the suboxide obtained by the wet and dry methods gave a max. photovoltaic effect which coincided with the max. photoconductance. The max. sensitivity was at λ 0.480 μ. It is impossible to explain the phenomena of Bequerel on the basis of the photoelectric effect alone. The app. for investigating these cells is described in detail.

W. George Parks
Heterogeneous chemical reactions under the silent electric discharge. XV. Preparation of colloidal solutions. 4. Susumu Miyamoto. *J. Chem. Soc. Japan* 56, 1359-64 (1935), cf. *C. A.* 29, 6846⁷.—By using active H₂ prepd. in the silent elec. discharge, (a) the hydrosol and the alcohol of Cu₂O from CuSO₄, (b) the hydrosol and the alcohol of CuS from CuS, (c) the hydrosol of Hg from Hg₂NO, (d) the hydrosol of HgS from HgS and from Hg thiocyanate were prepd. and their stability was studied.

T. Katsurai
Chemical reaction in the electric discharge. I. The chemical effects of impulse discharges. E. J. B. Willey. *Proc. Roy. Soc. (London)* A152, 158-71 (1935).—Wrede's results (*C. A.* 23, 2886) for the disson of N₂ in the controlled impulse discharge of a condenser are confirmed by chem. means. Concns of active N up to 40%, with NO as reagent, and to 13% with org. vapors (calcd. from the yield of HCN) were obtained. The controlled impulse discharge is superior to a -c. and d -c. discharges in both absolute and power yield. Under fixed conditions of gas flow, pressure, etc., the yield of active N depends only on the current, being independent of the frequency, length of discharge, and magnitude of the individual current impulse. The glow intensity and elec. cond. of the gas are no guide to the amts. of active N present.

L. E. Steiner
Purifying argon for filling incandescent lamps. Robert P. Moran. *Industrial Gas* 14, No. 6, 13, 20-5 (1935).—Commercial cylinder argon is purified by passing it in turn through soda lime, over P₂O₅, through a tube contg. Cu chips heated to 500°, a CuO tube at 500°, and finally again through soda lime and over P₂O₅. The steel tubes for Cu and CuO are in a gas-heated furnace, consisting of a vertical steel cylinder, 2 ft. in diam. and 3 1/4 ft. high, lined with 4 in. of firebrick. This plant supplies N₂ and Ar for 15,000 lamps in 8 hrs., using 1100 cu. ft. of 625 B. t. u. fuel gas per 24 hrs.

Selenium cells. Constantin Chidlovsky. Ger. 621,472, Nov. 7, 1935 (Cl. 21g 29). This corresponds to Fr. 747,791 (C. A. 27, 4963).

Fluid cells. Soc. anon. Le Carbone. Fr. 787,232, Sept. 10, 1935. The formation of climbing salt in batteries having an alk. electrolyte is avoided by forming, above the electrolyte, a chamber the atm. of which cannot be renewed.

Galvanic baths. Schering-Kahlbaum A. G. Fr. 787,506, Sept. 21, 1935. Baths, e. g., of Ni or Cu are restored to their original efficacy by adding a small amt. (1-3 g. per l.) of a substance having a surface action,

e. g., Al silicate, fullers' earth or pulverized gelatinous SiO_2 .

Electrolytic cells. Ferdinand Krauss. Brit. 431,165, Aug. 20, 1935. Divided on 431,488 (C. A. 30, 6879). A cell for producing per-salts without the use of a diaphragm comprises a container constituting 1 electrode and an electrode nested within and uniformly spaced from the outer 1. 1 of the electrodes comprises a set of conductive patches sepd. by insulating material.

Electrolytic cells. Maschinenfabrik Oberkron. Brit. 434,348, Aug. 20, 1935. Distd. H_2O is supplied periodically to the cells of a H_2O decomposer through branch pipes connected to a main pipe connected to a feed tank situated several meters above the cells.

Electrolytic cells. Hugh B. Franklin. Brit. 434,542, Sept. 4, 1935. Upward circulation of electrolyte through a series of superimposed cells is provided by means of narrow tubes extending from the liquid level of 1 cell into the gas space of the cell above.

Electrolytic cells. N. V. Philips' Gloeilampenfabrieken. Brit. 435,112, Sept. 16, 1935. A cell comprises a tubular electrode support of hard insulating material directly pressed into a bore of the wall of the vessel and secured in a bore of the electrode body, both in fluid-tight manner, said support permitting the leading through, not in fluid-tight manner, of an electrode connection through the wall of the vessel.

Electrolytic cell for production of anhydrous magnesium chloride. Wilhelm Moschel (to Magnesium Development Corp.). U. S. 2,024,242, Dec. 17. Various structural and operative details.

Electrolytic cell (with self renewing anodes) for aluminum manufacture. "Montecatini" Soc. generale per l'industria mineraria ed agricola. Austrian 143,310, Nov. 11, 1935 (Cl. 40c).

Electrolytic rectifiers and condensers. Ralph D. Mershon. U. S. 2,024,240, Dec. 17. Electrodes are made of Al or an Al alloy to which has been added (suitably 0.4-3.3%) of an alkali metal or alk. earth metal silicate such as Na silicate or glass wool which serves to give improved working properties.

Electrolytic condenser. Elektrizitäts-A.-G. Hydraul. Fr. 787,790, Sept. 28, 1935.

Plated metal for jewelry. Ermand H. Davignon (to General Plate Co.). U. S. 2,024,150, Dec. 17. A thin layer of Ni is electrodeposited on a cleaned surface of stainless steel and a layer of precious metal is united to the Ni by an intervening layer of soldering metal, and the material is rolled to produce a finely attenuated stock suitable for jewelry manufacture.

Chromium-coating articles such as those of glass or china. Ernst P. Schreiber. U. S. 2,025,528, Dec. 24.

A nonmetallic rigid article is immersed in an aq. soln. of Sn sulfate of about 5° Bé strength and superficially washed, and there is then poured over the article simultaneously a soln. of 1 oz. $AgNO_3$ and 1 oz. of a 28% NH_3 soln. in a qt. of water together with a soln. of Cl_2O , the article is rinsed in water, then submerged in a $CuSO_4$ soln. of about 25° Bé strength to which an elec. current of 5-15 amp. is applied, then rinsed with water, immersed in a Ni sulfate soln. of about 25° Bé strength, washed, dried, polished, washed in alkali soln., immersed in a chromic acid soln. of 25-40° Bé strength for 3-10 min. at 100-200 amp. and finally rinsed and dried. Coating of leather, paper, celluloid and rubber is also described.

Electroplating aluminum and its alloys with silver. Vereinigte Aluminiumwerke A.-G. (Hans Ginsberg, inventor). Ger. 621,489, Nov. 7, 1935 (Cl. 48a 60I). The cleaned metal or alloy is dipped in a strongly acid bath contg. HCl , HNO_3 and HF . A suitable bath contains HCl (36.3%), 3, HNO_3 (65%), 1, HF (40%) 1 and water 15 parts by vol. The material is then washed and dipped in an alk. bath, e. g., a 10% $NaOH$ soln. satd. with $NaCl$. Electrodeposition of Ag is then effected in the usual way. Dense coherent coatings are obtained.

Electrolytic cleaning and plating apparatus. Stanley R. Brewer and John F. Hunsley. Brit. 434,116, Aug. 23, 1935. Metal wire or strip or articles connected in a chain.

are descaled by passage through a narrow tank between electrodes mounted in recesses and similarly arranged electrodes of opposite polarity at the other end of the tank, the work forming an intermediate electrode

Preparing copper wire for enameling Pierre Fuster (one half to Soc anon J Boucse & Cie) U S 2,023,998, Dec 10 For producing uniform enameled wire for elec purposes, the wire, between drawing steps, is passed, as a sol anode, through an electrolytic soln of CuSO_4 capable of directly attacking the substance of the wire itself under the action of an elec current, to remove surface inequalities and protuberances of Cu on the wire, and, after further drawing, the wire is enameled

Ferrophosphorus Metallgesellschaft A-G (Conway Freiherr von Gurselwald, Hans Weidmann and Gerhard Roesner, inventors) Ger 618,958, Sept 19, 1935 (Cl 185 20) Fe-P with a high P content is obtained in two stages. First, Fe-P contg Si is obtained by reducing a fused mass contg phosphate, Fe, CaO , SiO_2 and Al_2O_3 . The amt. of Al_2O_3 is adjusted so that a Fe-P-Si alloy and a practically SiO_2 free aluminate slag results. In the second stage, the Fe-P-Si alloy is treated with further phosphate to remove the Si and increase the P content. In the example, bauxite, Fe shot and coke are heated in an elec furnace to give a Fe-P-Si alloy and a Ca aluminate slag. The slag is converted to CaCO_3 and NaAlO_2 by treatment with Na_2CO_3 soln. The Fe-P-Si alloy is heated again in an elec furnace with phosphate and Fe shot to give Fe-P. Cf C 29, 5005¹

Incandescent lamp with a glower of hafnium carbide Fritz Blau (to General Elec Co) U S 2,025,565, Dec 24

Fluorescent lamps Jean-Baptiste J M Abadie Fr 786,500, Sept. 3, 1935. The lamps have a double wall,

the exterior being composed of ordinary thick glass or a hard glass such as Sabor or Pyrex, and the interior being thin and composed of a mixt. of phosphorescent and fluorescent substances such as sulfides, which are mixed with a salt or salts in the vitrified state to form the interior layer.

5—PHOTOGRAPHY

R. R. BULLOCK

Photography in the far ultraviolet G. Rathenau *Physica* 2, 840-2 (1935)—All sensitizing oils of the 3 types mentioned by Harrison and Leighton (*J. Opt. Soc. Am.* 20, 313 (1930)) are partly transparent in thin layers for light of more than 2100 Å, thereby disturbing the light distribution. A better arrangement for photography of the far ultraviolet is as follows. The photographic plate is impregnated with an absorbing dye which absorbs selectively light of fairly long wave length, then covered with a sensitizer oil film which acts on short wave lengths unabsorbed by the dye. Dyes used are nitrosodimethylamine, methyl orange, fuchsin and sensitizer Cenco pump oil 11021B. R. J. C. van der Hoeven

Influence of atmospheric oxygen in the photographic process of bleaching-out of the latent image J. Marietta Blau, *Phot. Korrr* 71, Suppl., 21 8 (1935), cf. *C. A.* 29, 4685¹—Expts with gaslight and AgBr papers, and with transparency and neg. emulsion plates, show that a diminution of the atm. pressure to about 6 mm. has the effect of diminishing or preventing the Herschel effect and of partially restoring the original sensitivity of the materials after they have been desensitized with pink/ryptol yellow. Capri blue, which ordinarily desensitizes, can sensitize transparency plates, and this sensitization is then found to be greater under the diminished, than under normal, atm. pressure. It thus appears that a reaction in which O is involved is an essential process, alike in the Herschel effect and in desensitization by means of dyes. With ordinary com. color-sensitized materials, under the same conditions, even with addition of KBr, no influence of atm. O is to be observed. E. R. Bullock

Agfa's new pan-kine type II negative film Andreas Schilling, *J. Motion Picture Soc. India* 1, No. 8, 15-21 (1935)—In comparison with the Type G, the Agfa Type II film is found to be approx. twice as fast, to be equally fine-grained and to give better shadow-tone reproduction. G. P. Matthews

Voigtlander-Gevaert Bessapan film R. Weisacker *Atelier Phot.* 42, 161-2 (1935)—This is a panchromatic film has a speed of 10/10² DIN, good gradation, wide latitude, protection against halation, exceptionally good color rendition, freedom from fog and reasonably low graininess. H. Parker

Color films by the "silver-dye-bleaching" process Gerd Heymer, *Veroffentl. wiss. Zentral-Lab. phot. Abt. Agfa* 4, 177-80 (1935)—Under this title are classed those processes which effect bleaching of dyes through the agency of a Ag image. Included is Schweitzer's process, in which a Ag image is converted with toning solns. into one of PbCrO₄, which is then decompd. with an acid to liberate CrO₃, which, in turn, destroys the dye. Also included is Christensen's process, in which the Ag image appears to catalyze the destruction of the dye by reducing agents which otherwise act upon the dye very slowly or only at elevated temps. References are made to publications of Luther and Von Holleben, Crabtree, Lippocramer, and Gispir, and to work done in the Agfa research lab. The essential characteristics of the "Ag-dye-bleaching" process are said to be: "1. Only reduced dyes, a Ag image, the unused remainder of which is removed by any Ag solvent, a Ag solvent in acid medium as a bleaching soln., and in case the bleaching soln. has a tendency to liquefy the gelatin, a hardening agent for the gelatin, which is applied before the entrance of the sample into the bleaching soln." The most suitable dyes are said to be found among the substantive azo dyes. The diffusion of the dyes from 1 layer of a multilayer film to another is said to be diminished by the use of heavy-metal salts, basic dyes, or chemically similar colorless substances as

2 pptg. agents. A difficulty in the use of dyed emulsion layers sensitized for the colors which they absorb, as proposed by Christensen, is said to lie in the tendency of the other colors to penetrate the depth of the emulsion and produce clear highlights at lower exposure values than the absorbed colors, even though the absorbed colors give higher threshold speeds. Consequently, layers sensitized for transmitted colors are employed in some practical applications of the "Ag-dye-bleaching" process. This arrangement prevents making direct photographs in natural colors or direct prints in natural colors from similar originals. A method is described for making original records on lenticular biprism and printing these on a film bearing, on the 1 side, yellow and magenta layers, and, on the other, a blue green layer, differently colored filters being used in taking and printing. M. W. Seymour

Herschel effect in red- and infrared sensitive photographic plates J. Narbutz *Wiss. Phot.* 33, 48-51 (1934), cf. *C. A.* 28, 7180¹—Expts. demonstrating the effect are described. B. C. A.

Use of Sheppard sensitizers and cystine like substances. A. Steigmann *Phot. Ind.* 33, 602-3 (1935)—A completely inert bone gelatin (contg. no inhibiting substances) was used for testing the effect of the addition of Sheppard's sensitizers and it was found to produce a gelatin unsuitable for photographic emulsions. However, by combining inhibiting agents like cystine and formal cystine, with (NH₄)₂S₂O₈ and gelatins predominantly high in albumin, a good emulsion gelatin was obtained. H. R. B.

Reactions of gelatin sensitizers A. Steigmann, *Phot. Korrr* 71, 92-4 (1935)—After a discussion of the methods in use for the detection of gelatin sensitizers, S. describes tests on the wick waters from a gelatin that had been rendered completely inert and from a Nelson gelatin which was exceptionally rich in sensitizers. The results are in harmony with the view that the natural sensitizers in a gelatin consist of thiosulfates. E. R. Bullock

Properties of photographic gelatin A. Steigmann *Phot. Ind.* 32, 1172-3 (1934)—The character of the sensitizing and inhibiting substances in gelatin was investigated. Albumin has inhibiting properties but there seems to be no correlation between the amt. of albumin present, as detd. by heat coagulation, and the inhibiting property of the gelatin. The substances present in a good photographic gelatin from bone are thiosulfates, which easily oxidize to polythionates, and cystine-like substances but not pure cystine, since it is a strong desensitizing agent. H. R. Brigham

Modification of silver sulfide images E. Asloglou, *Photo-Rev.* 47, 299-31 (1935)—The tone of sulfidized prints can be modified by supplementary toning, for which formulas and directions are given. The procedures described include Se, Au, Fe, Cu and Hg toning, and mordanting for dye toning. P. W. Vittum

Fogging of the silver bromide plate by dyes Lippocramer *Z. wiss. Phot.* 34, 150-5 (1935)—Ordinary, noncolor sensitized plates, after being bathed for 2 1/2 min. in a 0.02% soln. of pinilavol or one of 5 dyes related to pinilavol and dried, and then developed in hydroquinone for 6 min., showed fogs of 2.0 with pinilavol and 0.3 to 0.4 with the related sensitizers. Pinicynol, benzoclenzole, benzothiazole and benzoxazole, similarly tested, gave fogs of 0.5, 0.15, 0.35 and 0.1, resp. This is also the order of decreasing toxicity of these dyes. When followed, without drying, by development in ferrous oxalate, 0.01% soln. of phosphine, isooquinoline red, acridine yellow, pink/ryptol yellow and phenosulfaniline gave fogs ranging from 1.6 to 0.15, while no fog was obtained with similar solns. of toluasafraim, brilliant rhodu-

line red, fuchsin, erythrosin or rhodamine B. L.-C. discusses the ease of fogging by a dye in the presence of a heavy metal salt, and in connection with Weber's explanation of this effect (C. A. 27, 3888) suggests that the dyeing of the Ag halide grain diminishes the protective action of the gelatin and thus favors the acceleration by the heavy-metal salt of the reducing action of the developer. E. R. Bullock

Intermediate soda bath E. Weyde *Phot. Chronik* 32, 270-1 (1935) —For decreasing the washing time by facilitating the removal of $\text{Na}_2\text{S}_2\text{O}_3$, the use, after fixing, of Na_2CO_3 (1%) for 1 min is suggested. Greater permanence of the prints is claimed. L. E. Muehler

Chromium intensification R. Nannus *Progresso fot.* 41, 294-7 (1934) —In a review of the practice of Cr intensification, N. suggests the following modification of his previous bleach soln. (*Progresso fot.* 40, 35-7 (1933)). KBr 50 g., CrO_3 5 g., H_2O to 1 l. Increase of the CrO_3 above 10 g. per l. decreases the degree of intensification. The gelatin of films bleached for Cr intensification is claimed to be greatly affected by the alteration occurring in the change from the acid bleach to an alk. developer. To avoid this, the 2nd developer used for the Baby Pathé reversal process is suggested. This consists of a soln. contg. NaHSO_3 1% and $\text{Na}_2\text{S}_2\text{O}_3$ 1%. L. E. M.

Printing papers with silver salts P. Weigleb *Schweiz. Phot. Ztg.* 37, 163-71, 175-82 (1935) —A general account of the structure and characteristics of Ag salt printing-out papers and of AgCl, Ag chlorobromide and AgBr development papers. E. R. Bullock

Ways and means of reducing R. Weizsaecker *Phot. Chronik* 42, 149-50 (1935) —In a list of well-known reducers, the following soln. given by Valenta, employing ammoniacal CuO with $\text{Na}_2\text{S}_2\text{O}_3$, is suggested for use with gaslight papers. NH_3 (conc'd) 200 cc. and CuSO_4 5H $_2\text{O}$ 25 g. To use, add 3 to 5 cc. of this soln. to 100 cc. of 10% hypo soln. L. E. Muehler

The function of alkali in a developer II. Physical developing G. P. Faerman and N. N. Shishkina. *J. Phys. Chem.* (U. S. R. S.), 456-63 (1934), cf. C. A. 29, 1852* —With const. Ag^+ concn the rate of phys. development and the rate of reduction of the Ag^+ in soln. decreases or increases with decreasing or increasing pH . For each Ag^+ concn in the soln. there is an optimum pH for the developer. If the systems Ag^+/Ag and oxidation/reduction have the same pH , the velocity of development is independent of the pH . Only on longer drawn-out development do factors other than pH , such as concn of Ag^+ ions, of developer, of acid anions, etc., have any effect. The expts. were carried out mainly on "Agfa" films with metol-citric acid developers in a pH from 1.6 to 3.0. III. An iron developer *Ibid.* 404-5 —In a ferro-feric oxalate developer the developing influence remains const. over the same interval of pH as does the oxidation/reduction potential, i. e., from pH = 4-7. F. H. Rathmann

A comparison of reflection densities measured photoelectrically and visually R. E. Owen and E. R. Davies *Phot. J.* 74, 463-70 (1934); *Kodak Research Labs. Monthly Abstr. Bull.* 20, 433-4, cf. C. A. 28, 7182* —The possibility of measuring the reflection ρ of photographic papers with an instrument embodying a photoelec. cell and an optical wedge is discussed with particular reference to the influence of the spectral sensitivity of the photoelec. cell and the spectral absorption of the wedge. Since neither a photoelec. cell which corresponds exactly with the eye in spectral sensitivity nor an optical wedge which is neutral over the wave-length range of interest is available, it is theoretically impossible to obtain exact correspondence between measurements made with such an app. and those made visually, if the photographic papers show any selective reflection. It is shown, however, that by suitably choosing the conditions of measurement, satisfactory agreement can be obtained for all photographic papers in general use, including sepia toned prints. Since the visual measurements were found to depend to some extent upon the color quality of the light used,

this was standardized as daylight and approximated to by screening a W lamp with a Wratten No. 78 filter. Authors

Plastic material [for making cinematographic films] (Fr. pat. 787,142) 13 Photometric app. for measuring the hiding power of photographic emulsions (Brit. pat. 434,136) 26

Color photography Béla Gáspár. Brit. 434,875, Sept. 5, 1935 Multicolor photographic images are produced on colored and differently sensitized multilayer or multicolor screen material, the same filters being used for recording and printing purposes, by using filters each having 2 light-transmission ranges, viz., 1 in the light, visible portion of the spectrum for recording and 1 in the dark, invisible portion for printing purposes. An example describes a screen contg. blue filter elements, transmitting at 400-500 $\text{m}\mu$ and also at 600-690 $\text{m}\mu$, formed by a mixt. of eosulin, methylene blue, rhodamine and Berlin or Prussian blue; green filter elements, transmitting at 500-600 $\text{m}\mu$ and also at 700-750 $\text{m}\mu$, formed by a mixt. of Patent blue, tartrazine and 2,2'-dimethyl-3,4,3',4'-dibenzothiotricarbocyanine chloride, and red filter elements, transmitting at 590 $\text{m}\mu$ and also above 750 $\text{m}\mu$, formed by a mixt. of indolemine carbocyanine, thioflavine T and 1,3,3,1'-3',3'-hexamethylindotricarbocyanine iodide. The red filter element may also be selected to have a transmission range of 350-390 $\text{m}\mu$ by coloring with rhodamine, Prussian blue and nitrosodimethylamine-HCl.

Color photography. I. G. Farbenud A.-G. Fr. 787,388, Sept. 21, 1935 In the production of mono- and polychrome images by synthesis of azo dyes, a material is used in which the photographic layers serving for the constitution of the image are allied with components of azo dyes which are substantive with respect to the layers. Thus, azo or diazo components in the dissolved state, which behave substantively toward gelatin are added to a soln. of gelatin and the gelatin is submitted to a careful washing and treated in the usual manner.

Colored photographic materials Béla Gáspár. Brit. 434,303, Aug. 29, 1935 See Fr. 777,098 (C. A. 29, 3617*).

Photographic sensitive materials Humphrey D. Murray, Harry Bames, Ralph A. S. Grist and Dufaycolor Ltd. Brit. 435,484, Sept. 23, 1935 In sensitive material using a monochrome or multicolor screen, the color screen is sepd. from the emulsion by a varnish layer which comprises a compn. contg. a "Glyptal" resin, e. g., "Paralac," which also contains a drying oil, e. g., linseed or tung. Inert substances, e. g., cellulose esters, chlorinated rubber compds. or metallic driers, may also be added to assist in the drying of the layer. Plasticizers may be added to increase the flexibility of the layer.

Light-sensitive layers Oskar Süs (to Kalle & Co. A.-G.). U. S. 2,025,675, Dec. 24. AgNO_3 , ferric NH_4 citrate and free malic acid, or like ingredients, are used together.

Intensifying photographic images Kenneth C. D. Hickman and Walter J. Weyerts (to Eastman Kodak Co.) U. S. 2,024,644, Dec. 17. For intensifying a photographic Ag image, it is bleached in a soln. contg. an oxidizing agent such as KMnO_4 and relatively poor in Ag precipitant, the bleached image is darkened in a soln. contg. Na sulfide and a solvent for Ag bromide such as Na thiosulfate and the resulting Ag sulfide image is then intensified in a soln. contg. NaHSO_3 , Na_2SO_3 and a Ag salt such as Ag sulfate. Various examples are given.

Positive reflex copies on diazotype layers Lodewijk P. F. van der Grinten (to N.-V. Chemische Fabriek L. van der Grinten). U. S. 2,020,292, Dec. 31. A sensitive sheet for prep. pos. reflex copies comprises a layer contg. diazo compds., presenting small areas substantially free from diazo compds. sepd. by areas contg. diazo compds. Cf. C. A. 30, 402*.

Cinematographic films in natural colors Georges A. Ragum (to "Société Lumière"). U. S. 2,025,671, Dec. 24. A transparent support is first coated with a glumk transparent varnish along a longitudinal portion corre-

sponding to the succession of images of the finished film but not along the longitudinal portion corresponding to the sound track; transparent multicolored particles are spread on the support, those particles which do not adhere are removed, and the whole width of the support is coated with a light-sensitive emulsion.

Cinematographic color sound films Béla Gáspár U. S. 2,025,639, Dec. 24. In a pre-dyed photographic light-sensitive Ag halide emulsion layer there is formed a developed and fixed Ag image constituting a sound record and a Ag image constituting a picture record, and the records are treated with an agent which locally destroys the dye to convert each of the records into a color image, the metallic Ag in the visual and sound records is converted into a Ag salt, and the sound record only is treated with a reducing substance to reconvert the Ag salt into metallic Ag, and the Ag salt is thereafter dissolved from the visual record portion by treating the film with a fixing bath.

Sound and like records N. V. Philips' Gloeilampenfabriek Brit. 434,020, Sept. 11, 1935. A carrier, preferably a film, on which sound, etc., may be recorded mechanically for optical reproduction and which comprises 2 adjoining layers, 1 of which is formed of a material capable of holding a dye or the like, e. g., of tanned gelatin, while an adjacent, preferably the covering, layer is formed of a material that repels dyes, e. g., of untanned gelatin, has its covering layer formed by or contg. a material that is opaque to red or infrared rays, whereas the other layer or layers is or are transparent to such rays. CuSO_4 may be used as the substance opaque to red and infrared rays.

Apparatus for drying photographic prints Charles Jellinek (to Kodak Ltd.) Brit. 431,431, Sept. 2, 1935.

Photographic printing by x-rays Siemens & Halske A.-G. Brit. 435,181, Sept. 12, 1935. Addn to 407,830 (C. A. 28, 5358). Photographic positives are produced by first using the sensitive Al or Al alloy supports prep. as described in 407,830 to produce negatives and then printing positives from the negatives by means of x-rays. Before use in the printing process, a Ag negative may be

converted by any known toning process into a negative of a heavier metal, e. g., Au or Pt or of a salt of Pb or other heavy metal.

Tanned prints Kalle & Co. A.-G. Brit. 431,073, Aug. 26, 1935. This corresponds to Ger. 615,958 (C. A. 29, 7842).

Pictures in relief from plane photographs Ernest L. Zeve (to Scul-Pho, Inc.) U. S. 2,020,202, Dec. 31.

Numerous operative details are described.

Motion-picture reverse mat. Frank D. Williams U. S. 2,021,081, Dec. 10. The image of an object reflecting light predominantly red before a background reflecting predominantly blue light of greater intensity than the light from the object is photographed upon a film comprising a panchromatic emulsion stratum on the front of a single base and an orthochromatic emulsion stratum superposed over the panchromatic emulsion stratum and facing the object, and the film is developed to produce a normal detail negative image corresponding to the object and a substantially nonlight-transmissive background.

Photographic plates Gaston Maillet U. S. 2,025,696, Dec. 31. A coating is used comprising a colloid mixed with a chromate salt of an org. base of the pyridine group such as pyridine or quinoline chromate or dichromate.

Printing plate Ernest S. Ballard (to Standard Process Corp.) U. S. 2,021,080, Dec. 10. A screen positive is made in which tones and shadows are represented by distinct dots in photographic gradation, a negative of the screen positive is produced on a sensitive plate, the negative is superposed on a smooth sensitized metal plate and the latter is exposed to light transmitted through the dot formation; the plate is developed and fixed so that its coating becomes nonconducting, and the fixed coating is electroplated to produce a printing plate having distinct openings of graduated sizes and the plate is stripped from the coating. U. S. 2,024,087 also relates to details of printing-plate production.

Enamels for use in photoengraving John J. Murray. Fr. 787,489, Sept. 23, 1935. See U. S. 2,000,453 (C. A. 29, 3928).

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Coordinate valency rings III. Some inner complex salts of iron and manganese. Tokuchi Tsumaki J. Chem. Soc. Japan 56, 1329-31 (1935), cf. C. A. 29, 3930².—By means of the reaction between (a) hot soln. and 150 cc. of a. and (b) 80 cc. of 5.6% Fe NH_4 alum, the Fe deriv. of trisallylaldelydiumine, $\text{C}_6\text{H}_5\text{O}_2\text{N}_3\text{Fe}$, was prepd. By similar processes the Mn derivs. of trisallylaldelydiumine, $\text{C}_6\text{H}_5\text{O}_2\text{N}_3\text{Mn}$, and of salicylaldehydebisallylamine, $\text{C}_{12}\text{H}_{15}\text{O}_4\text{N}_4\text{Mn}$, and the hydroxy-manganese deriv. of salicylaldehydebisallylamine, $\text{C}_{12}\text{H}_{15}\text{O}_5\text{N}_4\text{Mn}$, were obtained. T. Katsurai.

Compounds of aluminum bromide with bromides of lithium, copper and silver. V. A. Plotnikov and L. Ya. Gorenbeln J. Gen. Chem. (U. S. S. R.) 5, 1108-11 (1935), cf. C. A. 28, 1501⁴.—Crystals of complex compds. $\text{LiBr} \cdot \text{AlBr}_3$, $\text{CuBr} \cdot \text{AlBr}_3$ and $(\text{AgBr})_2 \cdot (\text{AlBr}_3)_2$ crystallize from an EtBr soln. of AlBr_3 mixed with the bromides of Li, Cu and Ag, resp. Melting points of the 3 complexes, in the order given above, are: 192, 241 and 180-185°.

S. L. Madorsky

The formation of barium aluminates from barium carbonate and alumina in solid state G. Grube and G. Heintz Z. Elektrochem. 41, 797-804 (1935).—II pulverized mixts. of BaCO_3 and Al_2O_3 are heated in a CO_2 atm. in the temp. range between 900° and 1050°, monobarium aluminate is formed as the reaction product whether the starting mixt. contains BaCO_3 or Al_2O_3 in excess. Aluminates in which more than 1 mol. Al_2O_3 is united to 1 mol. BaO do not form under these conditions. At temps. from 1000° upward, reaction products

are formed in which the Al_2O_3 is bound entirely as aluminate and the BaCO_3 is practically entirely transformed into BaO . Extensive measurements were made of the equal pressures of the reactions to det. whether di- or tri-barium aluminates are formed.

Chloroarsenate of calcium. C. M. Smith, J. Wash. Acad. Sci. 25, 435-6 (1935).—To 50 g. anhyd. CaCl_2 in 50 cc. H_2O was added 5 cc. concd. HCl . $\text{CaH}_2\text{AsO}_4 \cdot \text{H}_2\text{O}$ was then added to satn. and the mixt. put on the steam bath. In the course of 11 days crystals sep'd. A large vol. of EtOH was added and the crystals were filtered off. The empirical formula assigned to this new compd. was $(\text{CaCl})_2 \cdot \text{HAsO}_4 \cdot 2\text{H}_2\text{O}$.

Louise Kelley

Induced oxidation of potassium iodide by ozone Genevieve Guéron, Jules Guéron and Marcel Prettre Compt. rend. 201, 1376-8 (1935), cf. C. A. 29, 6372².— CaO from a reservoir of O_3 contg. 2-7 mg. $\text{O}_3/\text{l.}$ is passed at a measured rate (a) directly into aq. KI, and (b) into a similar soln. after diln. to a known extent by air, and the results are compared, the total oxidation and that due to formation of IO_3^- are separately det'd. As ozone becomes more dil. the total oxidation increases, but that due to IO_3^- decreases, the variations being almost linear. C. A. S.

Structure of nitrogen peroxide as deduced from action of potassium iodide Maurice Dodé. Compt. rend. 201, 1378-80 (1935).—When N_2O reacts in a vacuum with aq. KI of varying concn part is hydrolyzed to HNO_3 and HNO_2 ; this proportion increases from 14% with a 60% soln. to 85% with a 0.5% soln., the balance reacting according to $\text{N}_2\text{O} + 2\text{KI} = 2\text{KNO} + \text{I}_2$, which implies either ON-O-O-NO or $\text{O}_2\text{N-N-O}$ as the structure of N_2O .

With solid KI the reaction is $2\text{N}_2\text{O}_5 + 2\text{KI} = 2\text{KNO}_3 + 2\text{NO} + \text{I}_2$, which is best explained by the formula $\text{O}_2\text{N}-\text{O}-\text{NO}$. With moist KI (0.5% H_2O) both reactions occur simultaneously. C. A. Silberrad

Phosphorus pernitrate, P_4N_6 , Henri Moureu and Georges Wetroff *Compt rend* 201, 1391-3 (1935). —When $\text{P}_4(\text{NH}_4)_6$ obtained by heating the product of the action of liquid NH_3 on PCl_5 is heated at $500-600^\circ$ there is not, as thought by Renaud (C. A. 29, 5033), formed $(\text{PN})_4$, but H_2 and P_4N_6 are also evolved and the pernitrate P_4N_6 results. $2\text{P}_4(\text{NH}_4)_6 = \text{P}_4\text{N}_6 + 3\text{H}_2$, followed to some extent by $\text{P}_4\text{N}_6 + 3\text{H}_2 = 6\text{NH}_3 + (2x - 6)\text{PH}_3 + (10 - 2x)\text{P}$. P_4N_6 is white, insoluble, nonvolatile and spontaneously inflammable in the air. Heated for 12 hrs with H_2O at 215° it hydrolyzes: $\text{P}_4\text{N}_6 + 15\text{H}_2\text{O} = 2(\text{NH}_4)_2\text{HPO}_4 + \text{NH}_4\text{H}_2\text{PO}_4 + \text{NH}_4\text{HPO}_4$. The phosphate is, however, partially converted into phosphate with evolution of H_2 . Treated similarly, P_4N_6 hydrolyzes according to $\text{P}_4\text{N}_6 + 12\text{H}_2\text{O} = 2(\text{NH}_4)_2\text{HPO}_4 + \text{NH}_4\text{H}_2\text{PO}_4$. Heated in a vacuum above 750° , P_4N_6 evolves N_2 , forming PN identical with that previously obtained (C. A. 28, 3997). PN dissociates above 840° into P and N_2 , and only hydrolyzes on heating with H_2O at 215° for 3 days, with formation of $\text{NH}_4\text{H}_2\text{PO}_4$, NH_4HPO_4 , and H_2 . C. A. Silberrad

Hydration of chromic chloride in heavy water. Georges Champetier *Compt rend* 201, 1118-20 (1935). —The changes in constitution of solns of CrCl_3 in H_2O represented by $[\text{Cr}(\text{H}_2\text{O})_6]\text{Cl}_3$ (I) $\rightleftharpoons [\text{Cr}(\text{H}_2\text{O})_5\text{Cl}]\text{Cl}_2$ (II) $\rightleftharpoons [\text{Cr}(\text{H}_2\text{O})_4\text{Cl}_2]\text{Cl}$ (III) is shown by cond. dens. to occur similarly in 98.5% D_2O , the only differences being that the cond. in D_2O is less owing to the smaller mobility of the ions therein (cf. Lewis and Doody, C. A. 27, 4730), and that the changes proceed more slowly, that of II to III being at about $1/3$ of the rate in H_2O . C. A. Silberrad

A method for the preparation of pure carbon monoxide. G. Meyer, R. A. Henkes and A. Slooff *Rec trav chim* 54, 797-9 (1935). —Pure Ni was made by the reduction of a mixt. of the hydrides of Ni at 350° . The Ni was allowed to react with CO in a bomb under a pressure of 60 atms and the $\text{Ni}(\text{CO})_4$ was decompd. by passing through a hot tube at 200° . The CO produced, which was purified by passing through a liquid-air trap and collected over H_2 , analyzed from 99.7 to 100.3%. A. A. V.

The nitroprusside reagent and its changes by the action of alkali sulfide. E. Justin Mueller, *J. pharm. chem.* 22, 496-503 (1935). —The finally adopted formula for Na nitroprusside (A) is $\text{Na}(\text{CN})_5\text{Fe}(\text{NO})$ (B) $\rightleftharpoons \text{Na}(\text{CN})_5\text{Fe}(\text{NO})$ (C). One mol. A reacting with $2\text{Na}_2\text{S}$ forms 4NaCN plus an unstable purple-red compd. (B). $\text{Na}(\text{CN})_5\text{Fe}(\text{SNO})$ (D) $\rightleftharpoons \text{Na}(\text{CN})_5\text{Fe}(\text{SNO})$ (E). With Na_2O , D rapidly loses the (SNO) complex which in the nascent state reacts with 1 of the 2 remaining $\text{Na}_2(\text{CN})_4\text{Fe}$ groups, forming 4HCN , 2NaCN , 2NaNO , and the ferrous nitrosulfide, $\text{FeS}_2(\text{NO})$. Na_2O (or $\text{FeS}_2(\text{NO})$) $\rightleftharpoons \text{Na}_2\text{O}$. *Naquet, in Vauquelin's Dictionary*, 1, 1106). The other $\text{Na}_2(\text{CN})_4\text{Fe}$ in the presence of 2NaOH forms $\text{Na}_2\text{Fe}(\text{CN})_6$ and $\text{Fe}(\text{OH})_3$, the latter gradually oxidizes, and upon acidulation, Prussian blue is formed. The various phases of these reactions can be made visible by the touch method on wool. Ten references.

Chemical investigation of silicates. III. Behavior of talc toward MgO and chlorides of magnesium, cobalt and manganese on heating. Erich Thilo *Z. anorg. allgem. Chem.* 225, 40-63 (1933); cf. C. A. 27, 4185. —On heating mixts. of talc with chlorides of Mg , Co and Mn at about 800° , such products as MgSiO_3 , SiO_2 and orthosilicate and such mixed crystals as $(\text{Mg}, \text{Mn})\text{SiO}_3$ are formed. The definite compd. $\text{Mg}_2\text{Si}_2\text{O}_7$ was not recognized. This behavior is different from that of pyrophyllite, which reacts with CoO and MgO but not MnO and does not form orthosilicate. It is concluded that the crystal structures of talc and pyrophyllite, while very similar, are not identical. Pyrophyllite reactions depend upon octahedral voids, which in the structure of talc are occupied by Mg . For talc to react the lattice must be completely altered. For the dehydration of talc, therefore, a greater quantity of

energy is required, accounting for the occurrence of orthosilicate in the reaction products. H. Stoertz

Formation of "persulfate." Hugo Ditz, *Z. anorg. allgem. Chem.* 225, 90-2 (1935). —Comments upon an article by Krauss and Oettner (C. A. 29, 5763). D. claims that their statement that he was unable to obtain persulfate from H_2O_2 and Na_2SiO_3 is incorrect. H. S.

The existence of orthorhombic acid, H_2NO_3 . E. Zintl and W. Hauke *Z. physik. Chem.* A174, 312-16 (1935). —With the help of a K hl camera powder pictures of $\text{HNO}_3 \cdot \text{H}_2\text{O}$ were produced and compared with diagrams of the 5 low pressure modifications of NH_4NO_3 and cryst. H_3PO_4 . The authors agree with W. Beltz, *Nachr. Ges. Wiss. G ttingen Ges. Mitt. Math.-physik. Klasse* 111 1, 95 (1935), that the monohydrate of HNO_3 has the structure H_2NO_3 . R. H. Baechler

Preparation of selenic acid. L. I. Culbertson and C. B. King *J. Am. Chem. Soc.* 58, 180 (1936). —Oxidation of 150 g. SeO_2 with 500 g. of 30% H_2O_2 for 24 hrs at room temp., followed by refluxing for 12 hrs while O_2 is bubbled through the soln. (more H_2O_2 may have to be added) and removal of the H_2O on a steam bath and finally at $150-60^\circ$ and 4-6 mm., gives 192-5 g. H_2SeO_4 , m. $57-6^\circ$. C. J. West

The mixed polyhalides of titanium. G. P. Luchinski and A. I. Likhacheva. *Z. anorg. allgem. Chem.* 224, 420-6 (1935). — TiCl_3 mixes with Br in all proportions, forming mixts. of intense red color. The melting curve of the system TiCl_3Br has 3 eutectic and 2 singular points. Two mol. compds. are formed, TiBrCl_2 and TiBr_2Cl . Under the influence of heat and of H_2O the entire Br splits off from both compds. The Ti can be detd. colorimetrically in the presence of the Br compds. and after removal of the Br by chloroform extn. M. M.

Spontaneous decomposition of polythionate solutions. A. K rtenacker, A. M schin and F. Stastny. *Z. anorg. allgem. Chem.* 224, 399-419 (1935). —Investigation of the influence of pH on the decompn. of K salts of polythionates showed: (1) Hexathionates decompose in the region between $\text{pH} = 8.9$ and $\text{pH} = 0.3$, smoothly and without the formation of by-products, into S and pentathionate. (2) Pentathionate in weakly acid soln ($\text{pH} = 4.6$ and $\text{pH} = 3.8$) decomposes without formation of secondary products into S and tetrathionate. In neutral and weakly alk. soln. ($\text{pH} = 7$ and $\text{pH} = 8.9$) small amts. of trithionate, thiosulfate and sulfate appear probably on account of the decompn. of the tetrathionate. (3) The tetrathionate decompn. is more complicated. With pH not more than 8.9 the known decompn. into tri- and pentathionate occurs. With $\text{pH} = 11.5$ $4\text{S}_2\text{O}_8^{2-} + 6\text{OH}^- = 2\text{S}_2\text{O}_4^{2-} + 5\text{S}_2\text{O}_3^{2-} + 3\text{H}_2\text{O}$. (4) The trithionate decomps. thus: (1) $\text{S}_3\text{O}_6^{2-} + \text{H}_2\text{O} = \text{S}_2\text{O}_4^{2-} + \text{SO}_4^{2-} + 2\text{H}^+$ at pH 12 or less, quantitatively at pH 8.9-5.6, (2) $2\text{S}_3\text{O}_6^{2-} + 6\text{OH}^- = \text{S}_2\text{O}_4^{2-} + 4\text{SO}_3^{2-} + 3\text{H}_2\text{O}$ only at high OH-alk. concn. M. McMahon

The systems alkali oxides- CaO H_2O , SiO_2 - CO_2 . V. Stable equilibrium in the system Na_2O - SiO_2 - CO_2 and the CO_2 pressure in the reaction of K_2CO_3 and K_2SiO_3 . Carl Kr ger and Ernst Pingas *Z. anorg. allgem. Chem.* 225, 1-23 (1935), cf. C. A. 30, 693. —Equal and CO_2 pressures were detd. in the reaction between cryst. Na_2SiO_3 and Na_2CO_3 at various temps. between 368° and 1015° . CO_2 pressure curves are shown and results indicate the equl. is bivalent. The action of Na_2SiO_3 upon Na_2SiO_3 was studied between 480° and 790° . A cryst. form of Na_2SiO_3 was not obtained but only glass-like material, and the reaction with Na_2CO_3 shows a univariant equl. curve. In studying absorption of CO_2 , it was found that neither Na_2SiO_3 nor $\text{Na}_2\text{SiO}_3\text{-Na}_2\text{SiO}_3$ mixts. would take up CO_2 , but it is taken up by Na_2SiO_3 even at temps. of $200-300^\circ$ to form Na_2SiO_3 and Na_2CO_3 . In the reaction of Na_2CO_3 upon the pyrosulfate $\text{Na}_2\text{S}_2\text{O}_7$ the equl. varies between tri- and bivalent. The p - H diagram and stable equl. were detd. for the system Na_2O - SiO_2 - CO_2 . In the action of K_2CO_3 upon K_2SiO_3 it was shown that in the system K_2O - SiO_2 - CO_2 as in the system Na_2O - SiO_2 - CO_2 there is considerable difference in the behavior of glass-like and cryst. basic bodies.

p-4 diagrams were detd. for the system $K_2O-SiO_2-CO_2$ ¹

H. Stoertz
Cuprtetra-chlorides and -bromides of some secondary and tertiary amines and alkaloids. Jean Amiel *Compt. rend.* 201, 1383-5(1935); cf. C. A. 30, 406¹.—By similar methods $[CuX_4](BH)$, have been prep'd, where X = Cl and Br, B = NHEt₃, NHPMe, NHPPhEt, NPhMe, NPhEt₃, and also $[CuCl_4](NEt_3H)$. Except for $[CuCl_4](NHEt_3H)$, which is green, non-deliquescent and very sol in COMe₂, all closely resemble the compds previously prep'd. Similar compds were obtained with some alkaloids: $[CuX_4](B'H_2)$, where X = Cl and Br, B' = nicotine or quinine, with strychnine $[CuX_4](B'H)$, with nicotine also $[CuCl_4](B'H_2)$ H₂O, and with brucine $[CuCl_4](B'H)$. C. A. Suberrad

A new group of complex compounds—complex compounds whose central ion is a complex cation. III. Complex phosphate compounds with complex cobalt cations as central ions H. Bruntzinger and H. Osswald. *Z. anorg. allgem. Chem.* 225, 33 7(1935), cf. C. A. 30, 694¹.—The following complex cations were allowed to

react with 3N K_3HPO_4 soln

$(NH_3)_6]^{3+}$ Detn. of ion wt by dialysis showed that the following complex anions were formed.

H. Stoertz
Complexes of boric acid with one and two molecules of polyhydric alcohols in aqueous solution J. Böseken, N. Vermaas, W. H. Zaayer and J. L. Leefers *Rec. trav. chim.* 54, 853-60(1935).—Measurements of the rotation of polarized light by solns of mannitol in H₂O with NaBO₂ show the existence of complex ions of the formula BD⁻ and BD₂⁻, where D represents a mol. of a polyhydric alc. Measurements on a soln contg sorbitol and NaBO₂ also showed the presence of the ions BD₂⁻ and BD⁻.

Arthur A. Vernon
Composition and properties of potassium phosphotungstate E. A. Nikitina *J. Gen. Chem.* (U. S. S. R.) 5, 1133-8(1935).—Analyses show that the compn of H₂O-free K phosphotungstate is 3K₂O·P₂O₅·24WO₃; the H₂O-contg mol. is K₂H₄[P(W₂O₇)₄]. Its properties were studied with a view to utilizing the formation of this compd as a method of quant. analysis for K. The ppt. formed in the reaction of a K salt soln with H₂[P(W₂O₇)₄] is microcryst. It is difficult to filter and it settles very slowly. The salt is sol in H₂O but difficultly sol in HCl soln. Its soly in 18% HCl is 0, 0, 0, 0, 19, 0.44, 0.67 and 0.80 g. per 100 g. soln, at 0, 20, 43, 53, 70, 80 and 90°, resp. H₂[P(W₂O₇)₄] can be used for the detn. of K in the absence of Na or for detection of K in the presence of Na. S. L. Madorsky

Stability of sodium aluminate solutions V. D. D'yachkov and O. S. Kozhukhova *J. Gen. Chem.* (U. S. S. R.) 5, 1139-43(1935).—The stabilizing effect of an excess of alkali on Na₂O·Al₂O₃ solns increased sharply at Na₂O/Al₂O₃ = 1.4-1.5. The range of lowest stability for any given ratio Na₂O/Al₂O₃ is about 120-180 g. of Na₂O·Al₂O₃ per l. Agar-agar is a good stabilizer for Na₂O·Al₂O₃ solns. S. L. Madorsky

Asymmetric adsorption of complex salts on quartz (Tsuchida, et al.) 2 Asymmetric photochem. decompn. of complex salts (Tsuchida, et al.) 3.

7—ANALYTICAL CHEMISTRY

W. T. HALL

Theory of electrocapillary method of qualitative analysis III. S. I. D'yachkovskii. *J. Gen. Chem.* (U. S. S. R.) 5, 728-30(1935); cf. C. A. 28, 1625¹.—The electrocapillary method of qual. analysis is explained on the basis of the movement of superimposed layers of anions and cations which arrange themselves with respect to the moist filter paper placed between the electrodes. In case of simple dipoles (e. g., NaCl), only electrostatic forces act between the layers. In case of complex heteropolar mols (e. g., NH₄Cl), chem. forces act in addn to electrostatic forces. S. L. Madorsky

Application of organic reduction-oxidation systems in qualitative analysis. I. Theory of the application in oxidation processes Leonid M. Kul'berg *J. Gen. Chem.* (U. S. S. R.) 5, 1085-90(1935); cf. C. A. 29, 4280¹. Application of organic reduction-oxidation systems in quantitative analysis II. Theory of application in colorimetry. Oxidation processes *Ibid.* 1240-5.—A general discussion, with math. treatment, of the use of leuco dyes in the detection and colorimetric detn. of various inorg. compds based on the exact coordination of their resp. oxidation-reduction elec. potentials. In the preliminary communications various factors, such as temp., concn., μ_n , capable of affecting the reactions, and the literature are discussed. Twenty references. C. B.

Methods of quantitative Rontgen analysis. N. D. Borisov and P. I. Kisel'gof. *Zavodskaya Lab.* 4, 800-4 (1935), cf. C. A. 29, 1355¹.—A review with about 30 references. Chas. Blanc

Microchemical spectral analysis in high-frequency sparks A. Schleicher and N. Brecht-Bergen. *Z. anal. Chem.* 103, 198(1935), cf. C. A. 29, 5765¹, Gerlach and Gerlach, C. A. 27, 2909.—Further details are given. W. T. H.

Exact measurement of volume and exact titration R. Gol'tz *J. Gen. Chem.* (U. S. S. R.) 5, 779-82(1935).—A discussion of errors involved in volumetric titration and suggestions for reducing these errors to a min. S. L. Madorsky

Vacuum titration T. Thunberg *Skand. Arch. Physiol.* 72, 291-4(1935).—Description of procedure. S. Morgulis

Volumetric determinations in strongly alkaline solutions. III. Titration of thallium and cerium with hypobromite O. Tomiček and M. Jašek *J. Am. Chem. Soc.* 57, 2409-11(1935), cf. C. A. 29, 5376¹.—Thallous soln. in an alk. soln. are oxidized smoothly to insol. Ti(OH)₃ by means of 0.05 M NaBrO soln., the end point of the reaction can be detd. potentiometrically. This provides a suitable method for standardizing NaBrO solns with Ti₂CO₃ or Ti₂SO₄ as standard. Cerous salts can be ti-

trated similarly in 20-30% K_2CO_3 soln but it is necessary to work in an indifferent atm. W. T. H.

A new method for the determination of the water contents of liquids and solids. A contribution to the treatise of Karl Fischer Richter *Angew Chem* 48, 776(1935); cf. C. A. 29, 6532. It was found that Fischer's I method can be applied to foodstuffs with only a few exceptions. Results are reported on wheat flour, powd cocoa, margarine, soy oil, marmalade, malt extract and cheese. Good agreement is shown with detns by other methods, except for cheese which gave a low result with the I method, as it was not possible to subdivide the substance sufficiently.

Karl Kammermeyer

Use of resorcinol in chemical analysis. II. Alan H. Ware *Chemist and Druggist* 123, 282(1935), cf. C. A. 28, 7195. Trease and Tinney, C. A. 20, 3777. (1). Org. halogen derivs., i. e., $CHCl_3$, $CHBr_3$, CHI_3 , CCl_4 , $CH(OH)_2$, CCl_3CHOH , $CH(OH)COH$, CCl_3COH , CCl_3 , C_6H_5COH , give a deep pink, carmine or brownish carmine color when 0.05 g. solid or 1 cc. liquid substance is heated for 1 min with 0.05 g. resorcinol (I), 10 cc. of 5% KOH and a little Cu as catalyst. Cool, and if necessary, boil again for 5 min. "Chlorbutol" gives a neg. result. (2) If Cu is omitted, CCl_4 gives no characteristic color, with CHI_3 the test is then indistinct. (3) With the above Cl derivs. contg. a CO group, also with $MeCHClCCl_3$, $CH(OH)_2$, if 5% KOH is replaced by 2.5% aq. NH_4OH , a brownish carmine color is produced, when diluted with H_2O until pink or yellow in transmitted light, a sp. intense green fluorescence is seen. (4) To test for C_6H_5 , CCl_4 , warm it with A in a dry test tube, dissolve in aq. alkali and dil. with H_2O , a strong green fluorescence is obtained. If heated with KOH from the start, the test is neg. (5) To test nitrates, mix 2 cc. aq. soln with 0.05 g. A and allow 3 cc. N-free H_2SO_4 to run down the side of the tube, then shake lightly. Let stand 2 min., then add 5 cc. H_2O . Add 5 cc. of the mixt. to 5 cc. coned. cooled aq. NH_4OH , with NH_4 always in excess. A rich scarlet fluorescence is seen whose intensity by comparison with solns. of known strength is a measure of the nitrate content. Dln. of 1×10^{-4} shows a wine-purple color, 2×10^{-4} purple violet, 5×10^{-4} blue violet. This test permits ready detection of nitrate in coned. H_2SO_4 .

S. Waldbott

The Mohler-Denigès reagent for tartaric acid. C. H. Liberali *Rev. chim. e. farmacia* 1, 12-15(1935).—Mohler-Denigès reagent (to 2 or 3 cc. coned. H_2SO_4 , add 1-2 drops of aq. soln of 2% resorcinol and 1-2 drops of soln to be assayed, mix, heat to 108-110°, red-violet color) for tartaric acid, although not specific, is to be recommended. In the presence of chlorates, nitrates, nitrites, bromates and iodates, the color is changed. Gluconic, lactic and pyruvic acids are the cause of error, as they give the same color as tartrates. F. S. G. B.

The use of 5-methyl-8-hydroxyquinoline in analysis. Carlos E. Gietz and Adolfo S. *Anales asoc. quim. Argentina* 23, 45-57(1935).—Addn. of 5-methyl-8-hydroxyquinoline to a 5% NaOAc-10% AcOH soln will show, by various color reactions, the presence of 1,000,000 Fe^{+++} , 1,000,000 Pd^{++} , 1,300,000 Cu^{++} , 1,300,000 Ti^{+++} , 1,000,000 Mo , 1,300,000 W and in a 0.2 N NaOH 10% said by Na tartrate soln, 1,500,000 Cu or Fe^{++} and 1,500,000 Pd^{++} . The sensitivity of other ions is less. E. M. Symmes

Diphenylpicarbazide. C. F. Miller. *Chemist Analyst* 25, No. 10, 11-11(1936).—A method of prep. the reagent is described, a procedure is given for detg. Cr colorimetrically, and tests for Cd and Hg are given. The more or less fugitive color reactions with Cu, Ag, Pb, Mg, Zn, Fe, Ni, Co and Mn are given. W. T. H.

Colorimetric method of determining small quantities of arsenic in iron and steel. V. Ya. Tartakovsky. *Zarodskaya Lab* 4, 750-4(1935).—The method is based on that of Denigès and depends on the formation in soln of $H[As(Mo_2O_7)_2]$ which with $SnCl_2$ in dil. HCl gives a blue compd. $H[As(Mo_2O_7)_2]ONaO_2$. C. B.

Determination of trivalent and quaquevalent arsenic in the presence of each other. I. M. Dubrovyn. *Zarod-*

skaya Lab 4, 888-91(1935).—Dissolve a sample in 50% HCl, dil. and titrate As^{+++} at 50-60° with 0.1 N $KBrO_3$ in the presence of methyl orange as indicator. Make the titrated soln strongly acid with HCl, introduce pyridine sulfate, distil, titrate as above and calc. As^{+++} by difference. Chas. Blanc

Application of the logarithmic sector in the spectrum analysis of barium and strontium solutions. N. V. Luzinov. *Zarodskaya Lab* 4, 901-9(1935).—The exper. were carried out with the aid of the sparing vessel of Twyman and Hitchen (C. A. 25, 5864). Accurate results were obtained in HNO_3 solns. at concns. of 0.05% BaO and SrO and lower. The procedure, with math treatment, is described in detail. Chas. Blanc

New (color) test for bismuth. M. V. Gapchenko and O. G. Sheintsis. *Zarodskaya Lab* 4, 835(1935).—A mixt. of 1 g. quinine in 100 cc. alc. with 20 cc. of 25% KI gives a highly intense red-orange with Bi with sensitiveness of 0.02 mg. Bi in 1 (50,000). By the spot method 1.6 γ Bi in 1 drop can be detected. This reagent gives with Pb^{++} yellow, Hg^{+} green, Hg^{++} white, Ag⁺ very faint yellow, Sb^{+++} yellow, and with Cu^{++} and Fe^{+++} brownish yellow (liberation of I). All these cations, except the last 2, do not affect the detn. In the presence of Cu^{++} and Fe^{+++} , place 1 drop of 10% $NaHSO_4$ on the test paper said with the reagent and follow with 1 drop of the acidified soln to be tested. Chas. Blanc

Possibility of determining bismuth as basic carbonate. I. Friedrich Hecht and Richard Reissner. *Z. anal. Chem.* 103, 180-9(1935), cf. C. A. 30, 693⁺, 696⁺.—If a soln of $Bi(NO_3)_3$ contg. not over 60 mg. Bi in 100 ml. is treated with an excess of a satd. soln of $(NH_4)_2CO_3$, added in small portions, and is then boiled a few min., filtered, washed with hot water and dried in the app. of Dworkal and Reich-Rohrig (C. A. 25, 5465) in a current of air for 2-3 hrs., the ppt. can be weighed as $(BiO)_2CO_3$. The results obtained in 5 analyses were good, the greatest error was 0.5 mg. with a sample weighing 0.22 g. Bi_2O_3 . The procedure is satisfactory for analyzing as little as 1 mg. Bi_2O_3 . W. T. H.

Fundamentals and applications of absolute colorimetry. XII. Determination of iron. A. Thiel and O. Peter. *Z. anal. Chem.* 103, 161-6(1935); cf. C. A. 29, 71⁺.—The method of Lapin and Kill, C. A. 26, 789, which depends upon the formation of a red-colored soln by the action of sulfosalicylic acid upon Fe^{+++} in a soln, slightly acid with HCl or upon the formation of a yellow-colored soln by both Fe^{++} and Fe^{+++} in the presence of NH_4 , is suitable for the detn. of both total Fe and Fe^{+++} by abs. colorimetry. From 0.24 to 8.0 mg. per l. of Fe can be detd. with remarkable accuracy. W. T. H.

Rapid analysis of iron, ferrous and ferric oxides in a mixture. S. P. Leiba and Yu. I. Dolgina. *Zarodskaya Lab* 4, 743-7(1935).—The modification of the Wilner and Merck method for detg. Fe, FeO and Fe_2O_3 in a mixt. by oxidation of Fe with $HgCl_2$ is based on the observation that a part of the $FeCl_2$ is reduced by Hg and $HgCl$ formed in the process of solvation of the mixt. by boiling with HCl. Det. metallic Fe in the mixt. by the method of Wilner and Merck. For the detn. of FeO, introduce 5 g. of powd. sample into a dry flask (100 cc.) contg. CO_2 , 5 g. $HgCl_2$ and 30 cc. H_2O (preferably charged with CO_2). Boil the mixt. in a strong current of CO_2 for 1 min. Allow to cool and add 30 cc. of coned. HCl with shaking. Dil. the mixt. to 100 cc. Remove 15-20 cc. of the clear supernatant soln, dil. to 200 cc., add 15-20 cc. of the Renhardt soln and titrate with $KMnO_4$. Calc. FeO from the total value for FeO and Fe. Det. the total Fe in the mixt. by the Zimmermann-Renhardt method and calc. Fe_2O_3 . The method is accurate to 0.04% for Fe and FeO and 0.2% for Fe_2O_3 . Chas. Blanc

Determination of small quantities of iron in phosphates with sulfosalicylic acid. V. M. Peshkova and A. D. Egorov. *Zarodskaya Lab* 4, 835-7(1935), cf. Lapin and Kill, C. A. 26, 789.—Good results were obtained by colorimetric detn. of Fe^{++} and Fe^{+++} in NH_4OH soln with sulfosalicylic acid as reagent. Chas. Blanc

Determination of lead in alloys. M. V. Gapchenko and

O. G. Shelutskii, *Zavodskaya Lab.* 4, 868-70 (1935).—(1) Treat the filtrate from SnO_2 and SnO_3 with an excess of NH_4OH (to dissolve any $\text{Cu}(\text{NO}_3)_2$), add cryst. AcO-NH_4 to dissolve $\text{Pb}(\text{OH})_2$ and 10% NaHSO_4 , filter off PbSO_4 in a Gooch crucible, wash with cold H_2O , dry at 105° and weigh. (2) Filter off H_2SO_4 , wash it free from SO_3^{2-} (test with I and starch soln.), dissolve PbSO_4 in the filtrate with 10 cc. of 2 N NaOH and wash the filter to a neutral reaction (litmus). Introduce into the filtrate a standard soln. of I and after 10 min. 25% H_2SO_4 and titrate the excess of I with $\text{Na}_2\text{S}_2\text{O}_4$. Chas. Blanc.

Rapid method of analysis of red lead Stanley Kettle *Chemist Analyst* 25, No. 1, 6-8 (1936).—Treat 5-10 g. of sample with 20-40 ml. of 50% HNO_3 and measure the vol. of 1.2% H_2O_2 required to dissolve the Pb_2O_3 .

Determination of nickel by the combined Chugaev-Bruck and Moore methods I. I. Pomerantsev *Zavodskaya Lab.* 4, 960-7 (1935).—The Ni is pptd. with dimethyl glyoxime, the ppt. is removed, dissolved in HCl and the Ni titrated with KCN . Chas. Blanc.

A new microchemical reaction for potassium A. Kniga *Akhil (U. S. S. R.)* 1935, No. 7, 22-3.—The finely ground sample was fused on a Pt wire with Na_2CO_3 , treated with HCl , put on a microscope glass, heated to remove excess HCl and treated with 1 drop NaMnO_4 . After 1-2 min. the formation of black-violet crystals of KMnO_4 was noticed through the microscope. Na, Mg, Ca, Sr, Ba, Zn, Al, Cd, Ni, Bi and Cu did not interfere with the reaction. Mn, Co, Cr, iodide, cyanide, ferrocyanide and other reducing anions and org. matters did interfere. The same reaction was obtained with salts of Ni, (removed on ignition), Rb and Cs (both are rare). The sensitivity of this reaction is 0.04 mg. of K. A. P.

The refractometer method of determining potassium without separating the sodium M. Grindel *Khimiya i Selskoye Zemel'noye (Moscow)* No. 3, 101-6 (1935).—A discussion of the method and some results are presented. J. S. Joffe.

Rapid colorimetric method of determining silicon in cast iron and steel P. P. Fedorov *Zavodskaya Lab.* 4, 747-50 (1935); cf. Gutman and Froshutin *Khim.* C. A. 29, 7218.

Analytical determination of the form of silicon in aluminum castings Yu. A. Khachko *J. Gen. Chem. (U. S. S. R.)* 5, 1180-2 (1935). cf. C. A. 29, 1373.—An analytical method designed to differentiate between free and combined Si in Al castings is based on the fact that combined Si reacts with mineral acids (except HNO_3) to give SiH_4 , which in turn reacts with O of the air to form SiO_2 . However, if a stream of H_2 is passed through the soln., the SiH_4 is protected from oxidation and is removed by the H_2 stream. The method then consists in dissolving one sample of the Al casting in HCl in air. This gives total Si. Another sample is dissolved in HCl while a stream of H_2 is passed through the acid soln. This gives free Si, since the combined Si escapes as SiH_4 . The difference between the two deins. is combined Si. S. L. M.

Determination of the fineness of silver bullion M. R. Bercovitsh *Chemist Analyst* 25, No. 1, 11-14 (1936).—It is recommended to ppt. the greater part of the Ag^+ with a standard soln. of NaCl , filter, evaporate the filtrate somewhat, and titrate the remaining Ag^+ with KCN soln., with ferric alum as indicator. W. T. H.

Determination of titanium in stainless steels and zirconium in ferrozirconium with the aid of 8-hydroxyquinoline. S. L. Trimbberg *Zavodskaya Lab.* 4, 783-5 (1935).—The method of detn. of Ti in Cr-Ni-Ti steels is based on their soln. in HCl and H_2SO_4 . To a soln. of 1 g. sample in 50 cc. of 50% HCl or 20% H_2SO_4 , add 120-80 cc. and add dropwise 5% cupferron until the yellow ppt. begins to turn red (pptn. of Fe). Allow to stand 40-5 min., and filter through a filter cone. Filter paper pulp and wash the ppt. with 5% H_2SO_4 and H_2O . Ignite the ppt. with the filter and then with the addition of 10 parts of Na_2CO_3 for 15-2 hrs. Decompose the melt with 50 cc. of 50% HCl . Add to the soln. 1 g. of tartaric acid, neutralize with NH_4OH to methyl red, add 2.5 cc. of strong AcOH

and ppt. Fe with 10 cc. of 1% "oxine" at $70-80^\circ$ (cf. C. A. 29, 709). Ppt. Ti in the filtrate with 5% cupferron as above and ignite to TiO_2 . The detn. of Zr in Zr-Fe is based on the soln. of Zr oxine in dil. AcOH . Decompose 1 g. of powder sample in 20 cc. HNO_3 and 15 cc. HF . Evaporate the soln. with 5 cc. H_2SO_4 to fuming. Dissolve the residue in hot HCl and add to 1 l. To 100 cc. of the soln. add 1 g. tartaric acid, NH_4OH to a neutral reaction, 3 cc. of concd. AcOH and 10 cc. of 1% "oxine". Filter off and wash the Fe ppt. and det. as usual. Det. Zr in the filtrate either by direct addn. of 5% cupferron, or by first neutralizing the filtrate with NH_4OH and acidifying with 10 cc. of 50% H_2SO_4 and then pptg. with cupferron and igniting the ppt. to ZrO_2 . Chas. Blanc.

Colorimetric determination of titanium in the presence of bromine compounds G. P. Lushinskii and Antonina Ivanovna Likhacheva *Z. anal. Chem.* 103, 190-8; *Zavodskaya Lab.* 4, 831-5 (1935).—The colorimetric detn. of Ti by the Weller test ($E_{\text{Fe}}^{1\%} 1\text{cm} = 15, 250\text{m}\mu$) (1922) with H_2O_2 gives satisfactory results in the absence of Br, whose color in dil. solns. resembles that of the colored Ti compd. This error can be avoided, however, by taking advantage of the fact that Br is sol. in CHCl_3 , whereas the colored Ti compd. is not. The soln. to be tested colorimetrically should not contain more than 0.2% Ti, and 1% Br; it should contain at least 10% H_2SO_4 . To 25 cc. of Ti soln. add 25 cc. of H_2SO_4 contg. 5% H_2O_2 . It is important that the reagent and the soln. to be analyzed both have equal H_2SO_4 concns. before mixing. After allowing the color to develop for 0.5 hr., transfer to a separatory funnel and shake 0.5 hr. with 50 cc. of CHCl_3 . Draw off the aq. soln. and subject to the colorimetric comparison. W. T. H.

Determination of uranium, vanadium and iron in the presence of each other E. A. Ostroumov *Zavodskaya Lab.* 4, 754-7 (1935).—The volumetric detn. of U, V and Fe in a mixt. is made in 3 aliquot parts of the soln. V is detd. by the Hammer method of reducing V with FeSO_4 , oxidizing the excess of FeSO_4 with $(\text{NH}_4)_2\text{S}_2\text{O}_8$ and titrating V_2O_5 soln. with KMnO_4 . V and Fe are detd. by the Zimmermann-Reinhardt method by reducing V_2O_5 to V^{4+} with SnCl_2 and titrating with KMnO_4 . U, V and Fe are detd. by Semeva's method (C. A. 19, 224) as modified by Dumov and Volodina (C. A. 28, 71979). By substituting H_2SO_4 for HCl in the last procedure, the results are improved. Chas. Blanc.

Rapid determination of zinc in granulated slags. M. I. Shubin *Zavodskaya Lab.* 4, 85-7 (1935).—The method of detg. Zn in slags, obtained in smelting of waste Cu-Zn, depends on electrolytic deposition of Zn in alk. or NH_4OH solns. in the presence of the hydroxides of Ca, Al, Fe, Pb, Sb and Sn. After sepn. of SO_2 by filtration and Cu by electrolysis, the H_2SO_4 soln. is heated to $40-50^\circ$ and treated with 5 g. $(\text{NH}_4)_2\text{SO}_4$, 7-8 drops of 10% H_2O_2 and an excess of 2% NH_4OH . The mixt. is directly electrolyzed at 20° with a Pt electrode, with stirring, for 20-30 min. The electrode is washed with running water and alc. and dried at $70-80^\circ$. The detn. is accurate to $\pm 0.1\%$. C. B.

Separation of zinc from cobalt based on a new method for reducing post precipitation John R. Caldwell and Harvey V. Moyer *J. Am. Chem. Soc.* 57, 2275-7 (1935).—Adjust the pH of the Cl^- -free soln. contg. about 0.25 g. of Zn so that the hydroxides just remain in soln., and 6-8 g. of $(\text{NH}_4)_2\text{SO}_4$, d. to 230-300 ml. and add 0.2 ml. of acrolein. Introduce a rapid stream of H_2S for 20 min., add 5-10 ml. of 0.02% relative soln., filter after standing 15 min. and wash with cold water. Acrolein reacts with H_2S at the surface of the ZnS particles and thereby reduces the tendency of CoS to ppt. with the ZnS . W. T. H.

Microdetermination of carbon Wilhelm Littens and Walter Christian *Fis. Chem. Z.* 281, 310-13 (1935).—The org. material is oxidized in a combustion tube prepd. according to Pregl. The CO_2 is absorbed in 2 tubes with 0.1 N NaOH , which is measured out from a microburet. To aid the absorption the tubes are filled with 0.5 g. Ag filings. The absorbed CO_2 is liberated and measured in a Warburg app. The method for calg. the results is

discussed The C is detd in 0.2-0.6 g of substance

S Morgulis
Determination of pale red phosphorus in commercial red phosphorus A A Korinfski Zavodskaya Lab. 4, 762-4(1935) —The detn depends on the pptn of 2 mols of Cu from CuSO_4 by 1 mol of pale red P (inflammable), and the inability of the red modification of P to give this reaction

Chas. Blanc
Determination of sulfur in refined copper M R. Bercovitch *Chemist Analyst* 25, No 1, 4-5(1936) —Heat 200 g of the sample to redness in H_2 , absorb the H_2S in ammoniacal CdSO_4 , and finish the analysis as in detg S in steel

W T H
Rapid determination of sulfur in ores and other products L P Elenovitch and V G Makarova *Zavodskaya Lab* 4, 839-61(1935) —The sample is ignited with a mixt of ZnO and Na_2CO_3 and the melt extd with H_2O After pptn of SO_4^{2-} in the filtrate with BaCl_2 , the soln is neutralized with NH_4OH to methyl orange and treated with an excess of 0.2 N $\text{K}_2\text{Cr}_2\text{O}_7$. The filtrate is dil to a definite vol, and an aliquot part, after the addn of an excess of HCl , 10% KI and starch soln, is titrated with $\text{Na}_2\text{S}_2\text{O}_3$

Chas Blanc
Rapid determination of sulfur in ores, concentrates and flotation tailings L M Tol'son and E I Dyadicheva *Zavodskaya Lab*, 4, 873 9(1935), cf *C A* 29, 7865-7

The combustion is carried out in an elec furnace at 900° for 10 min in a current of air conducted at an exact rate The combustion gases are absorbed in neutral 1.5% H_2O_2 , and the SO_2 is titrated with 0.1 N NaOH in the presence of neutral red as indicator The analysis is completed in 20 min with uniformly accurate results by following exactly the procedure which is described in detail Cf Khlopin, *C A* 29, 787, Gerke, *C A* 29, 787, C B

C B
Organic flocculating agents in the quantitative precipitation of zinc sulfide John R. Caldwell and Harvey V. Moyer *J Am Chem Soc* 57, 2372-4(1935) —If 0.5-2 mg of gelatin or 2-5 mg of agar agar is added to a Zn soln of appropriate pH before or after treatment with H_2S , complete flocculation of 0.3 g ZnS takes place instantly Pptn can take place at room temp and the soln can be filtered in 15 min after the pptn Satisfactory seps were obtained from all other ions of the third group except Co, and the ZnS can be washed with cold water

W T H
Amalgamation as an aid in metal analysis Wolfgang Boehm *Metall u Erz* 32, 543-4(1935) —Large quantities of amalgam-forming heavy metals can be sepd from small quantities of alkali metals with the aid of Hg

Modified molybdenum method for determining phosphoric acid in mineral phosphates L V Vladimirov and L N Lobanov Zashchita Lab 4, 882–4 (1935) —A few minor modifications are made in the method of J O Handly
Chas Blanc

Determination of traces of prussic acid in tissues G. Harker J Proc Roy N S Wales 68, 102–6 (1934) —During some work on cancers, it became necessary to det small quantities of HCN and the method of Chelle was tested (C A 13, 2194, 3107, 14, 507, 1274). Forty g of the shredded organ was mixed with 75 ml of water and 5 ml of H_2PO_4 , heated and 50 ml of distillate collected. The distillate was placed in a flask, the HCN removed by a rapid stream of air, absorbed in 1 ml of 0.1 N KOH, after which the HCN was detected and detd either by the Prussian blue reaction or with the aid of ammoniacal AgI reagent. It was found that the use of $\frac{1}{10}$ as much H_2PO_4 and air free from CO_2 increased the yield of HCN, but there was always some loss, probably from hydrolysis of HCN during the boiling, and it is best to assume that the yield is 55% of the truth. Expts were also tried in which the tissue was ground with sand and water, made slightly acid and air drawn through directly without distn. There was bad frothing which was overcome by adding a drop of capryl alc. With 0.008 to 0.096 mg of HCN, the yield improved steadily as the amt of HCN increased and varied from 49.4 to 84%. In this way the HCN is concd in 1 operation and the yields are better, except with less than 0.01 mg HCN.
W T H

Electrocapillary method of qualitative analysis of cations of subgroup I, group IV. A F Orlenko J Gen. Chem. (U. S. S. R.) 5, 1091–2 (1935) —The electrocapillary method of passing a current at 80 v through a wet filter paper, at one end of which is placed a crystal of a reagent and at the other end a drop of the soln to be analyzed, was used for the detection of Hg^{++} , Cu^{++} , Bi^{+++} and Cd^{++} . The cations were introduced in the form of HgCl_2 , CuSO_4 , $\text{Bi}(\text{NO}_3)_3$ and $\text{Cd}(\text{NO}_3)_2$, and as reagents KI , $\text{K}_2\text{Fe}(\text{CN})_6$, $\text{C}_6\text{H}_5(\text{OH})_3$, Na_2SO_3 , $\text{K}_2\text{Cr}_2\text{O}_7$ and $(\text{NH}_4)_2\text{S}$, resp. were used. The relative mobilities of the cations were in the order $\text{Cu}^{++} > \text{Bi}^{+++} > \text{Hg}^{++} > \text{Cd}$, and of the anions in the order $\text{I}^- > \text{Cr}_2\text{O}_7^{--} > \text{Fe}(\text{CN})_6^{--}$. The ions move faster in an acid than in a neutral medium. It takes only 10–15 min to make a complete qual. analysis of the above cations by this method.
S L Madorsky

Titrimetric determination of water and alcohols by their acid-catalyzed reactions with acetic anhydride in organic media. Gerrit Tonnesen and Margaret Philott J Am Chem. Soc. 57, 2136–9 (1935) —The method is based on the fact that the reactions of Ac_2O with H_2O and alcs in the absence of a catalyst are negligibly slow in org media, while in the presence of a strong acid, such as perchloric or 2,4-dinitrobenzenesulfonic acid ($2-4 \times 10^{-3} M$ of the latter were used) the reactions are completed in less than 1 day. On titration with NaOMe , Ac_2O consumes 1 equiv, while after hydrolysis it consumes 2 (cf. C A 27, 5355). After alcoholysis the titration value of Ac_2O is unchanged, but an unused excess can be detd by the increase in titration value after hydrolysis with excess H_2O , this permits sep. detn. of H_2O and alcs. (MeOH and EtOH were used). The method is applicable to nonacidic and nonbasic solvents that are inert against the reagents. Examples are given of detns in CH_3CN , Ft_2O , C_6H_6 and CHCl_3 . The error in concns. of 1% is less than $\pm 1\%$,
S L Madorsky

Determination of the reducing power of impure air. L. W. Winkler. Z. anal. Chem. 103, 183–6 (1935). —If the air of a badly ventilated room, such as that of a school or a theater, is chilled, say by passing some of it for some time through a 2-l bottle placed in cracked ice, moisture will condense and the purity of the air can be estd by detg. how much alk. KMnO_4 is required to oxidize the impurities. The no. of ml of $N \text{ KMnO}_4$ required to oxidize 1 l. of condensed H_2O is defined as the reducing power of the air in degrees. To carry out the analysis, place 10 cc of alk. KMnO_4 soln (0.1 N in KMnO_4 , and 0.1 N in NaOH) in each of two 50-ml Erlenmeyer flasks. To one flask add 1 cc of distd water and to the other 1 cc. of the condensed water. After 24 hrs at room temp make both solns acid by adding 1–2 ml of 10% H_2SO_4 , add 0.05 g of KI and titrate the liberated I_2 with 0.01 N $\text{Na}_2\text{S}_2\text{O}_3$. The latter soln will keep indefinitely if it contains 10 ml of purified isobutyl alc. per l. The reducing power of fresh air varied from 1.0° (after a spell of rainy weather) to 2.2° (cloudy day). The reducing power of the air of a movie theater was 18.2°.

Method of spectral analysis of complicated mixtures. B Ya Dan, I V Granovskii and E S Puzenkin. J. Gen. Chem. (U. S. S. R.) 5, 1093–7 (1935) —Standards for the quant spectroscopic analysis of the system Mn-Co and the effect of impurities, such as chlorides of Na, K, Ba, Al, Ni and Fe, singly or in pairs, on these standards, are indicated.
S L Madorsky

The detection of strychnine in carcasses and corpses. Douw G Steyn Onderstepoort J Vet Sci 5, 130–74 (1935) —The factors affecting the taste, color and biol tests for strychnine are discussed. S was unable to detect a bitter taste in dilns of strychnine beyond 1 in 200,000 in distd. water when a standard quantity of 1 cc. of each diln. was placed on the tongue. A bitter taste could not be detected when only 1 drop of a 1 200,000 soln. was placed on the tongue. Wagner's reagent No 1 gave a distinct ppt. when 1 drop was added to 1 drop of a 1 20,000 soln of strychnine in distd water slightly acidified with H_2SO_4 . Mayer's reagent was slightly less sensitive. Under the same conditions phosphotungstic, phosphomolybdic, picric and tannic acids did not give pos results with 1 4000 solns. of strychnine. For the biol test strychnine was best injected into white mice and frogs in the form of a physiol saline soln slightly acidified with H_2SO_4 . As little as 0.008 mg. strychnine sulfate could be detected when it was injected intraperitoneally into white mice 3 weeks old weighing 10–12 g; white mice 14 days old weighing about 6 g. possessed the same degree of susceptibility per unit body wt. *Rana aequalensis* possessed the same degree of susceptibility as white mice 3 weeks old but a 9-fold quantity of strychnine sulfate had no effect on *Xenopus laevis*. Mice reacted much more promptly than frogs to small amts. of strychnine. The symptoms of strychnine poisoning in white mice and *R. aequalensis* are described. Factors responsible for the disappearance of strychnine from corpses and carcasses are discussed. Of 4 dogs killed with strychnine and exhumed 10 weeks later strychnine was detectable in 3 carcasses, while of 4 carcasses exhumed 18 weeks after death only 1 was pos. for strychnine. Strychnine was detectable in 4 of 8 carcasses of dogs exhumed 11 months after death. Methods of extg strychnine from carcasses and corpses and of purifying these exts are discussed. In fresh carcasses and corpses the most suitable organs for analysis for the presence of strychnine are liver, stomach, spleen, lungs, central nervous system and urine. In 2 of 3 dogs which had received strychnine as a tonic, strychnine was detectable in the liver and stomach (plus contents). A large no. of chem. substances which resemble strychnine chemically and biologically are discussed. A strychnine-like ptomaine was isolated from a decompd liver which was known not to contain any strychnine. This ptomaine had a bitter taste and gave a pos. H_2SO_4 - $\text{K}_2\text{Cr}_2\text{O}_7$ test for strychnine. The results of taste, chem. and biol. tests with identified

and unidentified ptomaines are recorded. Twenty-seven references. K D Jacob

Microcrystallographic identification of blood spots in situ. Alejandro Raitzin. *Rev. asoc. med. argentina* 49, 1115-22 (1935).—By means of Leitz's ultrapak and the formation of cryst. hemin-HCl it is possible to detect blood spots in situ. E S G B

Determination of chromium in organic compounds. C Franklin Miller. *Chemist Analyst* 25, No 1, 5-6 (1936).—Wet digestion of 10 g of sample with concd H_2SO_4 and HNO_3 is recommended. The clear, acid soln is poured into NaOH and the Cr oxidized to CrO_4^{--} with Na_2O_2 . After the removal of excess peroxide, the Cr can be detd. iodometrically or, if only little is present, by the color resulting with diphenylpicarbazide. W T H

Use of Schiff's reagent in the determination of acetaldehyde in acetic acid. G V Zavarov. *Zarodskaja Lab* 4, 764-7 (1935).—Toprep Schiff's reagent, mix 150 cc of 0.1% fuchsin with 100 cc $NaHSO_3$ soln (d₁₅ 1.308), 1000 cc H_2O and 15 cc H_2SO_4 , and allow to stand for 24 hrs. Prep standard solns of 0.02% and 0.1% AcH in 50% alc. Prep AcOH free from AcH by refluxing 500 cc of glacial AcOH with 10 g of CrO_3 for 1 hr and distg. the acid. Repeat the operation until the AcOH gives no color reaction with Schiff's reagent as described below. Place in a dry test tube 4 cc of 50% alc., 0.5 cc of AcOH to be tested and 1 cc of Schiff's reagent. Place in another tube 3.5 cc of 50% alc., 0.5 cc of one of the standard solns of AcH and 0.5 cc of the prepd AcOH. Shake well the 2 tubes and allow the contents to "age" for 30 min. Introduce into each tube 5 or 10 cc of H_2O , depending on whether 0.02% or 0.1% of the standard AcH soln was used, and compare in the Dubose colorimeter. The method is accurate to 0.003% for 0.1% AcH in 95.5% AcOH. Chas Blanc

Alkalimetric determination of pentabromacetone in the analysis of citric acid. G A Korzhemovskii and Ya N. Rekeida. *Zarodskaja Lab* 4, 768-70 (1935).—In the detn of AcOH (I) in wines, milk, tobacco, etc., by the Kuntz method, based on Stahre reaction, by oxidation of I to $CO(CH_3CO_2H)_2$ and conversion of the latter to pentabromacetone (II), a considerable saving of time is effected by titrating II with NaOH instead of drying it over P_2O_5 in vacuo. Wash the ppt of II thoroughly (until wash waters are neutral to methyl orange), transfer it with the filter to a flask, dissolve in 20 cc alc., add 50 cc of 0.1 N NaOH (KOH), digest on a water bath at 85-90°

(not higher) for 30 min and titrate back with 0.1 N HCl in the presence of methyl red as indicator. In the sapon II undergoes a no. of conversions, from which was evolved an empirical equation for the calcn of II: $a = 11.85b - 5$, in which a is mg. II and b is cc 0.1 N NaOH. C B.

Naphthalene determination with picric acid. A. P. W. Munch and R. Th. Heukens. *Chem. Weekblad* 32, 627-8 (1935); cf. C A 29, 6536³.—A reply to Pieters and Penners, cf. C A 29, 6023⁴. O W. Wilcox

Estimation of biacetyl. Hans Schmalfuss and Hildegard Rethorn. *Z. Untersuch. Lebensmittel* 70, 233-40 (1935).—A method is described for the detn of biacetyl as Ni salt of dimethylglyoxime with an av. error of -0.2%. In this method, care is taken as to the degree and length of heating, degree of diln, content in bases and the volatility of the biacetyl. On the other hand, the content in hydroxylamine hydrochloride and NiCl₂ may be varied within wide limits. Sixty-one references. F L Dunlap

Microchemical determination of cholesterol, carbanide, glycerol, etc., by means of liquid crystals. Paul Gaubert. *Compt. rend.* 201, 1202-4 (1935).—A drop of the liquid for examn contg, e g, carbanide, glycerol or citric acid, with a crystal of cholesterol, is placed on a plate heated to the m. p. of cholesterol (148.5°). As the mixt. cools combinations of the carbanide, etc., with cholesterol form characteristic liquid crystals. Cf. C A 4, 138. C A Silberrad

Ultraviolet titration and its application in the analysis of volatile oils. Lawrence S. Malowan. *Rieschstoff-Ind* 10, 199-200 (1935).—M. utilizes the change in fluorescence properties of such compds. as quinine, esculin and umbelliferone and its substitution products when subjected to various ph values. H M. Burlage

Compn. and properties of K phosphotungstate [detection or detn of K] (Nikitina) 6. Color reactions of phenols with HNO_3 (Malinovskii) 10.

Indicators. Raymond A A. Dry. Fr 787,604, Sept. 26, 1935. An indicator for colorimetric analysis is used in solid form, in the shape of a pencil which contains the reactive substance associated with a nonactive supporting material. Reactive substances used as indicators in this form include quinine, fluorescein, esculin, β -naphthol, umbelliferone, $K_4Fe(CN)_6$ (to detect the presence of Cu^{++} and Fe^{+++}) (AcO), Pb (to detect sulfides) and double iodides of Hg and Cu, or Hg and Ag (to detect variations of temp.).

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHLAIRER

The crystal form and molecular unit of nasygite. B. Gossner. *Zentr. Mineral. Geol.* 1935A, 321-7. —Nasygite is tetragonal or pseudotetragonal with $a = 12.5$, $c = 30.25$. The results are somewhat uncertain, owing to the easy deformability of the crystals. While some analyses lead to the formula $6Pb(S, Te)_2$, $AcTe$, no simple formula could be deduced for the Sb-bearing variety. Michael Fleischer

Significance of "filled" feldspar. H. P. Cornelius. *Schweiz. mineral. petrogr. Mitt.* 15, 4-30 (1935).—Plagioclase crystals "filled" with clinozoisite and (or) sericite or muscovite occur in certain granites, etc., of the Alps, occurrence of garnet, sillimanite or quartz as "filling" materials is doubtful. The plagioclase crystals, though retaining their form, are sometimes so much "filled" as to be indeterminate, in general the greater the proportion of anorthite the greater that of zoisite. The distribution of these "filled" plagioclases is stated and theories of their origin are discussed. C's view is that it is a deep-seated phenomenon, resulting from the action of K_2O and H_2O on plagioclase crystals under special conditions as to temp. and pressure during mountain-building processes, so that

optimal zones occur where these conditions were most favorable. C A Silberrad

Structure study of natural wollastonite. Max. Barnack. *Naturwissenschaften* 23, 770-1 (1935).—Wollastonite from Cziklova, Hungary, is monoclinic with $a = 15.33$, $b = 7.28$, $c = 7.07$ Å, $\beta = 95^\circ 24' 5''$, 12 mols. of CaO SiO_2 per unit cell, space group C_{2h}^2 . It is built up of $(SiO_4)_4$ rings placed on top of each other in the b -direction and linked by the side O atoms. Triclinic wollastonite has thus undergone micro-twinning. B J C v d H

Chemical and x-ray investigation of amphiboles. II. Distribution of the analytical deficit. J. Jakob. *Schweiz. mineral. petrogr. Mitt.* 15, 146-52 (1935). Cf. *Ibid.* 11, 140 (1931).—Addnl. analyses of tremolite (3), actinolite (4), pargasite (3), common hornblende (1) and asbestiform hornblende (4) are given. All except the last show a deficit, up to a max. of 3.45%, hitherto attributed to mol O. This supposed excess O depends in no way on the presence of any particular cation, but only on the form. It is as a rule absent from asbestiform, i. e., fibrous ("one-dimensional") varieties, but never from compact ("3-dimensional") varieties, in which it is

suggested that the O is held by labile linkages stabilized through the more wide-reaching bonds of the "3-dimensional" state. C. A. Silberrad

Twins and trillings of rock-forming olivine. Conrad Burri *Schweiz. mineral. petrogr. Mitt.* 15, 160-7 (1935) —Replacement of Mg in forsterite by Fe to form fayalite alters the axial ratio very little, with a max. for 15 mols % of FeSiO₄. The presence of Ca in the olivine mol. causes a much greater change, bringing the crystal nearer to hexagonal, with a corresponding greater tendency to form twins and trillings. C. A. Silberrad

The influence of original composition upon the micas in the metamorphic rocks of the Hsianshuissu series, near Mt. Tahoshang, South Manchuria. Mititaka Sawatari. *Mem. Ryojun Coll. Eng.* 8, 67-84 (1935) (in English) —Muscovite samples taken from a 2-mica schist and from an argillaceous calc-schist showed μ varying from 1.587 to 1.612 and 2V from 32° to 42°. Muscovite of high μ and low V occurred in rock rich in Fe minerals, while the muscovite in Fe-poor rock had low μ and high V values. Chem. compn. rather than grade of metamorphism was deduced as of most importance in influencing the optical properties of the muscovite, as well as of biotite. γ for the latter was 1.617-1.624 in calc-schist for which FeO/MgO was 1.04, and 1.642-1.647 in mica schist for which FeO/MgO was 1.63. P. S. Roller

The chemical nature of halloysite and the allophanoids. Hugo L. Piotrowski. *Arch. mineral. soc. sci. Varsovie* 10, 1-89 (87-9 in French) (1934) —Halloysite (I) and allophanite (II) are found in aluminite mine north of the St. Cross mountains in Poland, forming veins in an argillaceous sandstone, named by P. halloysite-sandstone (III). Compn. of I in wt. percentage: SiO₂ 33.50-38.60, Al₂O₃ 32.41-34.65, Fe₂O₃ 0.06-0.60, FeO 0-0.02, MnO 0-traces, CaO 0-0.30, MgO 0-0.03, H₂O 26.71-32.72, d. 2.039-2.108. II: SiO₂ 24.37-28.29, Al₂O₃ 35.81, 37.16, Fe₂O₃ traces-0.10, FeO 0, MnO 0-traces, CaO 0.64-0.72, MgO traces-0.02, H₂O 24.80-33.57; d. 1.897-2.003. III: SiO₂ 71.01, CO₂ traces, TiO₂ 0.16, P₂O₅ 0.22, Al₂O₃ 10.25, Fe₂O₃ 5.79, FeO 0.07, MnO 0.03, CaO 0.09, MgO 0.03, K₂O 0.45, Na₂O 0.07, H₂O 12.12. The above compn. reveals undoubtedly that (I) is an aluminosilic acid, contg. in addn. to adsorbed water 2 mols. H₂O combined chemically. From kaolin, I is distinguished only by its phys. state. The chem. nature of II is not evident. J. Wiertelak

Polish bentonite from the vicinity of Krzemieniec, southeastern Poland. Zbigniew Sujkowski. *Arch. mineral. soc. sci. Varsovie* 10, 98-116 (115-16 in English) (1934) —The bentonite consists of a claylike yellow mineral, which swells readily in water. It has a waxy luster when dry and a soapy touch when wet. Its chief constituent (95%) is montmorillonite, a cryptocrystalline substance, having μ 1.520, d_{110} 2.0745, birefringence 0.006-7, compn.: SiO₂ 48.85, Al₂O₃ 19.04, Fe₂O₃ 2.61, FeO 0.11, MnO 0.09, insol. matter 0.41%, corresponding to 96.07% of the first (3K₂SO₄·Na₂SO₄). The parameters, by x-ray powder method, are: $a = 5.635$, $b = 7.27$ Å. J. Wiertelak

Glaserite and syngenite of Stebnik, Poland. Antoni Lasziewicz. *Arch. mineral. soc. sci. Varsovie* 10, 117-21 (121 in French) (1934); cf. Kuzniar, C. A. 28, 5010* —Glaserite (aphtitalite) found in the salt mines of Stebnik in assoc. with syngenite and Glauber salt forms very pure prismatic crystals, as is evidenced by the compn. SO₃ 67.47, Cl 0.025, Ca 0.10, Mg traces, K 34.31, Na 7.36, H₂O 0.09, insol. matter 0.41%, corresponding to 96.07% of the first (3K₂SO₄·Na₂SO₄). The parameters, by x-ray powder method, are: $a = 5.635$, $b = 7.27$ Å. J. Wiertelak

Contact metalliferous deposits E. Raguin. *Bull. soc. géol. France* [5], 4, 563-71 (1935) —From observations on mines in the southwestern U. S. it is concluded that there are the following varieties of contact deposits: contact stockworks, hypothermal and mesothermal con-

tact deposits, pyrometamorphic replacements, and diffuse impregnations of the eruptive rock itself. C. A. S.

Mineralized crust zones in Gold Coast Colony. T. Pickering. *Mining Mag.* 53, 329-36 (1935). —Geology and tectonics of areas contg. quartz reefs at Bogosu and in the vicinity are described. The horizon is a complex of lavas, dikes and sills, with occasional development of water-laid tuffs and phyllites, a younger system is characterized by arenaceous beds and conglomerates, and with subsidiary phyllites. Graphite is found to be associated with the ore horizon, and occurs as very fine films occupying slips and partings. For most quartz bodies in the area crushing and panning are of some value for rough guidance, but very little Au can be panned from the richest crush-zone material, at least so far as the oxidized material is concerned, the Au is so finely divided that in panning tests about 80% of the total is lost before a concentrate is obtained, and the remaining 20% is probably masked by Fe oxide films. In the crush zone in quartz reefs, quartz is developed strongly as stringers, veinlets, blebs and lenses, often of great size. Evidence is plentiful that graphite has acted as a precipitant for the Au. A. W. F.

Gold minerals of eastern Uregra (Kivu, Belgian Congo). René van Aubel. *Bull. soc. géol. France* [5], 4, 675-96 (1935), cf. C. A. 28, 5783* —The Au occurs in veins in mainly biotite schists, assoc. with arsenopyrite and usually some pyrite and less often marcasite. The crystals of arsenopyrite are sometimes coated with a layer contg. scorodite and symplectite, with epidote and sericite. Black pleochroic (yellow to blue-green) tourmaline with some dravite is always present, and graphite frequently, especially at Mt. Kibikura. Accessory minerals are galena, sphalerite and chalcopyrite. The veins also contain (besides quartz) biotite, muscovite, pyrrhotite, garnet, magnetite, and more rarely albite, apatite and tetradymite, and in fissures chlorite, sericite and kaolin. The surrounding schists are more or less metamorphosed, tourmaline having been formed at the expense of the biotite. The localization and origin of the deposits, which are essentially permarginate, are discussed. The Au is practically entirely recoverable by crushing and amalgamation. Traces of Cu occur in most veins, Bi sporadically, assoc. especially with tourmaline; Sn is very rare in the veins and apparently not as cassiterite, though alluvial cassiterite and tantalum-columbite occur under circumstances which seem to imply that their origin was the same as that of the auriferous group. Spectrographic examn. of native Au shows the presence of Ag and Fe, with a little Bi and Pb, less Ti, Zn, Sn and Cu and traces of B, Mo, Sb and As. C. A. Silberrad

Geological study at Cusi reveals new ore. Robert T. Donald. *Eng. Mining J.* 136, 614-17 (1935). —Cusi-huachic, located 75 miles southwest of Chihuahua City, Mexico, has been a producer of high-grade Ag ores for over 270 years. Pb, Cu, Ag and Zn have been produced. Investigation of wall rock alteration in old veins having barren outcrops gives an index for exploring deeper ore-bodies. W. H. Boynton

Platinum deposits of Kuznetzk-Altau. A. K. Kyuz. *Soviet. Zolotoprom.* 1935, No 5, 23-5 —A detailed map and geol. description of the Kuznetzk-Altau Au-Pt-bearing district. In some cases the Pt content is several % of that of the Au. S. L. Madorsky

The mineral resources of Uruguay. Juan P. Pitamiglio. *Rev. mensual asoc. rural Uruguay* 1935, No 1, 42-4 —Uruguay has deposits of Fe as oxide, sulfide and carbonate, Mn as the oxide, Pb as galena, Cu and auriferous quartz. Deposits and mining operations of the first 4 of these are discussed. Nonmetallic minerals occurring and mined are talc, kaolin, asbestos, emery and graphite. Sand and marble and other forms of CaCO₃ are quarried. Amethyst and agate occur. Other important materials are clays, sandstone, porphyry, granite, syenite, gneiss and slate. Colin W. Whittaker

Obolitic iron deposits in Franche-Comté. Ch. Fimaton. *Bull. soc. géol. France* [5], 4, 347-68 (1934). —Oolitic Fe ores have from time to time been worked in the Lias in Franche-Comté, but mainly at or near the outcrop.

Borings show that these deposits extend widely. They consist of one bed about 4 m thick, with usually a second and sometimes a third, each 2 m thick. Numerous analyses are given, the ore from the borings shows loss on heating 25-32, Fe_2O_3 25-31, CaO 21-30, Al_2O_3 3-6, SiO_2 5-14, P_2O_5 0.68-1.02, Mn_2O_3 0.15-0.28%. The ore as mined is a compact red rock with visible oolites and usually a calcareous cement. In one boring (Vy les-Filam) 22 m of bituminous marl was passed through at 300 m. When fresh this ignited easily in a flame, but yielded only 2-3% of oil on distn.

Autogenous tourmaline in sedimentary rocks L. Déverny. *Schweiz. mineral. petrog. Mitt.* 14, 528-9 (1935)—Several addnl. occurrences in the Alps of autogenous tourmaline in cellular dolomite and calcareous schist are described C. A. Silberrad

"Horizontal sandstone" of Mandingo plateau (French

West Sudan). glauconitic sandstone of Koulikoro, and surface coating of decomposed ferruginous rock. Paul Jodot. *Bull soc. géol. France* [5], 4, 369-74(1934).—The surface rock differs from ordinary latérite in contg. no Al_2O_3 ; it consists of a certain amt. of quartz detritus from disintegration of the subjacent sandstone, recemented by hydrated Fe_2O_3 , which is noncrystalline (stulpinosiderite), and has been leached out of, and concd. from, the sandstone, in wet and dry seasons, resp. C. A. Silberrad

Flints, buhrstones and agates H. Douville. *Bull soc. géol. France* [5], 4, 537-44(1935); cf. C. A. 26, 4014— SiO_2 derived from sponges, radiolarians, etc., on their death, in the form of micelles, forms a pseudo soln with the decomposing remains. In contact with other material, especially calcite, the SiO_2 replaces it, as chalcedonite if the soln is impure, as quartz if pure. Chalcedonite on deposition adsorbs the impurities. Hence an alternation of chalcedonite and quartz in layers of thickness varying according to the conditions from about 0.0012 mm upward, the extreme case being the geode, in which after the first deposition of chalcedonite all subsequently incoming soln. is freed from impurities. Occasionally the chalcedonite forms spherulites. The impurities consist of goethite or other hydrated Fe_2O_3 , and a white material, probably kaolinite C. A. Silberrad

C. A. Silberrad
Some oolitic formations P. H. Derville. *Bull soc. géol. France* [5], 4, 771-5(1935)—Calcareous oolites occurring in the oolitic limestone of Carteret (Cotenin) are described, some are perfect, others apparently deformed before solidification C. A. Silberrad

Geology of glauconite E. Wayne Gallher. *Bull Am Assoc Petroleum Geol* 19, 1560-1601(1935).—In Monterey Bay, Calif., glauconite replaces biotite in sediments as they are followed off shore to deeper water.

In changing to glauconite, biotite loses some Al, K and Mg, it gains H_2O and most of the Fe is oxidized. Factors affecting these changes are (1) the alk. sea water and (2) conditions operating in the anaerobic black muds and oxidized layers overlying them. Slow sedimentation in parts of the bay provides a long diagenesis period for biotite alteration. The following regional occurrences of glauconite are explained by the fact that it forms from biotite: (1) Glauconite is rarely found in deep sea deposits, for most micaceous minerals come to rest around continental shores before reaching great depth. (2) It is found near land masses where exposed plutonic and metamorphic rocks contribute biotite to the adjacent ocean basin. (3) Glauconite compn., especially K_2O content, varies from place to place, depending on the K_2O in the biotite. (4) Glauconite is universally distributed, for it is formed from a prominent and widely distributed rock-forming mineral Alden H. Emery

Alden H. Emery
Some metamorphic minerals in the Molasse A. v. Moos. *Schweiz mineral petrog Mitt* 14, 530-1(1935)—Occurrences in the Molasse of Switzerland of staurolite and kyanite (usually assoc.), andalusite, chloritoid and blue hornblende are described. Of the last-named all varieties including gastaldite, glaucophane and crossite occur. As inclusions one or more of zircon, rutile and epidote occur in the 2 first and the last C. A. S.

9—METALLURGY AND METALLOGRAPHY

D J DFMOREST, OSCAR E HARDER AND RICHARD RIMBACH

Depression period well past for the rare metals and minerals Paul M Tyler *Mining Met* 17, 17 22 (1936).—Latest advances in the following are discussed: Sb, As, Be, Bi, Br, Cd, Ca, Cr, Co, Ga, Ge, In, Ti, Hg, Mo, K, Ra, rare earths, rhenium, Se, Na, Ta, Te, Th, Ti, W, V and Zr.

Metallurgical efficiency on the Sub Nigel G Carleton S *African Mining Eng* J 46, 197(1935).—The new reduction plant at the Sub Nigel Mine has reduced tailing values to 0.24 dwt per ton (formerly 0.37) for an extn of 98.5% (97.9% previously). Costs (including sorting and crushing) are 3s 3d per ton. About 55% of the ore value is extd on corduroy. Overflow from bowl classifiers is cyanide feed.

Principles of flotation IV An experimental study of influence of sodium sulfide, alkalis and copper sulfate on effect of xanthates at mineral surfaces Ian W Wark and Alwyn B Cox *Am Inst Mining Met Engrs Tech Pub No 659, 20 pp* (1935), cf C A 29, 1049.—By measuring the influence of Na₂S on the contact angle induced by xanthate between an air bubble and anglesite, cerussite, galena, sphalerite, pyrite, chalcocopyrite, bornite, covellite and chalcocite it is shown that: (1) Na₂S is a depressant for sulfide minerals; (2) the concn of Na₂S necessary to prevent contact is a function of the p_{H_2} value, (3) the hydrosulfide ion (HS⁻) is the effective depressant and there is, for each mineral, a critical HS-ion concn. just sufficient to prevent response to a given concn of K ethylxanthate, this crit value is not greatly influenced by the xanthate concn, (4) CuSO₄ influences the effect of Na₂S on galena and chalcocopyrite, probably removing it from soln. as a ppt of CuS, (5) CuSO₄ must be stoichiometrically in excess of the sulfide if it is to activate sphalerite; (6) the combined influence of CuSO₄ and Na₂S on pyrite is exceedingly complex; (7) anglesite responds to K ethylxanthate most readily between p_{H_2} 0 and 11, and cerussite at $p_{H_2} < 9$, (8) Na₂CO₃ increases the concn. of K ethylxanthate necessary to induce a response at surfaces of anglesite and cerussite; (9) controlled concns. of Na₂S activate anglesite and cerussite so that they respond to lower concns. of xanthate, but excess of sulfide prevents a response; (10) cerussite responds more readily to xanthate after an initial treatment with Na₂S, owing to the formation of a surface film of PbS, (11) the response of anglesite and cerussite to amylnxanthate is less influenced by Na₂S than their response to ethylxanthate, (12) Na phosphate can be substituted for Na₂S as an activator for anglesite and cerussite; (13) the test specimens of sulfide minerals consume very little sulfide or xanthate, but cerussite may consume appreciable amts.; under some conditions anglesite may consume a considerable fraction of the xanthate present; (14) sulfide is consumed in preference to xanthate by anglesite and cerussite; (15) because of the volatility of HS and the readiness with which Na₂S is oxidized it would be difficult to control the sulfide concn. of flotation-plant circuits.

Alden H Emery
The flotation of gold ore at the Bibiani mine W J. Cayer. S. *African Mining Eng* J 46, 281-3(1935).—The old plant, using a battery of 50 stamps with subsequent amalgamation and cyanidation, gave sand tailings assaying 1.5 dwts. per ton and slimes contg. 4.2 dwts. due to Au in pyrite. A new plant consisting of a 5 × 10 ft. ball mill, simplex classifier, Dorr agitators and thickeners gave a 3.60 dwt. tailing from a 120 dwt ore. Later ball mill discharge was fed to corduroy tables, which recovered more than 1/2 the Au. The concentrate was roasted and charged back into the ball mill circuit. Extn was more than 81% at 40%-200 mesh. In circ grinding was uneconomical, even at 92% extn. A new flow sheet using flotation was adopted. Use of soda ash was not beneficial. CuSO₄ did not activate the pyrite. Cresylic acid gave no increase in extn. Starch to depress graphite decreased extn. Au recovery by flotation was 91% and that by cyanidation 97%.

An investigation of gold-bearing ores at Trennill V G Agrenkov and K F Barusheva. *Soviet Zolotoprom* 1935, No 8, 35-43.—Reports of investigation of extn of Au by amalgamation and other methods from ore samples of the following sources: Laila, Alkabeke, Manka, Akdzhal, Riddersk, Kulundzhunsk and Maikin.

S. L. Madorsky
Gold ores of Retiv and Aleksandrovsk veins I N Plaksin and S V Shibaev *Soviet Zolotoprom* 1935, No 6, 44-51.—Most of the Au in these veins is in the free state and only a small fraction in the form of sulfide. Free Au content in the ore from Retiv and Aleksandrovsk vein is 1.97 and 4.51 g per kg ore, resp. A mixt. of these ores was ground to a fine pulp and extd. by a cyanide method. Grinding the ore to 65 mesh gave an 85% Au extn by this method.

S. L. Madorsky
Cyanidation (of gold ores) I V Paramonov. *Soviet Zolotoprom* 1935, No 7, 37-40.—A discussion. S. L. M.
Occurrence of rare elements in gold slime. V. Zemel *Soviet Zolotoprom* 1935, No 7, 23-5.—Results of analysis of 42 samples of Au slime, collected from various Russian gold mines, are given. Among the elements found in the slimes were: Zr, W, V, Ti, Th and Mo.

Variety of improvements noted in concentration and milling. Charles E. Locke *Mining Met* 17, 13-15 (1936).—The Hadel mill has been improved. Finer feed to ball mills is increasing. Advances and changes in design in various crushers, ball mills, screens, classifiers, thickeners, agitators, filters and flotation machines are described. For filtering small tonnages of concentrates in Au-flotation plants, small pan filters are used. A rubber-glass filter medium shows some advantages over canvas. Use of jugs of Lake Superior Fe ore is increasing. New flotation reagents are listed. Interesting developments in several plants are described briefly.

A. H. C.
Present situation and the future of the aluminum industry in Japan Zentaro Nakanishi *Aluminium* 17, 610-14(1935).—The historical development of the Al industry since its inception is 1901 is described. Statistics on production and imports of raw materials and Al ingots and scrap are given, and the present situation and outlook are reviewed.

M. Hartenhem
Progress in the field of beryllium extraction and the preparation of metallic beryllium, 1930-35. R. Strauss *Angew Chem* 48, 745-50(1935).—A summary covering the following subjects: decompn. of Be minerals with F compounds, with alkalis, acids and Cl₂, the sepn. of BeF₂ from the alkali fluoride in the soln. of the double fluoride, concn. of Be in the mineral, the prepn. of metallic Be and the prepn. of Be by means of vacuum distn. Thirty-nine references.

New methods for recovery of magnesium. Willy Machu *Metall u Erz* 32, 565-70(1935).—A discussion of

previously used methods for recovery of Mg and efforts to avoid formation of $MgCl_2$ as an intermediate step. New methods for electrothermal reduction of MgO with C are described. H. Stoertz

Silver and silver pitchblende ore from Bear Exploration and Radium, Limited, Great Bear Lake, N. W. T. W. B. Tamm, et al. *Can. Dept. Mines, Mines Branch, Rept.*, No. 747, 30-43(1935).—About 90% of the Ag can be recovered by tabling and flotation or blanket concn. and flotation, but the tailings carry 100-200 oz. Ag per ton that can be recovered only by chem. treatment. Amalgamation recovered 91.5-93.7% of the Ag, flotation recovered only 27% of the Ag in the tailing and left a 100 oz. tailing. Cyanide extn. is high, but cyanide consumption is excessive. Tabling recovered 54.7% of the pitchblende in a concentrate contg. 39.09% pitchblende, but left a 3.06% tailing. Flotation showed little concn.

Origin and growth of graphite nuclei in solid and liquid iron solutions. H. A. Schwarzer and Wolfram Ruff. *Am. Inst. Mining Met. Engrs. Tech. Pub. No. 655*, 17 pp. (1935).—In the white cast irons the no. of nuclei per unit vol. is not detd. by the melting and freezing conditions alone, but also by the temp. at which the nuclei are caused to grow. One sort of nodule that never grows to any considerable size is numerous, 10-20 times as frequent as the larger. These small nodules appear to increase in no. with time at graphitizing temp. The larger nodules do not alter greatly in no. with time but do change in size. At any given time, the size distribution of nodules is not very wide. The no. of larger nodules (and perhaps the no. of smaller ones) decreases as the graphitizing temp. decreases, and in a given Fe the max. size attained by nodules increases. The density of graphite packing in the nodules decreases as the graphitizing temp. increases; it is remarkably const. at a given temp. The no. of nodules is not solely a function of the graphitizing temp. Vestigial nuclei are of great importance in detg. the no. of nuclei that will grow into nodules. Graphitizing rate is enormously increased by previous quenching of white cast Fe from about 1000°, such treatment produces an enormous increase in no. of nodules. The no. of nuclei that will grow into nodules or mottles is a function of the materials of the charge, chem. compn., compn. of the melting furnace atm., melting and pouring temp., rate of cooling and temp. of germination of the graphite. A. H. E.

Separation of hematite by hysteretic repulsion. E. W. Schilling and Harwick Johnson. *Am. Inst. Mining Met. Engrs. Tech. Pub. No. 654*, 13 pp. (1935).—As the air gap between the plane on which the specular hematite was supported and the Fe core of the magnet was increased, the activity of the particles reached a max., then decreased. The speed of the moving particles increased as the frequency of excitation was increased to about 70 cycles per sec., then was const. As the relative amplitudes of vibration increased the wt. of hematite moved increased. Heat treatment of the hematite in a reducing atm. of H_2 increased its activity. Alden H. Emery

Silvicultural damage from the arsenic acid in the white smelter smoke of the arsenic metallurgical plant F. Hilsch. *Tharandt forstl. Jb.* 85, 117-66(1934); *Rev. Applied Mycol.* 14, 725, *Biol. Abstr.* 9, 1001.—A summary of a century of research on As damage in German forests shows injury extends 2-3 km. from the As plant in the direction of the wind and is more severe on the outer fringes than inside the stands. Of hardwoods ash is most susceptible, then beech, birch, oak, and poplar. Of the conifers spruce is most susceptible, then fir, Scotch pine (*Pinus sylvestris*), white pine (*P. strobus*), Douglas fir (*Pseudotsuga taxifolia*), and larch. The toxic effect shows on browning or burning of the foliage. Oden E. Sheppard

The chlorine method for treating copper pyrites slag. D. M. Chuzhikov and Sh. Sh. Margolina. *J. Chem. Ind. (Moscow)* 12, 811-18(1935).—Slag contg. Cu and Zn is chlorinated for 2 hrs. at 100° with enough Cl_2 to form $CuCl_2$ and $ZnCl_2$. If the slag contains 10% H_2O , the heat of the reaction raises the temp. to 110-20° and no further heat need be applied. The presence of N_2 and CO_2 in the Cl_2

has no effect on the reaction. The slag is then leached for 0.5 hr. with cold H_2O , and 93-5% of the Cu and 92-4% of the Zn are removed. The soln. is treated with $CaCl_2$ to ppt. sulfates and so give purer products later. The Cu is pptd. by Fe, and the Zn by CaO . The slag can be used in the blast furnace. H. M. Leicester

Slag in the manufacture of ferromanganese. Maurice Dénbéré. *Chimie & Industrie* 34, 777-9(1935).—In the so-called "slag method" of producing Fe-Mn, the phys. and chem. study of the slags must be considered as being as important as that of the metal obtained. A characteristic example is given and discussed, showing how the study of the differences in color of a slag can furnish valuable indications on the mechanism of the working of the furnace. A. Papineau-Couture

Five years of progress in southern blast furnace practice. Francis H. Crockard. *Am. Inst. Mining Met. Engrs. Tech. Pub. No. 653*, 20 pp. (1935).—The major developments in southern blast-furnace practice during the past 5 yrs have been (1) reduction in ash in coke, (2) improved structure and porosity of coke, (3) sizing of coke and ores, (4) careful selection of ores from chem. standpoint, (5) wider stock lines, (6) improved offtakes and downcomers, (7) improved bosh design, (8) widespread use of McKee distributors, (9) introduction of machine-cast Fe and (10) improvement in phys. characteristics of Fe. Coke consumption has been reduced from about 3000 lb. per ton to about 2200 lb. and flue dust production from 250-300 lb. per ton of Fe to 50-100 lb. Chem. analysis of Fe has been improved. Furnaces are kept more uniform on the desired grades. Man-hrs. have been lowered through mechanization. A. H. L.

Dimensions and lines of modern blast furnaces. M. A. Pavlov. *Rev. mt.* 32, 451-65(1935).—A survey of the contemporary trend of design of blast furnaces in Europe and the United States. P. offers a design of the furnace which would give the best results on the basis of his wide experience. J. D. Gat

Nature, formation and removal of dust through the top of a blast furnace as a function of constitution of obolite ores. J. P. Arend, A. Jungblut and C. Aschman. *Rev. mt.* 32, 263-392(1935).—Minette ores were investigated. About one-third of dust is charged with the ore, the rest is formed in the furnace by attrition and shrinkage caused by dehydration. Dehydration is not a continuous function of the temp. One-fourth of the water is removed between 100° and 200°, one-half between 200° and 320° and the rest requires heating to 500°. Top-gas dust can be sepd. into three groups according to the magnetic properties, depending on the temp. levels to which the ore had time to settle in the furnace. Amount of dust removed is proportional to the kinetic energy of gases. J. D. Gat

The control of cupola operation. H. L. Campbell and John Grennan. *Iron Age* 136, No. 25, 18-23, 84-6(1935).—Specific practical suggestions are given for improved cupola practice. F. G. Norris

Determination of the losses through burning in the cupola furnace by gas analysis. Try-Chalons. *Rev. fondre moderne* 29, 292-3(1935).—The method developed by McConachie (cf. *Foundry*, 63, 26(1935)) is explained and discussed. Although much more exact than methods which det. the losses in metal by weighing charge, product and slag, it is not considered accurate enough as it does not take account of the C of the combustion gases originating from the decompn. of the limestone (flux) and as the free O is not detd. exactly enough. However, the method is considered satisfactory for comparing the performances of furnaces. M. Hartenheum

Open-hearth roof temperatures. H. M. Schmitt. *Metals & Alloys* 6, 333-5(1935).—Four types of pyrometer installations are described, each having its own characteristics but all providing continuous records: (1) thermocouples imbedded under insulation, (2) thermocouples inserted in roof brick, (3) thermocouples mounted in refractory insert in water-cooled tuyère, (4) radiation pyrometer sighted into refractory tube mounted in the roof. Downt Schiaff

Solution of the problem of the hot stoves. Maurice Derclaye. *Rev. mét.* 32, 427-50 (1935).—Comprehensive mathematical analysis of the phenomena occurring in blast-furnace hot stoves. Double-zone stoves have a better temp. drop, which can be achieved in single-zone stoves by increasing the thickness of checker bricks. Parallel study of single- and double-zone stoves shows mathematically that the effects obtained are the same, but the single-zone type is less complicated. Heavier checkers in the upper zone can be dispensed with at the present because smaller bricks with the same mechanical and physical properties are already manifold. Efficiency of the stoves can be raised from the present 88.3 to 92% by preheating the air by passing it between a specially built outside and the usual shells of the stove. Frequency of reversals has a preponderant influence. Doubling this frequency will correspond, for example, to doubling the cond. of the bricks and their thickness. J. D. Gat.

Changing to gas fuel improves Columbia tool steels. Winfield Foster. *Ind. Gas* 14, No. 7, 9-10, 16 (1936).—The steel heating furnaces were altered for gas firing and equipped with low-pressure burners. Motor-operated proportioning valves are used to give the correct air and gas supply. Controls are located near the furnace, and permit automatic maintenance of desired temps. Decarburization of the surface of the steels has been reduced $\frac{1}{2}$, and scaling has been reduced $\frac{1}{4}$, so that the scale removed with the first hammer blows is only paper-thin. The thermal efficiency of the furnaces was increased approx. 50% by elimination of stack and infiltration loss, and greater temp. uniformity was secured. R. W. R.

Applied spectroscopy in metal-working industries. C. Heidhausen. *Mitt. Forschungsanstalten GHH-Konzern* 4, No. 3, 59-70 (1935).—The description of the spectrographic lab. of the MAN-Nuremberg serves to demonstrate how with simple and conveniently arranged app. spectroscopy can be used as an ordinary tool in exams and routine testing of materials, and also for detns in analyses. The principles of the measuring methods and the instruments are described. Six references.

The pressed-metal industry. O. P. Hatton. *Iron Age* 136, No. 22, 20-1, 94-6; No. 24, 34-6, No. 26, 26-9 (1935).—Historical review. F. G. N.

Treating metals and alloys. Société d'exploitation des procédés Mahoux, Paris. *Oberflächen tech.* 12, 285-6 (1935).—The new process, Ger. 621,200 (C. A. 30, 10199), of treating, especially steels and Fe alloys, is based on the fact that materials upon heating are put in mol. vibrations. It was found that the quality of the metallic structure is changed if in the metals or alloys under a heat-treatment, electromagnetic or mech. vibrations of ultrasonic frequency are generated which practically do not contribute to the heating; this is of particular advantage for treatments of materials with low transformation temps., e. g., C steels at 500°, which must not be exceeded in the treatment. The frequency of the ultrasonic vibrations applied lies between 1 and 10 million per sec. (far beyond the audible range). In the presence of these oscillations cementing and nitriding can be done at lower temps. than usual, as C and N penetrate into the surface and harden it. M. Hartenheim.

Methods of testing embrittlement of metals. P. B. Mikhailov-Mikheev. *Zavodskaya Lab.* 4, 940-50 (1935).—The results of tests of various steels are shown in graphs and are discussed. Chas. Blanc.

High standards are maintained in heat-treating springs. J. E. Coleman. *Industrial Gas* 14, No. 6, 7-8, 25 (1935).—A gas-heated continuous hardening furnace for springs is equipped with an alloy muffle and can also serve for drawing with a temp. range of 750-1750°F. Its rated capacity is 250 lb. per hr. A quench chute is provided, sealed

from the outside air, the oil temp. being maintained automatically. The muffle atm. is obtained by burning 570 B. t. u. city gas with $\frac{3}{4}$ cu. ft. of air per cu. ft. of gas, this amt. being insufficient for complete combustion, so that the resultant product is rich in CO and CO₂. Automatic temp. control is used. After hardening, the work is washed and then tempered in a salt bath, after which it is washed again. R. W. Ryan.

Action of carbide etching agents. R. Mitsche. *Arch. Eisenhüttenw.* 9, 311-12 (1935/6).—Expts. with different alloy steels showed that to obtain a satisfactory carbide etching action the presence of an oxidizing agent besides hydroxyl ions is necessary. A soln. of KMnO₄ in KOH or NaOH is particularly useful. An explanation of this action is seen in that ferrous ions are going into the soln. from the baser ferrite under the action of the hydroxide, and the nascent H ions are discharged on the nobler cementite. The oxidizing agent oxidizes H to H₂O and the Fe(OH), formed at first from the ferrous ions to Fe(OH)₃, which ppts on the cementite and darkens it more or less according to the duration of the etching. Six references. M. Hartenheim.

Theory of the conversion of metallic mixed phases. III. Phase diagram of partially oriented mixed phases. C. Borelius. *Ann. Physik* 24, 489-506 (1935) of C. A. 28, 50261.—The theory is extended and considered thermodynamically. Sample phase diagrams are shown. The properties of new alloys can be predicted. R. E. DeR.

Method of polished etching for metallographic tests. N. M. Zarubin and M. V. Sutin. *Zavodskaya Lab.* 4, 780-90 (1935).—It is considered that the method of chem. etching with subsequent burnishing of samples for metallographic examn. is preferable to any other procedure. Methods for prepn. of samples of metals unsuited for chem. etching because of their chem. or phys. nature are being investigated. Chas. Blanc.

Polishing in drums. F. Schwarz. *Oberflächen tech.* 12, 243-6 (1935).—Polishing in drums is applied to glass articles, especially for Cu-, brass-, Ni- or Cd-plated ware, Cr-plated articles cannot be polished in this manner. Rusty or scaly articles are first scoured in a wooden, cylindrical drum with sand which has been wetted with water or dil. H₂SO₄. A polishing soln. for Al and Al alloys is made up of acid K fluoride 500 g., Na bisulfate 400 g., Nalal 100 g. and water 100 l. For Fe and steel articles the soln. consists of soap flakes 4 kg., soda 2 kg., NaCN 0.5 kg. and water 100 l. For Cu and Cu alloys, soap powder 3 kg., potash 2 kg., NaCN 1 kg. and water 100 l., grain soap 4 kg., tartar 1 kg., Na bisulfate 1 kg. and water 100 l. Polishing with balls is used particularly for strongly profiled parts, the balls being of very hard, highly polished Cr steel of 0.5 to 10 mm. diam. The procedure and the design of the drums are described. Ten references. M. Hartenheim.

Hot-rolling of tubes of rectangular cross section. G. A. Nedel'ko, G. P. Pishchikov and P. M. Shuvalov. *Dames* 1935, No. 7, 64-9. S. L. Madorsky.

Thin plates, their manufacture, surface treatment and working. Koch. *Oberflächen tech.* 12, 291-2 (1935).—The mfg. processes of sheets of 0.5 mm. thickness and less for various industrial purposes and for fine mechanics, chem. treatment for surface quality, and requirements for deep-drawing are discussed. M. Hartenheim.

Effect of working conditions in the tinning process on the porosity of tinplate. Fritz Peter and Geo. Le. Cal. *Arch. Eisenhüttenw.* 9, 285-91 (1935).—The causes of porosity of tin coatings on steel sheets were investigated in the range from 30 to 110 g./sq. m. Porosity depends mainly on the purity of the surface of the sheet and on the thickness of the coating, then also on the pickling method and on the purity of the flux used. The H absorbed especially in pickling does not have as large an effect as is usually assumed. An abs. freedom from pores is at present not obtainable in com. grades of tin-plate in spite of recent improvements in the tinning process. Only by beginning at a thickness of Sn coat of 100 g./sq. m. can porous-free sheets be made under observations of all possible precautions. M. Hartenheim.

Softening and recrystallization of pure aluminum H R Aluminum 17, 575-6(1935).—The expts of Calvet (C A 29, 68674) to det the effect of impurities on the velocity of softening (melting) are discussed. The velocity depends to a large degree on the purity of Al. The recrystn velocity is very high for the pure metal and increases rapidly with increasing temp. M H

Additions which reduce the attack of solutions on aluminum H Rohrig Aluminum 17, 559-62(1935).—The disintegration of Al by alkali solns is prevented not only by adds of Na silicate (as discovered in 1929) but also by other colloidal substances, as animal and vegetable glues. As an explanation of this protective action it is assumed that the colloids deposit on the metal surface because of their elec charge. Expts were made with nicotine and nicotine sulfate in HCl solns, dibenzyl sulfide in HCl soln, and several special solns of different origins with pure Al and Al alloys, the results are shown in tables and show remarkable reductions in the amt. of metal dissolved. A no. of industrial and domestic applications are described. M Hartenheum

The action of tap water on aluminum Tsunetaka Sasaki and Jitsusaburo Sameshima J Chem Soc Japan 56, 1353-8(1935).—Al dissolves noticeably on being boiled with tap water. This is attributed to the action of HCO₃ contained in the tap water. T K

Heat treatment of cast iron R G McIlwain Trans Am Foundrymen's Assoc 6, No 6, 27-40(1935).—Various desirable combinations of compn and heat treatment are enumerated with particular regard to specific practical applications. F G N

The warm strength of cast iron with particular consideration of stress-walled castings W H Uhitzsch and W Leineweber Arch Eisenhüttenw 9, 185-92(1935).—As discrepancies exist in the literature on the mech properties of cast iron, new technological, metallographic, phys and chem investigations were carried out which permit one to conclude that the strength up to 200° is affected, besides other causes, by the magnetic transformation of the cementite. Tensile tests with 13 different cast irons showed that Si, Ni, Cr and Mo have a smoothing effect on the fluctuations of the property curves, this seems to be due, for Ni and Si, to a reduced magnitude of cementite transformation, for Cr and Mo to a shifting of the transformation point towards lower temps. In general, it can be said that the behavior of castings under heat depends not only on the nature of the pig Fe used and the remelting process but also just as much on the molding and pouring processes and the interior stresses caused by the casting process. The investigation extended up to 750°, the tests results are illustrated by curves. Twenty-nine references. M Hartenheum

Study of natural and artificial aging of iron castings by the string method A I Ilnikov and V P Tarasova Zavodskaya Lah 4, 779-86(1935), cf. C A 29, 70934.—A discussion of practical methods of prepn of samples for acoustic measurements of the residual tensions by the method previously described. Chas Blanc

Structural changes in gray iron subsequent to annealing V S Prever Industrija mehanika 17, 978-82(1935).—An ordinary type of gray Fe was heated to different temps and for different lengths of time and the structural changes were observed in the microscope. No typical changes can, however, be stated, the complexity of the phenomena does not permit of a uniform explanation. Metallographic conditions will, in most cases, have to be examd micrographically. M Hartenheum

Factors affecting the structure and properties of gray cast iron A Di Giulio and A E White Trans Am Foundrymen's Assoc No 35-9, 35 pp (preprint)(1935).—The cast Fe used for this investigation was of the unalloyed automotive cylinder type contg total C 3.20, graphite C 2.76, Si 2.00, S 0.118, P 0.36 and Mn 0.48%. The beneficial effects of superheating begin at 1480° and reach a max at 1670°. The optimum range of pouring temp is 1470° to 1565°. Improved phys. properties and smaller and more nearly uniform graphite flakes are the result of pouring at temps lower than the

superheating temp. During the cooling before pouring the graphite flakes dissolve completely in the melt and are thus refined. Quenching molten cast Fe in H₂O gives evidence that graphite will not entirely dissolve at the eutectic temp. If once dissolved, graphite cannot be pptd in the melt by cooling. Rules for improvement of the phys properties of unalloyed cast Fe are, the superheating temp should not exceed 1650°, too high superheat makes hard low-strength Fe; holding at a lower temp for a longer time will have almost as good an effect as superheat; pouring temp should be 1480°, charges with excessively coarse graphite flakes should be avoided, because these are more difficult to dissolve and may result in coarse flakes in the product. F G Norris

Impact resistance and other physical properties of alloy gray cast irons Garnet P. Phillips. Trans. Am Foundrymen's Assoc No 35-1, 18 pp. (preprint)(1935).—Samples from 38 cupola and 20 elec. furnace heats were tested to det transverse breaking load, deflection, and resilience, Brinell and Rockwell hardness, tensile strength, and repeated drop impact strength. Charpy and Izod tests were made on some of the compns. The transverse resilience bears a straight-line relation to the single-blow impact strength. The relation of resilience to repeated drop impact strength is not as definite. The relation between transverse strength and tensile strength is shown. The best impact resistance of the irons cast gray (not including austenitic Fe) was found in a 4 Ni-Mo iron of which the following compn is representative: total C 3.41, graphite C 2.69, combined C 0.72, Si 2.11, S 0.04, P 0.16, Mn 0.60, Ni 1.93, Cr 0.21 and Mo 0.90%. Austenitic Fe of low hardness has high impact resistance. The highest impact resistance is in samples cast white and annealed to give gray Fe. The compn. of the best sample is Si 1.33, total C 2.32, combined C 0.71, Mn 0.50, Cr 0.04, Mo 0.30 and Ni 0.19%. This sample had a resilience almost twice as great as the next best sample and 3 to 6 times as great as most of the samples. It did not break in any of the impact tests until after machining to less than standard section. F G Norris

The influence of phosphorus on the mechanical properties of gray cast iron at high temperatures Max Paschke and Friedrich Bischof Gieserei 22, 447 52(1935).—Eleven heats were melted in a 50-kg high frequency furnace and poured at 1290° into green sand molds to form bars 450 mm long and 30 mm diam. from which the test specimens were prepd. The compn was approx 3.70% total C, 2.90% combined C, 1.90% Si, and 0.08% S with Mn varied in the range 0.50 to 1.50% and P in the range 0.14 to 1.22%. The tensile strength, impact strength, and Brinell hardness were detd at temps from 20° to 900°, 700°, and 600°, resp. Up to 500° there are max in the tensile strength curve at 0.33 and 0.88% P and a min at 0.58% P. The general trend is decreasing tensile strength with increasing P. At 700° the min is less pronounced and occurs at 0.64% P. At 900° increasing P has small effect on the tensile strength. For all compns the tensile strength and hardness are approx const. with temp. up to 500° above which they decrease markedly with increased temp. Up to 500° the hardness curve has min. at 0.58 and 0.69% P and max at 0.64 and 0.77% P. Increasing P from 0.88 to 1.22 has a small effect on hardness, which is in contrast to a marked decrease in tensile strength beyond 0.88% P. At 600° there is a min in the hardness curve at 0.69% P. The highest impact values are at 400° in specimens contg 0.69 and 0.77% P. There is no definite relation between impact strength and P content. Fourteen references. F G Norris

Wear resistance of white cast iron O W. Ellis, J. R. Gordon, and G S Farnham. Trans. Am Foundrymen's Assoc No 35-4, 19 pp (preprint)(1935).—A ball mill test using 1/4-in Si carbide grain for the grinding medium was used to study the effect of compn and structure on the wear resistance of cast-Fe rods and balls in ball mill service. Forty-seven alloys were prepd in 10 to 12-lb quantities by use of graphite crucibles lined with sillimanite or, in case of high-Mn melts, with mg-

nesia. Most of the alloys contained 2.5% total C, below 0.03 graphite C, 0.75% Si and 0.50% Mn. The higher the C, the lower the wear resistance of white cast Fe. Variation of Mn content up to 1% Mn does not affect wear resistance. Increase of Si from 0.75% to 1.50% has no effect in white cast Fe, but increases the wear resistance of mottled cast Fe. Variation in Cu above its soly limit (from 0.05% to 5.25% Cu was studied) has small effect on wear resistance. During the early stages of test the high-S alloys have high wear resistance. After the hard skin is worn away S is detrimental to wear resistance. Marks made by an elec. pencil stood out in relief at the end of the test, this indicated a local increase in wear resistance produced by partial decarburization and the formation of martensite. Differences in Vickers hardness do not indicate the relative wear resistance. F. G. N.

Cinematographic record of the $\alpha \rightarrow \gamma$ iron transition, as seen by the electron microscope. W. G. Burgers and J. J. A. Ploos van Amstel. *Nature* 136, 721 (1935). — By use of an electron microscope with one magnetic lens, pictures were taken at 4 sec. intervals of the $\gamma \rightarrow \alpha$ Fe transition, at 900°. G. M. P.

Experiments on the diffusion of carbon, silicon and manganese in solid and liquid iron. H. Paschke and A. Hauptmann. *Arch. Eisenhüttenw.* 9, 305-9 (1935/6). — The diffusion coeffs. for C, Si and Mn were detd. by the method of Graham (cf. C. 26, 5282) and by the method of infinitely long half-spaces (cf. *Sitz. Akad. Wiss. Wien* 79, 161 (1879)). The results agreed very well in the temp. range from 900° to 1250°. The diffusion of Mn in solid Fe is slower than that of C. In the liquid state of Fe, only very approx. figures could be obtained for Mn and Si. The coeffs. are given in curves in sq. cm./hr. as function of temp. Ten references. M. Hartenheim.

Investigations into the phosphatic protection of iron obtained with the biphosphates of zinc, iron and manganese. O. Macchia and G. Boggio. *Industria meccanica* 17, 817-21, 906-9, 901-5 (1935). — A great no. of tests were made to find the principal factors which det. the protective action against atm. influences by phosphates with solns. of the biphosphates of Fe, Zn, Mn, Fe-Zn, Fe-Mn and Zn-Mn. The general conclusions of the results can be summarized as follows. Solns. of Zn biphosphate of about 3% offer a good protection but require too much time (85 min.). Solns. with 3.5% Mn biphosphate are good and more rapid. Fe biphosphate cannot be used, as it has no appreciable protective value. Fe-Zn biphosphate solns. of 3% concn. give a very high protective value. Zn-Mn biphosphate of 4% concn. and high in Mn biphosphate is satisfactory both from the point of view of protection and duration. Fe-Mn biphosphate gives the best results both from the viewpoint of behavior of the protective surface and from rapidity of treatment. The last one is recommended for all practical uses. Procedures are described, patents given and 41 references cited. M. Hartenheim.

The reactions of iron with liquid zinc. W. Pungel, Erich Scheil and R. Stenkhoff. *Arch. Eisenhüttenw.* 9, 301-4 (1935). — The reactions taking place and the formations of alloys between Fe and Zn during the hot-galvanizing process were studied in the temp. range of 450°-500°. The attack of Fe by liquid Zn can occur in 2 different directions, according to whether the crystal FeZn₁₃ is or is not formed. If no FeZn₁₃ is formed, the attack is very strong and a loose crystal skeleton of FeZn₁₃ is formed so that Zn can combine continually by soln. The thereby originating layer of alloy grows vertically to the Fe surface and creates oddly shaped excrescences. The non-formation of FeZn₁₃ is, however, observed only up to a definite upper temp. The formation of this Fe-Zn alloy provides a tightly enveloping protective layer which reduces considerably the attack of the steel by the Zn bath. The relation between the chem. compn. of the steel or the Zn bath and the occurrence of FeZn₁₃ could not yet be explained sufficiently by the present observations. Five references. M. Hartenheim.

The velocity of solution of iron in molten zinc. Herbert Grubisich. *Angew. Chem.* 48, 689-91 (1935). — The ac-

tion of pure Zn upon Armco iron was studied by measuring the amt. of Zn reacting with an Fe plate of known area. The temps. were kept const. within $\pm 1.5^\circ$ and the exptl. results showed variations of 3-5%. The "velocity of soln." (1) increases only slowly (for a given test period) from 430° to 480°. The structure of the alloy layer shows a dense, compact cover on the iron basis, and exhibits distinct boundaries with the iron and the pure Zn layer. According to Daniels, the amt. of Fe dissolved is $E = nt$, where $\log n = -(1256/T) + 2.705$, t is the time and T the temp. In this temp. range the growth of the thickness of the alloy layer behaves like that of dense metal oxide films. In the range of 480° to 520° I depends on the temp., Armco iron shows a definite max. at 495°. The alloy layer breaks up into a great no. of small crystals, which penetrate into the Zn layer, this eliminates the sharp boundary between the alloy and Zn layers. The migration of the crystals results in a decrease of the alloy layer thickness. The galvanization structure is very characteristic at the temp. of the max. The amt. of Fe dissolved in this range can be expressed by $E = kt$, the proportionality factor k depends on the temp., but could not be detd., as it varies greatly with the various kinds of iron examd. At 495° and 515° the linear increase of the dissolved Fe with t , up to the equal concn., could be observed. At temps. above 520° the structure of the alloy again becomes dense, this results in a decreased soly, and the thickness of the layer decreases greatly with increasing temps. The amt. of Fe dissolved is proportional to \sqrt{t} . Four other steels, with the amt. of C varying from 0.11 to 0.50%, and a Swedish iron (C = 0.03) were examd. likewise. A comparison of the soly. curves showed that the values almost coincide in the temp. ranges of 440-80° and 520-600°, while variations of 300% occurred at the curve max. at 600° (reaction time 1 hr.). No conclusions for the differences at the max. and the different behavior in the second temp. interval could be drawn from the chem. compn. A smooth "av. soly. curve" was established which can be expressed as $E = 10^{-4} n + 0.0017 (T - 419) \times \sqrt{t} (f/1.7)$, where T is the (const.) test temp., 419° the m. p. of Zn, t the extent of the test period and f the surface of the iron. The agreement of the calcd. and exptl. values is very satisfactory up to 600°, but above that temp. the calcd. values are considerably higher. Cold working of Swedish iron affected the soly, resulting in a broadening and simultaneous lowering of the max., and a shifting to a higher temp. as the amt. of cold work increased. Soly. curves and photomicrographs are presented. Twelve references. K. K.

Metallographic control of stamping sheet iron. A. M. Shirokov. *Zavodskaya Lab.* 4, 130-6 (1935). — Metallographic examn. satisfactorily shows the stamping properties of sheet iron as affected by the size and form of ferrite and cementite inclusions, contamination with slag and air bubbles, C contents, etc. Chas. Blanc.

Cause of longitudinal cracks on the surface of finished (steel) products. A. I. Nachal'nikov and Tz. N. Rafalovich. *Domes* 1935, No. 7, 17-26. — Cracks on the surface of steel products can be explained exclusively as a result of bursting of gas bubbles in the process of rolling in those cases where liquation or decarburized areas are found in the immediate neighborhood of these cracks. In the absence of such areas, the cracks can be explained either as due to bursting of gas bubbles, or to mech. strain, or to scratches resulting from rolling. S. I. M.

Cracks in round castings. A. Yakhkind and N. Gotgel'i. *Domes* 1935, No. 7, 26-32. — A study was made of the effect of the following factors on formation of longitudinal cracks in round steel castings: (1) diam. and thickness of casting, (2) C content, (3) rate of pouring the molten metal and (4) Si and S content. It is concluded that to avoid cracks, the rate and temp. of pouring should be low, particularly in castings with a diam. larger than 300 mm. The optimum rate of pouring is 1.3-1.5 ton/min. The no. of cracks increases considerably with increase of thickness. Low-C steels (up to

(0.25% C) have 3-4 times as many cracks as high-C steels (0.4-0.6%). S. L. Madorsky

Cracks in forged pieces. M. Ballay *Usine 44*, No. 46, 27-9 (1935).—The cause of fine fissures which sometimes are observed in large rolled or forged pieces and which are quite different from the dendritic and quenching cracks was investigated, but a satisfactory solution to the problem has not been found. The tendency to form these cracks (in French called "floccons") existed in increasing degree in C steels, Mn steels (1-1.5%), Mn-Si steels, steels with 1-2% Cr with or without Mo, Ni steel (1.5%), Cr-Ni steel and Cr-Ni-Mo steels in the order named. Steels made in the crucible or acid open hearth, and such made in high-frequency acid furnaces are less subject to these cracks than the basic open hearth or electric furnace steels. The tendency diminishes if temp. and velocity of pouring are reduced. Sufficiently slow cooling after forging is also important, about 1° per min. between 900° and 200° seems sufficient, which means about 10 hrs for this interval, and for very heavy pieces up to 80-100 hrs. The orientation of these cracks is perpendicular to the greatest deformation pressure and to the dendrites. Impurities do not seem to play any part. M. H.

Determining purity of steel by deep-etching. E. Houdremont and H. Schrader *Arch. Eisenhüttenw.* 9, 273-5 (1935).—In order to detect the impurities in steel, inclusions and segregations of P, by deep-etching, it has been found necessary to make this test only after heat-treatment, because in the untreated state the etching process may attack preferably the grain boundaries, especially in coarse grain. A correct etching shows in the longitudinal section mainly the P segregations, in the transverse section mainly the sulfide inclusions. The deep-etching test is, therefore, considered better suited to distinguish steels of different metallurgical production. The method is illustrated by numerous photographs of etchings demonstrating the different types of steel. Eight references. M. Hartenbaum

Transformation of austenite and the theory of hardening of steel. S. S. Shenberg *J. Tech. Phys. (U. S. S. R.)* 5, 467-82 (in Russian), *Tech. Phys. U. S. S. R.* 1, 395-603 (1935) (in English), cf. C. A. 29, 2422.—Expts with 0.7 and 1.3% C steel, high-speed steel, and Cr steel contg. 12% Cr and 2% Ni indicate that austenite decomposes in 3 ways. Between Ar' and 300° pearlite or troostite is formed, between 300° and Ar' cubic martensite is formed, and below Ar' tetragonal martensite. In the 3rd case, tension existing in the steel is alone sufficient to cause the transformation. Above Ar' the tensile stresses are insufficient and diffusion phenomena are required to initiate the decomposition. H. W. Rathmann

The brittleness of steel at sub-zero temperatures and rapid-cooling brittleness of annealed steel. Saburo Watanabe and Kiyochi Nagasawa *Tetsu-to-Hagane* 21, 890-7 (1935).—The brittleness of steels at sub-zero temp. was studied by means of Charpy's impact test. The impact values of the annealed C steels (0.04-0.38% C) drop between +25° and -20°, and those of quenched steel drop between +25° and -40°. From the result of the impact test at sub-zero temp. of several alloyed steels, it was found that steels contg. Ni show less brittleness than those contg. no Ni. The brittleness of steels at sub-zero temp. is not characteristic of a iron itself, but is due to the presence of carbides. By the impact test of C steels (0.10-0.26% C) which were annealed (920-870°), reheated (700-700° for 1 hr.) and then quenched in water, an extreme brittleness was found at room temp. This phenomenon was called "rapid cooling brittleness of annealed steel." This brittleness is attributed to the pptn. hardening of Fe₃C at low temp. Tomoo Sato

Effect of uranium on structure, hardenability and tempering permanence of unalloyed steels. H. Benack and C. G. Holzschner *Arch. Eisenhüttenw.* 9, 193-200 (1935).—Alloying expts with ferrouanium proved that practical segregation free castings can be produced with a low-C, low percentage ferrouanium if it is added in small pieces to a well-densitized melt in the ladle. High-C ferrouanium with high U content is not

suitable because of its difficult soly. The exptl. castings could be forged satisfactorily up to 5% U. Two new constituents were observed in C steels with U addn. which can be considered to be U carbides. Hardening and temper tests showed a certain soly. of the γ -solid soln. for U which, however, can be utilized in practice only to a limited degree, as melting phenomena occur at already fairly low temps. U improves uniform hardening over the whole vol. and reduces the sensitivity against overheating. U acts in the steel similarly to Cr as a special carbide-forming element, but improves the mech. properties of structural steels very little. Micrographs and curves illustrate the details of the expts. Eleven references.

M. Hartenbaum
The effect of special additions on the scaling of steel. K. Kewt *Mitt. Kohle- und Eisenforschung G. m. b. H. 1.1*, No. 2, 9-23 (1935).—The scaling phenomenon of steels at temps. of 900°, 1000°, 1100° and 1200° was investigated with particular consideration of the part played by addn. The formation of scale by diffusion created sharply defined layers of scale which were analyzed individually. All alloying elements of steel, base as well as noble elements, accumulated at the border of the Fe scale. Al, Cr and Si which increase the resistance against scaling noticeably, and Ti, Be and V which increase it only slightly, form protective layers. The addn. of a nobler element, as Cu, Ni and Pt, did not give an improvement in resistance against scaling, Pt even lessened resistance. The investigation led to the conclusion that in order to obtain protection against scaling the new kind of crystal which is formed by the diffusion of the Fe atom, but not by that of the O atom, must possess a low diffusion velocity and be sol. in ferrous oxide, and besides must form a tight envelope around the Fe which also prevents the diffusion of Fe. The compn. of scale layers is shown in photographs, the tests and results are discussed. Twenty-six references.

M. Hartenbaum
Steels and alloys for permanent magnets. André Michel *Usine 44*, No. 46, 27; *Rfr. met.* 32, 482-6 (1935).—A brief review of steels used at present for this purpose and their qualities and treatment. Fe-Co-Mo and Ni-Al steels are best suited according to the present state of knowledge.

M. Hartenbaum
Decarburization of some alloy steels by hydrogen. W. Baukloh and H. Guthmann *Arch. Eisenhüttenw.* 9, 201-2 (1935/6); cf. C. A. 29, 2122.—Tests on decarburization in a H₂ atm. at 700-1000° showed an increase in the decarburization velocity for unalloyed steels above 700° with increasing C content, while below 700° it decreases with increasing C content. In Ni steels, the decarburization decreases with increasing Ni content, with a max. at about 850°. The effect of H on the favorable decarburizing action of Cr is very slight up to 0.9% Cr, but becomes fairly large for higher Cr contents. Mn steels show the least attack by H for about 0.5% Mn in the investigated temp. range. The decarburization velocity is reduced for Si, W, Mo, Sn and Cu, the latter is least attacked at about 0.65%. Increasing Si and W contents increases the resistance against H attack, while Mo shows an irregular behavior with a max. attack at 0.48% Mo. V alloy steels were decarburized to a greater degree than unalloyed steels; a steel with higher V content shows lesser decarburization. Five references. M. H.

Effect of cold deformation and annealing on properties of chromium-molybdenum steel tubes. T. N. Rafalovich. *Domes* 1935, No. 7, 32-56.—Samples of Cr-Mo steel tubes having an av. compn. of C 0.34, Mn 0.7, Cr 0.82, Mo 0.29, P 0.040 and S 0.045%, and crit. points Ac, 820° and Ac₁, 740°, were heated to various temps. and then slowly annealed in the furnace. The samples were then cold-rolled. Mech. properties and microstructure were investigated before and after cold-rolling. The cold-rolled samples were also studied in regard to recryst. by heat-treating them for varying periods at 600°, 650°, 700°, 750° and 800°. Change of mech. properties was found to depend only on the extent of deformation. Samples subjected to a preliminary heating to 750° suffered the least disturbance in structure during deformation.

tion. Numerous tables, graphs and photomicrographs are given.

The carbon-oxygen equilibrium in molten steel. Sato Matoba. *Tetsu-to-Hagane* 21, 875-9(1935).—Equil. of C and O in molten steel is expressed as follows, (2) $\text{FeO}(s) + \text{CO} \rightleftharpoons \text{Fe} + \text{CO}_2$, and (3) $\text{C}(s) + \text{CO}_2 \rightleftharpoons 2\text{CO}$, where $\text{FeO}(s)$ and $\text{C}(s)$ mean the FeO and C dissolved into the molten iron, resp. By melting of Fe in mixed gases of CO and CO_2 at various rates, the above relations were investigated at 1570°, 1600° and 1620°. As long as the compn. of the gas mixt. remains unchanged, the soly of C in the molten Fe in equil. with the gas mixt. decreases, while that of O increases as the temp. rises. The relations of temp. (T) and equil. const. (K) and changes of free energy (ΔF°) were detd. as follows: For equil. (2), $\log K_2 = 7.450/T - 4.60$, $\Delta F^\circ = -34,000 + 21.31T$, for (3), $\log K_3 = -8.800/T + 7.40$, $\Delta F^\circ = 10,242 - 33.84T$.

Spectrographic examination of structure of alloys. Henri Triché. *Compt. rend.* 201, 1178-81(1935).—The surface of the alloy (e.g., Al-Fe or Al-Cr) is etched by an oxidizing mixt. and a high frequency spark produced between its surface and a thin Au or Pt wire, the wire being moved about to prevent fusion. The sparks always start from certain fixed points on the surface of the alloy, these being crystals of definite compn. projecting above the general (oxidized and so nonconducting) surface. From the spectrum of the sparks the compn. of the crystals is deduced without their isolation. Thus with Al-Cr alloys contg. 2, 4, 4.2 or 17% Cr the same spectrum is obtained, this indicates the crystals contain approx. 18.2% Cr, in fair agreement with 21.4% required by CrAl_3 (cf. Link and Freche, *C. A.* 28, 1970°).

A new low-melting alloy. S. J. French. *Ind. Eng. Chem.* 27, 1464-6(1935).—A quaternary alloy contg. 81.9% Lpowitz metal (50 Bi, 27 Pb, 13 Sn, 10 Cd) and 18.1% In proved to have a f. p. of 46.5°. Because of the high price of In, this low-melting alloy would cost, at present market prices, close to 5 dollars an oz. in small lots. The cost in large lots may be 1/2 of this figure.

Simple means of distinguishing different aluminum alloys. E. Zurbrugg. *Aluminum* 17, 531-3(1937).—A simple method is described by which Mn, Mg and Ni can be detected even in very small amts. Mn is found by oxidation with NH_4 persulfate in the presence of AgNO_3 , Ni by dimethylglyoxime, and Mg by tetrahydroxyanthraquinone. The alloys of the type Al-Mg-Si, Al-Mg and Al-Mg-Mn which cannot be distinguished by these methods (and also not by those described by Zeilereder (*C. A.* 29, 1045°) and Boschard (*C. A.* 29, 2134°)) are distinguished from one another by hardening tests in conjunction with scratch or ball tests. Procedures are described.

The power consumption in forging and pressing aluminum alloys. A. v. Zeilereder and R. Irrmann. *Z. Metallkunde* 27, 145-8(1937).—The general problem of working Al alloys is discussed, showing that the power requirements are much greater than for Cu alloys and comparable to those for Fe. Compression tests to show the effects of single components upon pure Al at temps. between 20° and 420° show that with adds. of up to 10% the power consumption increases more for Mg than Cu, while up to 2% Mg-Si has the least effect of any, com. alloys of the Al-Cu-Mg and Al-Mg-Si types both require more power than the above results would indicate, on account of their Mn content. Trip-hammer expts. on Fe at 900°, Avional at 420°, Fe at 1100°, Anticorodal at 180°, Fraca (57.7 Cu, 2.1 Pb, 40.2 Zn) at 700° and 99.5% Al at 500° showed the power requirements decreased in the order given. Die-forming of the same materials showed the importance of well-polished dies and forms, especially for the Al alloys.

Testing of sea-water-resistant aluminum alloys in the north sea. H. Röhrig and W. Nicolini. *Aluminum* 17, 519-20(1937).—Smooth, riveted and welded samples of pure (99.7%) Al, Albondur, Pantal, Hydronalium, and KS and PS sea-water Al alloys were exposed to the tides in the North Sea for 1 1/2 years. Surface quality, tensile

and shear strength and elongation were tested; the results are shown in tables and photographs. The BS and KS alloys and Hydronalium, both hard and soft, withstood perfectly the effects of the exposure for 1 1/2 years. The welded samples of pure Al (hard as rolled), Pantal and Hydronalium also did not change their properties. The riveted samples suffered very little; the shearing strength remained the same in all samples which were not corroded. Hard pure Al showed a loss of strength and elongation.

The effect of metals of the iron group on precipitation hardening of aluminum alloys of high purity. W. Koch and F. W. Nothling. *Aluminum* 17, 535-46(1937).—The effect of the metals Fe, Cu, Ni and Mo on pptn. hardening was investigated on an Al-Cu alloy with 4% Cu by taking time-hardness curves at room temp., at 135° and at 200°. The results can be summarized briefly as follows: Test series with Fe. Quench hardness as well as pptn. hardness at all temps. decreases with increasing Fe content. This is ascribed to the fact that Cu is bound by the addn. of Fe and thus taken out of the solid soln. A ternary compd. is thereby formed, Cu_3FeAl .

Test series with Co. Co is practically insol. in the Al-Cu alloy with 4% Cu in the solid state. It occurs as an intermetallic compd. of the probable compn. Co_2Al . At 525°, the quenching hardness shows an increase, partly because of the hardening actions of the pptns. and partly on account of an increase of the concn. of the solid soln. by removal of Al on account of the binary compd. Adds. of 0.1-0.2% Co impede the pptn. strongly at first; the increase of the pptn. hardness is about the same as that of the quench hardness. Test series with Ni. The view held by Bingham that Al-Cu-Ni alloys do not show pptn. hardening to any pronounced degree (*J. Inst. Metals*, 1926, 177) does not seem to be correct, as the tests with Ni: up to 2% show a slowly decreasing pptn. hardening with increasing Ni content, the decrease has a certain ratio to the quench hardness. The reason for the decrease is seen in the decrease of the amt. of Cu available for pptn. of the solid soln., and is due to formation of the ternary compd. Test series with Mo: The deciding influence in Al-Cu-Mo alloys is exerted by the originating Al-Mo compd., MoAl_3 or Mo_2Al . The increasing hardness after quenching from 300° is due to the hardening effect of the pptd. components. The results are represented in curves, all metals were added in amts. up to 2%. The curves which show maxima of pptn. hardness at different temps. are parallel among themselves, as also to the curve of quench hardness at 525°, except at very small amts. of addn. From this it is concluded that both quench hardness and aging and pptn. hardness are subjected in principle to the same effects, which view is also confirmed by examn. of the structures. For ternary alloys, it can be stated in general that the pptn. hardening is proportional to the Cu dissolved in the solid soln. According to whether Cu-free or Cu-contg. compds. occur, quench and pptn. hardness will be more or less affected. Sixteen references.

Transformations in copper-aluminum eutectoid alloys. I. Intermediate states in the hypercritical alloys. S. R. 2, 3-16(in German). *J. Tech. Phys.* (U. S. S. R.) 5, 395-406(1937)(in Russian).—Alloys contg. 10-15% Al were quenched from 600° to 930° and examd. by the Debye-Scherrer method. In alloys contg. less than 13% Al the β -phase changes to β' , in those contg. more than 13% Al, it changes to a γ' -phase. This γ' -phase decomposes in 2 distinct steps when heated. Decompn. starts at 300° and proceeds to a definite limit with the formation of γ . The remaining γ' decomposes only when heated to 425-50°, forming $\alpha + \gamma$. If the hypercritical alloys are quenched in a salt bath above 300°, some γ -phase is pptd. from the β -phase. The remaining β -phase with reduced Al content is stable for a long time below 425°. If, however, the hypercritical alloy is quickly cooled below 300°, the γ -phase is not pptd., and the β -phase will change to γ' at 170-200°. The transformation $\beta \rightarrow \gamma'$ is irreversible and is comparable to

the austenite-martensite transformation in steels

H. W. Rathmann

The abnormal phenomena of cast copper-rich antimony-copper alloys during heating Yoshio Tanaka and Masakatsu Ito *J. Chem. Soc. Japan* 56, 1293-1300 (1935); cf. Taketani and Katori, *C. A.* 30, 654.—The abnormal thermal expansion of the alloy (Sb = 2-9%) was studied by means of differential expansion measurement with pure Cu as standard. With the decrease of Sb the abnormal thermal expansion near 490° and 490° decreases. The limit of the solid soly of Sb at 470° is estimated to be 9.5-9.75%.

T. Katsurai

The abnormal phenomena of cast copper rich magnesium-copper alloys during heating Euchi Koizumi and Takeliko Kawaguchi *J. Chem. Soc. Japan* 56, 1300-4 (1935), cf. preceding abstract.—The thermal change of the alloy (Mg = 0.2-10%) prepared by die casting has been studied. The alloy (Mg = 0.8%) shows noticeable expansion near 550°.

T. Katsurai

The influence of the third metals on the normalization of cast structures of bronze Saburo Katori and Yasushi Ogino *J. Chem. Soc. Japan* 56, 1305-13 (1935), cf. preceding abstract.—To the bronze (Sn = 10%), 0.5-5% Zn, Mn, Ag, Ni, Sb, Al, Si, Mg were added, resp., and with pure Cu as a standard the differential dilatation of the alloys has been studied. The presence of Zn seems to accelerate the normalization (homogenization) of the cast structure by annealing, while the others retard the normalization.

T. Katsurai

The formation of the graphite eutectic in the iron-carbon alloy Tomoo Sato and Seiji Nishigori *Tetsu-to-Hagane* 21, 887-93 (1935).—Three kinds of the pure white pig iron (3.54, 4.05 and 4.85% C) were melted in a high-vacuum furnace which was specially devised with W wire as heating element, and thermal analysis was carried out. The eutectic reaction in the pure Fe-C system takes place in 2 steps which differ by 7-10°. This phenomenon agrees well with Ruer and Goerens' result, and the change which takes place at the higher temp., in cooling, is due to the formation of the austenite-graphite eutectic, and that of the lower temp., to the austenite-Fe₃C eutectic. In the specimens analyzed, 2 kinds of eutectics mentioned above were observed under the microscope. Therefore, the correctness of the double diagram of the Fe-C system was pointed out. By assuming that the degree of dissociation of Fe₃C in the molten pig iron decreases as the amounts of some impurities (Cr, S, etc.) increases, the readiness of formation of graphite eutectic in the pig iron melted in high vacuum was explained. The mechanism of the formation of the mottled iron and reversed chill casting was explained by this assumption.

Tomoo Sato

Iron-carbon beryllium alloys Marcel Bailly *Compt. rend.* 201, 1124-6 (1935).—From 0 to 4% Be was added to cast irons containing 3-4.45% C, 0.25 Mn, 0.25 Si, 0.02 S and 0.05 P, they were then cast in bars 15 mm in diam. in stove sand. A series averaging 3.2% C and consisting (in absence of Be) of pearlite cementite showed on addition of increasing amounts (up to 3.85%) of Be first steps of graphite, then with more than about 1% Be, an increasing amount of a complex cementite containing Be, with more than about 2% Be this gradually disappeared until with 3.85% Be there was scarcely any, in place thereof was Be₃C (perhaps containing a little Fe), which formed gray grains often with polygonal outlines attacked by boiling H₂O, but preserved from oxidation when the alloy is decarburized at 950° by a film of oxide. There was little change, save a slight decrease with less than 1% Be, in hardness of the alloys as cast or after oil tempering at 950°, but with 1.43% Be a marked increase of about 80 and 50%, resp., followed by a decrease with more Be until with 3.85% the hardness scarcely exceeded that of the original cast Fe. Addition of Be caused little change in Ac.

C. A. Silberrad

The system iron-cobalt-cobalt silicide-iron silicide Rudolf Vogel and K. Rosenthal *Arch. Eisenhüttenw.* 9, 237-9 (1935).—The ternary system Fe-Co-Si was studied

thermally and microscopically in the range Fe-Co-CoSi-FeSi. The compounds FeSi and CoSi form an uninterrupted series of solid solutions. The existence of a ternary compound, FeCoSi, was established; 2 subregions are distinguished, Fe-Co-CoSi-Fe-CoSi-FeSi and FeSi-FeCoSi-CoSi-CoSi. The crystalline phenomena in the former partial range are detected essentially by 5 four-phase planes of which 2 are transition planes and 2 eutectic planes, while the fifth plane corresponds to a ternary eutectoid disintegration. In the second partial region, the pairs of the opposite border systems are very similar. Since the border systems FeSi-CoSi and CoSi-FeCoSi are uninterrupted series of solid solutions, the three-phase equilibria of the border system CoSi-CoSi go over into those of the system FeSi-FeCoSi. The diagram of state and reaction occurring in the various zones are discussed and illustrated by photographs of structures. M. Hartenbach.

The rolling and recrystallization structure of an iron-nickel alloy W. G. Burgers and J. L. Snoek. *Z. Metallkunde* 27, 153-60 (1935).—The (200) pole figure is determined for a 50% Fe-Ni sheet reduced from 0.35 mm to 0.1 mm by cold-rolling. This is found to be in agreement with the findings for other face-centered cubic metals and is best described as a scattering about all orientations for which a {111} plane is parallel to the plane of rolling, with a {111} direction in the direction of rolling. Recrystallization in H₂ at 1100° a preferred orientation is found with a {110} plane in the surface of the sheet and a {110} direction in the direction of rolling, and not more than 10° of scatter. The same textures were found for a 35% Ni alloy and were not altered by 2.5% Cu, but completely destroyed by small amounts of Co or Al. It is suggested that the differences in recrystallization texture found among face-centered cubic metals can be explained by differences in fragmentation processes which occur along slip planes during deformation. The anisotropy of magnetization was observed on the recrystallized foil and found to be in agreement with previous work, magnetic susceptibility least in the {110} direction.

G. Derge

The relation of the rolling and recrystallization textures of iron-nickel alloys to their magnetic properties Fr. Pawlek. *Z. Metallkunde* 27, 160-5 (1935).—Reversible Fe-Ni alloys were prepared by melting Swedish Fe with Mond Ni and by sintering carbonyl Fe and Ni, but no marked differences of behavior were found. All data are for a 40% Ni, 60% Fe specimen in the rolling direction. For 50, 80 and 98.5% reductions the normal combination of orientations was found with a {112} direction and a {110} plane in the direction and plane of rolling, resp., or a {111} direction and a {112} plane. With reductions of less than 90% the recrystallization structure was random, above this a texture appeared and became completely {110} in the rolling direction with {010} in the plane of rolling when annealing above 800°. Between this temp. and that of recrystallization, 500°, another undetected orientation was evident. Curves are shown for the magnetic and tensile properties after the above reductions and for annealing temps. between 20° and 1100°, all of which show sharp breaks corresponding to the recrystallization temps., with additional differences dependent upon whether or not the recrystallized material is randomly oriented. Annealing above 1100° produced exceptional grain growth and a distinctly new preferred orientation with a {110} direction in the rolling direction and a {120} plane in the surface. Subsequent cold rolling of recrystallized material with the cubic texture produced no change in this orientation with less than 80% reduction, though transition to the normal texture is complete with 90% reduction. Reannealing this originally cubic material produces no texture for reductions of less than 90%. Corresponding anomalies are found in the magnetic and tensile properties. Reduction of 50% produces the lowest residual magnetism, and special curves are shown for initial material of both the random and cubic types of orientation, the latter having a higher recrystallization temp. extending over a wider range, accompanied by anomalies in the recovery curves for the other properties.

G. Derge

Nickel alloys in the architectural field G. F. Geiger

and R. E. Case. *Ind. Eng. Chem.* 27, 1130-2(1935).—Color and compn. are discussed. P. S. R.

Investigation of special nickel silvers. D. G. Butomo *Metallogr.* 10, No. 4, 76-87(1935).—Alloys contg. Cu 81-83, Ni 14-5 and Al 1.5-3% were prep'd, heat-treated and exam'd for microstructure and mech. properties. When quenched from 800° to 900° these alloys form solid solns and are soft and ductile. After annealing the quenched specimens at 400° they become hard because of the pptn. of an Al comp'd. The annealed specimens had a tensile strength of 80 kg./sq. mm. and an elongation of 10%.

H. W. Rathmann
Phase diagram and magnetic properties of platinum-iron alloys. I. Graf and A. Kussmann *Physik. Z.* 36, 544-51(1935).—The object of this work was (1) to det. the exact course of the magnetic properties, (2) to det. the concn. regions within which the intermediate phases exist and (3) to det. the relation between structure and magnetic properties. Sixteen alloys covering the entire concn. range were employed. For each sample the coercive force, the satn. value and the magnetic transformation temp. were det'd after annealing and after quenching from selected temps. up to 1100°. X-ray and micrographic methods were applied to structure and phase-existence detns. The temp. of the α - γ transformation of 1 e is gradually lowered by addn. of Pt up to 26 at. % where γ -1 e is stable at room temp. A very large hysteresis exists (0.600°) at this concn. Addn. of Pt up to 8.9 at. % (0.600 satn.) increases the satn. values of α -Fe by about 10%. The lattice parameter increases somewhat (from $a_0 = 2.87$ to $a_0 = 2.89$ Å). The alloy contg. 26 at. % Pt while in the γ -phase at room temp. can be transformed by cooling in liquid air. In the concn. field 35-65 at. % Pt the alloys quenched from temps. above 1200° exhibit micrographically a homogeneous γ -solid soln in which an oriented needle formation appears. X-ray structure diagrams indicate the presence of another lattice beside that of the γ -phase. This new phase is FePt and is body-centered cubic with $a_0 = 2.88$ Å. The 2 sorts of atoms appear to be randomly distributed. At 50 at. % Pt FePt forms at temps. below 1200° and is ferromagnetic. The Curie point of FePt is about 450°. In the concn. field 30-70 at. % the alloys exhibit an extraordinarily wide hysteresis loop with coercive forces up to 1800 gauss at a remanence of 4000 C.G.S. and thus exhibit a higher magnetic energy content than any other known alloy. It is considered that this large amt. of energy (80,000 erg/cc.) is intimately connected with the structural transformation. H. A. S.

Use of zinc alloys for water and gas pipes and distribution equipment in dwellings. R. Cazaud and H. Petot. *Génie. Civil* 105, 31(1934); *U. S. Pub. Health Eng. Abstracts* 15, W, 67(June 29, 1935), of *C. A.* 29, 79231.—Upon exposure of Zn to air or water, the Zn becomes coated with a protective layer of carbonate. With Zn-Al alloys contg. 5-25% Al this film is very tenacious and forms rapidly. Such alloys consist of a mixt. of a solid and eutectic soln in different proportions and can be forged, cast, rolled, drawn and annealed at about 300°. The structure and mech. properties of the alloys can be improved by the addn. of traces of Mg, Sb and Ti. The alloys resist corrosion by waters contg. large doses of Cl and O₂. They are very suitable for meters, as elec. reactions are reduced to a min. The e. m. f. developed between Ni and Zn is negligible. Pipes of 10-100 mm. interior diam. can be economically constructed from Zn-Al alloys. The amt. of Pb dissolved by water varies with the degree of aeration; some waters can carry 18-35 mg. of Pb per l. and Leipzig water up to 236 mg. Tests on guinea pigs show Al and Zn are much less toxic than Cu, and "total" alloys are 8 times less toxic than Cu. The Zn-Al alloys are very suitable for central heating systems and radiators as they conduct heat better than cast Fe and are unaffected by oil, hydrocarbons, alcs. and many chemicals.

C. R. Fellers

Phase changes during aging of zinc-alloy die castings. II. Changes in the solid solution of aluminum in zinc and their relation to dimensional changes. M. L. Fuller and

R. L. Wilcox. *Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Pub. No. 657*, 13 pp (1935); cf. *C. A.* 28, 66824.—The dimensional changes that occur in Zn-alloy die castings (A. S. T. M. alloy No. 27) during aging and low-temp. annealings have been shown to be due to changes in the α -phase. These changes are the segregation from, or the resoln. of γ in, the α -phase. This relationship has been est'd semiquantitatively by a comparison of dimensional changes calcd. from x-ray data on the phase structure with those changes actually experienced. The evidence indicates strongly that the β -phase decompn. plays a minor part, if any, in the aging shrinkage of this alloy. Room-temp. aging of freshly cast material resulted in a segregation of γ from α and an accompanying shrinkage. The annealing at 150° and 175° of castings that had been dimensionally stabilized at room temp. resulted in the resoln. of γ into α and a corresponding expansion. Com. stabilizing annealing of 3 hrs. at 95° resulted in a more rapid depletion of the Al content of α than takes place during room-temp. aging and a correspondingly more rapid shrinkage. Some further change in the α -phase and further shrinkage took place during room-temp. aging following the annealing. Prolonged annealing at 95° (2 weeks) increased the extent of the aging effects during the subsequent room-temp. aging.

C. L. Mantell

A study of lead bronzes with special consideration of manganese as an alloying element. J. Wecker and H. Nipper. *Z. Metallkunde* 27, 149-51(1935).—A survey of bearing bronzes shows that although Sn is required in high-Pb alloys, it is use objectionable because of the widening of the two-phase liquid region, the introduction of the δ eutectoid, and the possible formation of stannic acid. A suitable substitute for Sn is sought in an alloy contg. 30% Pb. Ni reduced the Pb segregation but gave a soft alloy. Alkalies, alk. earths and P had no beneficial effects, while Co required prolonged high-temp. melting and gave poor phys. properties. Fifty-kg. melts contg. 63% Cu, 30% Pb, 2% Ni and 5% Mn showed no segregation under a variety of casting and cooling conditions, and no stannic acid was formed. The frictional and shrinkage properties for this Mn-Ni bronze were about the same as those for standard white bronzes, while the hardness, temp. coeff. of hardness and impact hardness were all much better than for standard Sn-bearing alloys.

G. Dürge

Porous bronze. A. Chaplet. *Cuivre et laiton* 8, 502-3(1935).—Under certain conditions it may be desirable to have a porous metal as it has certain advantages, for instance, if the free surface of the metal is to be as large as possible so that a gas or a liquid can act upon it, or if lubricants have to be incorporated in the metal very intimately to reduce friction on the surface. Such metals are used for bearings, bushings, valve cocks, etc. They are made by alloying the metal with another one which crystallizes out in solidification and creates fine pores or interstices between the crystals, e. g., an alloy of 50% Pb and 50% Sb begins to solidify at 450° and to deposit Sb crystals. A com. porous bronze "oilite" is made of a mixt. of 90% Cu powder and 10% Sn powder which is compressed in steel forms to the desired shape, it is then heated to a point intermediate between the m. ps. of the 2 metals when bronze is formed. The pores take up 40% oil in vol. so that automatic lubrication takes place. M. H.

The corrosion resistance of Hydronalium, especially to sea water. G. Siebel. *Aluminium* 17, 562-7(1935).—Because of their resistance to alkalies, the Mg-Al alloys possess an excellent corrosion resistance to sea water, which increases with increasing Mg content. The heterogeneous structure of the cast state of high-Mg-Al alloys is practically as resistant to sea water as the homogeneous structure. The wrought alloys of Mg-Al become very temp.-sensitive by cold-deformation, which results in a strong, intercryst. corrosion. A stable structure can, however, be obtained by heterogeneization below the demixing line. Addns. of Ca, Si, Zn, Ti and Cr strengthen the homogeneous state and render these alloys safer against corrosion. M. Hartenheim

The welding of chromium steels in chemical plant equipment J R Dawson *Can Chem. Met.* 19, No 12, 337-8 (1935) — The rods chosen in oxyacetylene welding should be as nearly as possible of the same compn. as the material being welded. A smaller flame should be used on stainless steels than on ordinary steels to avoid overheating of the weld. X-ray examn and the free-bend method of testing for ductility have been of great value in checking up on welded products. The selection of the correct steel and procedure for welding for each type of service are important. W. H. Boynton

Performance of refractories used in basic alloy steel production (Soler) 19 Influence of metals in bleaching (Pettinger) 25 Selection of lubricants for cold-rolling of strip steel (Moore) 22 Staybrite steel in the dyeing industry (Godber) 25 Philippines: a source of chrome ore (Keeler) 8 Production and use of high-grade Zn (Breyer) 13 Grinding (Uhlmann) 19 Fe-O diagram (Bogatzki) 2 Rotary-drum app. for filtering and dewatering slimes such as those from ores (U S pat 2,024,358) 1. Processing laterite ores Ernest W. Westcott (to Comstock & Westcott, Inc.) Brit 434,897, Sept. 11, 1935. See Fr. 775,161 (C. A. 29, 2139*) and Can 353,342 (C. A. 29, 7928*)

Roasted blende Bergwerksgesellschaft Georg von Giese's Erben. Ger. 611,684, Sept. 13, 1935 (Cl. 40a 2.20). The blende in a porous nonagglomerated form, easy to leach out, is produced by roasting a mixt. of 1 part of crude blende with 5-10 parts of completely roasted blende contg less than 5% of sulfidic S.

Roasting sulfide ores Edward P. Fleming (to American Smelting and Refining Co.) U. S. 2,026,621, Jan. 7, 1935. In roasting sulfide ores (such as those of Zn) in suspension, air and the ore are introduced tangentially into the upper portion of a preheated roasting chamber so as to establish a concurrent roasting zone, and a countercurrent roasting zone is established by introducing addnl. air into the lower portion of the chamber in countercurrent flow to the descending ore particles, resulting gases being withdrawn from a neutral zone at the interface of the concurrent and countercurrent treating zones. App. is described. U. S. 2,026,622 relates to similar app. and procedure in which the peripheral velocity of the introduced air and ore is progressively increased as the air-ore mixt. descends, so that solids are deposited close to the outer periphery of the chamber. Cf. C. A. 29, 3288*

Treating sulfide ores containing zinc, copper and iron Thomas A. Mitchell (to Hughes Mitchell Processes, Inc.) U. S. 2,025,068, Dec. 24. A sulfide ore such as one contg sulfides of Zn, Cu and Fe is mixed with a Pb compd. such as PbS or PbO proportioned for combining with the sulfate radical formed during a roasting operation, and the mixt. is roasted to form a product contg the oxide of the desired ore metal such as ZnO interspersed with Pb sulfate. Various details of treatment are described.

Fusing iron ores Karl Koller and Zsigmond v. Galocsy Fr. 787,484, Sept. 23, 1935. In fusing Fe ores or briquets contg ores and C in a blast furnace, a part of the C necessary for the operation and the O are introduced in the form of a mixt. of hot gases prepd in a combustion chamber connected with the furnace by complete combustion of a fuel with O or air enriched with O. A furnace is described.

Treating iron ores containing various companion metals Friedrich Johannsen (to Fried. Krupp Grusonwerk A.-G.). U. S. 2,026,683, Jan. 7. For reclaiming, from ferriferous raw materials such as ores, companion metals (such as Cr, Mn, Mo, etc.) reducible at higher temps than Fe, a mixt. of the material with a reducing agent such as comminuted waste coke is passed through a metallurgical furnace such as a rotary tubular furnace in which the charge is agitated and preheated up to temps at which Fe compounds are converted into iron sponge (suitably to 600-900°), then further preheated (suitably to 900-1400°) to a

temp at which, while the companion metal compds. remain unreduced, the sponge iron is about to lump; a current of oxidizing gases is caused to react with the preheated charge so that a portion of the Fe of the sponge is burnt and addnl. heat is produced, sufficient for effecting the lumping of the iron sponge and for producing from the Fe oxides and the slag-forming constituents of the ore, which are fluxible by Fe oxide, slags contg. the companion metal compds. and Fe oxides sufficiently liquid as to sep. from the lumping iron; the Fe oxides of the slags are reconverted into lumped iron, while the companion metal compds. remain unreduced, and the slags and lumped iron are jointly removed from the furnace and are subsequently sep'd from each other. App. is described.

Chloridizing zinc ores. Lafayette M. Hughes Brit 434,800, Sept. 6, 1935. In chloridizing a roasted sulfide ore contg ZnO, the major portion of the ZnO is first chloridized, e. g., at 80-110° in an atm. contg. Cl, HCl, etc., the ZnCl₂ being optionally removed, and the ore is then treated in the presence of Fe₂O₃ with HCl gas in substantial absence of air and at a final temp. of below 90° to form cryst. FeCl₃ which is caused to react with the unchlorinated Zn to form FeCl₂ and more ZnCl₂. To complete the formation of chlorides, air may be passed over the treated ore in counter-current at 250-350° to decompose the Fe chlorides and form Fe₂O₃ and Cl, the waste gases from this stage being utilized in the 1st chloridizing step.

Recovering metals from oxides. Österreichisch-amerikanische Magnesit A.-G. (Konrad Erdmann, inventor) Austrian 143,621, Nov. 25, 1935 (Cl. 40a). A mixt. of a metal oxide and C is fed at regular intervals, in small quantities at a time, to a furnace heated to above the b. p. of the metal at the working pressure. The conditions are so selected that a rapid reaction occurs and accumulation of the charge in the furnace is avoided. Also, the furnace is preferably so constructed that by-products or impurities which remain solid under the working conditions are carried away by the gaseous and vaporized reaction products. The initial mixt. may be fed to the furnace in the form of small briquets. The process is particularly useful in the production of Zn, Cd and Mg. Plant including an elec. arc furnace is described.

Aluminum waste Metallurgische Erbslöh A.-G. Ger. 618,731, Sept. 14, 1935 (Cl. 40a 50.20). Al waste, especially foil, is pressed, or rolled to form a transportable mass.

Apparatus for making centrifugal castings such as those of different steels Hans Breitbart. U. S. 2,026,457, Dec. 31. Mech. and operative details.

Casting mold Heraeus-Vacuumschmelze A.-G. and Wilhelm Rohn Ger. 618,870, Sept. 17, 1935 (Cl. 31c 26.01). A mold for the casting is made by sintering powd. W or Mo or their carbides. An addn. of powd. low-melting metals such as Fe, Ni or Co may be given.

Aluminothermic process Wilhelm Sander (to Th. Goldschmidt A.-G.). U. S. 2,024,132, Dec. 10. Alloying constituents such as Mn, Ni, Cr, Ti, V or W are added to an aluminothermic mixt. in a crucible, in admixt. with inert, refractory, slag-forming substances such as Al₂O₃ or slag, and the mixt. is applied as a packing layer about the tap hole of the crucible to prevent flow of the aluminothermic melt prior to completion of the aluminothermic reaction (the usual aluminothermic mixt. being added to the crucible above the packing layer). App. is described.

Metallurgical furnace Levi S. Longenecker. U. S. 2,024,649, Dec. 17. Various structural, mech. and operative details.

Open-hearth metallurgical furnace of the reversing type Wm. M. Henry (to American Steel and Wire Co. of N. J.). U. S. 2,025,165, Dec. 24. Structural features of a furnace with water-cooled fuel nozzles.

Furnace construction suitable for open-hearth furnaces Leon T. Petit. U. S. 2,024,595, Dec. 17. A construction is described of bricks so shaped and arranged as to provide internal undercut pockets which serve to hold in place an inner lining of material, such as chrome ore and MgO or the like, resistant to attack by basic substances when highly heated.

Rotating-drum furnace for metallurgical and chemical operations. Metallgesellschaft A.-G. (Kurt R. Göhrre, inventors). Ger. 618,872, Sept. 17, 1935 (Cl. 40a 5 01).

Furnace for roasting ores, etc., comprising superimposed rotary and stationary hearths. Balz-Erzrohung G. m. b. H. Ger. 621,100, Nov. 2, 1935 (Cl. 40a 4 53). Means is described for cooling the upper hearths with air.

Rotating furnace for roasting ores. Fried Krupp Grusonwerk A.-G. (Walter Hartwig, inventor). Ger. 618,600, Sept. 11, 1935 (Cl. 40a 5 01).

Furnace for roasting sulfidic ores and foundry products. Soc. anon. la nouvelle Montagne. Ger. 618,757, Sept. 16, 1935 (Cl. 40a 2 01).

Crucible furnace suitable for melting metals. Furman South, Jr., and Oscar E. Neuhausen (to Lava Crucible Co. of Pittsburgh). U. S. 2,024,707, Dec. 17. Various structural details.

Apparatus for fusing metals. Enrique G. Touceda (to Consolidated Car-Heating Co.) U. S. 2,024,615, Dec. 17. An app. is described in which a spectral image of an enclosed blank such as one in an electrically heated furnace is formed outside the enclosure to indicate the incidence of fusion.

Apparatus (with a vertical reaction chamber) for roasting fines such as those of pyritic ores. Wm. J. Burgoyne and Henry J. Cordy (to General Chemical Co.) U. S. 2,025,709, Dec. 31. The finely divided material is introduced into the upper end of the app. and suspended in an oxidizing gas. Various structural and operative details are described.

Furnace for heating metal strip before rolling. Demag A.-G. Ger. 621,199, Nov. 2, 1935 (Cl. 18c 6 60).

Oil-fired two-chamber furnace for annealing and hardening reamers and like tools. Carl Stiefel. Ger. 621,040, Oct. 31, 1935 (Cl. 18c 5 10).

Annealing furnaces. Siemens-Schuckertwerke A.-G. (Johann Schnepf, Otto Günther, Rudolf Grundmann and Heinrich Wassner, inventors). Ger. 618,821, Sept. 16, 1935 (Cl. 40d 2 40). Rollers for conveying metal objects through annealing furnaces are made from steatite heated to 600-700°. The steatite may be mixed with kaolin or feldspar.

Conveyor shaft for high-temperature furnaces such as those used for heat-treating metals. Oliver K. Carpenter (to Duraloy Co.). U. S. 2,024,024, Dec. 10. Structural and mech. details.

Pyrometric device suitable for use with air mains of blast furnaces. Howard A. Byrns (to National Tube Co.). U. S. 2,025,015, Dec. 17. Structural details of a device with a thermocouple.

Carburizing box for use in heat-treating furnaces. Henry H. Harris. U. S. 2,026,311, Dec. 31. End parts of a carburizing box are formed of castings of relatively high-Fe-content alloy and central portions of the box walls and bottom are formed of flexible sheet metal of relatively low-Fe-content alloy. Various structural details are described.

Slag deflector for furnaces. Fred J. Chatel. U. S. 2,026,270, Dec. 31. Structural details.

Blast-furnace slag. Veremigte Stahlwerke A.-G. (Josef Roll, inventor). Ger. 621,282, Nov. 4, 1935 (Cl. 80b 5 04). The mech. properties of blast-furnace slag are improved by introducing silica into the furnace at a point below the tuyères. This is preferably effected by blowing sand into the furnace.

Magnesium. Oesterreichisch-amerikanische Magnesit A.-G. Fr. 787,476, Sept. 23, 1935. Powd. Mg is wetted with hydrocarbon oils which are removed by heating in an inert or reducing atm. and metallic Mg is produced in a compact form by heating the mass to a temp. near the b. p. of Mg until the particles agglomerate, or by completely re-evap. and condensing.

Metallic magnesium. Fritz Hansgig (to American Magnesium Metals Corp.) U. S. 2,025,740, Dec. 31. Mg vapor such as that produced by the thermal reduction of MgO by C and H is condensed to obtain solid Mg in finely divided form and the latter is then heated with a nonoxidizing gas such as H to nearly the b. p. of metallic

Mg to effect coalescence of the Mg particles. Cf. C. A. 30, 715.

Apparatus for removing lead from zinc by distillation. The New Jersey Zinc Co. Ger. 618,820, Sept. 19, 1935 (Cl. 40a 34 80).

Zinc, tin and lead oxide "Sachtblehen" A.-G. für Bergbau und chemische Industrie (Adolf Krus and Waldemar Jensen, inventors). Ger. 618,685, Sept. 13, 1935 (Cl. 40a 41 01). Zn, Sn, PbO and Ag are obtained by heating slag contg. these and roasted pyrites in a converter with air-blast nozzles in its base. The slag is either molten or mixed with coke. Examples are given.

Apparatus for refining zinc by distillation. The New Jersey Zinc Co. Ger. 618,873, Sept. 17, 1935 (Cl. 40a 34 80).

Bearing materials. Leadizing Co. Brit. 434,277, Aug. 26, 1935. In a composite bearing element having a facing member of a hardened Pb alloy contg. not less than 95% Pb bonded to a metallic body or backing member, the bonding medium or solder consists of a Pb alloy contg. 20-30% Sn. The Pb alloy of the facing member is hardened by the presence of Ca, Na or other alkali or alk. earth metals, "Safco" and "Iary" metals and "Bahnmetall" being especially suitable. The surface of the backing member is covered with a corrosive flux, e. g., an aq. soln. contg. 50-75% ZnCl₂, and dipped in the molten solder which is maintained at 340-370°. The hardened Pb alloy is then cast against it at not less than 480°.

Producing pipe from skelp. Walter T. Mahla and James L. Mauthe (to National Tube Co.) U. S. 2,025,001, Dec. 17. In a process involving heating skelp in a furnace and then passing it through a welding bell, heated air and a mixt. of air and O are successively applied to the edges of the skelp after leaving the furnace and before passage through the welding bell, to avoid undue burning.

Pipes or tubes from skelp. Julius L. Sussman. U. S. 2,024,493, Dec. 17. App. and various operative details are described, involving the use of elec. current for heating and welding the skelp.

Pipes and tubes from pierced billets. Bryant Bannister. U. S. 2,025,140-7-8, Dec. 24. Various details of app. and operation.

Hard lining metal for lining steel tubes, etc. Frederick A. Kormann and Walter F. Hirsch (to Industrial Research Laboratories, Ltd.) U. S. 2,025,000, Dec. 24. Cast iron of a C content of 2-5% is melted in contact with borax and in the presence of Si and extraneous C and the material is maintained in molten condition for from about an hr. to several hrs. to cause absorption of B to the amount of 0.15-4.0% of the metal.

Metal surfaces. Bozel-Malétra (Société industrielle de produits chimiques) Fr. 780,225, Aug. 29, 1935. Metal surfaces are made resistant to wear and seizing by coating them with Co in any manner.

Apparatus for removing scale from hot wheels, etc., during rolling by scraping. Amos G. Cole. U. S. 2,024,993, Dec. 17. Structural, mech. and operative details.

Pickling metal blanks. Walter Heimberger. Ger. 618,614, Sept. 12, 1935 (Cl. 48d 2 01); Fr. 786,191, Aug. 28, 1935. The pickling acid consists of a mineral acid of less than 5% concn. and contg. in soln. up to 5% of a salt with a different anion and whose cation is a less noble metal than that to be pickled. The bath is heated to above 50°. Thus Fe is pickled in a bath contg. HNO₃, 1 and MgSO₄, 2% or HCl or H₂SO₄, 1 and KNO₃ or NaNO₃, 2%.

Treating metal sheets, etc. Bethlehem Steel Co. Brit. 434,113, Aug. 22, 1935. Tendency to flute or stretcher strain in annealed or normalized low-C steel sheets is lessened by subjecting them to mech. strain and preventing their reversion to their original state upon heating and subsequent cooling by subjecting them to mech. strain during the cooling while still above 700°F., preferably at about 750°F.

Nitriding metal articles. Lorenz Stammberger (to Leeds & Northrup Co.) U. S. 2,025,134, Dec. 24.

For imparting high surface hardness with a smoothly continuous and substantially linear hardness-depth characteristic, the temp of the load in a nitriding atm is maintained substantially const at about 465-540° for a certain period and subsequently, during a substantial portion of the total nitriding period, is increased to about 600-650°. App is described for control of the process.

Rolling sheet metals Howard G. McIlvried (to American Sheet and Tin Plate Co.) U. S. 2,025,002, Dec. 17. In working a thin and relatively wide metal strip, it is moved through a single-stand cold rolling mill at a linear speed of at least 400 ft per min., the cross-sectional area of the strip is reduced at least 35% on its first pass, and is further reduced at least an additional 35% while confining the material to not more than three passes after the first pass. App is described.

Rolling rails, etc. Herman J. van Royen. Brit. 434,955, Sept. 12, 1935. Rails are made from steel with lamellar-pearlitic structure contg. C less than 0.9, Mn 0.6-0.8 and Mo up to 0.3%, the work cooling to about 1000° before the final rolling pass so that it leaves that pass at below 900° and retains said structure. The steel may contain Cr 0-0.5, W 0-0.7 and (or) V 0-0.2, in which case the Mn may be reduced to about 0.5%. Si 0.2-0.3 and P and S below 0.04% may also be present.

Preventing formation of blisters in heat treatment of aluminum and its alloys Philip T. Stroup (to Aluminum Co. of America.) U. S. 2,024,751, Dec. 17. Blistering due to gas formation is prevented by treating the molten metal, prior to casting, with about 0.05-5.0% of Na fluoroborate.

Heat treatment of malleable iron castings Cyril S. Smith (to Battelle Memorial Institute.) U. S. 2,024,014, Dec. 10. Malleable iron castings contg. C 0.5-5% are heated to about 700-850°, cooled at a rate greater than approx 25° per hr to about 400-600°, and, without further cooling, maintained at a temp within the latter range for a sufficient time (which may be about 4 hrs.) to produce a substantial increase in hardness. Cf. C. A. 29, 3641.

Heat treatment of chromium alloy steels Frederick M. Becket and Russell Franks (to Electro Metallurgical Co.) U. S. 2,024,561, Dec. 17. Ferritic steels contg. Cr about 4-30, C not over about 0.23% and Ti at least about 4 times the C content and not more than 4 times the C content plus about 1.5% are heated to about 700-1000°, held at such temp. for about an hr. and then cooled to room temp.

Treatment of metals or alloys, particularly steel, with heat and supersonic waves Soc. d'exploitation des procédés Mahoux. Ger. 621,200, Nov. 2, 1935 (Cl. 18c 8.50). See Fr. 695,045 (C. A. 25, 1792), 700,049 (C. A. 25, 3304), 38,999 (C. A. 26, 1565) and 39,915 (C. A. 27, 608).

Magnetic iron and steel Heihachi Kamura. U. S. 2,026,390, Dec. 31. Carbonless reduced iron is mixed with high-P reduced iron produced by H reduction from Fe ore high in P, and the mixt is melted with a small addn. of Si and Ti.

Cementing steel and iron Hugo Hanusch (to E. F. Houghton & Co.) U. S. 2,025,050, Dec. 24. A compn. molten at cementing temps. and contg. material capable of supplying C to the metal at such temps. is formed of an alkali metal cyanide such as NaCN about 8, NaCl about 62-65, KCl 18-19 and an activated C of low combustibility about 8%. An app is described.

Steel Earl C. Smith (to Republic Steel Corp.) U. S. 2,025,425, Dec. 24. After making Bessemer steel contg. about 0.05% Mn, about 1.25% of Mn is added to the steel while it is being poured into a ladle, and 4-7 lbs. of siderite per ton of steel is also added during the pouring, to produce a steel which can be readily machined.

Steel Mannesmannröhren-Werke (Wilhelm Bernatzky, inventor) Ger. 621,345, Nov. 6, 1935 (Cl. 18d 2.20). For making pressure weld containers, tubes, etc., required to withstand pressure, use is made of steel prep. by a fusion process and contg. C up to about 0.2 and W 0.1-0.7%.

Normalizing steel Wm. C. Chancellor (to National Tube Co.) U. S. 2,025,010, Dec. 17. The steel is heated to a temp. slightly above the crit. temp. range, cooled to a temp. below the crit. range and, during cooling through the crit. range and while above its transformation temp., is subjected to alternate tensile and compressive stresses effecting a slight reduction in area.

Dephosphorization and desulfurization of steel. Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. Fr. 790,390, Sept. 2, 1935. The steel is beaten up with a very oxidizing fluid slag contg. one or more free bases in large excess, the operation being carried out so as to obtain a reciprocal penetration and so that the slag retains its strongly basic character. The fluidity is obtained by adding fluxes such as fluorspar, SiO₂ or TiO₂. Thus a flux may be used contg. lime 45, SiO₂ 20, Fe oxide 19, MnO₂ 6 and fluorspar 10%.

Working metals such as copper on steel Frank L. Antselt (to Copperweld Steel Co.) U. S. 2,026,605, Jan. 7. For making a coherent, integral mass of metal from a series of layers such as Cu-coated steel, portions of each layer are successively compacted to refine the grain structure, leaving intermediate portions in their original coarse grained state to anchor the layers together, and the layers are annealed so that the intrusive effect of the compacted portions extends to adjacent layers, wiping out boundaries and uniting the layers. App is described.

Annealing steel Vereinigte Stahlwerke A.-G. (Franz Eisenstecken, inventor) Ger. 621,346, Nov. 5, 1935 (Cl. 18c 8.80). In steel-annealing processes in which a nonoxidizing gas, e. g., coke-oven gas, is used to prevent oxidation, the gas is first passed at 250-400° over a catalyst contg. Cu and (or) Ni, and then dried. Traces of O in the gas are thus removed.

Stainless steel Fabien C. L. Rochat and Jules L. A. Rochat. Fr. 787,234, Sept. 19, 1935. The steel contains Fe 73.15-71.13, C 0.1-0.12, Cr 16-18, Ni 9, Co 0.5, Ag 0.25, Al 0.5 and Mg 0.5%.

Weld steel, I. G. Farbennad, A.-G. (Otto Heusler, inventor). Ger. 618,956, Sept. 19, 1935 (Cl. 18c 4). Small shot or puddled Fe is packed within the interstices filled with a mixt. of metal powder and a substance giving off an indifferent or reducing gas and pressed at welding temp. In an example, the filling mixt. may be powd. Fe obtained by decompn. of Fe oxide, chloride or carbonyl and NH₄Cl or colophony.

High-chrome steel Lewis B. Lindemuth (to Moa Bay Co.) U. S. 2,026,183, Dec. 31. Chrome-iron is blown in a basic converter to a point where most of the Cr is accumulated in the slag as oxide, and a charge consisting of the converted slag and a sufficient quantity of the blown metal to produce the desired product is melted and refined under nonoxidizing conditions in a basic furnace in which reducing agents such as ferro-Si or Al are added to the slag to deoxidize the Cr in it.

Hard alloys. Anton Kratky. Austrian 133,627, Nov. 25, 1935 (Cl. 40b). In the manuf. of hard alloys by sintering hard carbides and (or) nitrides with 5-20% of an auxiliary metal of lower m. p., e. g., Fe, Co, Ni or Cr, use is made of a system where thin layers of the alloys are successively prep. and superimposed. A thin layer of the powd. alloy components is first spread on a support heated to a temp. somewhat below the m. p. of the auxiliary metal, e. g., 1000-1200°, and sufficient pressure is applied, e. g., by a roll or stamp, to form a coherent layer. Another thin layer of powd. alloy components is then applied, and the process is repeated until a mass of the required thickness is obtained. The products may be homogenized by heating them for some time. The process is effected *in vacuo* or in a reducing gas. The support may be of Fe, W or C, and may or may not, as desired, be removed from the finished products. App is described in which the alloy layers are built up on the inner surface of a rotating ring.

Hard alloys Alfred Kropf. Ger. 621,191, Nov. 2, 1935 (Cl. 40b 17). Addn. to 564,202 (C. A. 27, 915) and 611,934 (C. A. 29, 58037). Suitable materials are fused together to yield alloys of the compn. W 3-78,

Gold alloys W C Heraeus, G m b H. Ger 621,152, Nov 2, 1935 (Cl 40b 4). Hard alloys capable of being cast contain Au up to 20, Cd, Mo and (or) W up to 5, and Al, Mg, Sn, Zn, Cr and (or) Mn up to 10%, the remainder being Pd and Ag, with or without up to 3% of P or Si. The hardness of the alloys may be raised by chilling them from 900° or more and then reheating to 300-700°. Sp alloys are described.

Magnesium alloys Roy E Faine (to Magnesium Development Corp.) U S 2,026,549, Jan 7. Alloys which have good resistance to corrosion contain Mg together with Pb 0.5-22 and Cd 1-10%. U S 2,026,590 relates to alloys of Mg with Pb 0.5-22 and Al 1-15%. U S 2,026,591 relates to alloys of Mg with Pb 0.5-22, Al 1-15 and Sn 1-15%. U S 2,026,592 relates to alloys of Mg with Pb 0.5-22, Al 1-15, Mn 0.1-1 and Ca 0.1-2%. All these alloys are resistant to corrosion. Cf C A 29, 3640.

Nickel-chromium-calcium alloys David P. Moore U S 2,026,243, Dec 31. Alloys which may be used for lamp filaments or in making stainless steel contain Ni 33-95, Cr 2.5-33.3 and Ca 2.5-33.3%.

Coating metal sheets with tin Wm. E Taylor (to American Can Co.). U S 2,026,598, Jan 7. For removing impurities from oil used in a tin-coating app., the oil contg impurities is transferred to a cleaning device such as a filter, and the purified oil is heated and returned to the coating app. App is described.

Coating metal sheets by use of a molten tin bath Henry W Nieman (to Bethlehem Steel Co.) U S 2,026,768, Dec 31. In the use of a molten Sn bath, molten metal is continuously removed from the bath, cleaned and returned to the bath. App is described.

Testing and arranging magnetic materials such as steel blooms Wilbur H Armco (to Superheater Co.). U S 2,024,500, Dec 17. App and various operative details are described.

Welding electrodes The British Thomson-Houston Co Ltd Brit. 434,524, Sept 3, 1935. The electrodes are provided with a flux coating comprising a backing

member impregnated with a flux contg 10-60% of ilmenite (I). A suitable flux consists of I 21, feldspar 39, liquid Na silicate 31 and a deoxidizing material, e. g., Fe-Mn, 9%.

Coated welding rod Wilber B Miller (to Orwel Acetylene Co.) U S 2,024,991, Dec. 17. A core such as one of ferrous metal is provided with a coating contg slag-forming materials 65-98, a coal such as canal coal about 2-25% and a binder such as water glass.

Welding rod suitable for forming hard facings on metal articles Wm A Wissler and Wilber B Miller (to Haynes Steel Co.). U S 2,024,992, Dec 17. A core of ferrous metal is provided with a coating contg flux material, metallic compds., carbonaceous material and metallic alloys formed of C 3-5, Mn 10-25, Si 0.1-3.0, Cr 30-45 with the balance principally Fe.

Rod suitable for welding with an oxyacetylene flame. John J Crowe (to Air Reduction Co.). U S 2,026,418, Dec. 31. An alloy is used contg C less than 0.3, Ni 1-4, V 0.05-0.5, Mn 0.4-1.2 and Si 0.1-0.45%.

Apparatus for electric welding of materials such as springs and electrical contacts Conrad L Pfeiffer (to Western Elec Co.) U S 2,024,597, Dec 17. Structural, mech and operative details.

Welding iron and steel alloys containing manganese. John H. Hall (to Taylor-Wharton Iron & Steel Co.) U S 2,026,407, Dec 31. Iron or steel alloys contg Mn 10-15% and C 1.0-1.4% are welded by use of a welding alloy of iron or steel contg Mn 10-15, Ni 1-5% and less C than the parent stock. U S 2,026,468 relates to a weld rod, for welding austenitic Mn steel articles, consisting of austenitic Mn steel having air toughening properties and contg Si about 0.5-2.5%.

Solder Carl Wunderle (15%) to Frank A Hunter). U S 2,025,323, Dec 24. Molten lead 12 oz in a crucible is treated with 0.25 gram of NH_4Cl and stirred to sep impurities such as compds of As, Fe and Cu which collect at the surface and are removed, Sn 3.13 oz. is added and Bi 0.87 oz is subsequently added.

10—ORGANIC CHEMISTRY

CHAS A ROUILLER AND CLARENCE J WEST

The action of thiocyanogen on unsaturated hydrocarbons A Krassulchik. *Ann combustibles liquides* 10, 923-87 (1935). —By double decompn. between $\text{Pb}(\text{NO}_3)_2$ and KSCN , pure $\text{Pb}(\text{SCN})_2$ is obtained which, after drying *in vacuo* over H_2SO_4 , is suspended in AcOH made H_2O free by refluxing with Ac_2O . Upon addn of Br, $(\text{SCN})_2$ (I) is formed, and its soln is filtered off. Solns 0.1 N or weaker are stable. Weighed amts. of unsatd hydrocarbons are dissolved in the AcOH soln of I, and after reaction, the excess I is titrated with KI and $\text{Na}_2\text{S}_2\text{O}_3$. With 300% excess I, the reaction is bimol and is practically complete in 10-40 hrs., with absorption from 60-95% of theoretical, depending on the hydrocarbon. Some hydrocarbons, like stilbene, do not react at all. The addn of I is not as regular as that of I, and is greatly influenced by traces of Cl or Br. The variation in rate of addn of I may be used to fractionate mixts of olefins. G. Calingaert.

Atomic equilibria in the molecules of hydrocarbons of the series $\text{CH CCH}_2\text{R}$ E F Zeberg. *J. Gen. Chem. (U. S. S. R.)* 5, 1016-19 (1935), cf. *J. Russ Phys.-Chem. Soc.* 50, 161 (1918). —Various expts on the heating of $\text{CH}_3\text{CICH}_2\text{CICH}_2\text{Ph}$, b_m 136-8°, α 242-5°, and $\text{CH}_3\text{Br-CHICH}_2\text{Ph}$, b_m 137-8°, with alc. and solid KOH under pressure and in the water bath under atm and neg. pressures gave only methylphenylacetylene (I), b 182-3°. The results indicate the instability of the intermediate phenylallene and the instantaneous isomerization of benzylacetylene to I.

Chas Blanc. Dimerization of 1,3 butadiene S Lebedev and S Sergienko. *Compt rend acad sci U. R. S. S.* 3, 79-82 (1935). —Fractionation of the dimer formed during the

thermal polymerization of 1,3-butadiene yields mainly 1-ethenyl-3-cyclohexene (I), b_m 129.5-30.5°. A small amt of a monocyclic hydrocarbon isomeric with I is also obtained. Bromination of I yields 2 isomeric tetra-bromides, *cis* (II), m 74-5°, and *trans* (III), m 101.5-2.5°. The hydrocarbons generated from II and III proved identical with the original dimeric product and with I and its isomer show no tendency to further polymerization.

W J Peterson

The synthesis of the derivatives from 2,4-dichloro-2-butenes The use of by-products from the synthesis of chloroprene A L Klebanski and K K Cheyukhalova. *Sintet Kautchuk* 1935, No 6, 16-21. —(I) 2,4-Dichloro-2-butenes (I) was treated with a 15% excess of 24-50% alc. KOH, by stirring for 4 hrs on a water bath (60-70°). The product of reaction was sep'd from salts and fractionated *in vacuo* and was collected at 62-64° at 40 mm; it had the following consts.: d_{20}^{20} 0.7923, n_D^{20} 1.4382, mol refraction 36.03, Cl 26.07%, C 54.04%, H 8.01%, O 11.78, LiO 99.70% of theoretical value, formula $\text{C}_4\text{H}_5\text{OCl}$ (Et ether of 2-chloro-2-buten-4-ol); it did not polymerize. (2) I was treated with 15% excess of 15-20% Na_2CO_3 , by stirring for 2 hrs on a boiling water bath. The product of reaction is a chloro alc. (chlorobutenol) (II), it was dist'd at 90-110° (yield 70-80%), and b_m 92°, d_{20}^{20} 1.106, n_D^{20} 1.4652, mol refraction 26.64, Cl 32.8%, C 45.33%, H 6.47%, O 15.40%, formula $\text{C}_4\text{H}_5\text{OCl}$, it did not polymerize. (3) To establish the alc. group in II a xanthate was obtained by adding the theoretical amt of KOH to the II with stirring for 30 mins and heating on a water bath. KOH was in a suspension; with the addn. of a 20% excess of CS_2 , a cryst

ppt. of xanthate was formed, the latter was dried in air or at const. temp. of 30–40°. The reaction proceeded as follows: $\text{CH}_3\text{CCl}(\text{CH}_2\text{CH}_2\text{OH}) + \text{KOH} + \text{CS}_2 \rightarrow \text{KSCCOCH}_2\text{CH}_2\text{CH}_2\text{OH} + \text{H}_2\text{O}$. The resulting xanthate was sol in water and alc.; it contained Cl 17.6%, S 31.20%, at 142° it changed from yellow to a darker color, it can be used for flotation (equals the K Et xanthate) (4). The water soln. of KOH (15% in excess) was treated with II, heated on a water bath, and I was gradually added with stirring. The reaction was completed in 4 hrs. The product of reaction was washed with water, dried over CaCl_2 and distd. *in vacuo* (yield 80–90%). The consts. of the resulting dichlorodibutyl ether were $b_D^{42} 142^\circ$, Cl 36.9%, d₄ 1.171, $n_D^{20} 1.4590$, mol. refraction 50.11, formula $\text{C}_8\text{H}_{16}\text{OCl}_2$. The product did not polymerize (5). I was passed through a china pipe over silica gel at 245–75°, over Glukhovskaya clay at 240–60° and 250–300° and over molten KOH at 285–450°. In all cases chloroprene was obtained (yield 17–24%), with the following consts. $b_D^{26} 26^\circ$, d₄ 0.9375, $n_D^{20} 1.4570$.

A Pestoff

Synthesis of α,β -dichlorobutadiene and its polymerization. A. I. Klebanik, A. S. Volkenshtein and A. P. Orlova. *J. Gen. Chem. (U. S. S. R.)* 5, 1255–67 (1935). Attempts to obtain $\text{CH}_2=\text{CHCl}(\text{CHCl})_2$ (I) from $\text{CH}_2=\text{CHCl}$ (II) directly with SbCl_5 in the presence of SbCl_3 (cf. *Chem. Ind.* 25, No. 1, 22 (1931)) and by treating II with a soln. of CuCl_2 , CuCl and NH_4Cl or FeCl_3 , CuCl and NH_4Cl resulted in little I and considerable tetramer and tetrachloride. The best results were obtained by converting II with NaClO to $\text{CH}_2=\text{CHCl}(\text{CHCl})_2$ (III) and this with HCl to I under the following optimum conditions: III, b 55–7°, d₄ 1.021, d₂₀ 1.0034, $n_D^{20} 1.4693$, M. R. 23.61, exaltation 0.64, was obtained in 57% yield by mechanically shaking for 16 hrs. II with 5% NaClO contg. 15% NaOH . Several months after this work was completed Jacobson and Carothers (*C. A.* 28, 95) reported that by a similar process they obtained III in 10% yield, possessing extremely explosive properties. This may be explained by contamination of their product with Cl derivs. of C_4H_6 , I, $b_D^{40} 60^\circ$, d₄ 1.207, $n_D^{20} 1.5078$, M. R. 30.47 (obs.), 29.472 (calc.), exaltation 0.99, was obtained in 56% yield when 139 g. HCl (d 1.19) said with HCl to 50–3% concn. was treated with 80 g. III, 23.2 g. CuCl and 4 g. NH_4Cl and then allowed to stand for 16 hrs. I is spontaneously polymerized to a rubber-like polymer which on vulcanization gives an ebonite-like substance. Twenty literature references. C. B.

Organic vanadium compounds. I. A. V. Kirsanov and T. V. Sazonova. *J. Gen. Chem. (U. S. S. R.)* 5, 956–62 (1935). (iso-AmO) \cdot VO reacted with PhMgBr , giving Ph and some org. V compounds which could not be isolated (cf. Vernon, *C. A.* 25, 5897). The interaction of MeMgI and (iso-AmO) \cdot VO produced C_4H_9 and no org. V compounds (BrO), VOH , ($\alpha\text{-HOC}(\text{H}_2\text{CO}_2)\text{VOH}$, ($\alpha\text{-H}_2\text{N}(\text{H}_2\text{CO}_2)\text{VOH}$ and (CH_3CO_2) \cdot VOH were prepd. by the interaction of a H_2SO_4 soln. of V^{+++} with the Na salts of the acids. Chas. Blanc.

The reversible splitting of organomercuric cyanides with hydrogen chloride. Edward Carr. *Iowa State Coll. J. Sci.* 10, 61–3 (1935).—The electron-sharing ability of org. radicals (cf. *C. A.* 21, 2637) may serve as a basis for systematizing org. chemistry. This ability can be measured by ionizations or equilibria. Kharasch defines electronegativity on the basis of irreversible splitting of organo-Hg compds. (cf. *C. A.* 26, 1589). Both R_2HgCN and RHgR were split with HCl. The former, a reversible reaction, measures a different property of the RHg bond than does the latter, an irreversible reaction. Decomposition temps were found by heating to darkening. Comparison of results shows that thermal decompn. and irreversible decompn. with HCl measure the stability of the C-Hg bond. F. E. Brown.

Production of decylaldehyde. O. Osipova. *Masloboino Zhivoe Delo* 11, 378–9 (1935).—Distn. of fusel oils gives about 3% of a residue contg. 13% fatty acids with about 60% capric acid. Passing a vapor mixt. of capric and

formic acids over MnO at 330–75° resulted in 70–8% decylaldehyde. Chas. Blanc.

Production of nonylaldehyde and nonyl alcohol. R. Shagalova. *Masloboino Zhivoe Delo* 11, 452–3 (1935).—The Hesse method of production of nonylaldehyde (I) and nonyl alc. (II) by fusing undecylenic acid with KOH to give pelargonic acid (III), reducing the Et pelargonate with Na in abs. alc. to II and oxidizing the latter to I, was modified by reducing III in the presence of a MnO catalyst to I of high purity with 60–5% yield. The method of reducing I to II is being investigated. C. B.

Production of hydrocitronellal. O. Khol'mer. *Masloboino Zhivoe Delo* 11, 379–80 (1935).—The bisulfite compd. of citronellal was hydrated and then decompd. with NaOH, giving 50% of pure hydrocitronellal. Chas. Blanc.

Addition of hydrogen bromide to triple and double bonds. Undecyanoic, undecenoic and 10,11-epoxyundecenoic acids. P. L. Harris and J. C. Smith. *J. Chem. Soc.* 1935, 1572–6, cf. *C. A.* 29, 7278¹.—Passing HBr-air through $\text{CH}_3\text{C}(\text{CH}_3)_2\text{CO}_2\text{H}$ (I) in C_6H_6 contg. Br_2/H for 3 hrs. at 0° gives as the main product 11-bromo-undecenoic acid (II), in the presence of PhNH_2 , 33, 27 and 18% of I remained after 3, 5 and 8 hrs., resp., the main fraction by, 151–7° and m. 12.1°. Identification of the products of the reactions depends on the constitution of the Br acid, m. 41.5°, assumed by Kraft and Seldis (*Ber.* 29, 2232 (1896)) to be *trans*-II. The following considerations give a clear indication of the constitution. The product of incomplete catalytic reduction does not contain 10-bromoundecenoic acid (III) and although the 11-isomer was not isolated, its presence was indicated by the cryoscopic behavior of the mixt., complete reduction gives undecenoic acid, the Br atom in III is very difficult to reduce. The formation of solid solns. with the 11-Br acid and of a eutectic system with III indicates great similarity of structure with II. Addn. of HBr to undecenoic acid (IV) in CS_2 , CHCl_3 and CCl_4 is sensitive to "oxidants", unless traces of EtOH are removed from CHCl_3 , the solvent acts as an antioxidant and gives mainly III. In the absence of EtOH , Br_2/H has an immediate catalytic effect on addn. to IV. 10,11-Epoxyundecenoic acid (V), m. 45.5°, results in 25–50% of Br_2/H from IV and Br_2/H in ligroin at 30°; HBr gives a mixt. of bromohydrins. From a mixt. of IV and V in ligroin, HBr at 0° gives the 11-Br deriv. of IV. In these reactions none of the catalysts is effective in the absence of mol. O_2 . V is not an intermediate in the formation of the 11-Br deriv. of IV. C. J. West.

Preparation in a high state of purity of long-chain compounds, in view of the determination of their energy contents. I. Oleic acid. L. Keffler and J. H. McLean. *J. Soc. Chem. Ind.* 54, 362–77 (1935); cf. *C. A.* 29, 6209¹.—The thorough purification of oleic acid is described. The Pb salt method fails to remove the final 3–4% of satd. impurities. The use of $\text{Pb}(\text{OAc})_2$ in large excess of the quantity required for the pptn. of the satd. acids does not render the sepn. more effective. The recrystn. of the Li salts from 5 vols. of 80% alc. can remove completely the higher unsatd. impurities, but 10–12 recrystns. are needed to secure that result. The low-boiling as well as the high-boiling satd. esters which contaminate the esters of oleic acid can be removed to within 0.2–0.3% by repeated fractional distn. under very much reduced pressure. The higher unsatd. esters cannot be removed thus. In the case of esters of oleic acid which have "aged" by keeping for long periods, complete (although possibly very wasteful) recovery may be effected by fractional distn., especially when combined with a preheating treatment at a temp. just below the b. p. of the ester. Oleic acid free from linoleic acid, and the esters prepd. from it, are much less susceptible to rancidity changes than samples which contain impurities of a highly satd. nature. Improvements in the app. required for the most effective fractional distn. of fatty esters are described. W. J. Peterson.

Oleic acid. T. P. Hilditch. *Chemistry & Industry* 1935, 1009.—Keffler and McLean (preceding abstr.) are

criticized for their failure to acknowledge the work of others in the prepn of pure olic acid. Brocklesby and Denstedt (C. A. 25, 5582) have described and illustrated a form of Bahl receiver which is the same in principle as that presented by K. and M. W. J. Peterson.

Relation between acidity and tautomerism IV. The role of the cyano group. F. Arndt, H. Scholz and Frobel. *Ann.* 521, 95 121 (1935), cf. C. A. 29, 1816¹—NCCCH₂CO₂Me (I) contains 1–32% of enol (Br titration), depending upon the temp (–12° to 20°), with CH₃N₃ it yields 2 Me derivs, m 76° (II) and 97–8° (III), the latter being NCC(CMeOMe)CO₂Me (Schmitt, *Bull. soc. chim.* 31, 341 (1904)), both give NCC(CMeOMe)CO₂Me with 2 N NH₄OH, heating II at 130–5° for 3.5 hrs gives III, indicating cis-trans isomerism. p-MeC₆H₄SO₂CH₂CN (IV) gives no color with FeCl₃, does not add Br and is sol in 2 N Na₂CO₃ only on heating, it does not react with CH₃N₃ on heating for 14 days, but in MeOH it reacts slowly (12 days), giving C₇H₅SO₂CH₂MeCN, b_p 200–5°, m 60°, and C₇H₅SO₂CH₂CN NMe, m 162°.

The Na deriv of IV with ClCO₂Me gives *Me tosylcyanoacetate* (V), m 70–80°, which is strongly acidic, gives a pos FeCl₃ reaction and adds Br, the enol content varies from 48 to 91%, with CH₃N₃ there results from 3 g. V at –50° 0.1 g. C₇H₅SO₂C(CO₂Me)C NMe, m 125–7°, and 0.9 g. C₇H₅SO₂CMe(CN)CO₂Me, m 101°; the 1st but not the 2nd decolorizes Br-MeOH soln. The Na salt from 19.5 g IV and 7.9 g AcCl in Et₂O give 7.9 g of 1-tosyl-1-cyanoacetone (VI), m 122–3°, with 30–65% enol form, with CH₃N₃ at –10° there result C₇H₅SO₂C(CN)CMeOMe, m 124°, and C₇H₅SO₂CMe(CN)Ac, m 150–1°; both are insol in cold alkali; the former is sol. in hot 2 N KOH, giving VI. H₂C(CN)₂ does not react with FeCl₃, Br or CH₃N₃ in MeOH. The Na deriv. from 19.5 g IV and 10.6 g BrCN give 8.1 g *tosylal nonitrile*, m 101–2°, with 45–88% enol form, at –50° CH₃N₃ yields a small quantity of C₇H₅SO₂CMe(CN)₂, m 103°, at –10° C₇H₅SO₂C(CN)C NMe is probably formed but was not isolated. The Na compd of CH₂(CN)₂ and ClCO₂Me give *Me dicyanoacetate*, m 65°, with 26–60% enol form, CH₂N₃ at –50° does not give a cryst. compd; the liquid is a mixt of O- and N-Me derivs. 1,1-Dicyanoacetone, m 141°, has 1.4 to 3.3% enol form, p-nitrophenylhydrazine, reddish brown, m 144° (decompn), CH₂N₃ gives a brown-yellow oil, a mixt of O- and N-Me derivs. The acidifying effect of the CN group is the strongest of all the C-contg simple substituents and follows the SO₂R group. It also shows electromeric action, as well as the form of the "enotrophic effect" as in "conjugation partner." In both respects it is less effective than the CO group but more so than the CO₂R group. The group CHCN can be transformed into the enamide group (C C NH) but a conjugation-partner is necessary, this may be a 2nd CN group, an ester CO group or a NO₂ group. The C C NH group behaves toward FeCl₃, Br and CH₃N₃ like the enol group. C. J. West.

The catalytic dehydrogenation and dehydrogenation of alcohols. N. N. Motovilova. *J. Chem. Ind. (Moscow)* 12, 1184–8 (1935).—A review. H. M. Leicester.

The synthesis of esters by the dehydrogenation of alcohols at ordinary pressure. B. N. Dolgov, M. M. Koton and S. L. Lei chuk. *J. Chem. Ind. (Moscow)* 12, 1060–73 (1935).—When EtOH is passed at 275° and a rate of 15 cc. per hr over a Cu catalyst prepd from Cu(OAc)₂ and contg 0.2% Ce, it gives 33% of EtOAc. If the gas mixt. is passed 4 times over the catalyst at 250°, the products are 49% EtOAc, 20% AcOH and 15.5% AcEt. Long columns of catalyst give better yields of ester. The catalyst is very stable and can be regenerated easily by passing air and then H₂ over it. Poor results are obtained if the catalyst is powd. or is deposited on asbestos, but if it is deposited on granular C, it works well. The addn of H₂O to the EtOH used lowers the yield of ester and raises that of the aldehyde. AcOH and AcEt deactivate the catalyst, while EtOH, EtOAc and MeCH(OEt)₂ and BuOAc (by-products of the reaction) have no effect on it. It is therefore best to keep a slight excess of EtOH

always present in the reaction chamber. BuOH and iso-BuOH undergo an analogous reaction to yield about 19% of the corresponding esters. Mixts of alcs do not give good yields of esters. The mechanism and possible use of these reactions are discussed. I. M. Leicester.

The synthesis of ethylene glycol. N. Wada and M. Sato. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 497–500 (1935), cf. C. A. 29, 7913¹.—The prepn of glycol by the chlorohydrin process gives better results than by the chloride process, the former giving a yield of 71% and the latter 43%, based upon the CaH₂ 1 xptl results are presented. Karl Kammermeyer.

Trichloro hydroxy aliphatic amines. F. D. Chattaway and P. Witherington. *J. Chem. Soc.* 1935, 1623–4.—Reduction of Cl₃CCH(OH)CH₂NO₂ (C. A. 29, 7277¹) with Sn and HCl gives γ,γ,γ-trichloro-α-amino-β hydroxy propane, m 123°; HCl salt, m 235° (decompn), oxalate, m 220° (decompn); sulfate, m 255° (decompn); N-Ac deriv, m 154°, O,N-di-Ac deriv, m 99°. KCN gives trichlorohydroxypropylurea, m 175°, γ,γ,γ-Trichloro-α-amino-β hydroxypentane, m 141°, HCl salt, m 231° (decompn); oxalate, m 232° (decompn); sulfate, m 235–100° (decompn), N-Ac deriv, m 109°, O,N-di-Ac deriv, m 136°; the urea m. 205° (di-Ac deriv, m. 175°). C. J. West.

Derivatives of carbamylcholine chloride. Alberto Ercole. *Ann. chim. applicata* 25, 263–73 (1935).—Carbamylcholine chloride is a somewhat more powerful blood-pressure-reducing drug than acetylcholine, but is more toxic. Therefore, several derivs have been prepd in an attempt to retain the advantages of the former, while reducing its toxicity. The following representative derivs were prepd: MeCOHNCO₂(CH₂)₂Cl (I) is prepd by adding CH₃(OH)CH₂Cl to MeCOCN with cooling. It crystallizes as white needles m 73–4°. By heating I for 30 hrs at 100° with 18% Me₂N in C₂H₅MeCOHNCO₂(CH₂)₂NMe₂Cl (II) is formed as fine hygroscopic needles. When H₂NCO₂(CH₂)₂Cl (III) is suspended in water, acidified slightly, and then CH₃O added, the compd. CH₃H₂NCO₂(CH₂)₂Cl₂ (IV) is formed as white plates, m 148°. CH₃H₂NCO₂(CH₂)₂NMe₂Cl₂ (V) is prepd from IV by treating with Me₂N just as II, above, is prepd from I. The chloroplatinate of V forms yellow-orange crystals with 2 H₂O, m 230°. When III is treated directly with CH₃O and concd HCl, an oil [CH₃NCO₂(CH₂)₂Cl₂] (VI) forms, which cannot be crystd. Treated with Me₂N VI also forms a choline deriv [CH₃NCO₂(CH₂)₂NMe₂Cl₂] (VII) which is amorphous. Its chloraurate and chloroplatinate are also amorphous. When III is added to MeNHPh a colorless oil, MePhNCO₂(CH₂)₂Cl (VIII) is formed, b_p 165°, 290–300° (decompn), d₄ 1.196. With Me₂N VIII gives a choline MePhNCO₂(CH₂)₂NMe₂Cl (IX). It is an oil whose chloroplatinate m 222°, and chloraurate m 190°, both are readily crystd. When III is heated with KCN, and then CH₃(OH)CH₂Cl added, and the heating continued 10 hrs longer on an oil bath at 130°, white crystals of H₂NCO₂(CH₂)₂Cl₂ (X) are formed, m 202°. With Me₂N, X gives the choline deriv H₂NCO₂(CH₂)₂NMe₂Cl₂ (XI), as white, very hygroscopic crystals. It is very stable even in boiling water. The chloraurate m 240° (decompn), the chloroplatinate decomposes at 248°. V is about 0.5 as effective as acetylcholine as a blood pressure-reducing agent, but is only 1/3 as toxic and is the most promising of these derivs. The cholines show decreasing activity in comparison with carbamylcholine, thus, XI is only 1/250th as active. A. W. Conter.

Phenomena of migration in the course of the hydrolysis of the 3 mixed diesters of orthophosphoric acid. Passage of α- to β glycerophosphates and vice versa. O. Bailey and Jacques Gaumé. *J. pharm. chim.* 22, 32–32 (1935); cf. C. A. 28, 5498¹, 6105¹, 29, 1388¹, 3941¹, Levene and Raymond, C. A. 29, 1067¹.—A summary and discussion. S. Waldbott.

Esterification of hydroxy acids and polyalcohols. R. Ciocca and A. Sempron. *Ann. chim. applicata* 25, 319–23 (1935).—The principle of Thielpappe (C. A. 28, 108¹) has been extended to the esterification of HIO acids

and polyols. Instead of H_2SO_4 , a sulfonic acid such as $PhSO_3H$, $MeC_6H_4SO_3H$, $C_6H_5SO_3H$ and camphorsulfonic acid, was used. The Et esters of lactic, tartaric, citric and nicotinic acid, and glycol and glycerol stearates were prepd. with yields up to 95%. The formates cannot be prepd. by this method as HCO_2H is decomposed by CaC_2 .

A. W. Conner

Action of normal solutions of sulfuric acid and sodium hydroxide on glycoyl I S. Yauchnikov J. Gen. Chem. (U. S. S. R.) 5, 967-9 (1935), cf. J. Russ. Phys.-Chem. Soc. 52, 147 (1920).—Further tests disclosed that the action of $N H_2SO_4$ and $N NaOH$ decreases the formol-titrated N not only in a dipeptide (glycylglycine) but also in its component amino acid (glycoyl). This may be explained by the formation of an anhydride or a polymer, and in case of an amino acid by the formation of a dipeptide.

Chas. Blanc

Interaction of glycoyl and glycylglycine with nicotine I. S. Yauchnikov J. Gen. Chem. (U. S. S. R.) 5, 970-1 (1935), cf. C. A. 28, 790¹.—The results of Sørensen titration showed that glycoyl and glycylglycine in the presence of CH_2O are capable of combining up to 70% of nicotine.

Chas. Blanc

Optical rotatory dispersion in the carbohydrate group VI The amide rotation rule I. L. Harris, I. L. Hirst and C. L. Wood J. Chem. Soc. 1935, 1658-62, cf. C. A. 29, 3933¹.—This study was made to det. whether the amide rotation rule depends upon control of the sign of the induced activity by the configuration of the 2nd C atom. Data are given for Me *d*-dimethoxysuccinate (I), *d*-dimethoxysuccinamide (II) and its Me ester (III), 1,2,3,5-trimethylarabonamide (IV) and *d*-1,6-dimethylmannonamide (V). In II, which follows the amide rule, the rotation is definitely controlled by the induced dissymmetry and can be represented by a 1-term equation of the Drude-Natanon type. The absorption band giving rise to the rotation is situated at λ 2300. Exactly similar considerations apply to III and IV. V does not obey the amide rule in H_2O but follows it in EtOH, in H_2O , the observed rotation is governed by the induced dissymmetry, the sign of the induced term is pos. and the rotation therefore fails to obey the amide rule at any wave length. In this amide the normal action of the α -HO group has been altered by the influence of the neighboring groups to such a degree that the total effect produced by coupling with the CO group gives a pos. partial rotation in place of the expected neg. term. The study of I shows that between λ 6709-2613 the rotation of the ester in H_2O is given by the equation $\alpha = 4.5283/(\lambda^2 - 0.07) - 2.0129/(\lambda^2 - 0.05)$, in which the 2 frequency const. are identical with those used by Bruhat for tartaric acid. In I the sign of the induced term is neg. and is opposite to that of the corresponding term in II, hence the rotation of the amide has the same sign as that of the ester in the visual region. The paper contains a discussion of the interpretation of dispersion equations. Within the limits of exp't error, the equation for sucrose, $\alpha = 7.4645/(\lambda^2 - 0.0213)$, can be replaced by $\alpha = 7.4645/[\lambda^2 - 0.0212 + 0.0001 \lambda^2/(\lambda^2 - 0.0212)]$, the half width of the band (λ_1) having the reasonable value of 100 Å.

C. J. West

Structure of hexamethylenetetramine Mieczyslaw Dominikiewicz, Arch. Chem. Farm. 2, 78-129 (127-9 in German) (1935).—Of all proposed formulas for hexamethylenetetramine (I) only those of Duden and Scharf (Ann. 288, 247 (1895)) and Delépine (C. A. 6, 622) are discussible, although none explains satisfactorily the reactions and paramount properties of I. The results of Duden and Scharf do not justify by any means the assumption of a trimethylenetetramine ring as a fundamental structural unit in I. D's results disprove also the existence of such derivs.: Addn of I (14 g.) to Ac_2O (10.5 g.) in Et₂O (150 cc.) gives in the cold pentamethylenediacetyl-

1 *di*-Bz deriv. could not be obtained, since it is benzoylated immediately farther to trimethylenetetrabenzoyltramine (II) of the formula $Bz_2NCH_2N(CH_2)NBz$, m. 218-19°,

colorless, insol. in H_2O , increasingly sol. in C_6H_6 , Et₂O, EtOH, CHCl₃, $CHBr_3$, AcOH. Another product of benzoylation is dimethylene-*N,N'*-bis(methylenedibenzoyl)-

2 aminediamine, $Bz_2NCH_2N(CH_2)NCH_2NBz$, colorless, m. 267-8°, insol. in H_2O , soly. increasing in C_6H_6 , Et₂O, cold AcOH, CHCl₃, $CHBr_3$ and hot AcOH. A 3rd addn product of the benzoylation is the hexamethylenetetraminebenzoyldibenzoyl, of the formula $Bz_2N(CH_2)N(CH_2)N(CH_2)N(CH_2)N(CH_2)N(CH_2)NBz$, m. 218-19°, easily sol in

3 EtOH, CHCl₃ and $CHBr_3$, less sol. in Et₂O and AcOEt. On boiling with an acid it degrades to HCHO, BzOH and an NH₄ salt. Benzoylation of I in CHCl₃ in the presence of pyridine gives chlorobenzoylhexamethylenetetramine, $CIN(CH_2)N(CH_2)N(CH_2)N(CH_2)N(CH_2)NBz$,

4 m. 188-9°, and an addn product, dichloropyridinedibenzoylhexamethylenetetramine (III), $Bz_2N(CH_2)N(NCICl_2H)N(CH_2)N(CH_2)N(CH_2)N(CH_2)NBz$, m. 235-6°. Benzoylation of I in

5 Thus it is evident that also dichlorobenzoylhexamethylenetetramine, $(CH_2)_6N(CH_2)NBz$, is formed during the reaction. III is decomposed by water to HCl salt of I, m. 185°, in addn during this decomn. another product of benzoylation is formed, viz. dimethylene-*N*-methylendibenzoylamine-*N'*-methylenebenzoylaminediamine, $Bz_2NCH_2N(CH_2)NCH_2NHBz$, m. 235-6°. Benzoylation of I in

6 presence of Na_2CO_3 gives II, in a pure state, m. 218-19° (Duden and Scharf's compd. is impure, m. 220-1°). On the basis of the above expts. the formula:

7 $N(CH_2)N(CH_2)N(CH_2)N(CH_2)N(CH_2)N(CH_2)N$ is attributed to I. J. Wiertelak

Trimethylenetriallyltramine and its mercury derivatives M. Dominikiewicz Arch. Chem. Farm. 2, 150-4 (1935) (German summary).—Allyltramine in Et₂O treated with an CH_2O condenses to trimethylenetriallyltramine (I), $(CH_2)_3N(CH_2CH=CH_2)_3$, b. 138-41°, colorless liquid, with a spermiac odor, sol. in all proportions in H_2O and most org. solvents. Picrate, yellow, m. 139°, sol. in hot H_2O , does not decompose on alkalization. Mercuration of I with $Hg(OAc)_2$ in MeOH gives the *Hg* deriv., $(CH_2)_3NCH_2CH(OAc)_2CH_2Hg(OAc)_2$. This compd. is sol. in NaOH, and on satg. the soln with CO_2 trimethylene- γ -hydroxymercuri- β -methoxy- α -propyltramine, $C_6H_5ONa \cdot Hg$, is pptd. as a yellow powder. Its alk. solns. are quite stable. J. Wiertelak

Condensation of α -formyl-1,2-dicarboxylic esters with esters of α -halo-substituted acids M. N. Shchukina and N. A. Preobrazhenskii. Ber. 68B, 1991-8 (1935).—As already stated (C. A. 28, 4039¹), this condensation was studied for the purpose of prepg. homoparaconic acids. $RO_2CCH(R')CH(CO_2R)CHO + R''CHO \rightarrow RO_2CCH(R')CH(CO_2R)CH(R'')CHO + H_2O$

9 $CO_2R'CH(R'')CH(CO_2R)CH_2$. As a matter of fact, EtO₂CCH₂CH(CO₂Et)CHO (I) with $CH_3CO_2CH_2$ gives NaCl and the ester EtO₂CCH₂CH(CO₂Et)CHOCH₂CO₂Et (II), and EtO₂CCH₂CH(CO₂Et)CHO (III) with EtCHBrCO₂Et yields an isomeric ester EtO₂CCH₂CH(CO₂Et)CHOCH₂CH₂CO₂Et (IV). III with $ClCH_2CO_2Et$ similarly gives the ester EtO₂CCH₂CH(CO₂Et)CHOCH₂CH₂CH₂CO₂Et.

186-7° (yield 30%), colorless prisms, sol. in H_2O , EtOH and CHCl₃, less sol. in Et₂O, AcOEt and C_6H_6 . An analogous

CO-Et (V). II and IV are entirely distinct from each other, hence the condensation does not follow the course of the Frankland and Duppa synthesis, which would have given the same ester, $\text{ROCCHEIC(CO}_2\text{R)(CH}_2\text{CO}_2\text{R)-CHO}$, in both cases; the acids (VI and VII) obtained by hydrolysis and decarboxylation of II and IV are likewise different. II, IV and V do not show free aldehyde properties, they do not color fuchsin- SO_2 and form no semicarbazone even on long standing. On boiling with $\text{NH}_3\text{-AgNO}_3$, however, they form an intense Ag mirror in 5-10 min. and they immediately decolorize Br water. The free acid of II shows the same qual reactions. It is therefore assumed that O-alkylation of the hydroxymethylene form of the formylsuccinic ester occurs in the condensation. As there was a possibility of an Erlenmeyer condensation of the aldehyde group with the halo-substituted ester to form a glycidic acid ester, 2 esters of the latter type were selected for comparison. *di-trans*-Ethylene oxide-dicarboxylic ester forms no Ag mirror with $\text{NH}_3\text{-AgNO}_3$, does not decolorize Br water, and does not color fuchsin- SO_2 , and pilopylethylene oxide-dicarboxylic ester likewise does not color fuchsin- SO_2 or decolorize Br water, although it does form a Ag mirror when boiled with $\text{NH}_3\text{-AgNO}_3$. In the sapon of glycidic acid esters, CO_2 is split off and the oxide group rearranges to carbonyl, where VI and VII contain no C O groups and are unsat. Kunyantz and Gershub (C. A. 29, 6882) assign the oxide ester structure to IV and the 4-ketohexane-1,2-dicarboxylic acid structure to VII because VII gives succinic acid on oxidation. But succinic acid is an unavoidable oxidation product of O-alkylated formylsuccinic acids and S. and P. have obtained it in the oxidation of VII with all. Ag_2O , the case with which the oxidation occurs in itself evidence against the keto structure for VII. In boiling acid aq. soln. the ether union in these unsat. esters is quite stable, many hrs. boiling with 10% (CO-H), gives chiefly VI and VII. Boiling 10% HCl, however, ruptures the ether union, giving $\text{HOCH}_2\text{CO}_2\text{H}$ (or $\text{EtCH(OH)-CO}_2\text{H}$) and $\text{HO-CH}_2\text{CH}_2\text{CHO}$ (or the Et homologue), isolated as the semicarbazone. A characteristic property of II, IV and V is their intense light blue fluorescence. II (yield, 54%), b_p 270°, b_r 193°. VI, b_p 202-4°, m. 102-3°. Et succinic acid hemiacetaldehyde semicarbazone, m. 161-2° (decomp.). IV, b_p 187°, b_r 211.5°, d_4^{20} 1.0900, n_D^{20} 1.4600. VII, b_p 182-4°, b_r 211-12°, d_4^{20} 1.1386, n_D^{20} 1.4646. C. A. R.

Tautomerism of the products of condensation of aromatic aldehydes with barbituric acid. Mieczyslaw Krakowski Arch. Chem. Farm. 2, 164-70 (1935) (German summary).—It is attempted to ascertain whether condensation products of methyl- and ethyl-vanillin are suitable for the distinction of the 2 kinds of vanillin. To this purpose vanillin (7.6 g. in 30 cc. EtOH) is refluxed for 1 hr. with barbituric acid (16.4 g. in 60 cc. EtOH), giving a theoretical yield of *C-methylbarbituric acid*, $\text{C}_8\text{H}_{10}\text{O}_4\text{N}_2$ (I), orange, difficultly sol. in H₂O with yellow color, m. 263°. Bourbonal (ethylvanillin) gives under identical conditions *C-bourbonalbarbituric acid* (II), $\text{C}_{10}\text{H}_{12}\text{O}_4\text{N}_2$, similar properties. Piperonal gives *C-piperonalbarbituric acid*, $\text{C}_{11}\text{H}_{12}\text{O}_4\text{N}_2$, yellow, insol. in H₂O and Et-O, decompd. at 200°. Veratraldehyde, treated similarly with barbituric acid, gives *C-veratralbarbituric acid*, $\text{C}_{12}\text{H}_{14}\text{O}_4\text{N}_2$, orange-yellow, insol. in H₂O and Et-O, difficultly sol. in EtOH, decompd. at 270°. I and II in alkalis turn orange because of formation of a quinoid grouping in the ring of the aldehyde residue. In the 2 other compds. such grouping is not possible; hence their solns. do not change color. J. Wiertelak

Hydrolysis of cellulose and its oligosaccharides. Karl Freudenberg and Gunnar Blomqvist. Ber. 68B, 2070-82 (1935).—The structures and configurations of the oligosaccharides of the cellulose series (cellobiose, -triose, -tetrose) have now been fully cleared up; they all belong to the β -series. If cellulose, as is now generally assumed, is the end product of the same series, its properties should agree with those called by extrapolation from the properties of the oligosaccharides. Expt. has shown that the yield of biose from cellulose is in harmony with the as-

sumption that all the glucose units in cellulose are combined in the same way as in cellobiose, and that the kinetics of the degradation of cellulose can be explained on the same assumption. There is a simple relationship between the optical rotations of cellulose and its oligosaccharides, the mol. rotation of cellobiose differing from those of the triose and tetrose by units corresponding to the mol. rotation of 1 and 2 glucose units, resp., of the polysaccharide. In addition to the calcd. and found values for triose and tetrose derivs. in 50% H_2SO_4 , water and CHCl_3 already published (F. Tamm, Cellulose, Lignin, Berlin, 1933), the following new values are given (calcd. values in parentheses): cellobiose in 51% H_2SO_4 , for m. 578, 64° (50°); α -acetylcellobiose, CHCl_3 , m. 589, 71° (73°); β -acetylcellobiose, CHCl_3 , m. 589, -57.5° (-56°); cellobiotetrose, 51% H_2SO_4 , m. 578, 42° (38.5°). The close agreement between the calcd. and observed values is perhaps the best proof thus far obtained that the assumption of β -units exclusively in cellulose is correct. The study of the kinetics of the degradation of cellulose made when only cellobiose was known has now been amplified by a study of the triose and tetrose. As expected, the velocity of the cleavage increases with time; the initial velocities are intermediate between those for cellobiose and cellulose, the values for $k \times 10^4$ in 51% H_2SO_4 being as follows at 18° and 30°, resp.: Cellulose 0.505, 2.34; tetrose 0.506-0.520, 3.65-3.80; triose 0.630-0.640, 4.50-4.60, biose 1.07, 6.94. The values here given for cellulose and the biose were detd. with greater accuracy than those previously reported. The activation heats (U) and steric factors ($A \times 10^{-10}$) calcd. for the 4 ones from the above values are: biose 27,300, 3.4; triose 28,600, 18; tetrose 28,900, 24; cellulose 29,800, 67. Full details of the measurements are given. The velocity of cleavage is affected greatly by small changes in the acid concn., $k \times 10^4$ in 65% H_2SO_4 at 18° being 2.5 for cellulose and 5.50 for the biose. C. A. R.

Oxidation of cyclobutylamine. N. Ya. Dem'yanov and Z. I. Shuškina. J. Gen. Chem. (U. S. S. R.) 5, 1213-25 (1935).—Study of the behavior of simple aldehydic amines to various oxidizing agents in connection with the tendency of the simplest cycles to polymerization was begun with the oxidation of cyclobutylamine (I) to cyclobutanone (II). For the prepn. of I, b. 80-84°, $\text{Br(CH}_2\text{)}_4\text{Cl}$ was condensed with Na methylmalonate giving 40% di- α -Me tetramethylene-1,1-dicarboxylate, b. 220-6° (Kuzhner, J. Russ. Phys.-Chem. Soc. 37, 507). The free acid on distn. gave 71% tetramethylenedicarboxylic acid, b. 180-91°. This with PCl_5 gave 84.4% of the acid chloride, b. 137-9°, which in abs. Et-O with dry NH_3 gave 82.9% of the amide. This heated for 5 min. with 10% excess of NaClO, obtained by the method of Graebe (Ber. 35, 43, 2753 (1902)), gave 78.2% I. The oxidations of I with CrO_3 , $\text{CrO}_3 + \text{H}_2\text{SO}_4$, KMnO_4 , and ozonized air produced poor yields of II (semicarbazone, m. 200-1°). Catalytic oxidation of I by the method of Taube and Schönwald (Ber. 39, 178 (1906)) gave with Cu 18.6% II and with Os-O₄ about 25% II. As by-products were formed cyclobutyl ketoxime, m. 54-6°, and succinic acid. The results confirm the complex mechanism of the oxidation of amines observed by other investigators, and in the case of I can be tentatively thus conceived

(2) $\text{I} + \text{O} \rightarrow \text{CH}_2(\text{CH}_2)_3\text{C(NH)}_2\text{OH} \rightarrow \text{NH}_2 + \text{II} \rightarrow (\text{CH}_2)_4\text{CNOH}$. Chas. Blane. Action of trimethylene bromide on acetmedicarbonylic ester. A new and more convenient method of synthesis of ethylcyclohexanone-2,6-dicarboxylate. P. C. Guha and N. K. Seshadriengar. Current Sci. 4, 155 (1935); cf. C. A. 28, 7252. $\text{CH}_3(\text{CH}_2)_3\text{Br}$ and the Na deriv. of $\text{CO}(\text{CH}_2\text{CO}_2\text{Et})_2$ (II), suspended in dry CH_2Cl_2 , were heated for nearly 100 hrs. at 140-50°. The reaction mixt. was sepd. into gasoline-sol. (II) and gasoline-insol. (III)

aminocrotonate (I), this also results by adding the amine, heated to about 200°, to 4 mols. boiling $\text{AcCH}_3\text{CO}_2\text{Et}$ (reactions A and B), to obtain a lepidine deriv., it is necessary to use a sealed tube. $\text{m H}_2\text{NC}_6\text{H}_4\text{NHAc}$ gives Et β -3-acetamidophenylaminocrotonate (II), m 92°, $\text{p-C}_6\text{H}_4(\text{NH}_2)$, by reaction A gives the β -isomer of I, m 135°, in a quant. yield, EtOH-FeCl_3 gives a dark red color, Knorr's compd., m 176°, could not be obtained (Ber 17, 545 (1884), 19, 3303 (1886)). EtOH-HCl gives β -C₆H₄(NH₂)HCl, the same compd. resulted in reaction B. β -H₂NC₆H₄NHAc gives the 4-isomer of II, m 185°, reaction B gives the same compd. but heating in a sealed tube at 140° for 5 hrs gives $\text{p-C}_6\text{H}_4(\text{NHAc})$; Bismidine gives Et 3,3'-dimethoxybiphenylene-4,4'-bis- β -aminocrotonate, cream, m 132-140°, toluene gives the 3,3'-di-Me analog, m 129-30°. Benzidine gives Et biphenylene-4,4'-bis- β -aminocrotonate, m 99-6-100°, but the main product was the compd. $\text{C}_6\text{H}_5\text{O}_2\text{N}_2$, m 134°, which appears to be a double compd. of 2 mols of 4-H₂NC₆H₄NHAc, HClO_4Et with 1 mol of ($\text{p-C}_6\text{H}_4\text{NHCMe}_2\text{CHCO}_2\text{Et}$), with Ac_2O it yields Et 4-acetamidobiphenyl-4'- β -aminocrotonate, m 201°. All the esters are readily hydrolyzed to their parent bases by cold dil. mineral acids but none of them could be converted into a quinoline deriv.

Asymmetric platinum atom VII. A new kind of optically active compound Hans Reihlen, Gerda Seipel and Erwin Weinbrenner. Ann. 520, 256-9 (1935); C. A. 29, 6163. —(—)-H₂NC(CH₂)₂NH₂(phen) (1.32 g) in 20 cc. Et₂O, added to 4.5 g. K₂PtCl₆ in 30 cc. H₂O at 40° with stirring, gives 98% of dichloro-(—)-phen-platinum-2 (I), yellow, difficultly sol. in boiling H₂O. Refluxing 4 g. I and 1.56 g. α,α -dipyridyl (dipy) in 61 H₂O for 4 hrs gives 62% of (—)-phen-dipy-platinum-2 chloride (II), $\text{C}_{10}\text{H}_8\text{N}_4\text{Cl}_2\text{Pt}$, pale yellow, with 2 or 3 mols. H₂O, [M]_D 89°, chloroplatinate, yellow. II (0.45 g) and 0.31 g. Na bromocamphorsulfonate (III) (mol ratio 1:1) in H₂O, give 85% of the chloride (+)-bromocamphorsulfonate (IV), with 3 mols. H₂O, [M]_D 363°, this is termed the racemic form. With a mol ratio of 1:2, there results 85% of an active isomer (V), with 3 mols. H₂O, [M]_D 392°, $[\Delta]_D^{25}$ 25-9°, the intermediate glass in the prepn. of V is nearly pure racemic di-(+)-bromosulfonate (VI), with [M]_D 622°, addn. of III to the mother liquor of V gives the active isomer (VII) with 2 mols. H₂O, [M]_D 604°. The nitrate (VIII) from IV or VI (91% yield), [M]_D 88.5°, that (IX) from V or VII has [M]_D 119°. Shaking 0.6 g. VIII with H₂O at 10-15° for 15 hrs gives 0.3 g. IX, the filtrate contains VIII, the sol part from IX also has the higher rotation. α -Phenanthroline and K₂PtCl₆ give 92% of dichloro- α -phenanthroline platinum 2, yellow, (—)-phen- α -phenanthroline-2 chloride, with 2 mols. H₂O, pale yellow, [M]_D 119°, chloroplatinate, red, dibromocamphorsulfonate, with 2 mols. H₂O, [M]_D 670°. Phenyl-ethylendiamine ethyldiamine platinum-2 chloride was sepd into 2 fractions, [M]_D 132° (difficultly sol.) and 120° (easily sol.). the iodide has [M]_D 139° and 110.5°; the perchlorate, [M]_D 109° and 142° (easily sol. fraction); the stodeo perchlorate has [M]_D 142°.

C. J. West

Stereochemistry of azobenzene. IV. Eugen Muller and Rolf Illgen. Ann. 521, 72-80 (1935), C. A. 27, 2141. —Nitration of hydrattic acid gives 30% of the p-NO_2 deriv. (I), m 87°, reduction of the Na salt with Zn in NH₄Cl gives the p-hydroxylamino deriv. (II), m 155-8°; FeCl_3 oxidizes this in EtOH at 0° to the p-NO_2 deriv. (III), pale yellow, m 93° (30% yield), a mixt. of II and III gives the azoxy deriv. (IV), m 198° (83%). I may be resolved by quinine, (+)-I, m 88.5°, [a]_D²⁵ 10.9° (0.092 g in 25 cc. MeOH); (—)-I, m 86.5°, [a]_D²⁵ -11.2° (0.039 g in 25 cc. MeOH); (+)-II, m 155-8°, [a]_D²⁵ 9.6° (0.573 g in 25 cc. MeOH); (—)-II, [a]_D²⁵ -10.6° (0.0052 g in 5 cc. MeOH); (+)-III, m 91°, [a]_D²⁵ 14.1° (0.1083 g in 25 cc. MeOH); (—)-III, m 92°, [a]_D²⁵ -14° (0.0848 g in 25 cc. MeOH). (—)-II and (+)-III give IV, optically inactive; this also results from (+)-II and (—)-III. (+) II and (+)-III give a (+) (+)-IV, [a]_D²⁵ 14.5° (0.2516 g in 25 cc. MeOH).

C. J. W.

Azo group as a chelating group. I. Metallic derivatives of α -hydroxy azo compounds. Marjorie Eilkins and Louis Hunter. J. Chem. Soc. 1935, 1594-1610. —Metallic salts of the α -hydroxy azo compds. have been prepd. with a view

of detecting coordination of the type $\text{C}_6\text{H}_5\text{O}-\text{N}=\text{N}-\text{Ar}$

The formation of coordinated salts appears to be common to all such compds. and it is believed that their stability is due to their chelated structure, since salts of the p-isomers are extremely unstable. Benzeneazo- p-cresol and excess $\text{Cu}(\text{OAc})_2$ in 50% aq. EtOH give cupric β -benzeneazo- p-tolyl oxide, brown, m 230°, Ni salt, black with green reflex, m 216°, Co salt (formed in presence of H_2O_2), dull black, m 202°, 3- p-toluene analogs: Cu , red-brown, m 242°, Ni , dark olive-green, m 242-3°, Co , jet-black, m 201-1°, 3- m-toluene analogs: Cu , dark red-brown, m 221°, Ni , dark green, m 214°, Co , black, m 187°, 2,4-Bisbenzeneazophenoxides: Cu , chocolate-brown, m 243°, Ni , black, decomp. 295-310°, Co , black, m 180-5°, 1-Benzeneazo- β -naphthorides: Cu , red-brown, m 295°, Ni , dark green, m 290°, Co , brownish black, m 221°, 2-isomers: Cu , dark brown, m 237°, Ni , light olive-green, m 213°, Co , dark purplish brown, m 199°. Decompn. of the metallic complexes by cold acid to the original azo compds. supports the view that all stable azo compds. are *trans*.

C. J. West

Oxidation of hydrohalic salts of phenylhydrazine in the presence of copper salts. A. B. Bruler and L. Z. Soborovskii. J. Gen. Chem. (U. S. S. R.) 5, 1024-8 (1935). Gatterman and Heile (Ber. 25, 1074 (1921)) obtained good yields of PhCl, PhBr and PhI by the oxidation of the resp. hydrohalic salts of PhNHNH₂ (I) with 4 mols. of CuSO_4 . Treating CuCl_2 in 12% HCl in the cold, with stirring, with an equimol. amt. of I resulted in a complete decolorization of the soln. and pptn. of white, cryst. I. HCl CuCl_2 (II). The reaction is conceived as a partial oxidation of I with the formation of CuCl which reacts with I, giving II. This theory is supported by a nearly 100% yield of II obtained by the interaction of CuCl and I. The slight variations in the compn. of II obtained are caused by its instability to atm. O_2 . Thus, II in HCl on exposure to air or addn. of O_2 is rapidly decompd. with the formation of PhCl, but can be preserved for months by keeping it in hermetically sealed containers. The probable mechanism of the oxidation of I in HCl to PhCl with an excess of Cu^{++} salts consists of preliminary formation of II which on further oxidation forms PhN₂Cl and this with CuCl gives PhCl according to the Sandmeyer reaction.

Chas. Blanc

α - and p-Tolylstannonic acids. K. A. Kocheskhov and M. M. Nad. J. Gen. Chem. (U. S. S. R.) 5, 1158-67 (1935); C. A. 23, 5172; 23, 22934. —The following new stannanes and stannonic acids and their derivs. are described. $\text{p-(MeC}_6\text{H}_4)_2\text{SnCl}_2$ (I), m 49-50°, and $\alpha\text{-(MeC}_6\text{H}_4)_2\text{SnCl}_2$ (II), m 49-50°, were obtained by heating SnCl_4 with p- and $\alpha\text{-(MeC}_6\text{H}_4)_2\text{Sn}$, resp., on a water bath and then at 200-5° for 2 hrs. I gave with 4 mols. HgCl_2 in alc. $\text{p-MeC}_6\text{H}_4\text{HgCl}_2$ m 233°, and with 1 mol. HgCl_2 and KOH $\text{p-(MeC}_6\text{H}_4)_2\text{Hg}$, m 243.5°. $\text{p-MeC}_6\text{H}_4\text{SnCl}_2$ (III), b_p 163-3°, d₄²⁰ 1.7512, resulted in 40% yield from 3 mols. of freshly prepd. SnCl_4 and 1 mol. of $\text{p-(MeC}_6\text{H}_4)_2\text{Sn}$ on heating the mixt. in a sealed tube at 210-15° for 2 hrs. III was also obtained in 45% yield by heating an equimol. mixt. of I and SnCl_4 for 2 hrs., first at 100° and then at 210-15°. $\alpha\text{-MeC}_6\text{H}_4\text{SnCl}_2$ (IV), b_p 157-5°, d₄²⁰ 1.7719, in H_2O with H_2S gave 100% $\alpha\text{-(MeC}_6\text{H}_4)_2\text{SnS}_2$, yellow, amorphous and infusible powder. IV gave $\alpha\text{-MeC}_6\text{H}_4\text{HgCl}_2$ m 146°. III mixed with pyridine in Et₂O gave III.2Py. $\alpha\text{-MeC}_6\text{H}_4\text{SnO}_2\text{H}$ (V) and the p-isomer , infusible at 295°, were prepd. by the interaction of III and IV, resp., with 20% KOH , neutralizing the soln. with AcOH and then with CO_2 to a neutral reaction, dissolving the ppt. in alc. and evapg. the filtrate at 40-55° *in vacuo*. $\alpha\text{-(MeC}_6\text{H}_4)_2\text{Hg}$, m 107°, was prepd. from IV in 5 N KOH with an equimol.

amt. of HgCl_2 . V oxidized with $\text{K}_2\text{Fe}(\text{CN})_6$ is completely decolorized, with sepn. of nearly 100% $\text{K}_2\text{S}_2\text{O}_8$. C. B.

Derivatives of allyl ethers of phenols mercaptated in the nucleus. A. N. Nesmeyanov and R. Kh. Shatzkaya. *J. Gen. Chem.* (U. S. S. R.) 5, 1248-52 (1935).— $\text{C}_6\text{H}_5\text{OC}_3\text{H}_5\text{I}_2\text{HgCl}$ (I) was prepared in 3.5 g yield (40%) by refluxing a mixt of 8 g α - $\text{NaOC}_3\text{H}_5\text{I}_2\text{HgCl}$ (II) in 25 cc Me_2CO with 6 g allyl bromide (III) for 7 hrs. A prolonged heating gave α - $(\text{C}_6\text{H}_5\text{OC}_3\text{H}_5)_2\text{Hg}$ (IV), m. 50.5–60.5°. IV was also obtained by substituting allyl chloride for III in the above rxn., and by treating 1 g I with 1 g SnCl_4 in 20% NaOH ($\text{C}_6\text{H}_5\text{NC}_3\text{H}_5\text{I}_2\text{HgBr}$), m. 120–15°, was obtained (I) by treating 30 g II in 40 g $\text{C}_6\text{H}_5\text{N}$ at -10° with 11.2 g III, (2) by mixing in the cold 3 g HgBr_2 in $\text{C}_6\text{H}_5\text{N}$ (satd.) with an equal vol. of III, and (3) from 1,2- $\text{HOC}_3\text{H}_5\text{I}_2\text{HgCl}$ in $\text{C}_6\text{H}_5\text{N}$ with III $\text{p-C}_6\text{H}_4\text{OC}_3\text{H}_5\text{I}_2\text{HgCl}$ (V), m. 101–15°, was obtained in 2.5 g yield (57%) by treating an emulsion of 15 g PhOC_3H_5 , 9 cc. of 80% AcOH and 37 cc. H_2O with 6.5 g HgO in form of a paste, pouring the hot mixt into a boiling soln. of 50 g NaCl , boiling for 2–3 min. and allowing the mixt to cool. V, treated with Na stannite as above, gave $\text{p-C}_6\text{H}_4\text{OC}_3\text{H}_5\text{I}_2\text{Hg}$, m. 108.5–10°. $\text{C}_6\text{H}_5\text{OC}_3\text{H}_5\text{I}_2\text{HgCl}$, m. 161–2°, was prepd from 5 g $\text{C}_6\text{H}_5\text{OC}_3\text{H}_5$ and HgO by the method described for the prepn. of V. The structures of some of these compds. are being investigated. Chas. Blanc.

Decolorization of indigotin by alkyl and aryl sulfonic acids. Max Bazken and Fritz Scholtz. *Ber.* 68B, 2045 (1935).—Hitherto it had not been possible to decolorize indigotin in water with alkyl and aryl sulfonic acids as with aldehydo sulfonic acids (C. A. 21, 3170). B and S have now established the conditions under which the reduction can be effected with these acids also. The free sulfonic acids themselves cannot be used, as they decompose above 100° before they exert a reducing action. Salts must be used, at 180° and above, best in glycerol. Under these conditions they behave like, e. g., rongite. Aq. neutral indigotin (1.7 g indigo per l.), boiled with a few particles rongite, is decolorized after a time, and on cooling and shaking with air the blue color is immediately restored. The neutral Na and Zn salts of RSO_3H (R = Me, 1,1',3',5'- and β - C_6H_4) behave in exactly the same way in glycerol at 180° and above, as do also $\text{p-MeC}_6\text{H}_4\text{SO}_3\text{H}$, α - $\text{H}_2\text{NC}_6\text{H}_4\text{SO}_3\text{H}$, benzanthrone- β -sulfonic acid and β - $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_4\text{SO}_3\text{H}$. C. A. R.

Color reactions of phenols with nitrous acid. M. S. Mahmood. *J. Gen. Chem.* (U. S. S. R.) 5, 1247–8 (1935).—A discovery that phenols on the addn. of highly dil. HNO_2 give nearly identical color reactions from brown to yellow without the formation of a blue tint, observed by Castiglioni (C. A. 27, 2078) and other investigators, led to a study of the influence of the following factors on the coloring of phenols by HNO_2 : the degree of HNO_2 diln., the position of the OH groups in phenols, and the presence of other than OH groups in phenol. The procedure consisted of adding 2–3 drops of strong H_2SO_4 and 2–3 drops of 1% phenol in H_2O to 2 cc. of a nitrite soln. Trihydric phenols gave coloring of the highest intensity. PhOH , cresol, carvacrol, α - and β - $\text{HOC}_6\text{H}_4\text{NO}_2$, phenetole and anisole gave no color reaction even with 10% HNO_2 . A closer position of the OH groups to each other in a mol. increases the color sensitivity of phenols: pyrocatechol is colored by 0.004% HNO_2 , while hydroquinone begins to give color with 0.02% HNO_2 . Pyrogallol (1%) gives color reaction with 0.001% HNO_2 , while phloroglucinol and hydroxyhydroquinone give no color at this concn. of HNO_2 . Di- and tri-hydric phenols with the 1 OH acetylated give no color reactions. Free HNO_2 , nitrates, HClO_3 , HClO_4 , and other oxidants give no similar reactions with phenols. Chas. Blanc.

Iodination and nitration of diphenyl ether-aldehyde. K. H. Slotta and K. H. Soremla. *Ber.* 68B, 2059–66 (1935).—In the Gattermann method of prepn. $\text{p-PhO-C}_6\text{H}_4\text{CHO}$ (I) (C. A. 1, 820), when applied to large quantities of materials, recombination reduces the yields to 20%. This has been found to be due to the use of the large excess (5 mols.) of HCN , by using 1.3–1.8 mols

1 HCN per mol. Ph_2O , 70–80% I can be obtained and purification through the bisulfite compd. is not necessary. Introduction of I into I must be effected with reagents which do not alter the CHO group. Of the various methods tried, only the use of ICl and HIO_3 was successful. There was thus obtained in good yield $\text{p-(4'-iodophenyl)-benzaldehyde}$ (II), the structure of which was established by oxidation to the acid. The addn. of HIO_3 seems to be specific, since without it no or only very little iodination occurs. The most successful of the various methods tried for prepn. $\text{p-(2'-O-NC}_6\text{H}_4\text{O)}_2\text{C}_6\text{H}_4\text{CHO}$ (III) by nitration of I consisted in dropping I at 15–20° into concd. HNO_3 (d. 1.140), which yielded about 50% $\text{p-(4'-O-NC}_6\text{H}_4\text{O)}_2\text{C}_6\text{H}_4\text{CHO}$ (IV) along with III. Nitrating acid ($\text{HNO}_3 \cdot \text{H}_2\text{SO}_4 = 1:2$) gave 70–80% $\text{2',4'-dinitro-4-iodobenzaldehyde}$ (V). $\text{p-(2',4'-O-NC}_6\text{H}_4\text{O)}_2\text{C}_6\text{H}_4\text{CHO}$ (VI), from 2,4- $\text{O-NC}_6\text{H}_4\text{Cl}$ and $\text{p-HOC}_6\text{H}_4\text{CHO}$, when nitrated like I above, gave V, that the new NO_2 group is in the 2-position was established by the fact that V is different from the $\text{2',4',6'-trinitro compd}$ (VII) prepd from puryl chloride and $\text{p-HOC}_6\text{H}_4\text{CHO}$. This was confirmed by cleavage of the corresponding acid prepd. by oxidation of V with CrO_3/AcOH . In the product, 3-nitro-4-(2',4'- $\text{dinitrophenyl})$ benzoic acid (VIII), the O-bridge, evidently weakened by the 2- O-NO_2 groups, is ruptured by boiling dil. alkalis with formation of 2,4- $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{OH}$ and 1,3- $\text{HO}(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{OH}$. I, b. 174–6°, 170–82°, 1.3–5, 101–3° under 12, 14, 18 and 22 mm. r.p. II (yld. 81% from I in AcOH at 50° slowly treated with slightly more than 1 mol. ICl , then heated 20 hrs. at 110–20° with hourly addns. of finely powd. HIO_3 (about 5 g in all for 50 g I) and purified through the bisulfite compd.), light yellow, m. 65–7°; phenylhydrazone, yellowish white, m. 150°. acid, $\text{IClC}_6\text{H}_4\text{CO}_2\text{H}$, m. 215°. I was unchanged by 1- HIO_3 in boiling $\text{p-IOH-H}_2\text{O}$, and $\text{p-IClC}_6\text{H}_4\text{O}$ in C_6H_5 with AlCl_3 and HCN gave only PhO and I, with no II. IV, m. 107–8°; phenylhydrazone, light yellow, m. 160°. III, m. 84–6°, acid, m. 143°. V, m. 100°. phenylhydrazone, red, m. 190–2°. VI (90% yld.), whitish yellow, m. 128° becomes discolored in the light; phenylhydrazone, yellow leaflets with metallic luster, m. 225°. VIII, greenish white, m. 205–7°. C. A. R.

The salts of 1,2,4-phenoldisulfonic acid. J. Šuráček. *Chem. Listy* 29, 213–5 (1935).—S. prepd. and analyzed the crystals of Li, Na, K, Be, Mg, Zn, Cd, Ca, Sr, Ba, Cu, Mn, Ni, Co and Al 1,2,4-phenoldisulfonates. In comparing these salts with those prepd. with PhSO_3H , $\text{p-MeC}_6\text{H}_4\text{SO}_3\text{H}$, $\text{p-HOC}_6\text{H}_4\text{SO}_3\text{H}$, 1,2,4-Me($\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{SO}_3\text{H}$, and 1,2,4- $\text{HOC}_6\text{H}_3(\text{SO}_3\text{H})_2$, S. finds that the no. of mols. of water of crystn. becomes larger and more variable as the structure of the anion becomes more complicated and complex. Placing Be and Mg into the subgroup containing Zn and Cd of the periodic system is erroneous, for the no. of mols. of the water of crystn. attached to the Be, Mg and Zn, Cd salt becomes more variable and divergent as the anion becomes more complicated and as the sulfonic acid becomes more distinctive in its chem. behavior. Be 1,2,4-phenoldisulfonate just as Be α -naphthalenesulfonate forms tetrahydrates. T. M.

Metallic derivatives of 2-nitroso-5-methoxy- and of 3-chloro-2-nitroso-5-methoxyphenol. Herbert H. Hodgson and Walter E. Batty. *J. Chem. Soc.* 1935, 1617–19.—In the following $\text{X} = \text{CH}_3\text{O}$ and $\text{Y} = \text{Cl}$, O_2N . The following are probably coordination compds. HgV_2 , deep red microcrystals, m. 201°; HgI_2 , bright red microcrystals, AlVCl_3 , light yellow, ZnVCl_2 , darkens in air; AlVCl_3 , very light yellow prisms SnVCl_3 , red-orange microplates; SnVCl_3 , brown-red plates, $\text{Fe}(\text{O}_2\text{N})_2$, dark green microneedles; FeV_2 , brown; $\text{Fe}(\text{O}_2\text{N})_2$, dark green needles; FeI_2 , brown. CoV_2 , bright microcrystals; CoI_2 , bright red micrograins. NiV_2 , microcrystals; NiI_2 , bright red. The NiV compd. with α - $\text{HOC}_6\text{H}_4\text{CHO}$, light yellow; the KX compd. with α - $\text{HOC}_6\text{H}_4\text{CHO}$, light yellow. Non-coordinated compds.: NaV , bright green; NaI , bright green; KX , bright green; KI , green-yellow. AgV , red-brown microcrystals; AgI , brown microcrystals; ZnX_2 , light yellow-brown, flat prisms; ZnI_2 ,

light yellow prisms, CdX_2 , maroon macroprisms; CdY_2 , maroon plates PbX_2 , dark yellow-brown, PbY_2 , dark brown MnX_2 , brown prisms, MnY_2 , dark brown prisms UO_2X_2 , yellow-brown, UO_2Y_2 , yellow-brown microplates. The structure of these compounds is discussed.

C. J. West

Mechanism of the oxidation of *o*-toluenesulfonamide to saccharin O Yu Magidson and I G Zil'berg *J Gen. Chem. (U S S R)* 5, 920-3 (1935) —In the preliminary study of the mechanism of oxidation of *o*- $MeC_6H_4SO_2NH_2$ (I) to saccharin, I was oxidized with CrO_3 in Ac_2O at from -5° to 30° with and without the addition of a little H_2SO_4 . By the method of fractional neutralization and EtO extn of the mother liquor, the following 4 compounds were isolated *o*- $MeC_6H_4SO_2NHAc$, m 132-4°; (with

H_2SO_4) acetosaccharin $OC_6H_4SO_2NAC$, m 195-7° (cf *Ber* 29, 1050), a compound, m 174-6°, easily oxidized with $KMnO_4$ to saccharin and which is, probably, either

$AcOCH_2C_6H_4SO_2NHAc$ or $AcOCH_2C_6H_4SO_2NAC$, and a compound, m 103-5°, which was not identified. C. B.

Walden inversion reactions of the *p*-toluenesulfonic and the *p*-toluenesulfonic esters of ethyl *d*- β -hydroxy- β -phenylpropionate Joseph Kenyon, Henry Phillips and Gerald R. Shutt *J Chem Soc* 1935, 1063-8, cf. *C. A.* 29, 7272° — $PhCH(OH)CH_2CO_2H$ (I) may be resolved by brucine, *d*-I, m 115°, $[a]_{D}^{25}$ 18.9°, $[a]_{D}^{25}$ 23.4°, $[a]_{D}^{25}$ 33.4° (EtOH, c 5.00); brucine salt, m 145°, $[a]_{D}^{25}$ 37.85°, $[a]_{D}^{25}$ 45.8° (EtOH, c 5.00); *L*-I, m 115-16°, $[a]_{D}^{25}$ -19° (EtOH, c 5.130); *E* ester (II) of *d*-I, *b*₁, 90-1°, *d*₁⁺ 1.058, *n*_D²⁰ 1.5125, α_{D}^{25} 19-17°, α_{D}^{25} 23.39°, α_{D}^{25} 31.52°, with EtI and AgO II yields *E* *d*-(+)- β -ethoxy- β -phenylpropionate (III), *b*₁, 85-6°, *n*_D²⁰ 1.4983, *d*₁⁺ 1.007, α_{D}^{25} 7.59°. The *Ac* deriv of II *b*₁, 102-3°, *d*₁⁺ 1.088, *n*_D²⁰ 1.5168, α_{D}^{25} 1.32°, α_{D}^{25} 1.66°, α_{D}^{25} 2.79°, the formoxy deriv *b*₁, 95-7°, *d*₁⁺ 1.123, α_{D}^{25} 1.5333, α_{D}^{25} 2.47°, α_{D}^{25} 2.98°, α_{D}^{25} 4.39°. II and *p*- MeC_6H_4SOCl give the *p*-toluenesulfonate deriv (IV), yellow, could not be distd., α_{D}^{25} 3.77°, *n*_D²⁰ 1.5286, *d*₁⁺ 1.178°, heating with Ac_2O and $AcOH$ gives the *Ac* deriv, while HCO_2H gives the formoxy deriv. IV is converted into *L*-(-)- $PhCH(Cl)CH_2CO_2Et$ (V) by Cl in $CHCl_3$ (α_{D}^{25} -1.57°), Cl in H_2O (α_{D}^{25} -1.30°), $HOCl$ (α_{D}^{25} -0.72°) and ICl (α_{D}^{25} -2.27°). Br in $CHCl_3$ or H_2O gives *E* *L*-(-)- β -bromo- β -phenylpropionate, *b*₁, 82-4°, *n*_D²⁰ 1.5124, α_{D}^{25} -1.43°. $CNCl$ yields the *p*- CN deriv, *b*₁, 78-9°, *n*_D²⁰ 1.5243, *d*₁⁺ 1.811, α_{D}^{25} -0.38°, α_{D}^{25} -0.53°, α_{D}^{25} -0.92°. IV and HNO_3 gives *L*-(-)- $PhCH(OH)CH_2CO_2Et$, α_{D}^{25} -2.57°. Refluxing III in EtOH (*N* atm.) for 48 hrs gives *L*-III with α_{D}^{25} -3.73°, while EtOH contg. $LiCl$ and K_2CO_3 gives *d*-III with α_{D}^{25} 4.91°. Oxidation of IV with H_2O_2 gives the β -*p*-toluenesulfonyloxy deriv (VI), which could not be distd., α_{D}^{25} -1.04°. Oxidation of *L*-III with H_2O_2 gives the β -*p*-toluenesulfonyloxy *L*-III with α_{D}^{25} -5.12° and EtOH- $LiCl$ - K_2CO_3 gives *d*-III with α_{D}^{25} 4.36°. V with EtOH- K_2CO_3 gives *d*-III with α_{D}^{25} 0.23°. IV and H_2O in $AcOH$ give the *L*-*Ac* deriv, α_{D}^{25} -0.85°; addn of $LiCl$ to this reaction gives a mixt of the *Cl* deriv with α_{D}^{25} -1.3° and the *Ac* deriv with α_{D}^{25} -1.23°. d -(+)- $PhCH(OH)CH_2CO_2Et$ yields (-)- $PhCH(Cl)CH_2CO_2Et$ with PCl_5 (α_{D}^{25} -1.59°), PCl_5 + C_2H_5N (α_{D}^{25} -2.40°), PCl_5 (α_{D}^{25} -1.04°), PCl_5 + C_2H_5N (α_{D}^{25} -2.69°), $SOCl_2$ + C_2H_5N (α_{D}^{25} -2.21°), while $SOCl_2$ alone gives the *d*-*Cl* deriv with α_{D}^{25} 2.87°. PBr_3 gives the *L*-*Br* deriv with α_{D}^{25} -5.08°, while with C_2H_5N α_{D}^{25} is -7.25°. The configurational relations of these compounds are discussed and illustrated with charts. C. J. West.

Addition of halogens to unsaturated acids and esters. V. The bromination of *m*-methoxycinnamic acid and its ethyl ester J. Idres Jones and T. Campbell James *J. Chem. Soc.* 1935, 1600-4 —*m*- $MeOC_6H_4CH=CHCO_2H$ (I) and Br in $AcOH$ in the dark give a quant. yield of the 6-*Br* deriv. (II). Br in CCl_4 or $CHCl_3$ at 0° in the dark gives the same deriv. In boiling CCl_4 in bright sunlight there results α , β -*dibromo*- β -3-methoxyphenylpropionic acid (III), m 167°, the rate of addn in ice-cold CCl_4 in incident sunlight is very slow. addn of Br was also observed

in boiling CS_2 , in boiling $AcOH$ in sunlight the product was almost pure II. In boiling $CHCl_3$ the product was a mixt of II and III, with II predominating. I and Br in boiling $MeOH$ gave 6,3 $Br(MeO)C_6H_3CH=CHCO_2Me$. The *Et* ester of I and Br in cold $AcOH$ or $CHCl_3$ in the dark give the 6-*Br* deriv., while in CCl_4 in strong sunlight there results the *Et* ester of III, m 58°. II and Br in CCl_4 in sunlight gave the β -6-*Br* deriv of III, cream, m 163°. III (20 g) with 2 mols EtOH-KOH for 2 days at 25° gives 2.4 g of the α -*Br* deriv. (IV) of I, m 122°, and 9.8 g of α -*bromo*-*m*-methoxyphenylpropionic acid (V), pale yellow, m 91°. V is transformed into IV by sunlight or by heating the solid at 150° for several hrs. IV is considered to have the *trans*- and V the *cis*-configuration. The ester of III gives a larger proportion of IV. These acids may be sepd. as the Ba salts, that of IV being less sol. in H_2O . IV and 2 mols EtOH-KOH boiled 4 hrs, give 96% of *m*-methoxyphenylpropionic acid (VI), m 103°. VI and I in K_2CO_3 give α , β -*diso*-*m*-methoxycinnamic acid, yellow, m 142°. Catalytic reduction of VI yields *m*-methoxyphenylpropionic acid, m 109-10°, the 6-*Br* deriv, m 133°, forms by the action of Br in cold $CHCl_3$ in the dark. C. J. West.

Spectroscopic investigations of amino acids and amino acid derivatives. I. Ultraviolet absorption spectra of *L*-tyrosine, *d*-phenylalanine and *L*-tryptophan Katherine Feraud, Max S. Dunn and Joseph Kaplan *J Biol Chem* 112, 323-8 (1935) —The ultraviolet absorption spectra of *L*-tyrosine, *d*-phenylalanine and *L*-tryptophan resemble those of their corresponding aromatic nuclei, hydroxyphenyl, phenyl and indole. The aliphatic side chains serve merely to produce alterations in the positions of the absorption bands. The accurate detn of either *L*-tyrosine or *d*-phenylalanine in a protein or a mixt of amino acids is feasible only in the absence of the other form because of the overlapping spectra of these 2 amino acids. A. P. Lohrhop.

Lichen substances. LIX. The nonexistence of γ -collatolic acid Yasuhiko Asahina and Tokujiro Fujikawa *Ber.* 68B, 2020-1 (1935); cf *C. A.* 29, 7963° —It had been reported that the *Me* ester of α -collatolic acid (I) is isomerized on sapon. with alkali to a β -acid (II), m 162°, whereas on standing 2 days in pyridine it changes into a 2nd isomeric γ -acid (III), m 140-1° (*C. A.* 29, 3066°). It has since been found that I changes completely into II on long standing in $NaHCO_3$. II is best characterized through its *Me* ester, m 75°. Permethylations of I and II with CH_3I gives the same *d*-*Me* ether *Me* ester (IV), m 114°. The supposed III proved to be a nonhomogeneous substance, consisting of I admixed with more or less I. On repeated crystn from benzene it yields pure II and CH_3N_3 converts it almost quantitatively into IV. III should therefore be stricken from the literature, and there remains for II only the structure $CO-O-C-$

LX. Microphyllinic acid and its cleavage products *Ibid* 2022-6 —Having secured a larger amt of the lichen, A and F have been able to ext. enough microphyllinic acid (I) (*C. A.* 29, 2524°) to make some of its derivs. Treated in $AcOH$ suspension with a drop of concd H_2SO_4 , I gives anhydroadipylmicrophyllinic acid, m 98°, insol in $NaHCO_3$, Na_2CO_3 and cold KOH , gives no color with alc. $FeCl_3$. Sapon of I with cold $LiOH$ yields olivetonide *p*-*Me* ether (II), m 57°, and olivetonic acid, m 150-60°, sol without color in $NaHCO_3$, Na_2CO_3 and KOH and giving a violet color with alc. $FeCl_3$ and a red color with bleaching powder (*Me* ester, m 85-6°). *Me* ester *d*-*Me* ether of I, from I with Ag_2O and MeI in ether (excess of CH_3N_3 decomposes I), m 89-90°, insol. in cold KOH , gives no color with alc. $FeCl_3$; with boiling 95% HCO_2H it gives olivetonide *d*-*Me* ether, m 94°, and olivetonide α -*Me* ether (III), m 146-7°, which gives no color with alc. $FeCl_3$ or bleaching powder and dissolves without color in KOH . *p*-*Acetyl*olivetonide, from olivetonide and Ac_2O , m 53°, insol. in Na_2CO_3 , difficultly sol. in alkalis, gives a violet color with $FeCl_3$.

and no color with bleaching powder, yields with MeI and Ag₂O in ether the *o*-Me ether, m. 84°, also obtained by acetylation of III. II, best prep'd. from olivetonide and ClH₃N₃, m. 57°, gives a violet color with alc. FeCl₃. *o*-Ac deriv., m. 60–1°, gives no color with alc. FeCl₃. Olivetonic acid *p*-Me ether, from II and aq. KOH, m. 94–5°, gives a violet color with alc. FeCl₃, is readily converted back into II by boiling HCO₂H. Me ester, m. 80°. Olivetonic acid *o*-Me ether, from III and aq. KOH, m. 119–20°, gives no color in alc. with FeCl₃ or bleaching powder. LXI. Olivetonic acid 3. Ibid 2026–8—Olivetonic acid (I), identical in all respects with that obtained from *Alectoria salazana* Gyalnik (*C. A.* 26, 3244, the lichen is incorrectly named in this paper, see *J. Jap. Bot.* 10, 18 (1934)), has been isolated from *Parmelia olivetorum* Nyl. It m. 150–1°, gives in alc. with FeCl₃ a violet, with bleaching powder a red color, and is slowly colored lemon-yellow and then green when moistened with Ba(OH)₂. Me ester, from the acid tritied in ether with CH₃N₃, yellow color with subsequent rapid decolorization, m. 134°, gives in alc. with FeCl₃ a violet, with bleaching powder a blood-red color. Me ester *tri*-Me ether, from the acid with Ag₂O and MeI in ether, in 74.5%, is hydrolyzed by 5% alc. KOH to olivetonic acid *di*-Me ether, m. 93° (giving no color with alc. FeCl₃ or bleaching powder), and olivetolcarboxylic acid *o*-Me ether, m. 105°.

C. A. R.
Synthesis of coumarins from phenols and β -ketonic esters. III. Use of various condensing agents. Duhkharan Chakravarti *J. Indian Chem. Soc.* 12, 530–9 (1935); cf. *C. A.* 26, 434—Various condensing agents have been investigated as substitutes for P₂O₅ for the synthesis of chromones but all attempts failed since coumarins were invariably formed. In Pechmann's reaction H₂SO₄ may be replaced by P₂O₅ with advantage, especially in the case of polyhydroxy phenols, when better yields and purer products are obtained. In Bulow's reaction the condensation of phenols with β -diketones may be effected with advantage by using H₂SO₄ or better, P₂O₅. The addn. of 30 cc. of H₂PO₄ to a mixt. of 10 cc. of resorcinol (I) and 8 cc. of AcCH₃CO₂Et (II) produced, on standing, 50% of β -methylumbelliferone (III), m. 185–6°, Ac deriv., m. 150°. I and II condensed in the presence of AcONa, B₂O₃, EtONa on heating to give 72, 50 and 64% yields of III. The condensation of I with EtO₂CCH₂CH₂AcCO₂Et (IV) in the presence of H₂PO₄ or P₂O₅ gave 7,8-dihydroxy-4-methylcoumarin-3-acetate, m. 163°, identical with a specimen prep'd. in the presence of H₂SO₄. With orcinol and IV, Et 5-hydroxy-4,7-dimethylcoumarin-3-acetate, m. 194–200°, was similarly prep'd. Pyrogallol and IV in the presence of H₂SO₄ yielded Et 7,8-dihydroxy-4-methylcoumarin-3-acetate, m. 180°. With H₂PO₄, AcONa or EtONa as condensing agents, mixts. of phenols and β -ketonic esters gave the following coumarins: 5-hydroxy-4,7-dimethyl, m. 250°, 7,8-dihydroxy-4-methyl, m. 235°, 5,7-dihydroxy-4-methyl, m. 285°, 7,8-dihydroxy-3-phenyl-4-methyl, m. 268°, 7-hydroxy-4-phenyl, m. 210°, 7,8-dihydroxy-4-phenyl, m. 188°, 7-hydroxy-3-benzyl-4-methyl, m. 221°, 7-hydroxy-3,4-dimethyl, m. 250°, and 4,6-dimethyl, m. 150°. The condensation of α - and β -C₁₀H₇OH with II in the presence of H₂PO₄ or NaOAc gave 4-methyl-1,2- α -naphthopyrone, m. 168°, and the corresponding β -naphthopyrone, forming the styrene deriv., m. 193°, with BzH₂. IV. Coumarins from 4-chloro- and 2-nitroresorcinols. Duhkharan Chakravarti and Baidyanath Ghosh *Ibid* 622–6.—The generalization made by Clayton (*C. A.* 2, 1966) as to the hindering and total inhibition of Pechmann's reaction by the introduction into the phenolic nucleus of halogen atoms and neg. groups, resp., has been tested by an investigation of the condensation of chloro- (I) and nitroresorcinol (II) with alkylacetoacetic esters in the presence of H₂SO₄ and of P₂O₅. I, m. 88.5–9°, b. 250°, condensed in the presence of H₂SO₄ with AcCH₃CO₂Et to form 6-chloro-7-hydroxy-4-methylcoumarin, m. 280°, Ac deriv., m. 168°. On changing the condensing agent to P₂O₅, the identical coumarin and no chromone was formed (*C. A.* 9, 2762). I condensed with the Me, Et, Pr, iso-Bu, PhCH₂, α -Cl derivs. of acetoacetic ester and also with (HO₂CCH₂)₂-

CO, EtO₂CCH₂CHAcCO₂Et and BzCH₂CO₂Et in the presence of H₂SO₄ or even of P₂O₅ to give good yields of the following 6-chloro-7-hydroxy-4-methylcoumarins: 3-Me, m. 248° (Ac deriv., m. 170–1°); 3-Et, m. 257–8° (Ac deriv., m. 145°); 3-Pr, m. 230° (Ac deriv., m. 137°); 3-iso-Bu, m. 199°; 3-benzyl, m. 249°; 3-Cl, m. 154° (Ac deriv. m. 192°), and the 6-chloro-7-hydroxycoumarin-4-acetic acid, m. 210°; Et 6-chloro-7-hydroxy-4-methylcoumarin-3-acetate, m. 174°, and 6-chloro-7-hydroxy-4-phenylcoumarin, m. 258–60°. I condensed with HO₂CCH₂CH(OH)CO₂H in the presence of H₂SO₄ to form 6-chloroumbelliferone, m. 271° (Ac deriv., m. 160°), as readily as resorcinol under the same conditions. II condensed with AcCH₃CO₂Et and MeCH₂COCH₂CO₂Et in the presence of H₂SO₄ to give 8-nitro-7-hydroxy-4-methylcoumarin, m. 256° (Ac deriv., m. 193°), and 8-nitro-7-hydroxy-3,4-dimethylcoumarin, m. 260° (decompn.) (Ac deriv., m. 246°), in 60 and 15% yields, resp. No condensation was achieved with the ethyl-, propyl- and butyl-acetoacetic esters and it was not possible to isolate any product with P₂O₅, due to the formation of resins. Thus a substituent in the acetoacetic ester mol., however heavy or complex, does not in any way favor the formation of a chromone even in the presence of P₂O₅. The violet fluorescence of the umbelliferones in alk. soln. is appreciably increased by the introduction of Cl into the pyrone ring but is destroyed completely by the presence of the NO₂ group. C. R. Addnall.

Bitter principles of calomel roots. III. K. Feist, E. Kuntz and R. Brachvogel. *Ann.* 521, 184–8 (1935); cf. *C. A.* 29, 7339.—This is largely a discussion of the differences in the results of previous work by F. and those of Wessely (*C. A.* 29, 6242); these are probably due to the fact that W used an impure product. In an expt. on the action of *p*-MeC₆H₄SO₃Me upon calumbin in 5% EtOH-KOH, there resulted a comp'd termed carbonylo-*iso*-*V*-calumbin, C₂₁H₂₄O₈, m. 191–5° (decompn.); loss of CO₂ gives *iso*-*V*-calumbin. C. J. West.

Sulfur compounds of terpenes. VI. Action of gold chloride on C₁₀H₁₆S (≡C–S–C≡ type). Akita Nakatsuchi. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 511–12 (1935); cf. *C. A.* 27, 3927.—Upon mixing C₁₀H₁₆S (I) and AuCl₃ in a mol. ratio of 4:1, at 30°, C₁₀H₁₆S.AuCl₃ (II) was obtained as yellowish crystals, and with liberation of HCl the crystals changed to a colorless liquid. In 45 days, 60% Cl was liberated and C₁₀H₁₆S.AuCl₃ (III) was formed. The reaction velocity between I and II was measured, and it was found that the reaction may be considered pseudo monomol., if a large excess of I is present. AmOH (IV), PhNO₂ (V), limonene (VI) and I, resp., were added to II dissolved in CHCl₃, and upon standing at 50° for 44.75 hrs. the following amts. of metallic Au were obtained: IV 2.60%, V 1.80%, VI 18.42% and I 0%. VII. Action of gold chloride on C₁₀H₁₆S (≡C–S–C≡ type) at higher temperatures. *Ibid* 512–13.—Data are reported on the stability of II and III in presence of I at 100–20°. A large excess of I inhibited the reduction to metallic Au. III was stable at 100° with excess of I, but decomposed rapidly at 120°. III in I was heated at 109–110° for 6 hrs. in presence of colophonium, ester gum and ethylcellulose, resp., and an increase in reduced Au was noted. Ten mols. of I and 1 mol. of AuCl₃ at 110° gave a grayish, oily liquid, which yielded an olive greenish ppt. after the volatile liquid was dist'd off and the residue had been treated with alc. This comp'd contained 71.35% Au and 8.11% S, was sparingly sol. in Et₂O, C₆H₆, AmOH, but sol. in CHCl₃ and CS₂, and decomp'd at 160°. K. K.

Synthesis of *dl*-piperitone (*dl*- Δ^1 -*p*-menthen-3-one). James Walker. *J. Chem. Soc.* 1935, 1585–6—C₁₀H₁₆CH₂Ac (5 g.) and 8.1 g. of AcCH₃(isoPr)CO₂Et with EtONa in EtOH, allowed to stand 20 hrs. at room temp. and then refluxed 7 hrs., give 3.6 g. of *dl*- Δ^1 -*p*-menthen-3-one-4-carboxylate, b_p 155–60°, n_D²⁰ 1.4225; this is unchanged after refluxing with 20% HCl for 20 hrs., but with 3 mols. 20% MeOH-KOH in 12 hrs. 74% (26% overall) of *dl*-piperitone results. This is the 1st complete synthesis of this comp'd. C. J. West.

on contact with Na a considerable e. m. f., though with the compds. possessing no mobile H this e. m. f. is very small. In the presence of NaI the e. m. f. of the compds. incapable of changing to the enol (or analogous) form either increases many times or remains nearly unchanged. To the first group belong ketones (Ph_2CO), nitriles (PhCN) and heterocyclic derivs of the pyridine group. To the 2nd group belong some compd. esters (e. g., nitrates). The intermediate position is occupied by PhNO_2 and iso- AmNO_2 . Of interest is the small increase of the e. m. f. shown by BzOEt , this indicates a poorer reactivity of the ester C O than the ketone C O (cf. Trosov, *et al.*, *C. A.* 22, 2535). The e. m. f. of compds. with a OH group on the addn. of NaI is either not affected (acids and some alcs., such as allyl alc. and cyclohexanol) or is changed considerably, but less than, e. g., with the compds. incapable of enolization of ketones. This may be explained by the decreased tendency to complex formation with NaI in the absence of a double or triple bond. The double bond of acids is, evidently, little active. The effect of the C double bond in a mol. of alc. is little pronounced. Pyrrrole gave no increase of activity. Compds. with C O, C N and NO_2 groups and H atoms in the vicinity of the unsatd. group showed either a considerably increased e. m. f. (cyclohexanone, methyl oxide) or very little or none at all (MeCN , MeNO_2 , AcH). This may be conditioned by a different degree of enolization and by the different reactivities of the possible tautomeric forms. The difference in the effect of NaI on AcH and BzH is very great, because AcH can exist in 2 hydric forms $\text{CH}_2=\text{CHOH}$ and MeCOH (bivalent C), while BzH cannot change to the 1st form and does not evidently exist in the 2nd form, which follows from the absence of paraaldehyde polymerization. MeNO_2 behaved in the same not as a nitro compd. but as an acid, viz., $\text{CH}_2=\text{N}(\text{O})\text{OH}$. The results clearly show that the reactivity of some unsatd. groups, particularly C O and C N, to Na increases greatly on the addn. of NaI. In this the compds. contg. these groups differ sharply from the compds. with an active H. It is also shown that the activity of C O group depends greatly on its position in the mol. It is especially active in ketones and aldehydes but not in compd. esters and acids. The NO_2 group in nitro compds. behaves differently from that in nitric esters. It suggests itself that this method can find application for the identification of various unsatd. groups in org. compds. and even for the detn. of their positions in the mol.

Chas. Blanc

Hydrogen reactivity in the complex compounds of alcohols with unsaturated organic compounds. B. V. Trosov and L. P. Kulev *J. Gen. Chem. (U. S. S. R.)* 5, 1233-9 (1935); cf. *C. A.* 29, 2054¹ and preceding abstr.—The influence of mol. structure, such as the chain length, chain branching, double bond and C_6H_5 ring, on the H reactivity in alcs. detd. by the e. m. f. of the reaction with Na, was studied by the complex formation PhOH , iso- PhOH , BuOH , MeCOH , cyclohexanol, $\text{MeC}(\text{OH})\text{Et}$ and $\text{PhCH}_2\text{CH}_2\text{OH}$ were mixed in various proportions with Et_3N , $\text{C}_6\text{H}_5\text{N}$ and PhNO_2 and made up to 6 cc. with C_6H_6 . Conclusions.—The primary satd. alcs. either give no complex compds., or the latter have but little effect on the e. m. f. of the reaction of these alcs. with Na. The secondary satd. alcs. show no max. above the e. m. f. observed for a given alc. Tertiary alcs. showed insignificant e. m. f. in the reaction with Na with and without the addn. of Et_3N . With $\text{C}_6\text{H}_5\text{N}$ and PhNO_2 they formed complexes highly active to Na, increasing the e. m. f. more than 10 times (MeCOH). Of the secondary alcs., cyclohexanol and its homologs are exceptions, acting as tertiary alcs. by increasing considerably the e. m. f. on the addn. of the unsatd. compds. (*C. A.* 25, 894). $\text{PhCH}_2\text{CH}_2\text{OH}$ behaves somewhat similarly to phenols, increasing slightly the e. m. f. on the addn. of $\text{C}_6\text{H}_5\text{N}$ and PhNO_2 . The satd. alcs. with PhNH_2 and $\text{C}_6\text{H}_5(\text{NH}_2)$ showed no increase of the e. m. f., while aromatic alcs. gave a small max.

Chas. Blanc

Oxidation of diphenylpyruvic acid. Jules Jarrousse (*compt. rend.* 201, 676-7 (1935))— $\text{PhCH}(\text{CO}_2\text{H})(\text{CO}_2\text{H})$ -

1 $\text{CHPhCOCO}_2\text{H}$ (I), treated in the cold with alk. KMnO_4 , gives an unstable acid (II), extd. with Et_2O from the acidified reaction mixt. and $\text{PhCH}(\text{CO}_2\text{H})\text{CHO}$ (III), m. 114° (semicarbazone, m. about 200° (decompn.)). The formula $\text{PhCH}(\text{CHPhCOCO}_2\text{H})$ has been assigned to II as a result of the oxidation of the tert. alc. group of I. II easily loses CO_2 in alk. soln. to give III. III gives reactions characteristic of aldehydes. On oxidation with I_2 a small amt. of an unstable acid with higher mol. wt. than III is obtained.

Rachel Brown

Derivatives of benzoylbenzoic acids. I. 3-Methyl-2-(2'-hydroxybenzoyl)benzoic acid, 3-methyl-2-(4'-hydroxybenzoyl)benzoic acid and 3-methyl-2-(4'-chlorobenzoyl)benzoic acid. Mosuke Hayashi and Shinzo Tsuruoka *J. Chem. Soc. Japan* 56, 1031-4 (1935).—Condensation of 3-methylphthalic anhydride (I) and PhOH gave 2-hydroxybenzoylbenzoic acids, m. 220-1° (II) and m. 197-8° (III). On treating them with concd. H_2SO_4 and letting stand II gives an isomer (IV), m. 141-2°, and III gives an isomer (V), m. 183-4°. Judging from the fact that treating 3,2-MeBzC₆H₄CO₂H with concd. H_2SO_4 changes it to its 6-Me isomer, II is 3-methyl-2-(2'-hydroxybenzoyl)benzoic acid, IV is the 6-Me isomer of II, III is 3-methyl-2-(4'-hydroxybenzoyl)benzoic acid and V is the 6-Me isomer of III. The product from the condensation of I and PhCl is probably 3-methyl-2-(4'-chlorobenzoyl)benzoic acid, m. 173-4°.

II 3-Methyl-2-benzoylbenzoic acid and 6-methyl-2-benzoylbenzoic acid. *Ibid.* 1084-92.—That 6- (I) and 3-methyl-2-benzoylbenzoic acids (II) are isomers due to the change of positions of the CO-H and Bz groups and not stereoisomers is proved by the following method. The condensation product from 3-methylphthalic acid and C_6H_5 is treated with aq. Na_2CO_3 , the insol. portion gives 1-methyl-2,3-dibenzoylbenzene, m. 116-17° (and not diphenylmethylphthalide), and the sol. portion gives benzoylbenzoic acids, $\text{C}_{14}\text{H}_{10}\text{O}_4$, from which I, m. 126.5-7.5°, and II, m. 171-2°, are sep'd. Heating of II in concd. H_2SO_4 at room temp. gives no change but when heated at 100-5° it gives an isomer I. Oxidation of I and II with KMnO_4 gives diphenyl ketone-2,6-dicarboxylic acid, m. 225-6°, and the 2,3-isomer, m. 121-5°, resp. III 3(6p)-Nitro-2-benzoylbenzoic acid, 3(6p)-nitro-2-(2'(4'p)-hydroxybenzoyl)benzoic acid, 3(6p)-nitro-2-(2'(5'p)-dimethylbenzoyl)benzoic acid and 5(4'p)-nitro-2-(2'(2'5'p)-dimethylbenzoyl)benzoic acid. Mosuke Hayashi, Shinzo Tsuruoka and Akio Nakayama *Ibid.* 1093-1101.—Condensation of 3-O- $\text{NC}_6\text{H}_4(\text{CO})_2\text{O}$ (I) and C_6H_5 by the Friedel-Crafts method gave 2,3(6'p)-Bz(O- N) $\text{C}_6\text{H}_4\text{CO}_2\text{H}$ (II), m. 236-7°; the m. p. of II was not changed by heating in 10 vols. concd. H_2SO_4 at room temp. for 17 hrs. or at 100-5° for 45 min. 2,3-AcO(NO₂) $\text{C}_6\text{H}_4\text{CO}_2\text{H}$ in a similar manner gave 2,6(3'p)-Bz(O- N) $\text{C}_6\text{H}_4\text{CO}_2\text{H}$, m. 160-1°. 4-NO₂- $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$ and *p*-xylene gave 4(5'p)-nitro-2-(2'(5'p)-dimethylbenzoyl)benzoic acid, m. 191.5-2.5°. The other compds. in the title are not obtained in pure state. K. Kutsuta

Substitution in polycyclic systems. I. Nitration of fluorene and 9-bromofluorene. S. V. Anantakrishnan and E. D. Hughes. *J. Chem. Soc.* 1935, 1607-9.—Dinitration of fluorene confirms the results of Courtot (*C. A.* 25, 508). Mild nitration of 9-bromofluorene gives the 2-NO₂ deriv. (I), m. 145°; oxidation gives 2-nitrofluorenone. More vigorous action of HNO_3 in Ac_2O gives a mixt. of 60% of the 2,7-di-NO₂ deriv. (II), m. 255-60° (decompn.), and 20% of the 2,5-di-NO₂ deriv. (III), m. 199°, sep'd. by Me_2CO . Nitration in AcOH is complicated by oxidation and nuclear bromination and gives II and a ketone, $\text{C}_{14}\text{H}_8\text{O}_2\text{NBr}$, m. 230°, which may be 7-bromo-2-nitrofluorenone (Schmidt and Bauer, *Ber.* 38, 3755 (1905)). Nitration of I gives a mixt. of II and III.

C. J. West

Influence of poles and polar linkings on the course pursued by elimination reactions. XXIII. Stable derivatives of the trivalent-carbon compound of Ingold and Jessop. E. D. Hughes and K. I. Kurryan. *J. Chem. Soc.* 1935, 1609-11; cf. *C. A.* 29, 5073¹—The compd. (C_6H_5)₃CSMe, isolated by Ingold and Jessop (*C. A.* 24, 588), proved to be unstable; the NO₂ derivs

have now been studied. 9-Bromo-2-nitrofluorene (I) and Me_2S in PhNO_2 give 2-nitrofluorenyl-9-dimethylsulfonium bromide (II), m 135° with decompn to I and Me_2S , which also results on crystn from dil EtOH . The picrate in 185° (decompn). I with alkali in H_2O , EtOH or Me_2SO gives dimethylsulfonium 9-(2-nitrofluorenyl)ide (III), dark purple needles, slowly decompn on standing and more rapidly on heating, it does not m 300°, on heating in MeNO_2 , 2,2'-dimitrobis(phenylethylene) results. Fluorenyl-9-dimethylsulfonium picrate and HNO_3 at 0° give the 2,7-di- NO_2 deriv, yellow, m 180° (decompn). HBr in AcOH gives 9-bromo-2,7-dinitrofluorene (IV), bromide, from V and HBr , m 230° (decompn.) to IV and Me_2S , it also decomposes on crystn from EtOH . Dimethylsulfonium 9-(2,7-dinitrofluorenyl)ide (V), KMnO_4 like crystals, changing to brick-red on heating and finally decompn with a flash of light, at 150° it evolves Me_2S , boiling MeNO_2 gives 2,2',7,7'-tetranitrobis(phenylethylene), m above 300°. 9-Bromo-fluorene and Me_2S give fluorenyl-9-dimethylsulfonium bromide, m 134-5° (quant yield), picrate, m 143°, heating with H_2O for 30 min gives Me_2S and 9-fluorenyl alc. Alkali gives a very unstable black ppt, which yields Me_2S at room temp.

C J West
Action of bromine on 2- and 4-nitro-1-naphthylamines. Raphael Conden and Joseph Kenyon. *J. Chem. Soc.* 1935, 1596-7.—4,1- $\text{C}_{10}\text{H}_7(\text{NO}_2)\text{NH}_2$ (I) and Br in CHCl_3 gives 2,4-dibromo-1-naphthalenediazoperbromide (II), which decomposes at 128-36° to give 1,2,4- $\text{C}_{10}\text{H}_4\text{Br}$ (III), heating with $\text{C}_6\text{H}_5\text{N}$ also gives III. In AcOH I and Br give principally 2-bromo-1-nitronaphthylamine (IV) and some II, IV reacts with Br in CHCl_3 or AcOH to give II. Ac deriv of IV, yellow, m 235-6°. 2,1- $\text{C}_{10}\text{H}_7(\text{NO}_2)\text{NH}_2$ and Br give the 4 Br deriv., reacting with excess Br to give II, decompn by boiling AcOH to III.

The preparation of Neville-Winter acid from α -chloronaphthalene. N N Voroshilov, Jr, and P V Karish. *Russ. gen. mat. color* 39, 373-8 (1935).—See C A 29, 2530.

Halsey E Sillman
Biaryls and their derivatives. IV. Oxidation of 2-naphthol-6-sulfonic acid and 2,6-dihydroxynaphthalene. I S Ioffe and S G Kuznetsov. *J. Gen. Chem.* (U S S R) 5, 877-85 (1935), cf C A 28, 2709.—The oxidation of 2,6- $\text{HO}_2\text{C}_6\text{H}_3\text{SO}_3\text{H}$ (I) by FeCl_3 in H_2O at elevated temps gave 2,6- $\text{HO}_2\text{C}_6\text{H}_3(\text{SO}_3\text{H})\text{Cl}$ and no 2,2'-dihydroxy-1,1'-binaphthyl-6,6'-disulfonic acid (II) as was expected (cf C A 28, 1691). At 20-5° the reaction proceeded normally, giving 90% II after 20 days of interaction, II, heated with 25% H_2SO_4 at 170-80° for 12 hrs, gave 2,2'-dihydroxy-1,1'-binaphthyl, m 216°. II, fused with KOH at 330° for 15 min, produced 47.7% of 2,6,2',6'-tetrahydroxy-1,1'-binaphthyl (III), m 318-20° (uncor.) (decompn). 2,6- $\text{C}_{10}\text{H}_6(\text{OH})_2$ (IV) gave with 1 mol of FeCl_3 III and with 1.5 mols of FeCl_3 the tetramer consisting of 4 IV groups with mol wt 650 (cf Sals, *Ber* 39, 300b (1906), Willstätter and Parnas, *Ber* 40, 1406 (1907)). II is highly sol and cannot be sepd with NaCl . The sepn was effected by making the reaction mixt. slightly alk. with $\text{Ba}(\text{OH})_2$, neutralizing the filtrate with AcOH , evapn the soln to a small vol and filtering from BaCl_2 . The filtrate was treated with $\text{Ba}(\text{OAc})_2$ and the I in the soln was removed by coupling it with the theoretical amt of β - $\text{O}_2\text{NC}_6\text{H}_4\text{N}_2\text{Cl}$. The filtrate was treated with the exact amt of H_2SO_4 and the filtrate from BaSO_4 was repeatedly evapd to dryness, giving II 73% (dil alc). V. Optical activity of 2,2'-dihydroxy-1,1'-binaphthylsulfonic acids. I S Ioffe and I V Grachev. *Ibid* 950-5.—The dibrucine salts of the 6,6'- and 7,7'-disulfonic acids of 2,2'-dihydroxy-1,1'-binaphthyl were sepd by fractional crystn. into the diastereomeric dibrucine salts of 1- and 4-acids. The latter by the action of alkali sepd the optical antipodes, 1- and 4-acid. These show optical rotation only in the form of the Na salts in alk. soln, and none in a free state or in acid soln. The antipodes of the 7,7'-disulfonic acid are more stable than the 6,6'-acid. The racemization of the 2 acids proceeds more rapidly in an alk. soln than in an acid one.

VI. Oxidation of 2-naphthol-3-carboxylic acid I. S Ioffe and I Z Smolnitskaya. *Ibid* 1215-9.—The oxidation of 2,3- $\text{HO}_2\text{C}_6\text{H}_3\text{CO}_2\text{H}$ (I) with 3 mols of FeCl_3 proceeded with the formation of 2,2'-dihydroxy-1,1'-binaphthyl-3,3'-dicarboxylic acid (II), m 331°, and 1,2,3- $\text{Cl}(\text{HO})_2\text{C}_6\text{H}_3\text{CO}_2\text{H}$ (III), m 231°, at a ratio depending on the conditions of the reaction. In aq medium the Na salt of I gave 90% II and 6% III, while free I under these conditions produced 60% II and 25% III. Similar results were obtained by working in dil alc and AcOH . With a large excess of HCl no II and 60% III were formed. I (5 g), heated with 2.5 g of dry CuO in 10 cc. PhNO_2 at 210-20° for 6 hrs, gave 2.5 g II. II is not affected by boiling with FeCl_3 or by CuO in PhNO_2 at 200-40°. At 300° the latter procedure results in the cleavage of CO_2 and formation of dihydroxybinaphthyl, m 229°. Cyclization of II with the formation of a perylene ring was effected by heating a mixt. of 10 g of Pb salt of II with 40 g of anhyd AlCl_3 at 150° for 1 hr. The product, m above 330°, is a dye for animal fibers, giving in acid bath an orange dying changing to a beautiful brown-chocolate after mordanting with $\text{K}_2\text{Cr}_2\text{O}_7$. The presence of a perylene ring was demonstrated by the formation of perylene on distn with Zn dust. The product is, probably, 1,12-dihydroxyperylene-2-carboxylic acid or 1,12-perylenequinone-2-carboxylic acid. VII. Oxidation of 2-hydroxyanthracene. I S Ioffe. *Ibid* 1210-12.—The oxidation of 2-hydroxyanthracene with FeCl_3 in alc or AcOH resulted in the formation of 2-hydroxy-1,1',9,9'-bianthrylene oxide (I) and a brown compd of unknown structure I is unstable, changing at 200° to the brown compd, m above 300°. I gives with HCl the oxonium salt and with AcO in dry pyridine the Ac deriv, m 247-50° (uncor.).

Chas Blanc
Halochromism of 5-benzoyl-1,4-naphthohydroquinone. Roland Schell, Joachim Donat, Sigrif Hass and Alfred Keller. *Ber.* 68B, 2034-9 (1935).—1-Benzoylanthraquinone is converted by Al powder in concd H_2SO_4 , the anthraquinone by concd H_2SO_4 (or other strong acids) alone, through the oxanthrone into the emerald-green sulfate of the violet 2-phenyl-6,7-benzoylene- β - β' -benzofuran (C A 27, 3210). It was of interest to determine whether the C_{10}H_6 analogs, 5-benzoyl-1,4-naphthohydroquinone (I) and the hydroquinone (II), would likewise give the halochromic sulfate of a deeply colored 2-phenyl-6,7-acrylene- β - β' -benzofuran. The brownish yellow soln of I in concd H_2SO_4 on heating with Al powder rapidly becomes a vivid ruby-red (violet in thin layers), with bright blue fluorescence. A similar soln results immediately when II is introduced into concd H_2SO_4 and the same results are obtained with hot 70% HClO_4 instead of H_2SO_4 . If I in acetone is treated with 70% H_2SO_4 or HClO_4 , or with HCl gas there soon sep. dark violet (red by transmitted light) crystals with strong golden luster which form in concd H_2SO_4 and hot HClO_4 solns of the same ruby-red color and blue fluorescence as those obtained directly from I and II. The solid salts dissolve in org. solvents more or less readily with blue color, but the solns, especially in alc, soon become discolored, the solns in acetone, alc and concd H_2SO_4 are immediately decolorized by water with formation of a yellow ppt. From this behavior it must be assumed that the solid salts are not halochromic salts of an acrylenebenzofuran but of II. The sulfate and chloride are not suitable for setting this point by detg. the amt of II set free by water, for they contain more H_2SO_4 or HCl than corresponds to a mol ratio of 1 and less than 1.2. A perchlorate of the compn $\text{C}_{16}\text{H}_{10}\text{O}_4\text{ClO}_4$ can readily be obtained, however, and when it is heated in acetone contg NaOAc and treated with hot water it yields 80% of the calcd amt of pure II, thus proving that it is a halochromic salt of II. In addn to the open structure, $(\text{HO})_2\text{C}_{10}\text{H}_6(\text{CO}_2\text{H})_2$, II can have the lactol structure, and certain phenomena in the anthracene series speak in favor of this structure for II itself and for its halochromic salts. 6-Methyl-5-benzoyl-1,4-naphthohydroquinone, m 148°, from 1,2- $\text{C}_{10}\text{H}_6\text{Br}_2\text{Me}$ and CrO_3 in AcOH (18% yield), 2,6-Di- β -homolog, m 109°, obtained in 32% yield from 2,6-di-

methyl-1-benzoylnaphthalene, b.p. 218–60°, m. 83–4° (prepd. from $\text{C}_{10}\text{H}_7\text{Me}$, BzCl and AlCl_3). Bi-2-(1,4-dihydroxynaphthyl), from the biquinonyl in AcOH at 35° with 7n dust, colorless needles, begins to decompose 100°, blackens 250°, sensitive to the air and soon assuming a bluish tinge even when well dried; solns. in org. solvents become violet when heated in the air and on cooling deposit black-violet needles of the quinoxaline, which begins to decompose about 200° C. A. R.

Constituents of natural phenolic resins III Synthesis of dehydro-"sulfite liquor lactone" dimethyl ether and some observations on the structure of podophyllotoxin Robert D. Haworth, Thomas Richardson and Geo. Sheldrick *J. Chem. Soc.* 1935, 1576–81, cf. C. A. 29, 5100°. The proposed structure for dehydro-"sulfite liquor lactone" (I) has been confirmed by its synthesis. Li β -(3,4-dimethoxybenzoyl)propionate m. 57–8°, HCO_2Et with Na in C_6H_6 give the β -hydroxymethylene deriv. m. 114–16° (red color with FeCl_3) and $(\text{CO}_2\text{Et})_2$ gives Li β -(3,4-dimethoxybenzoyl) Δ^2 -crotonolactone- γ -carboxylate, yellow, m. 151–6°, recognizable reduction products of these esters could not be prepd. 3,1-(MeO) $_2$ - $\text{C}_6\text{H}_3\text{CH}_2\text{C}(\text{CO}_2\text{H})\text{CH}_2\text{COC}_6\text{H}_3(\text{OMe})_2$ -3,4(3,4)-formalin and 10% NaOH give 2,7 of β -(3,4-dimethoxybenzoyl)- α -(3',4'-dimethoxybenzylidene)- β -methylpropionic acid, m. 157–8°, MeOH acid with HCl gives a mixt. of Me 6,7-dimethoxy-1-(3',4'-dimethoxybenzylidene)-2-chloromethylnaphthalene-3-carboxylic acid, m. 171–7° (free acid (II), m. 241–5° and then 291–5°), and the lactone of β -(3,4-dimethoxybenzoyl)- α -(3',4'-dimethoxybenzylidene)- β -chloromethylpropionic acid (III), yellow, m. 183–4°; boiling MeOH gives the β -methoxymethyl analog, yellow, m. 145°; II, heated in camphor at 200–10° for 10 min, yields 4',5',6,7-tetramethoxybenzo-3,4-fluorene-1-carboxylic acid, cream, m. 303–5° (Me ester, m. 202–4°). Heating II with 10% NaOH for 1 hr. at 100°, hydrolysis of the Me ester of II with 10% MeOH-KOH, or boiling III with MeOH-HCl in CHCl_3 for 6 hrs., followed by hydrolysis with 10% MeOH-KOH, acidification of each of the reaction products and lactonization by heating at 100° for 0.5 hr., gives I (lactone of 6,7-dimethoxy-1-(3',4'-dimethoxybenzylidene)-2-hydroxymethylnaphthalene-3-carboxylic acid), m. 215–16°; the overall yield is practically quant. The application of the above synthesis in the prepn. of substances related to podophyllotoxin has also been investigated. 3,4,5-(MeO) $_3$ - $\text{C}_6\text{H}_2\text{COC}_6\text{H}_3(\text{CO}_2\text{Et})_2$ (83 g.), $\text{BrCH}_2\text{CO}_2\text{Et}$ and $\text{Fe}(\text{OAc})_3$, refluxed in EtOH for 16 hrs., give, after hydrolysis, 4,2 g. of β -(3,4,5-trimethoxybenzoyl)propionic acid, m. 121–2°; the Na salt with piperonal and Ac_2O gives the γ -lactone, yellow, m. 101–2°, of β -(3,4,5-trimethoxybenzoyl)- α -(3',4',5'-trimethoxybenzylidene)propionic acid, m. 183–4°; HClHO gives the β -methylene deriv. m. 169–70°. 6,7-Methylenedioxy-1-(3',4',5'-trimethoxybenzylidene)-2-chloromethylnaphthalene-3-carboxylic acid, does not m. 300°; the lactone of the 2-hydroxymethyl analog, m. 258–6°, on oxidation yields 6,7-methylenedioxy-1-(3',4',5'-trimethoxybenzylidene)naphthalene-2,3-dicarboxylic acid, characterized as the anhydride, pale yellow, m. 293–300°, and the di-Me ester, m. 206–7°, dehydroanhydripropodipodophyllin gives the same acid. C. J. West.

By-products formed in the Friedel-Crafts synthesis of ketones from acid chlorides and phenolic esters Synthesis of ketones of naphthalene series. P. I. Popov *J. Gen. Chem.* (U. S. S. R.) 5, 996–92 (1935).—In the synthesis of ketones from phenolic esters and acid chlorides with AlCl_3 in CS_2 , the ether ext. of ketones, obtained by the decolor. of the reaction product with H_2O_2 , was washed with dil. NaOH and the alk. ext. acidified, producing always a crystallizable oil. The amt. of this by-product is greater the longer the reaction. It was postulated that these alkali-sol. products are β -HO ketones formed by sapon of the alkyl ketones by the excess of AlCl_3 . $\text{AcC}_6\text{H}_4\text{OMe} + \text{AcC}_6\text{H}_4\text{OH}$. In the synthesis of 1,4-MeOC $_6\text{H}_3$ Ac there was isolated 1,2,4-HOC $_6\text{H}_3$ Ac, m. 179–40° and no 1,4-HOC $_6\text{H}_3$ Ac. In a similar expt. with the production of 1,4-LiOC $_6\text{H}_3$ Bz from BzCl and α -C $_6\text{H}_4\text{OH}$ with AlCl_3 , the alk. extra. produced 1,4-

HOC $_6\text{H}_3$ Bz, m. 164–5°, and 1,2,4-HOC $_6\text{H}_3$ Bz (I), m. 138–9°. The formation of I may be best explained by the partial sapon of the ether to α -C $_6\text{H}_4\text{OH}$ by AlCl_3 , which with BzCl forms $\text{C}_6\text{H}_4\text{OBz}$. This under the action of AlCl_3 is rearranged partly to 1,4-HOC $_6\text{H}_3$ Bz (Rosenmund and Schurr, C. A. 22, 1570) and 1,2-HOC $_6\text{H}_3$ Bz. The latter in the presence of BzCl and AlCl_3 is converted to I. The ability of α -naphthol 2 ketones to give naphthol 2,4-diketones was demonstrated by the condensation of 1,2-HOC $_6\text{H}_3$ Ac with BzCl and AlCl_3 in CS_2 to 1,2,4-HOC $_6\text{H}_3$ AcBz, m. 131–2°. Chas. Blanc.

Constitution of alkannin, shikonin and alkannan. Hans Brockmann. *Ann.* 521, 1–47 (1935).—Alkannin (3-(2-methyl-5-hydroxypenten-5-yl)-5,8-dihydroxy-1,4-naphthoquinone), $\text{C}_{18}\text{H}_{16}\text{O}_4$ (I), from *Alkanna tinctoria*, brown-red with Cu ester, m. 118° (all m. ps. cor.), $[\alpha]_D^{25} -157^\circ$ (C_6H_6), -227° (CHCl_3), contains 3 active H atoms, I sublimes unchanged at 140–50° at 0.001 mm Hg, the rotatory power is independent of the concn of the soln. "Alkannin" Merck (20 g.) gives 2.5 g. pur. I. I contains about 0.1% of alkannan (3,4-hexylnaphthazarin) (II), m. 97–8°, optically inactive, sep'd by adsorption on kieselguhr. Shikonin (III) (Majumdar and Kuroda, *Acta physicochim.* 1, 43 (1922)) is the optical antipode of I and has $[\alpha]_D^{25} 135^\circ$ (C_6H_6); the absorption spectra of I and II are identical, O $_2$ gives 1 mol. Me_2CO . Dry distn. of I gives 1-methylquinizarin, which was synthesized by passing air through an alk. soln. of the condensation product of diacetylnaphthazarin and pipertonylene (heated 1 hr. at 100°). Zn distn. of I gives C_6H_4 and α - and β -methylanthracene. I yields a tri-Ac deriv. (IV), yellow, m. 132°, $[\alpha]_D^{25} -110^\circ$ (C_6H_6); di-Bz deriv., yellow, m. 174–5°. IV with O $_2$ gives 1,4-dihydroxyphthalic acid, I gives Me_2CO , KMnO_4 gives only AcOH and malic acid, I and MeOH-HCl at 20° for 15–18 hrs. give the Me ether, brown-red, m. 195°, contains 2 active H atoms and is optically inactive. The Me ether (V) of III also m. 105° and does not depress the m. p. of the deriv. of I. The Li ether of I, brown-red, m. 83°, the Pr ether, m. 57–8°. A mixt. of 50 mg. of III and 40.5 mg. of I in C_6H_6 + benzene give a racemic I, m. 148°. Catalytic reduction of I with 1 mol. H_2 gives only I; with 3 mols. H_2 there results II, whose di-Ac deriv., yellow, m. 99–101°; reductive acetylation of II yields a tetra-Ac deriv., $\text{C}_{18}\text{H}_{16}\text{O}_4$, m. 170°. Oxidative degradation of II gives isopropylidene, whose β -bromophenacyl ester, m. 75°; the corresponding ester of isocaproic acid, m. 75°. The dihydro deriv. of V, red, m. 50–1°; oxidation with KMnO_4 in MeCO gives α -methoxyisocaproic acid, b.p. 123–4°, prepd. from the α -Br deriv. (b.p. 84–60°) and MeONa; oxidation gives isocaproaldehyde, whose 2,4-dinitrophenylhydrazone, yellow, m. 95°. I and 2 N NaOH, heated 2 hrs. at 100° in a N atm, gives anhydralkannin, $\text{C}_{18}\text{H}_{16}\text{O}_4$ (VI), dark red, m. 155°. PrOH-HCl gives 15% yield; catalytic reduction gives II. I and ZnCl_2 in C_6H_6 give cycloalkannin (VII), $\text{C}_{18}\text{H}_{16}\text{O}_4$, red, m. 79–80°, $[\alpha]_D^{25} -69.2^\circ$ (C_6H_6); the cyclo deriv. of III, m. 70–80°, $[\alpha]_D^{25} 51.2^\circ$ (C_6H_6). The racemate m. 86°.

C. J. West
Substitution in arylsulfon-1- and -2-naphthalides. Raphael Conden and Joseph Kenyon. *J. Chem. Soc.* 1935, 1091–6. α -C $_6\text{H}_4\text{NH}_2$ and $\text{m-O}_2\text{NC}_6\text{H}_4\text{SO}_2\text{Cl}$ in $\text{C}_6\text{H}_5\text{Mg}$ give $\text{m-nitrobenzenesulfon-1-naphthalide}$ (I), m. 162–4°. I (30 g.) with concd. HNO_3 in AcOH gives 24 g. of the 2,4-di-NO $_2$ deriv., yellow, m. 185–8°; cold

fuming HNO_3 with or without AcOH gives the 2,4,5-tri- NO_2 deriv. (II), m. 215° (decompn). 5-O-N- α - $\text{C}_6\text{H}_4\text{NH}_2$ and m-O- $\text{N}_2\text{C}_6\text{H}_4\text{SO}_2\text{Cl}$ give 5-nitro-1-m-nitrobenzenesulfonaphthalide, m. 208-10°, nitration gives I and Br in CHCl_3 , refluxed 1 hr, give the 4-Br deriv., m. 174-6°, hydrolysis gives 4-Br- α - $\text{C}_6\text{H}_4\text{NH}_2$, further action of Br in $\text{C}_6\text{H}_5\text{NH}_2$ gives the 2,4-di-Br deriv., m. 232-3°, also prep. from m-O- $\text{N}_2\text{C}_6\text{H}_4\text{SO}_2\text{Cl}$ and 2,4-Br- α - $\text{C}_6\text{H}_4\text{NH}_2$; 4 Nitro-1-p-toluenesulfonaphthalide and Br in $\text{C}_6\text{H}_5\text{NH}_2$ give the 2 Br deriv., yellow, m. 193-5°; no reaction occurs in boiling CHCl_3 . p-Toluenesulfonaphthalide (III) (20 g.) and concd HNO_3 give the 2,4-di-Br deriv. 2,4-(O_2N) $_2$ - α - $\text{C}_6\text{H}_4\text{OH}$ and fuming HNO_3 give a mixt. of 2,4,5- and 2,4,7-tri- NO_2 derivs III and Br in CHCl_3 give the 1-Br deriv., m. 100°. Reduction of 1,3,2-Br $_3\text{C}_6\text{H}_3\text{NH}_2$ with Sn and concd HCl -EtOH gives 3-bromo-2-naphthylamine, m. 173°. Ac deriv., m. 177°. p-MeC $_6\text{H}_4\text{SO}_2\text{Cl}$ gives 3-bromo-2-p-toluenesulfonaphthalide, pale yellow, m. 127-9°; HNO_3 in AcOH gives the 1- NO_2 deriv. (IV), pale yellow, m. 237-9° (decompn), this also results on bromination of the 1- NO_2 deriv. of III, reduction with Sn and HCl or Zn and AcOH gives 3-bromo-2-p-toluenesulfonaphthalenediamine, m. 185°. Hydrolysis of IV gives 3-bromo-1-nitro-2-naphthylamine (V), orange, m. 105°. Ac deriv., yellow, m. 136°, 3-bromo-1-nitro-2-naphthol, yellow, m. 131° (decompn). Reduction of V gives 3-bromo-1,2-naphthylenediamine, m. 85° (decompn) (quinazoline deriv., yellow, m. 195-9°). 1,6-Dinitro-2-p-toluenesulfonaphthalide gives the 3-Br deriv., pale yellow, m. 228-31° (decompn), hydrolysis yields 3-bromo-1,6-dinitro-2-naphthylamine, golden, m. 238-41°. Ac deriv., m. 273-7° (decompn). III in $\text{C}_6\text{H}_5\text{NH}_2$ with I, ICl or ICl_3 gives the 1-I deriv., m. 126-7°. 3-Iodo-2-p-toluenesulfonaphthalenyl, m. 114-15°, the 4-p-toluene isomer, m. 109-15°, 4-iodo-2-p-toluenesulfonaphthalide, m. 127-32°. C. J. W.

Constitution and reactivity XIV. Reaction kinetics of the sulfonation by oleum and the properties of different concentrations of fuming sulfuric acid. Karl Lauer and Ryohei Oda, *J. prakt. Chem.* 144, 32-40 (1935), cf. C. A. 29, 6216f.—Sulfonation of anthraquinone (I) with H_2SO_4 at various temps and concns gave the following results at 130°, 140° and 150° for $k \times 10^4$, calcd. for a pseudomonomol reaction: H_2SO_4 , H_2O , 479, 1210, 2510, 1,289% SO_3 , 854, 1696, 3340, 3.2% SO_3 , (1380), (2890), 5913, 5% SO_3 , 40.1, 91.5, 213, 8.5% SO_3 , 804, 1583, 3851, 19.9% SO_3 , 2542, 5062, 9350. Since equimol. quantities of SO_3 were used, the mol ratios of H_2SO_4 to I to SO_3 varied from 3.2:1 to 39:1. However, this appeared to have no effect on the value of k . Sulfonation of I with H_2SO_4 has an activation heat of about 40,000 cal. and an action const. of $300-1000 \times 10^{10}$. With SO_3 the values are 22,000 cal. and 0.1×10^{10} . Oleum with 3-10% SO_3 contains SO_3 in a specially inactive form. This accounts for the observation that the reaction of sulfonation of I with 2-3% oleum at 140° soon comes to a standstill. C. J. West.

Benzanthrone derivatives III. The autocyclizable dihydrobenzanthrone E. Clar, *Ber.* 68B, 2069-70 (1935), cf. C. A. 26, 594f.—It had been found that benzanthrone (I) in alk. or mineral acid soln is reduced to 1,10 trimethylene-9-hydroxyphenanthrene (II). No dihydrobenzanthrone could be isolated as intermediate product in these reductions, but this gap has now been filled. With Zn dust and AcOH I gives in excellent yield a dihydro compd (III), whose interesting properties explain the earlier failures to isolate it. The colorless, well-cryst. III is very sensitive to air, so that all operations must be carried out in a CO_2 atm. It also shows the properties of a biradical, it takes up exactly 1 mol. O in xylene, instantly decolorizes 2 atoms Br and is disproportionated by strong acids or weak alkalis, or by heating to 150°, into I and II. The oxidation is markedly accelerated by light and proceeds with greatest velocity (in about 5 min.) in AcOH, but in this solvent only about 1.6 atoms O is taken up. The xylene and AcOH mother

liquors nevertheless show for days the properties of peroxides (liberation of I from KI, decolorization of KMnO_4). In xylene the O is apparently given up to the solvent and does not act further on unchanged III, while in AcOH H_2O_2 is split off and forms I with II still present. β -5-1-bromobenzanthrone also yields a dihydro deriv. (IV) with similar properties. The detn. of the structure of III is rendered very difficult by the sensitivity of III to acids and heat, so that it can undergo almost no reaction without alteration of the skeleton of double bonds. Short action of Ac_2O gives an acetate not sensitive to air. Of the possible formulas for III,

seems the most probable. The course of the reduction of I is further confirmation of the conception of a reactive diyl state for I, which would explain its behavior as an unsat. ketone. Especially worthy of note is the appearance of an orange-red intermediate stage in the reduction of I, as well as in the oxidation of III in solid state or in soln (not in xylene, however). This intermediate stage is also observed when I is reduced to III with Zn dust, pyridine and AcOH according to Kuhn and Winterstein (C. A. 27, 723). Since no pinacol of I can be obtained by any reduction method, it may be that the orange-red intermediate stage represents a disocd. pinacol, a monohydro compd or quinhydrone. Attempts to prep such a compd from equal mols. of I and III gave an orange-red product which, although homogenous in appearance, melted considerably lower (120-5°) than its components, on oxidation it consumed exactly half as much O as III, but not enough of the oxidation product (also formed in small amt. in the oxidation of III in xylene) was obtained for study. A radical monohydric compd. can therefore be present only in very small concn. in equi. with I and III. III, tables, quickly becoming orange-red in the air and brown-yellow in the light, sol. in concd. H_2SO_4 with orange-red color and fluorescence, m. 150-2° on rapid heating under CO_2 in a sealed capillary (the m. p. falls to 132° when the detns are repeated). Acetate of III, m. 159-61° (decompn.) under CO_2 (sealed tube), 154-5° in air. IV, m. 167° (evolution of HBr). C. A. R.

Condensation of phthalic anhydride with α -octahydrophenanthrene E. de Barry Barnett, N. F. Goodway and C. A. Lawrence, *J. Chem. Soc.* 1935, 1684.— α -Octahydrophenanthrene and $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$ with AlCl_3 in $\text{C}_6\text{H}_2\text{Cl}_4$ give 90% of α -1,2,3,4,5,6,7,8-octahydrophenanthrylbenzene acid (I), m. 200°, 4,5-C $_6\text{H}_3(\text{CO})_2\text{O}$ yields the 4',5'-di-Cl deriv., m. 276° (decompn.). Reduction of I with Zn, NaOH and NH_4OH by heating 15 hrs at 100° gives ω -1,2,3,4,5,6,7,8-octahydrophenanthryl- α -toluene acid, m. 182°, cyclized by concd H_2SO_4 to octahydro-1,2,3,4-dibenzanthrone, pale yellow, m. 200°, AcO and $\text{C}_6\text{H}_5\text{NH}_2$ give octahydro-1,2,3,4-dibenzanthranil acetate, yellow, m. 214°, CrO_3 in AcOH gives octahydro-1,2,3,4-dibenzanthraquinone, yellow, m. 234°; reduction gives octahydro-1,2,3,4-dibenzanthracene, pale yellow, m. 129°.

C. J. West

Constitution of vitamin D $_2$. A Windaus and W. Thiele, *Ann.* 521, 160-75 (1935).—The acetate from 15 g. vitamin D $_2$ (I) and 6 g. maleic anhydride, refluxed 4 hrs in benzene, give an amorphous product which, neutralized with 10% KOH in MeOH, acidified with AcOH, esterified with CH_3N_3 and crysd. from MeOH, yields 6-7 g. of di-3- α -vitamin D $_2$ acetate maleate (II), $\text{C}_{28}\text{H}_{44}\text{O}_4$, m. 141°, $[\alpha]_D^{25}$ 170.8°, adds 2 atoms O on titration with MeOH-KOH . The mother liquor, hydrolyzed with MeOH-KOH , acetylated and esterified, yields the β -isomer (III), m. 94-5°, $[\alpha]_D^{25}$ -158.3°, adds 3 atoms O. These compds distil at 0.01 mm without decompn. The dihydro deriv. of II in 112°, $[\alpha]_D^{25}$ 167.6°, and adds 1.16-1.33

for over 111 days. Benzidine gave an unidentified phenazine deriv. in 84 days. Phenol, quinol, and α - and β -naphthol in aq. or dil. NaOH solns. gave similar dark unidentified ppt. in 64 to 121 days. Resorcinol, pyrocatechol and pyrogallol were unchanged after 156 days. A 1% soln. of α -C₆H₄(NH₂)₂ in dil. HCl gave 2,3-diaminophenazine-HCl in 125 days. Aq. m -C₆H₄(NH₂)₂ gave 2,6-diaminophenazine, m. 128°, in 28 days. p -C₆H₄(NH₂)₂ in dil. HCl gave 3,6-diaminophenazine (?), m. 130°, in 106 days. p -H₂NC₆H₄NMe₂ in dil. HCl in 120 days gave an intensely violet soln. which was shown to contain an unidentified azine dye. Aq. p -H₂NC₆H₄NHAc gave diacetyl- p , p' -diaminodiphenylamine, m. 219°, in 81 days. 1,8-C₆H₄(NH)₂ in dil. HCl in 87 days gave a brown ppt. which was probably *peri*-dinaphthalene azoxide, since it gave azine reactions. o -HOC₆H₄NH₂ in aq. soln. in 94 days gave a red compd., C₁₀H₈N₂O₂, identical with one described by G. Fischer (*J. prakt. Chem.* [2], 19, 318 (1879)). m -HOC₆H₄NH₂ gave an unidentified brown ppt. in 62 days. p -HOC₆H₄NH₂ in 70 days gave a violet ppt. whose properties indicated that it was p , p' -dihydroxydianilinoindophenol. m - and p -HOC₆H₄NMe₂ were unchanged in 125 days. o -MeOC₆H₄NH₂ in dil. HCl gave 1,5-dimethoxyphenazine, no m. p., in 78 days. p -MeOC₆H₄NH₂ gave 3,7-dimethoxyphenazine, o -LOC₆H₄NH₂ gave 1,5-dithoxyphenazine, p -LOC₆H₄NH₂ gave 3,7-dithoxyphenazine, and 2,4-HOC₆H₄(NH₂)₂ gave an unidentified black ppt. which had the properties of a phenazine deriv. H₂NC₆H₄CO₂H in dil. HCl gave phenazine-1,5-dicarboxylic acid, m. higher than 300°, in 120 days. m -H₂NC₆H₄CO₂H in dil. NaOH was unchanged, but p -H₂NC₆H₄CO₂H gave the Na salt of p , p' -azobenzene-dicarboxylic acid, di-Et ester, m. 111°. Vanillin, 2,4-(OH)₂C₆H₃CHO, and p -Me₂C₆H₃CHO were unchanged. Aq. p -OHC₆H₄NH₂ in dil. HCl gave p , p' -dialdehydoazobenzene, m. 239°, in 123 days. Aq. 1% eosin was decolorized in 75 days and gave HBr and a ppt. of 2,4-dibromobenzoic acid, m. 218°. Aq. 1% erythrosin was decolorized in 120 days to give III and by analogy, 2,4-diodobenzoic acid (?), no m. p. p -H₂NC₆H₄NHAc in dil. HCl in 75 days gave an unidentified ppt., m. 180°, which reduced NH₄AgNO₃. Gallacetophenone in dil. NaOH was unaffected. Ph₃HNH₂ evolved N₂ and in 56 days gave an unidentified, apparently heterocyclic N₂ compd., m. 128°. 2-Aminothiazole in dil. HCl gave a trace of ppt. which apparently was a phenazine deriv. Aq. thiocarbamide gave S and carbamide in 46 days. α -Benzil dixime in dil. NaOH gave 3,4-diphenylfuran, m. 94°, in 35 days. Sterile aq. 1% maleic acid gave pyruvic acid in 123 days. Sterile citric acid was unaffected. Tartaric acid, while mainly unchanged, gave a trace of a solid with strong aldehydic or ketonic properties. Erucic acid in dil. LiOH gave dihydroxyerucic acid, m. 118°, in 38 days. Aq. 1% maleic acid was completely converted into fumaric acid in 50 days. Na cinnamate was 17.2% converted into allocinnamic acid in 50 days. Aq. itaconic, citraconic, and tiglic acids and Na oleate and brassydate were not inverted after 75 days.

John E. Milbery
Dihydroxy derivatives of ternary arsesines, arsonium bases and their salts. G. A. Razuvaev, V. S. Malinovskii and D. A. Godina. *J. Gen. Chem.* (U. S. S. R.) 5, 721-7 (1935); cf. Razuvaev and Malinovskii, *C. A.* 29, 68037.—The di-HIO derivs. of ternary arsesines were obtained by the following reactions: $R_3AsX_2 + 2RMgX \rightarrow R_3As + 2MgX_2$; $R_3AsX + RMgX \rightarrow R_3As + MgX_2$; $R_3As + I_2 + 2H_2O \rightarrow R_3As(OH)_2 + 2HI$ ($R = Me$ or Ph ; $X = Cl$ or I). The reaction with the dihydrophenarsine series proceeds analogously. All di-HIO derivs. on drying over P₂O₅ in *vacuo* give oxides. Trimethyl- and dimethylphenyl-arsines give the corresponding oxides. These compds. form hygroscopic crystals, sol. in H₂O and alc. They give with HNO₃ monobasic salts, R₃As(OH)ONONO₂, and with H₂SO₄ (Ph₃AsOH)₂SO₄. In distinction from the described derivs. of the fatty-aromatic series, the oxides and dihydroxides of 10-R-9,10-dihydrophenarsine are little or not at all hygroscopic and are considerably more difficultly sol. in H₂O and alc. (cf. R. and M., *C. A.* 25, 1831). They give with HNO₃ no

salts but are very easily nitrated (cf. R. and M., *C. A.* 28, 4058). This indicates a greater mobility of H in the C₆H₅ nuclei of these derivs. of dihydrophenarsine than in that of methylphenylarsine. The structure of the dihydroxides, oxides and their salts may be thus formulated.

(III)

(IV)

Formula I agrees with the ability of the dihydroxides to form monosubstituted salts, the difficulty in forming neutral salts and the evident inequality of the 2 OH groups or the 2 halide atoms in the corresponding dihalide derivs. of ternary arsesines (cf. Michaelis, *Ann.* 321, 162 (1902); Steinkopf and Schwen, *C. A.* 16, 1407 (1921)). Formula II is substantiated by the easy conversion of the dihydroxides into oxides and the even dehydration indicates the presence of the H₂O of hydration and not of constitution. It is possible that the compds. I and II exist in a state of mutual equil. Formula III for the HIO derivs. of dihydrophenarsazines is based on their easy dehydration, inability to form salts and the relatively poor sol. in H₂O. The dihydroxides of dihydrophenarsazine and their derivs. are more toxic than the corresponding derivs. of fatty-aromatic arsesines. The arsonium bases and their salts were obtained by the following reactions: $R_3As + MeI \rightarrow R_3MeAsI$; $2R_3MeAsI + Ag_2O \rightarrow 2R_3MeAsOH + 2AgI$; $R_3MeAsI + AgNO_3 \rightarrow R_3MeAsONO_2 + AgI$. The reaction with the heterocyclic arsesines proceeds analogously. The following structure of these arsonium derivs. is based on their high degree of dissociation, and salt formation:

For the production of arsine derivs. R₃As was oxidized with I in alc.-H₂O to R₃As(OH)₂; this on heating with HNO₃ was converted into R₃As(OH)ONONO₂. The arsonium compds. were prepd. by treating R₃As in the cold with MeI. The R₃MeAsI in H₂O, refluxed with Ag₂O, gave R₃MeAsOH and with aq. AgNO₃ R₃MeAsONO₂. The filtrates from Ag were evapd. to 2-3 cc. and dried in a vacuum desiccator over P₂O₅ to a const. wt. The dihydroxides and their nitrate salts were similarly isolated, the solns. were freed from HI with Ag₂O or AgNO₃. All these reactions, except the formation of ternary arsesines,

gave theoretical yields with 70-80% of pure products. MeAs was prep'd in a H atm. The EtO soln. was distd. in a CO₂ atm into a receiver contg a reagent to produce the desired arsine deriv. The EtO soln of MeAs treated with Br soln and reworked gave MeAsO and not MeAs(OH); MeAs(OH)ONa, m 127° MeAsI, m 328°. MeAsONa, m 268-70° MeAsOH could not be isolated. PhMeAs was obtained in 60% yield. PhMeAs(OH), m 157-61°, gave PhMeAsO. PhMeAs(OH)ONa, m 149-50° PhMeAsOH, m 106-16°, is highly hygroscopic. PhMeAsONa, m 195-6°. PhMeAs is an oil. PhMeAs(OH), is highly hygroscopic. PhMeAs(OH)ONa, m 106-7° PhMeAsI, m 211-13°. PhMeAsOH, m 129-35°, is highly hygroscopic. PhMeAsONa, m 149-51°. PhAs(OH), m 115-16°. PhAs(OH)ONa, m 165°. PhMeAsI, m 176°. PhMeAsOH, m 124-6°. PhMeAsONa, m about 100°. (PhAsOH)SO₃, m 195°. Derivs of methylcyclohexylarsine (C₆H₁₁)₃MeAs, b_m 170° (C₆H₁₁)₃MeAsI, m 186-7° (C₆H₁₁)₃MeAsOH could not be isolated (C₆H₁₁)₃MeAsONa, m 147° Chas Blanc

Ergometrine Harold W Dudley *Proc. Roy Soc (London)* B118, 478-84 (1935), cf C A. 29, 7988². Ergometrine is a white alkaloid, freely sol in the simple alics, AcOEt, MeCO and MeCOEt, sparingly sol in dichloroethylene and C₆H₆, and very sparingly sol in CHCl₃. It crystallizes from 400 parts C₆H₆ as slender white needles, and from MeCOEt as stout prisms, m 162-3° (decompn). A soln. in 40 parts AcOEt at -4° deposits thin, white, lustrous plates, m 160-1°, free from solvent of crystn, on concn *in vacuo*, the mother liquor deposits needles which dissolve on warming, on cooling to room temp diamond-shaped plates deposit contg. 0.5 mol AcOEt of crystn and m 130-2° with effervescence but no darkening. The alkaloid tends to darken in the air, contains an indole nucleus (pos. reactions with glyoxylic acid, p-Me₂NC₆H₄CHO, and FeCl₃), has the formula C₁₇H₂₃N₃O₄, is moderately sol in H₂O to a d-rotatory, alk (to litmus), blue fluorescent soln. which oxidizes and becomes brown on exposure to the air. In alc the alkaloid has [α]_D²⁵ 40.25°, [α]_D¹⁸ 59.2°, its soln in CHCl₃ is slightly l-rotatory. Calcd from values for its salts in aq soln, the ergometrine anion has [α]_D²⁰ 70-1°. Ergometrine forms stable salts with HCl, HBr, oxalic and picric acids. Ergometrine-HCl, needles, m 245-6° (decompn). Ergometrine-HBr, needles, m 236-7° (decompn). Ergometrine oxalate, needles, m 193° (decompn). Ergometrine picrate exists as yellow hydrated needles, m 148° (decompn), and red anhyd columns, m 188-9° (sudden decompn), which are interconvertible. Ergometrine, ergotocine and ergobasine apparently are identical. Joseph S Hepburn

An alkaloid from *Trichodesma incanum* D C I G Men'shikov and V Rubinshtein *Ber* 63B, 2039-44 (1935).—Ext'n of the plant with 95% alc. contg 1% NH₃ gave about 0.1% crude bases from which was isolated an alkaloid *trichodesmine*, C₁₇H₂₃O₄N (I) (14 g from 20 kg dried plants), which contains 2 HO groups, forms a cryst methiodide and does not react with HNO₃ in the cold. Hot 10% NaOH hydrolyzes it to an unsatd base C₁₅H₁₉O₄N (II), dl-lactic acid (isolated as the quinine salt), and iso-BuCOMe. The base II, *trichodesmine*, has the same m p as the heliotridane (III) obtained by sapon of heliotrine (C A 26, 4818), but the rotation and the much lower mixed m p show that II and III are not identical. II is readily hydrogenated by the Adams method to a satd HO-contg base, *hydroxytrichodesmine*, C₁₇H₂₇O₄N (IV). In this respect and in the m p and rotation, II is very similar to the retronecine (V) formed by sapon of retrorsine (Barger, *et al*, C A. 29, 1829²), but no V was available for direct comparison. From the character of IV, M and R are inclined to believe that II and V are also not identical. B describes the retronecinal obtained by hydrogenation of V as an oil, while IV, which has the same compn, is a solid m. 92-4°. IV is also different from the isomeric hydroxyheliotridane (C A. 29, 5451²) obtained by hydrogenation of heliotrine. IV with hot concd H₂SO₄ loses 1 mol. H₂O to form an unsatd.

base, b. 164-7°, obtained in too small amt for precise characterization. To compare the O free skeleton of II with that of III, VI was hydrogenated by Adams' method, yielding a small amt. of a said. base, b. 165-9°, whose picrate, m. 236° (decompn), and methiodide, carbonizing above 300°, proved to be identical with the corresponding derivs. of heliotridane. It is therefore quite probable that II and III differ in the position of the HO groups and perhaps of the double bond, but have the same C skeleton. iso-BuCOMe can be formed in the hydrolysis of II only by ketone cleavage of the corresponding β-ketonic acid, this may be either iso-PrCH₂CH₂CO₂H or iso-BuCOCH₂CO₂H. I is therefore a complex ester of II (contg. 2 HO groups) and 2 acids, 1 of which is dl-lactic acid and the other is 1 of the 2 ketonic acids above. Since I gives no color with FeCl₃, it is probable that the lactic acid esterifies the enolic HO of the tautomeric form of the ketonic acid. I m 160-1° (decompn), reacts strongly alk., to litmus in water, instantly decolorizes KMnO₄ in dil H₂SO₄, [α]_D²⁵ 38° (10% alc. soln); methiodide, m. 202° (decompn). II m. 117-18°, instantly decolorizes KMnO₄ in 10% H₂SO₄, [α]_D²⁵ 50° (10% MeOH soln); picrate, yellow, m 142 2 5°. Picrate of IV, yellow, m. 211 5 15° (decompn). C. A. R.

The oxidation products of vasicine with hydrogen peroxide T. P. Ghose, S Krishna, K. S. Narang and J. N. Ray. *Current Sci* 4, 158-9 (1935).—Vasicine (I) reacts with 30% H₂O₂ (contg 3% H₂O) as stated in C. A. 27, 510) to give II, m. 214°, and III, m. 168°.

Although Morris, Hanford and Adams (C A. 29, 4365²) were unable to obtain III, G, K, N and R. obtained it repeatedly. III was oxidized almost quantitatively to II. The structure of the acyl deriv. of I, m. 164°, is most probably IV. Rachel Brown

Occurrence of epiquinine and epiquinidine in cinchona bark. Chemistry of quinuclidine Wilhelm Dirscherl and Heinrich Thron *Ann* 521, 48-71 (1935).—Quinuclidine (I), a non-cryst brown smp obtained from the ext'n. of cinchona bark after the known cryst. alkaloids have been removed, analyzes approx. for C₁₇H₂₃O₄N₂, contains 10.06% MeO and has a mol. wt. in C₆H₆ of 311-35, by titration 363.6. Oxidation with hot KMnO₄ in H₂SO₄ gives 44% of quinine acid; at 5° there results 57% of HCO₂H. Catalytic reduction yields a *dihydro deriv*, a brown resin, analyzing for C₁₆H₂₅O₄N₂, which does not yield a compd with Hg(OAc)₂. Purification of I by means of Hg(OAc)₂ gives 65% of the vinyl bases, with [α]_D²⁵ 50° (N HCl) or 59° (EtOH); oxidation of this product yields 68% HCO₂H. Heating 10 g of purified I with 6.05 g 80% H₂SO₄ 2 hrs at 140° gives 8.8 g quinuclidotouine (II), yellow resin, [α]_D²⁵ 16.6° (N HCl); with (CO₂H)₂ there results from 40 g II 15.2 g of quinuclidine oxalate, m. 156°, soly. in H₂O 1:20, [α]_D²⁵ 21.6° (N HCl), [α]_D²⁵ 25° (EtOH-CHCl₃, 1:2); that from quinine m. 166-7°, [α]_D²⁵ 24° (EtOH-CHCl₃). II and BzCl in C₆H₆ give a *Bz deriv*, yellow resin, sol. in 20 parts Et₂O, its *isomeric deriv* (45 7 g) with 5% NaOH at 45° gives 16.3 g. of *benzoylmerquinoidineesterile* (III), light yellow resin, and 16.5 g of quinic acid III (1 g) and aq Ba(OH)₂, refluxed 20 hrs, give 0.83 g of merquinoidine sulfate.

acetylmerocinnone, m. 110–11°. The β ester of merocinnone, b. 119–21°, $[\alpha]_D^{25}$ 43.33° (HCl soln, m. 108°, $[\alpha]_D^{25}$ 32.5°). III with HCl and $HgCl_2$, heated 6 hrs. at 200°, yields β -collidine. Purified I with EtOH-HCl yields about 50% of a mixt. of about equal parts of epiquinone and epiquimidine; this is the 1st time these epiquinone compounds have been found in nature. C. J. West

Rearrangement of hydrocinnoline by esterification in two stages. Rufin Ludwiczakówna and Jerzy Szułko *Arch. Chem. Farm.* 2, 190–202 (1935) (German summary).—A rearrangement of hydrocinnoline (I) by esterification in 2 stages leads in the 1st step to β -toluene-sulfonylhydrocinnoline, $C_6H_5N_2CH(CHO)SO_2C_6H_5$ (II), obtained by interaction during several days at room temp. of I and β -MeC₆H₄SO₂Cl in pyridine, prisms, m. 160–7° (decompn.), slightly sol. in H₂O, easily sol. in org. solvents, $[\alpha]_D^{25}$ 52.5° (in 96% EtOH). The ester is saponified in the usual way with 4% NaOH, whereby no hetero hydrocinnoline (III) is obtained. The 2nd step is the formation of benzoylhydrocinnoline, $C_6H_5N_2CH(CHO)C_6H_5$ (C(OBz)₂C₆H₄N, from II and BrOK by boiling during 95 hrs. in abs. EtOH, short prisms, m. 141–2°, easily sol. in common org. solvents, insol. in H₂O, $[\alpha]_D^{25}$ –21.8° (m. 96% EtOH). This ester is saponified by prolonged heating in alc. NaOH, concd. HCl or preferably in dil. HCl, whereby BrOH and III are obtained in theoretical yield, colorless prisms, m. 201–2°, difficultly sol. in Et₂O and AcOEt, $[\alpha]_D^{25}$ 154.5° (in 96% EtOH). III is analogous as regards sign and value of rotation to the epiquinone obtained previously (C. A. 27, 2958). J. Wiertelak

Synthesis of hydrastinine chloride on a technical scale. 1. Gryszkiewicz-Trochimowski *Arch. Chem. Farm.* 2, 148–60 (1935) (German summary).—The prepn of hydrastinine chloride (I) on a tech. scale proceeds as follows: heptopropin is condensed with malonic acid in pyridine and piperidine at 40–50° to form methylenedioxybenzoic acid (yield 90%). The latter is reduced with Na-Hg (or less economically with H in presence of Pd or Pt) in alk. medium to methylenedioxyhydrocinnamic acid (II) (yield 90%). The chloride is obtained by treating II, m. 125–6°, may be easily recrystd. from water. The amide of II, treated in the cold with hypochlorite and heated subsequently with 40% NaOH, gives homopiperonylamine, b. 140–1°, (yield 80%). The resulting amine, condensed with BzH, is methylated with Me₂SO, and the product hydrolyzed immediately to *N*-methylhomopiperonylamine (III) and BzH, these 3 reactions being performed in one step. III is a colorless liquid, b. 141–2°, yield 80%. Boiling III with HCO₂H and a trace of pyridine during 5 hrs. gives *N*-formylmethylhomopiperonylamine, and the latter boiled with SOCl₂ gives I, m. 210°, in 75% yield. J. Wiertelak

Sophoricoside, a new heteroside from the fruits of Sophora japonica L. C. Charaux and J. Rabaté *J. pharm. chim.* 21, 546–54 (1935).—From 1 kg. of the green pods of *S. japonica*, 15 g. sophoricoside (I) was obtained in small white prisms, m. 297–8°, $[\alpha]_D^{25}$ –32.2° in pyridine soln. contg. 10% H₂O, as it is very feebly sol. in H₂O, alc. and AcOH. By dil. acids or emulsin, I is hydrolyzed to *D*-glucose and sophorol (II) identical with genistein (from *Genista tinctoria*; Perkin and Newbury, 1899). Upon fusion with alkali, I forms phloroglucinol and β -HOC₆H₄CH₂CO₂H. Constitution of genistein. *Ibid.* 22, 32–3 (1935).—Baker and Robinson (C. A. 20, 190, 21, 246), restudying genistein and prunellol (Immemore, C. A. 5, 567), found them to be identical, an isoflavone, C₁₅H₁₀O₆. This (revised) formula for II leads to C₁₅H₁₀O₆ for I, it agrees better than the old formula (C₁₅H₁₀O₆) with the data obtained for it. The genisteoside obtained by Waltz from *Soja hispida* (C. A. 25, 5675) has the same compn., but its m. p. 254–6° is much lower. S. W.

Chemical examination of Glycosmis pentaphylla and the constitution and synthesis of its active principle. Sukh-bhushan Dutt. *Proc. Acad. Sci. United Provinces Agra Oudh, India* 5, 55–60 (1935).—A compd. glycosmin, C₁₇H₁₈O₁₀, m. 169°, was isolated from a benzene ext. of the plant leaves. The rotation of a 5% soln. in EtOH

shows $[\alpha]_D^{25}$ –30°. It yields salsylaldehyde and veratric acid on oxidation with acid KMnO₄. It was proved to be identical with veratroylsalicyl prep. synthetically.

C. E. P. Jeffreys

Toad poisons. I. Selenium dehydrogenation of cinobufagin. R. Teschesche and Hans-A. Ofse. *Ber.* 68B, 1908–2000 (1935).—Although the work of Wieland and his co-workers (C. A. 29, 4371), Jensen and Chen (C. A. 24, 4851) and Kondo and Ikawa (I, C. A. 29, 7341) has made it very probable that the toad poisons are derivs. of hydrogenated cyclopentanophenanthrene, it had hitherto not been possible to obtain conclusive evidence of this. Wieland and Hesse by dehydrogenation of bufotalin with Se obtained, instead of methyleclopentanophenanthrene (I), some other hydrocarbon, probably chrysene. T and O have now, however, obtained a little I (5 mg.) by dehydrogenation of cinobufagin (5 g.) at 270–335°. The I so obtained m. 125–6°, does not depress the m. p. of the Diels I, and agrees with the latter in n_D^{20} (1.5538 \pm 6 and 1.6753 \pm 6 for α and β) and in its absorption. Wieland's theory of the success was probably due to the use of too high a temp. in the dehydrogenation. C. A. R.

Porphyrias. XXXV. Synthesis of porphyrin. Hans Fischer and Wilhelm Gleim *Ann.* 521, 157–60 (1935); cf. C. A. 29, 5451°.— α -Pyrrolealdehyde (20 g.) in 40 cc. EtOH, added dropwise during 2 hrs. to 200 g. 100% boiling HCO₂H and refluxed 36 hrs., gives 17 mg. porphyrin, dark red leaflets, gradually darkens about 400°, with acid no 1.7 and contg. 2 active H atoms. Spectra are given for solns. in C₆H₆N-Et₂O, HCl and dioxane and for the Cu salt in C₆H₆N-Et₂O. The principal reaction product is a resinous black product. C. J. West

Synthesis of diminoporphyrins. I. Hans Fischer, Hans Haberland and Adolf Müller *Ann.* 521, 122–8 (1935).—5,5'-Dibromo-4,4'-dimethyl-3,3'-dipropionic acid-pyromethene-HBr (5 g.) and 150 cc. 25% NH₄OH, after 4 weeks, give 150 mg. β,β -diminoporphyrin (I),

violet needles, m. 308–400° (Pregl block). The yield is smaller with dil. NH₄OH. It is easily sol. in alkali with a blue color (no fluorescence). The HCO₂H soln. is blue-green, that in HCl is green. The Cu salt m. over 300° and is sol. in C₆H₆N with a blue color. The tetra-*Me* ester, prep. with CH₃N, forms violet needles, m. 250° (Cu salt, violet, m. 312°). C. J. West

Syntheses of benzoylporphyrins. Hans Fischer and Kurt Hansen. *Ann.* 521, 128–36 (1935).—2,3-Dimethylpyrrole (5 g.) and 5 g. N₂CHCO₂H with a little Cu powder give 3.5 g. of Et 2,1-dimethylpyrrole-5-acetate (I), yellow, b. 142°, the 2-methyl-3-ethyl analog (II), pale yellow, b. 143°. 2-Methyl-3-ethylpyrrole (3 g.), HCN and HCl give 2.6 g. 2-methyl-3-ethylpyrrole-5-aldehyde (III), m. 109° (alazine, yellow, m. 162°). 2,5-Dimethyl-3-carbethoxypyrrole, BzCl and AlCl₃ in CS₂ give the 4-Bz deriv. (IV), m. 135°. Refluxing the ester with 10% NaOH yields 2,4-dimethyl-3-benzoylpyrrole-5-carboxylic acid, m. 194° (decompn.); at 200° this gives, nearly quant. 2,4-dimethyl-3-benzoylpyrrole (V), m. 130°, which gives a strong red color with 1 hr. reagent. 2,3-Dimethylpyrrole-5-aldehyde (VI) (0.5 g.), 0.8 g. V, 3 cc. abs. EtOH and 0.5 cc. 48% HBr, heated 5 min., yield 55% of 3',4,5,5'-tetramethyl-4'-benzoylpyromethene-HBr (VII), m. 268° (decompn.); Br in AcOH gives the 3-Br deriv., red, decompn. 193°. VI and 2,4-dimethyl-3-acetylpyrrole give the 4'-Ac analog of VII, decompn. 212°; Br splits off a portion of the Ac group. V and III give 3',5,5'-trimethyl-4-ethyl-4'-benzoylpyromethene-HBr, red.

dish yellow, m. 224° (decompn), 3-Br deriv, brownish red, decomp 202°. The 4'-Ac analog, prisms with a blue luster, m. 214°, nearly quant yield, again Br gives an unsatisfactory product. 2,3,4-Trimethylpyrrole-5-aldehyde and V give 91% of 3,3',4,5,5'-pentamethyl-4'-benzoylpyrromethene-HBr, yellow, m. 224° (decompn), 2,4-Dimethyl-3-ethylpyrrole-5-aldehyde and V give 89% of 3,3',5,5'-tetramethyl-4-ethyl-4'-benzoylpyrromethene-HBr (VIII), m. 211° (decompn) V and 3-methylpyrrolepropionic acid-2-aldehyde give 92% of 3,3',5'-trimethyl-4'-benzoylpyrromethene-4-propionic acid HBr, yellow, m. 204° (decompn), 5-Br deriv (IX), no definite m. p. Heating V with 90% HCO₂H and adding 48% HBr give 75% of 3,3',5,5'-tetramethyl-4,4'-dibenzoylpyrromethene HBr (X), decomp 225°, it also results in poor yield with AcOH-Br, also from 2,4-dimethyl-5-carbethoxypyrrole-3-aldehyde and V with HBr in EtOH, the free methene, golden yellow, m. 209°. VIII (2 g.) and 3 g. 5,5'-dibromo-4,4'-dimethylpyrromethene-3,3'-di-propionic acid HBr (XI) with 10 g. succinic acid (XII), heated 2 min in lots of 1.5 g. with 2 g. XII, give, after esterification, 40 mg (1%) of di-Me 2,3,5,5-tetramethyl-1-ethyl-4-benzoylpyrrolin-6,7-dipropionate, m. 263° (cor.), the hemin, C₄₄H₅₀N₄FeCl, forms dark needles, there is also formed about 2% of mesoporphyrin 13 X and XI with XII give a very poor yield of di-Me 2,3,5,5-tetramethyl-1,4-dibenzoylpyrrolin-6,7-dipropionate (di-Me ester of dibenzoyldeuteriopyrrolin 13) (XIII), reddish brown, m. 252° (cor.), the hemin (XIV), bluish black, m. 290°, 7% HCl exts a very small quantity of a porphyrin, m. 183.5° (cor.) and 1% HCl exts a porphyrin, m. 257° (cor.), XIII also results in a still smaller yield from 5-bromo-3,3',5'-trimethyl-4'-benzoylpyrromethene-4-propionic acid-HBr and XII XIV (10.5 g.), BzO and SnBr₄ at 70° give 100 mg benzoylpyrrolin HMe ester 15 (XV), m. 313° (cor.), acid no 7, 10% HCl gives benzoylpyrrolin 15 (XVI), does not m. 320°, stable to boiling HCl, even after addn of HBr, and to melting with m-C₆H₄(OH), XV yields a hemin (XVII), black prisms, and a Cu salt, rhombic prisms XVI yields an oxime, bluish red, m. 244° Reduction of XVI with KOH in abs EtOH by heating 4 hrs gives a hydroxybenzylpyrrolin, dark red, does not m. 300°. Me ester, bluish red, m. 206° (cor.), the behavior with Ac₂O (EtCO)₂CO and concd H₂SO₄ is described Reduction of XVII with Na and iso-AmOH yields a chlorin

C J West

The constitution of adenylypyrophosphoric and of adenosinediphosphoric acid K Lohmann *Biochem Z* 282, 120-3(1935)—The facts that the rate of hydrolysis of 2 mols H₂PO₄ by boiling dil acids corresponds with that of inorg pyrophosphate, that inorg pyrophosphate is formed by Ba sapon, that hypoxanthine derivs are formed by HNO₃, and that complexes with Cu salts are obtained, as well as the elec titration curves before and after hydrolysis, all lead to the conclusion that adenosine triphosphate (I) and adenosine diphosphate (II) have the following constitutions

then I is RCH₂OPO(OH)OPO(OH)OPO(OH)₂ and II is RCH₂OPO(OH)OPO(OH)₂.

The phytosterolin in wheat germ H A. Ichiba *Sci. Papers Inst Phys Chem Research (Tokyo)* 28, 124-7(1935), cf C A 25, 2434—The phytosterolin was a mixt. of the glucosides of β- and γ-sitosterol

J J. Willaman

Phytosterol of wheat-germ oil A. Ichiba *Sci. Papers Inst Phys Chem Research (Tokyo)* 28, 112-23 (1935)—Dihydrostosterol and 4 isomeric stosterols were obtained by fractionating the Ac deriv. with MeOH-Et₂O mixts α-Sitosterol and its Ac deriv. m. 134-5°, 116-7°, [α]_D -22.7°, -23.6°. β-Sitosterol, Ac and Bz derivs, m. 136-7°, 122-3°, 140-5°, [α]_D -31.5°, -36.7°, -12.3°. γ-Sitosterol, Ac and Bz deriv, m. 147°, 143°, 152°, [α]_D -42.8°, -47.7°, -19.4°. δ-Sitosterol, Ac

and Bz deriv, m. 140-7°, 113.5-14.5°, 157-8°, [α]_D -23.9°, -24.4°, -16.0°. The mother liquors from these contained an unidentified hydrocarbon J J W.

Relation between the cholesterol and carotene structures W. M. D. Bryant *Chemistry & Industry* 1935, 907.—The C skeletons of α- or β-carotene can be more conveniently arranged to yield the cholesterol structure than can squalene The following scheme of cyclization is suggested.

Ring closure is thought of as beginning at the right of ring A, already present in carotene, rings B, C and D forming successively in a manner characteristic of the higher terpenes. The formation of a 5- instead of a 6-membered ring is attributed to the presence of the 4 unbranched C chains formed by the sym. union of 2 partially cyclized phytyl chains in carotene. It seems possible that this departure from the more common consecutive form of isoprene catenation is responsible for the preferential formation of a 5-membered ring. The aliphatic side chain of cholesterol is formed by cutting off the last 2 isoprene units of the sym. carotene structure

W. J. Peterson

Structure of sitosterol Mihail Vangelovici and Barbu N Angelescu *Bul soc chim Romania* 17, 177-90 (1935)—Cholesterol, heated gently for 2 hrs with an excess of citraconic anhydride, gives cholesterol citraconate (I), m. 195°. Sitosterol, similarly treated, gives sitosterol citraconate (II), m. 169°. The following derivs of chloro-β-cholestanone (III) are prepd.: oxime, m. 178°, semicarbazone, m. 155°, nitrophenylhydrazone, m. 207°. Nitration of sitosterol chloride with concd HNO₃ and NaNO₂ at room temp gives nitrodehydrocholesterol chloride (IV), m. 118°. Reduction of IV with Zn and AcOH gives chloro-6-sitostanone (V), m. 112°, oxime, m. 180°, semicarbazone, m. 207°, nitrophenylhydrazone, m. 188°. Reduction of III with Na + Hg in alc gives iso-6-cholestanone (VI), m. 97°, oxime, 157°. V reduced in the same manner gives 6-sitostanone, m. 77°, oxime, m. 173°. Oxidation of V with HNO₃ in AcOH gives a chloro dibasic acid (VII), C₂₇H₄₄ClO₄, m. 277°. VII, heated with Ac₂O, gives the anhydride Sitosterol acetate oxidized with CrO₃ in AcOH gives Me₂CO, indicating that the lateral chain in sitosterol is possibly MeCHCH₂CH₂CH₂CH₂CH₂CH₂. Reduction of III and V by Clemmensen's method yields isocholesteryl chloride, m. 110°, and sitosterol chloride, m. 108°, resp. In view of existing facts the following is suggested as the probable formula of sitosterol

W J Peterson

Synthesis of compounds related to the sterols, hile acids and estrus-producing hormones VII. A. Cohen, J. W. Cook and C. L. Hewett *J Chem Soc* 1935, 1633-7; cf C A 29, 4372—1-Keto-2-methyl-1,2,3,4-tetrahydrophenanthrene (method of prepn given), CH₃CHCH₂MgBr, PhOMe and Et₂O, boiled 3 hrs, and the residual oil

boiled 0.5 hr. with 98% HCO_2H , give 2-methyl-1-allyl-3,4-dihydrophenanthrene, b_p 177-0° (picrate, crimson, m 75-8°); with AcOH-HCl 1 hr. at 100° there results 2-methyl-1-propylphenanthrene, m 65° (picrate, yellow, m 121.5-2°); sym-trinitrobenzene compd., pale yellow, m 131°; Se at 320° for 15 hrs. gives the same compd 2-Methyl-1- Δ^1 -butenyl-3,4-dihydrophenanthrene (I), b_p 155-60° (picrate, dark red, m 77-8°), in large-scale expts there results some 2-methyl-3,4-dihydrophenanthrene (sym trinitrobenzene compd., yellow, m 155-7°). H_2SO_4 in AcOH appears to convert I into an isomer (?), which gives chrysene with Se. The Grignard reagent from β -5-tetralylethyl chloride and cyclohexanone give 1-(β -5'-tetralylethyl)cyclohexanol, b_p 175-80° (3,5-dinitrobenzoate, yellow, m 124-5°). KHSO_4 gives 1-(β -5'-tetralylethyl)- Δ^1 -cyclohexene, b_p 140-50°. Cyclization gives a mixt of sat'd hydrocarbons, which, on complete dehydrogenation with Se or Pt black, yields chrysene and 4,5-benzohydroindene 1 spirocyclohexane, b_p 140°, m 56-7° (picrate, orange, m 125-6°). The quantity of chrysene obtained shows that not more than 10% of the original mixt consists of dodecahydrochrysene and although octahydrochrysene was isolated after partial dehydrogenation, the small yield precluded the use of the method for preparative purposes. C J West

Tea leaves III Chem constitution of tannin in tea leaves (Oshima) 12 Homogenization with amines of some amine-water systems (Mertztun, Ust-Kachintzev) 2 Catalytic action of Japanese acid clay 1 Condensation of benzyl chloride and benzene (Kuwata) 2 Raman effect and org chemistry (Bourguet, Piaux) 3 Physicochem. studies of organometallic and furan compds (Cathin) 2 Catalysis with org fibers (Bredig, et al) 2 Reaction mechanism study—action of fused Na amide on mono-, di- and trimethylamines (Fry, Culp) 2 Quantum mechanics and kinetics of org chem reactions (Hindewood) 2 Dissoc const's and rotations of some α -substituted ethylamines (Burch) 2

Oxygenated organic compounds from hydrocarbons Orlando R. Sweeney, Frank C. Vilbrandt, Henry H. Beeson and Howard A. Montgomery (to Hanlon-Buchanan, Inc.) U. S. 2,024,954, Dec. 17 For sepg constituents of a freshly prep'd. vapor-phase mixt of oxygenated org compds. contg aldehydes such as may be formed by the oxidation of a petroleum fraction, the vapors are brought into contact with a phenolic material such as PhOH with which at least one of the constituents, such as an aldehyde reacts to form a condensation product adapted for use as a plastic, and the remaining constituents are sepd. from the condensation product

Hydrating olefins Standard Oil Development Co. Fr. 793,041, Aug. 26, 1915. An olefin is caused to pass in a continuous manner into intimate contact with a catalyst in dil. aq. soln., in a series of steps, at a temp. below 350° and increased pressure. A partial pressure of water is maintained, by adding water, so as to prevent any appreciable concn. of the catalytic soln., the olefin being thus hydrated to form an alc., and the catalytic soln. is withdrawn continuously and the alc. recovered by distn. at a pressure below that at which the reaction is carried out. App. is described.

Hydrogenation of tertiary alkyl-phenols to form hydroaromatic alcohols Herman A. Brunson and Lloyd W. Covert (to Rohm & Haas Co.). U. S. 2,020,668, Jan. 7. Tertiary alkylated phenols the tertiary alkyl group of which contains at least 8 C atoms such as $\alpha,\alpha,\gamma,\gamma$ -tetramethylbutylphenol, *tert* isododecylphenol, *tert*-isohexadecylphenol and the corresponding cresols, xylenols, resorcinols, guaiacols, and naphthols, obtainable, resp., from the tertiary olefins such as diisobutylene, triisobutylene, tetraisobutylene, β -dibutylene, and diisopentylene, by condensation with phenols in the presence of acidic catalysts, preferably H_2SO_4 , upon treatment with H under high pressure and at elevated temps. in the presence of active, finely divided hydrogenation catalysts such as finely divided Ni, give the corresponding nuclear

tertiary alkyl hydroaromatic secondary alcs. They are colorless, practically odorless liquids or low-melting waxes which are insol. in water but readily sol. in petroleum oils, fatty glycerides and in most org. solvents, and are miscible and compatible with rubber, paraffin, natural and synthetic resins, cellulose esters and cellulose ethers. Because of their high b. ps, low vapor pressure, pale color, light-fastness, freedom from rancidity, they are useful as plasticizers for coating and molding compns., and as lubricants for textile fibers or for fine mechanisms such as watches. They are useful as intermediates for prep. long-chain *tert*-alkyl adipic acids by oxidation with HNO_3 , for example, also in preparing esters, or as dye intermediates, as softening agents in rubber compns., and as ingredients for cosmetics, soaps, and insecticides. $\alpha,\alpha,\gamma,\gamma$ -Tetramethylbutylcyclohexanol m 56° and b_p 140-2°. *tert* isododecylcyclohexanol b_p 180-200°. Mixed *tert*-isohexadecylcyclohexanols solidify from a viscous oily liquid to a waxy mass. $\alpha,\alpha,\gamma,\gamma$ -Tetramethylbutylmethylcyclohexanol is a colorless viscous oil. Various examples with details are given.

Aldehydes I G Farbenind A.-G. (Ulrich Hoffmann, inventor) Ger. 618,972, Sept. 19, 1935 (Cl. 12a, 17 03). Addn to 528,822 1,2-Oxides are isomerized with more than two C atoms in the mol in the gaseous phase with the aid of a surface catalyst of silicate or SiO_2 gel. The oxides may be used alone or mixed with chlorohydrins or glycols. Thus, propylene oxide vapor mixed with steam is heated over a SiO_2 gel contact catalyst to 300° to give a 70% yield of propionaldehyde.

Ketones Rheumische Kampfer-Fabrik G. m. b. H. (Siegfried Skrap, inventor) Ger. 621,454, Nov. 7, 1935 (Cl. 12a 20 01). Ketones are produced when aromatic or heterocyclic compds., excepting compounds of the pyridine series, are strongly heated with org. acids or their anhydrides in the presence of a catalyst of large surface area. Thus, $\text{C}_6\text{H}_5\text{I}$ and BzOH , boiled for 4 hrs. in the presence of an Al hydrosulfate, yield β - $\text{C}_6\text{H}_5\text{I}$, COPH , m 82°. Hydroxy ketones may be obtained either as described above or by heating the corresponding phenol esters under similar conditions. Thus, 1-hydroxy-2-benzoylnaphthalene, m 65°, is obtainable by heating either α -naphthol and BzOH or α -naphthyl benzoate to 230-250° in the presence of an Al hydrosulfate. Examples are given also of the prepn. of phenolphthalein from phthalic anhydride and PhOH , a phenylidihydrocoumarin from cinnamic acid and PhOH , a 1-aminonaphthyl phenyl ketone, m 80°, from α -naphthylamine and BzOH , a benzoylindole, m 114°, b_p 100-210°, from indole and BzOH , a benzoylthionaphthene, m. about 235°, from thionaphthene and BzOH , and a mixt. of butyrylthiophenes, b_p 180°, from thiophene and PrCOOH .

Cyclic ketones Schering-Kahlbaum A.-G. Brit. 475,330, Sept. 19, 1935 Addn to 415,259 (C. A. 29, 813). This corresponds to Fr. 44,912 (C. A. 29, 8246).

Esters of hydroxy acids. Carbide & Carbon Chemicals Corp. Fr. 787,812, Sept. 30, 1935. The H of each carboxylic group of esters of hydroxy carboxylic acids is replaced by an alkoxy alc. radical, e. g., the radical of a monoalkyl ether of an alkylene glycol and more particularly of ethylene glycol or diethylene glycol and in each hydroxy group is substituted a radical of an aliphatic monocarboxylic acid. Examples are given of the prepn. of bis(butoxyethyl) tartrate diacetate, b_p 236°, tris(methoxyethyl) citrate acetate, decomposes on heating and β -ethoxyethoxyethyl lactate butyrate.

Fatty acid esters of symmetrical dialkyl ethylene glycols Virgil L. Hansley (to E. I. du Pont de Nemours & Co.) U. S. 2,025,684, Dec. 21. Fatty acid esters, of a sym. dialkyl ethylene glycol having more than 12 C atoms per mol, such as the diacetate of sym. diundecylethylene glycol (m. about 34°), etc., are produced by reducing a fatty acid acylon (as by use of H under pressure in the presence of a Ni catalyst) to produce a glycol and then esterifying the glycol with an aliphatic acid. The acyloins of caprylic, lauric, myristic or stearic acid or the like may be used. Numerous examples with details of procedures are given.

Monalkyl ethers of aromatic polyhydroxy compounds. Karl Marx, Hans Wesche, Karl Bittner and Hans Baenger to General Aniline Works). U S 2,024,534, Dec. 17, 1935. The production of a monalkyl ether such as guaiacol, reaction is effected between an alkyl halide such as chloromethane and an anhyd acid alk earth metal salt of an aromatic polyhydroxy compd such as the acid Na salt of 1,2-dihydroxybenzene suspended in an inert org liquid such as xylene (suitably by heating to about 240°).

Halogenated ethers. Norman D Scott (to E. I. du Pont de Nemours & Co.) U S 2,024,749, Dec. 17, 1935. See Brit 423,520 (C A 29, 4374).

Halogen compounds. N. V. de Bataafsche Petroleum Maatschappij. Fr 787,520, Sept. 23, 1935. Products which may be used for purifying mineral oils and gases and for making resins are prep'd by treating monohalides of the vinyl type with an aq soln of halogen, a hypo-halogenated acid, hydrogen halide or org hypohalites. Examples are given of the prep'n of chlorobutane ($\text{CH}_3\text{COCHClCH}_3$, from 2-chloro-2-butene), chloroacetaldehyde (CH_2ClCHO , from vinyl chloride), *tert*-dichlorobutyl alc (from isocetyl chloride), 2,3,3-trichloro-2-methyl-1-phenylpropane, 3-chloro-2-(chloromethyl)-1-phenyl-3-propene and 1,2-dibromo-3-propanol.

Polyhalogenated hydroxy compounds and hydrocarbons. Herbert P. A. Groll and Geo. Hearne (to N. V. de Bataafsche Petroleum Maatschappij). Brit 435,096, Sept. 13, 1935. Unsaturated monohalides contg at least 4 C atoms and the halogen linked to a sat'd C atom are caused to react with hypohalous acids, aq halogen solns, solns of the said acids and H halides, or alkyl or aralkyl hypohalites in the presence of H_2O , to give polyhalogenated compds. The unsat'd halides and reaction product should not be permitted to come into contact with free or undissolved halogen, the soln of halogen in H_2O is therefore preferably effected in a sepg stage. Among 7 examples, (1) a cyclic system comprising reaction chamber, a separator stage for breaking up emulsions in the reaction products and an absorption column for satg circulating H_2O with Cl is employed, the system is charged with H_2O , CCl_4 and *n*-butenyl chloride (I). These are agitated in the reaction chamber and the H_2O circulated through the system, Cl being introduced into the column continuously and I into the reaction chamber. H_2O is introduced to maintain the HCl concn at 0.7 N. A portion of the circulating liquid is intermittently withdrawn to maintain the vol const. The product is sepd into 2 layers and the non-aq phase, together with an Et_2O ext of the other, distd to remove Et_2O and CCl_4 . The main product is a dichloro-*tert* butyl alc., and (2) isopentenyl chloride is treated with 0.5 N HClO_4 to give a dichloro-*tert*-amyl alc.

Halogenated indanthrenes. James Ogilvie (to National Aniline & Chemical Co.) U S 2,026,647, Jan. 7, 1936. In the halogenation of an indanthrene, as in the production of a mono- or poly-halogenated deriv, Cl or Br is caused to react with a suspension of the starting material, such as indanthrene, in a chlorobenzene such as $\text{C}_6\text{H}_5\text{Cl}$.

Purifying chlorinated hydrocarbons. Edgar C. Britton, Gerald H. Coleman, John W. Zimba and Ldwrd C. Zuckerman (to Dow Chemical Co.) U S 2,025,924, Dec. 24, 1935. A chlorinated aliphatic hydrocarbon material such as C_2Cl_4 is freed from impurities such as unstable toxic compds which cannot be removed by washing with an aq alk soln by treating the material with NH_3 or a primary amine such as triethylamine, a secondary amine contg not more than one aryl substituent linked with the basic N atom, a tertiary alkyl amine, a sat'd ring N base, or a pyridine base, and then fractionally distg.

Methyl chloride. Hans Klein and Conrad Pfandlfer (to I. G. Farbenindustrie A.-G.) U S 2,026,131, Dec. 31, 1935. See Fr 788,481 (C A 29, 4809).

Halogenated acyclic hydrocarbon derivatives containing fluorine. Herbert W. Daudt, Mortimer A. Youker and Harry H. Reynolds (to Kinetic Chemicals, Inc.) U S 2,024,095, Dec. 10, 1935. In fluorinating a halogenated acyclic hydrocarbon deriv. contg a halogen other than F, with substantially anhyd HF , the reaction is effected in the presence of an Sb halide such as a fluorochloride

contg a controlled and substantially const F content (as by use of an Sb fluorochloride contg F 4-13% in producing CF_3Cl from HF and CCl_4 at a temp. of about 45-95°).

Organic fluorine compounds. I. G. Farbenindustrie A.-G. Fr 786,112, Aug. 27, 1935. HF is caused to act, if necessary in the presence of an inert diluent, on compds contg at least 3 C atoms and at least 1 triple bond. Thus, 9,10-difluorostearic acid, m. 70-4°, is prep'd from stearic acid in CH_2Cl_2 .

Chlorination derivatives of naphthalene. Ernest R. Hanson and Sanford Brown (to Haloway Corp.). U S 2,025,742, Dec. 31, 1935. A liquid neutral Cl substitution product of naphthalene which exhibits no cloudiness and is transparent at -5° and contains up to 30% of Cl is produced by distg a liquid impure chlorinated naphthalene having a sp. gr. of 1.25 or less at 150° under a pressure of 35 mm Hg or less and collecting a fraction having a color lighter than 2.

Dehalogenating organic halides. Herrick R. Arnold and Wilbur A. Laner (to E. I. du Pont de Nemours & Co.). U S 2,025,032, Dec. 24, 1935. Reactions such as the production of C_2H_4 from CH_2Cl_2 are effected by the action of an excess of H in the presence of a catalyst essentially comprising a sulfide of a metal from group 6, sub-group A of the periodic system such as Mo and Cr sulfides at a temp. of 200-600° (suitably about 400° under 200 atm pressure). Several examples are given.

Trialkyl phosphates. Consortium fur elektrochemische Industrie G. m. b. H. Fr 787,438, Sept. 23, 1935. See Brit. 433,927 (C. A. 30, 732°).

Aliphatic sulfur compounds. Firm. Alexander & Posnansky. Fr 787,810, Sept. 30, 1935. S is combined with aliphatic compds. contg unsat'd bonds by submitting them to the simultaneous action of H_2S and S. A basic substance such as NH_3 , hydrazine, amines, piperidine, substituted guanidines and thioam sulfides may be used as a carrier for the S. The process may be used for vulcanizing rubber and for making a clear solid or liquid facts. If polysulfides of H are used, e. g., in making facts, a min amt. of a stabilizing substance such as a chlorinated aliphatic hydrocarbon is added.

Organic disulfides. I. G. Farbenindustrie A.-G. Brit 435,113, Sept. 16, 1935. See Fr. 772,002 (C. A. 29, 1436°).

Organic disulfides from mercaptobenzothiazoles. Silesta, Verein Chemischer Fabriken. Fr 786,126, Aug. 27, 1935. See Ger 613,068 (C. A. 29, 5469°).

Anthraquinone compounds and dyes. Soc. pour l'ind. chim. & Bâle. Fr 786,105, Aug. 27, 1935. Heterocyclic compds of the bianthraquinonyl and dianthrene series are prep'd by treating bianthraquinonyl compds, which contain in the 2 position at least 1 NH_2 group or group capable of being transformed to NH_2 by a sapon agent, if necessary after treatment with reducing agent and if necessary after subsequent oxidation, with condensing agents so that both 2 positions are joined by a bridge contg N. The products may be halogenated, and if compds acylated in the 2 position are used the acyl group may be sapon before or during the condensation. Examples are given of the prep'n of 2-phthalimido-1,1'-bianthraquinonyl (I), 2-phthalimido-(II) (by treating I with Cu in H_2SO_4 at a low temp.), 2-phthalimido-2'-methyl-, 2,2'-diphthalimido-, 2-amino-, 2,2'-diamino- and 2,2'-amino-meso-benzodanthrone, 2-phthalimido- (by oxidizing II with MnO_2), 2-phthalimido-2'-methyl- and 2,2'-amino-meso-naphthodanthrone and an *allo*-pyridino-meso-benzodanthrone.

Diazo compounds. I. G. Farbenindustrie A.-G. Brit 434,725, Sept. 9, 1935. See Ger 611,299 (C. A. 29, 4021°).

Water-soluble diazomino compounds. Miles A. Dahlen (to E. I. du Pont de Nemours & Co.) U S 2,025,095, Dec. 24, 1935. Compds capable of stabilizing diazotized primary arylamines against reaction with typical coupling components in a neutral or alk. medium are formed by coupling a primary arylamine which may contain in the aryl nucleus one or several N-oxochrome substituents.

but which does not contain a S-auxochrome, through the diazo group to the N of an isonitrobenzene-mono- or di-sulfonic acid in a neutral or alk. medium, as by coupling diazotized 4-chloro-2-aminoanisole through the azo group to N of isonitrobenzenesulfonic acid. Numerous examples and details of procedure are given.

Hydrogenating phenolic compounds Yorkshire Tar Distillers Ltd and Edward B. Maxted, Brit. 435,102, Sept. 13, 1935. In the conversion of cresols and other phenolic compounds into hydrocarbons by treatment with H₂, a catalyst consisting of, or contg., a metallic thiomolybdate, e.g., of Co, Cr, Sn or Bi, is used. The use of thiomolybdates contg. a volatile cation, and of other thiomolybdates that are converted into sulfides at the reaction temp., is disclaimed.

Quaternary ammonium compounds I. G. Farbenindustrie A.-G., Brit. 434,602, Sept. 5, 1935. See Fr. 769,444 (C. A. 29, 3088).

Benzanthrone derivatives E. I. du Pont de Nemours & Co., Brit. 435,321, Sept. 19, 1935. See U. S. 1,965,855 (C. A. 28, 5471).

Dibenzanthrone derivatives I. G. Farbenindustrie A.-G. (Karl Köberle, Hugo Wolff and Emil Krauch, inventors), Ger. 621,475, Nov. 7, 1935 (Cl. 225 3 00). Dibenzanthrone or a substitution product is treated at 20–90° with aq. HNO₃ of 10–75% concn, preferably 35–60%. Nitrodibenzanthrones free from OH compds. are obtained. Sp. processes are described.

Bs-2-Azabenzanthrone derivatives I. G. Farbenindustrie A.-G. (Friedrich Ebel and Otto Bayer, inventors), Ger. 621,455, Nov. 7, 1935 (Cl. 12p 5). Compds. of the formula ACONHC(H₂)COOR, where A is 1-anthraquinonyl and R is H or an alkyl or aryl group, are heated alone or in the presence of a condensing agent, e.g., Ac₂O, NaOH, AlCl₃ or silica gel. The product is Bs-1-hydroxy-Bs-2-azabenzanthrone, m. 334°, or a deriv. thereof in which the COOR group from the starting material is substituted in the Bs-3-position. Mixts. of these products may also be obtained. Sp. processes are described. The starting materials are obtainable by condensing anthraquinone-1-carboxylic halides with glycine or its esters, and details are given of the prepn. of 1-anthraquinonylglycine Et ester, m. 187–9°, and the free acid, m. 257°.

Phthaloylfluorene derivatives I. G. Farbenindustrie A.-G. (Paul Nawsky and Rudolf Robl, inventors), Ger. 621,474, Nov. 7, 1935 (Cl. 225 2 07). *In*-Phthaloylfluorene (I) (C. A. 28, 10377), or a substitution product unaltered at the CH₃ group, is treated with an aldehyde or a ketone or a reagent which reacts like an aldehyde or a ketone under the reaction conditions. The reaction may be effected by boiling the reagents together, if desired in a solvent, e.g., pyridine. Products of unspecified constitution, useful as vat dyes or intermediates, are obtained. Examples are given of the manuf. of products from I and BzH₂ (or PhCHCl₂), PhCOPh, anthraquinone-2-aldehyde and its 1-chloro-, 1-bromo- and 1-amino derivs., and glyoxal sulfate.

Azo-, amino- and acylamino-N-nitroamines Société pour l'ind. chim. à Bâle, Brit. 434,917, Sept. 11, 1935. N-Nitroamines of primary aromatic amines of the C₆H₅ series, nitrated in the nucleus, are treated with reducing agent in neutral or alk. medium so that reduction of the nuclear NO₂ occurs in stages to the azo or amino compd., the latter of which may be further acylated. Among examples, the Na salts of the nitroamine of 1-amino-4-nitro-2,5-dimethylbenzene, obtainable by treating this compd. with NaNO₂ and oxidation with hypochlorite, and the nitroamine of 1-amino-2,5-dichloro-4-nitrobenzene are reduced in alk. soln. with Na₂S to give the corresponding amino-mono-N-nitroamine compds., the N-nitroamine of 1-amino-2-methyl-1-nitrobenzene is reduced by Zn dust in NaOH to give the dinitroamine of 4,4'-diamino-3,3'-dimethylazobenzene. The last compd. may be printed with 2,3-hydroxyphenothione anilide and nitrite and developed with acid to give a brownish violet dye; the 1,4-amino-N-nitroamines may also be mono- and tetra-azotized, the 1-N-nitroamino-2-methyl-4-amino-2-nitrobenzene (II) giving, on diazotization and printing as

above, a red-brown tint on cotton and, with the use of double quantity of nitrite and development, a blue print. 1-Nitro-5-methylbenzotriazole is obtained from I (prepd. as above) on treatment with NaNO₂ and dil. acid. The benzoylation of 1-N-nitroamino-4-amino-2,5-diethoxybenzene is also described.

Bromomethylbenzanthrones Soc. pour l'ind. chim. à Bâle, Fr. 787,175, Sept. 18, 1935. Br is caused to react in the presence of H₂SO₄ and water (the water being at least 5 and not more than 20%) on 2-, 5-, or 6-methylbenzanthrone or the mixt. of methylbenzanthrones obtained after eliminating the 2-methylbenzanthrone from the mixt. of methylbenzanthrones prepd. from 2-methylanthraquinone.

Terpenes Soc. alsacienne de produits chimiques, Fr. 780,437, Sept. 3, 1935. Mixts. of bornyl and fenchyl ethers contg. terpenes and resulting from the etherification of pinene by AcOH are submitted to direct sapon. the AcONa formed is sep'd by decanting and boric acid is added to form bornyl and fenchyl borates, the terpenes remaining unchanged. The terpenes are removed by distn. and the borates are sapon'd with water.

Xanthates Wilhelm Hirschkind (to Great Western Electro-Chemical Co.) U. S. 2,024,023, Dec. 17, 1935. In the production of xanthates such as Na ethyl xanthate, K ethyl xanthate, K butyl xanthate or Na amyl xanthate, if the alkali metal alcoholate used as initial material for reaction with CS₂ is free from water the reaction proceeds approx. quantitatively without formation of any considerable quantity of by-products even without cooling but permitting the reaction temp. to rise even to about 80°. Several examples are given. U. S. 2,021,925 relates to similar production of xanthates from anhyd. alkali metal alcoholates such as those of tertiary, secondary or dihydric alcs., fatty alcs., terpenes, etc., by reaction with CS₂ without need of cooling. U. S. 2,024,024 (Wilhelm Hirschkind, Wm. D. Ramage and Harry Bender, to Great Western Electro-Chemical Co.) relates to xanthate production by reaction of an anhyd. alcoholate with CS₂ in the presence of an unhydrated desiccant such as anhyd. Na₂SO₄, Na₂CO₃, CaO, CaSO₄, or Na₃PO₄, from which the xanthate formed can be subsequently leached with a solvent such as C₆H₆ or toluene. Various examples are given.

Organic acids from alcohols and carbon monoxide. John C. Woodhouse (to E. I. du Pont de Nemours & Co.) U. S. 2,025,676, Dec. 24, 1935. Production of an acid such as HOAc from an alc. such as MeOH is effected in the presence of a catalyst comprising a halogenated aliphatic monocarboxylic acid such as monochloroacetic acid or an aliphatic acyl halide such as acetyl chloride by heating under pressure and in contact with activated charcoal. U. S. 2,025,677 relates to the generally similar production of acids such as propionic, butyric or valeric acid from olefinic hydrocarbons such as C₃H₆, C₄H₆ or C₅H₆ by reaction with steam and CO in the presence of similar catalysts.

Polyhydroxy carboxylic acids I. Hoffmann-La Roche & Co. A.-G., Ger. 618,907, Sept. 19, 1935 (Cl. 12a. 11). Uronic acids, their esters, uronides, or salts are treated with H under pressure at temps. not exceeding 140°, in the presence of usual hydrogenation catalysts. Thus, an aq. soln. of d-galacturonic acid is given an addn. of an alc. suspension of Ni-kieselguhr gel catalyst and treated with H in an autoclave to give l-galactonic acid. Similarly d-glucuronic acid gives l-gluconic acid. Other examples and structural formulas are given.

Lactic acid Geza Braun (to Standard Brands Inc.) U. S. 2,024,565, Dec. 17, 1935. A suitable carbohydrate material such as sucrose is heated with a strong alkali such as Ca(OH)₂ at a temp. of 200–250° and under a pressure of at least 20 atm. Ca lactate formed may be treated with ZnSO₄ to form Zn lactate from which free lactic acid may be recovered. Various details of procedure are described.

p-Diketocamphanecarboxylic acid and hydroxyketocamphanecarboxylic acid Kenzo Tamura, Gyoikuji Kihara, Yasuhiko Asahina and Morizo Ishida, U. S. 2,026,280, Dec. 31, 1935. A compn. contg. these compds. is

produced by introducing CO_2 into β -diketocamphane in the presence of an alkali metal such as Na

1,3 Dibromo-2-aminoanthraquinone-6- or -7-sulfonic acid Georg Kranzlein, Martin Corell and Wilhelm Schösch (to General Aniline Works) U S 2,025,169, Dec 24 2-Aminoanthraquinone is disulfonated by heating to about 150° with H_2SO_4 contg SO_3 , and a dibromo deriv. is produced by treating the product, in aq soln., with Br at about $40-50^\circ$ U S 2,025,170 relates to the production of 2-amino-3-bromoanthraquinone-6- or -7-sulfonic acid by heating 2-amino-3-bromoanthraquinone with H_2SO_4 contg SO_3 at a temp. of $125-30^\circ$. These products may be used as dye intermediates

Acetylene from methane and gases containing methane. Martin Banck (to Ruhrchemie A.-G.) U S reissue 19,794, Dec 24 A reissue of original pat. No. 1,773,611 (C A 24, 4994)

Acetaldehyde from acetylene I G Farbenind. A.-G. (Walter Rosinsky and Paul Baumann, inventors) Ger 621,202, Nov 4, 1935 (Cl 12a 7 02). Addn to 620,402 (C A 30, 737) See Brit 393,690 (C A 27, 5751-2).

Dimethylamine from monomethylamine Commercial Solvents Corp Ger 621,214, Nov 1, 1935 (Cl 12q 1 01). See L S 1,926,691 (C A 27, 5756)

Trimethylamine I G Farbenindustrie A.-G. Brit 435,200, Sept 17, 1935 See Fr 752,212 (C A 29, 6907) and Ger 615,527 (C A 29, 8007)

Trimethylamine, trimethylamine I G Farbenindustrie

1 A.-G. Brit. 435,404, Sept. 19, 1935 NMMe_2 and NEt_3 are obtained by passing vaporized NHMe_2 or NH_3 over a dehydrating catalyst at raised temp. and preferably at raised pressure Among examples, NHMe_2 is passed at 380° and 200 atm. over alumina gel and the products are condensed under 10 atm. pressure, a mixt. of NH_3 and methylamines contg 61% of NMMe_2 is obtained and is sep'd by fractional distn. under pressure

Vinyl alcohol Chemische Forschungsgesellschaft m. b. H. Brit. 434,580, Sept. 4, 1935 This corresponds to 1r 781,503 (C A 29, 6907)

Ketene Consortium für elektrochemische Industrie G. m. b. H. Brit. 435,210, Sept. 17, 1935 See Fr. 747,483 (C A 29, 4329)

α -Naphthol Wm J. Cotton (to National Aniline & Chemical Co.) U S 2,025,197, Dec. 24 Naphthalene is sulfonated under such conditions that there is produced a reaction mass contg cryd. 1-naphthalenesulfonic acid and H_2SO_4 , but contg less than 2% of 2-naphthalenesulfonic acid, the cryd. 1-naphthalenesulfonic acid is sep'd and fused with caustic alkali

2-Amino-1,1'-bianthraquinonyl Soc. pour l'ind. chim. à Biele. Fr 786,363, Sept. 2, 1935 An almost equimol. mixt. of 1-halo-2-acylaminoanthraquinone and 1-haloanthraquinone is submitted to a treatment with dehalogenating agents and the products thus obtained are treated with saponig. agents.

ARTHUR W. DOX

The protein of Bence-Jones L Meyer *Nederl. Ind. d. ch. Geneeskunde*, 79, 5712-15 (1935) —Bence-Jones protein, found in the urine in myeloma, ppt's at 60° and redissolves at 100° M preps a protein with similar properties from bone marrow The fluid pressed from the bone marrow of calves is mixed with 2 vols EtOH , the ppt is ext'd with water and filtered To the clear filtrate, which contains 0.3 to 0.4% protein, some NaCl and AcOH are added This soln., when heated to 60° , turns turbid, when heated to 100° it becomes clear It is ppt'd by HNO_3 , H_2SO_4 , HCl , AcOH , sulfosalicylic acid and picric acid, two parts of sat'd $(\text{NH}_4)_2\text{SO}_4$ will ppt it, also an excess of sat'd NaCl in acid soln It gives pos. biuret-, Millon- and xanthoproteic reactions Moreover, the protein from bone marrow, like Bence-Jones protein, is more readily dissolved at 100° , if, in an acid soln., a salt is added, CaCl_2 is more effective than NaCl , also Na_2SO_4 , Na citrate and urea have this action After injection of the bone-marrow filtrate into rabbits, Bence-Jones protein appears in the urine, although it is sometimes difficult to detect Since Bence-Jones protein has been found in the urine in leucemia and emphysema, it also ext'd pos. obtained from emphysema, and lymphocytes from leucemic patients, using the same technic as for bone marrow In this case also, a protein with properties like those of Bence-Jones was found Protein from other sources, or various other organs, when ext'd., fails to show this phenomenon R. Beutner

Action of amylases on starch H C Gore *Ind. Eng. Chem.* 28, 86-8 (1936) —A discussion of the present status of the problem of the action of amylases on starch A brief description is given of the 3 types of diastatic activity of plant amylases These 3 types are discussed under the general headings of "saccharogenesis" or attack on raw starch, "liquefying power" and "saccharification" or Lintner activity Three quant. methods for measuring diastatic activity are contrasted Seventeen references F. L. Dunlap

Advances in the colloidal chemistry of protoplasm during the last ten years. I. W. W. Lepeschkin *Protoplasma* 26, 470-94 (1935) —Eighty six references F. L. D.

Constitution of cytochrome C Jean Roche and Marie T. Bénévise *Bull. soc. chim. biol.* 17, 1473-93 (1935) —Hemin from hog blood was repeatedly reduced by Na_2SO_3 and oxidized by $\text{K}_3\text{Fe}(\text{CN})_6$, forming "hematin C" Cytochrome C was prep'd from beef yeast. The absorption spectra of the pyridine hemochromogens derived from cytochrome C and hematin C are almost identical Absorption spectra of several related compds. were also det'd Hematin C, unlike other hematin, does not combine with globins to form methemoglobins It does unite with globins to form parahematin, which yield hemochromogens when reduced None of the hemochromogens of hematin C, protein or nonprotein, exhibits the non-autoxidizability characteristic of cytochrome C. Fourteen references L. E. Gilson

The initial phosphorylations of glycogen J. K. Parasz and T. Baranowski *Compt. rend. soc. biol.* 129, 397-10 (1935), cf. C. A. 29, 8012 —Expts with muscle ext. showed that the free H_2PO_4 groups liberated during the fission of adenosinetriphosphoric acid (I) attach themselves by preference to the glycogen but some are hydrated to form free phosphate Fructosediphosphate ester is formed in the reaction between glycogen and I, and this reaction proceeds independently of the simultaneous esterification of the glycogen by the free phosphate The last-named reaction produces only monophosphate ester. L. E. Gilson

Spectrophotographic determination of phenol in different media G. Barac *Compt. rend. soc. biol.* 129, 520-2 (1935), cf. C. A. 29, 1117 —A very dil. soln. of PhOH in Et_2O shows 3 narrow absorption bands at 2670, 2740 and 2807 Å The mol. extinction coeff. in Et_2O is 2400 for 2807 Å The Beer-Lambert law holds good to within 1% for such solns PhOH was added to blood and plasma, the mixts were defecated with H_2WO_4 and an almost quant. recovery of the PhOH was made by extg. the filtrates with Et_2O . State of phenol added to blood *Ibid.* 522-3 — PhOH added to whole blood divides itself equally between plasma and corpuscles When added to the sep'd corpuscles 80% can be recovered after defecation with H_2WO_4 , and 100% after defecation with $\text{CCl}_4\text{-CO}_2\text{H}$, showing that it is not destroyed by the corpuscles PhOH is not fixed by the lipides of the plasma and can be sep'd from plasma by ultrafiltration L. E. Gilson

Inactivation of adrenaline by methylglyoxal, glycer-aldehyde and acetaldehyde. J. Toscano Rico and A. Malafaya Baptista. *Compt. rend. soc. biol.* 120, 545-6 (1935); cf. *C. A.* 29, 4385¹, 30, 516¹—At pH 6.6 or above a 1/50,000 soln. of adrenaline was inactivated by methylglyoxal in concns. greater than 0.04 M, by glycer-aldehyde at 0.04 M but not at 0.01 M, and by AcCl at 0.0025 M concn. The Na salts of phosphoglyceric and pyruvic acids had no inactivating effect. The inactivation of adrenaline by acetaldehyde verified by experiments with various organs containing smooth muscle. A. Malafaya Baptista. *Ibid.* 547-50. L. F. G.

Action of magnesium on the aspartase system. Kurt P. Jacobson and Fernando Belo Pereira. *Compt. rend. soc. biol.* 120, 551-4 (1935)—The enzymic formation of aspartic acid from fumaric acid and NH_4 salts is discussed. When a nonproliferating culture of *Escherichia* was used as a source of aspartase the reaction fumaric acid \rightleftharpoons aspartic acid reached a definite equil. The addn. of a Mg salt to 0.1 M concn. caused a considerable shift of the equil. point toward the fumaric acid side. L. F. G.

Absence of any correlation between the lactoficification reaction and protein unbalance of [human] blood serum. G. Lefrou and L. Aulfrét. *Compt. rend. soc. biol.* 120, 514-16 (1935). L. E. Gilson

Swelling of structured proteins. The influence of the reticular tissue on the swelling of collagen in water and hydrochloric acid. Dorothy Jordan-Lloyd and R. H. Marriott. *Proc. Roy. Soc. (London)*, B118, 439-45 (1935), cf. *C. A.* 29, 949¹—The reticular tissue, which invests the collagen fibers in the tendons in the tail of the rat, undergoes mech. rupture and rolls back to form reticular garters or rings when the collagen fibers swell and contract in length. Young tendons usually swell less than adult tendons. In HCl solns. with pH less than 2, young and adult tendons swell similarly, and to a greater extent than anticipated from their behavior in more dil. solns. Joseph S. Heplurn

Bound water and phase equilibria in protein systems. egg albumin and muscle. T. Moran. *Proc. Roy. Soc. (London)* B118, 548-59 (1935).—The chemically bound H_2O is approx. the same (0.26 g. per g. of protein) in native egg albumin and in egg albumin denatured by heat and by urea; the H_2O held more loosely at high activities is less in the denatured protein. The eutectic point of muscle is approx. -37.5° ; its bound H_2O is small, and is 0.40 g. per g. of dry solids at intermediate and high activities of H_2O . Joseph S. Heplurn

Oxidation of hemoglobin to methemoglobin by oxygen. II. The relation between the rate of oxidation and the partial pressure of oxygen. J. Brooks. *Proc. Roy. Soc. (London)* B118, 660-77 (1935), cf. *C. A.* 25, 5903¹—The oxidation of hemoglobin to methemoglobin at pH 6.69 and a temp. of 30° was unimol. with respect to substrate concn. The only detectable reaction was formation of methemoglobin. The rate of oxidation was proportional to the concn. of reduced hemoglobin and to a function of the O pressure. Apparently O reacted at the same rate with all unoxxygenated ferro-radicals in the system. Joseph S. Heplurn

The lipochrome of higher animals and of man. L. Zechmeister and P. Tuzson. *Naturwissenschaften* 23, 840-5 (1935).—A review of the chem. and phys. properties of vegetable lipochromes found in animal tissue, methods for their isolation, course of decompn. or deposition in the animal metabolism, etc. B. J. C. van der Hoeven

The active group of heparin. Sune Bergström. *Naturwissenschaften* 23, 706 (1935).—The heparin substance active in inhibiting blood clotting is a chondroitinpolysulfuric acid. Sulfuric acid esters of several polysaccharides were tested for heparin action. cellulose, chitin, starch, glycogen, gum arabic, yeast, nucleic acid and chondroitin sulfuric acid were heated with chlorosulfonic acid in pyridine and treated by the method of Gebauer, et al. (*C. A.* 24, 1501¹). All preps. showed a heparin effect; the one from cellulose (3 sulfate groups) had an activity equal to that of com. heparin preps. Evidently natural heparin is active through its sulfate group, like-

wise its metachromatic violet color with toluidine blue depends on it (Lison, *C. A.* 29, 4033¹). Thymonucleic acid has no heparin effect; the polysaccharide sulfuric acid from *Chondrus crispus* is active. The cellulose deriv. is toxic, 200 mg. causes pleural hemorrhage in rabbits.

B. J. C. van der Hoeven
Heavy hydrogen in biology. G. v. Hevesy. *Naturwissenschaften* 23, 775-80 (1935).—A review of expts. on the behavior of D_2O in living organisms: algae growth, frog life, development of frog eggs, D_2O as indicator for H_2O metabolism, diffusion through tissue, etc.

B. J. C. van der Hoeven
Transformation of rutin into brown pigment by tobacco enzymes. C. Neuberg and M. Kobel. *Naturwissenschaften* 23, 800-1 (1935).—The slightly sol rutin (quercetin-rhamnogluconide) is transformed by tobacco enzyme into a sol brown pigment, one of these products, a sol glucoside, hydrolyzed by HCl, gives a slightly sol aglucon. The expts. were made with a 0.5-1.0% suspension of tobacco leaves or a 1:10 H₂O dry prepn. of fresh leaves with 0.1-0.2 g. rutin per l. The brown coloration is intensified by using 0.003% H_2O_2 instead of H_2O . Under those conditions the insol rutin disappears in a few min. Boiled enzyme is inactive.

B. J. C. van der Hoeven
The enzymic activity of egg white—its bearing on the problem of watery whites. I. van Manen and Claude Remington. *Onderstepoort J. Vet. Sci.* 5, 329-41 (1935).—The enzymic activity of solns. of thick and thin albumin from normal and watery egg whites was studied, by use of a microtitration method to det. peptide cleavage in terms of the increase in amino N. Thick or thin albumin alone at pH values ranging from 5.5 to 8.5 undergoes no autolysis at 37° and protein-splitting enzymes cannot be detected at any pH value by the addn. of gelatin as a substrate. The presence in egg white of at least 2 crepsin-like enzymes having different pI optima (approx. 5.5 and 7.0-8.0) was demonstrated. It seems unlikely that these enzymes play any part in the development of watery whites. The work of Balls and Swenson (cf. *C. A.* 28, 3493¹) is criticized on account of the insufficient sensitivity of the method employed and the fact that it is such as would fail to distinguish between an increase in acid groups due to lypolytic and due to proteolytic activity. Moreover, the use of casein as a substrate is incapable of differentiating protease from creptic activity. K. D. Jacob

Invertase. II. Purification of invertase by adsorption methods. Noboru Taketomi. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 579 (1935); cf. *C. A.* 28, 6738¹.—The expts. were made with an aq. ext. of takadiastase and 3 other enzyme solns. purified by different methods. As adsorbents the following were used: kaolin (I), kiesguhr (II), silica gel (III), Japanese acid clay (IV), activated clay (V), cholesterol (VI), $Al(OH)_3$ (VII) and active carbons (VIII). Invertase was scarcely adsorbed by I, II and III, and only slightly more by IV. V adsorbed it well and can be used for the purification. When a suitable amt. of V was mixed at 30° with the enzyme soln. contg. about 25 vol. % EtOH, invertase was adsorbed and most of the amylase present in the liquor. The 2 enzymes can be sep'd in this way. VI adsorbed invertase, amylase and proteins quite well, but not selectively. The adsorbed enzymes were readily sep'd. from the adsorbent by dissolving VI in H_2O . VII behaved like VI in regard to adsorption. VIII showed varying adsorptive powers. Coloring matter could be removed from the enzyme soln. by a pretreatment with a small amt. of C, while invertase and amylase were scarcely adsorbed. The latter could then both be completely adsorbed by adding a suitable amt. of active C, but a sep'n. of invertase and amylase by this active C adsorption method was difficult. K. K.

A potentiometric study of hepatoflavin. F. J. Stare. *J. Biol. Chem.* 112, 223-9 (1935).—The oxidation-reduction potentials of hepatoflavin have been measured at pH values from 0.32 to 13.38 by titration with reducing agents. Definite branching of the titration curves in the more acid regions into 2 1-valent curves is indicated. Graphic analysis indicates ionization consts. at pH values

about 6.8 in the reductant and about 9.6 in the oxidant. An E_0 value of 0.188 v. was obtained which is rather close to the value reported for lactoflavin. A. P. Lothrop

A crystalline by-product obtained in the large scale extraction of theelin and theolol. A. W. Dox, W. G. Bywater and F. H. Tendick. *J. Biol. Chem.* 112, 425-30 (1935).—A hitherto unknown constituent of pregnancy urine has been sepd. from the crude ext. in the concn. extn. of theelin and theolol. The cryst. substance, $C_{21}H_{29}O_5N_3$, is alkali-sol., resistant to hydrolysis and gives no reaction for proteins, amino acids or purines. Three active H atoms are present, 1 of which is easily ethylated to give a monoethyl, alkali-insol. deriv. An acid, $C_{21}H_{27}O_5N_3$, results from oxidation with chromic acid. The substance shows no hormone activity and is toxic to mice in doses of 0.0055 g. per g. of body wt. A. P. Lothrop

Photochemical processes in biology. A critical review. I. The principal photochemical reactions and the mechanism of their production. Giovanni De Toni. *Biochim. terap. sper.* 22, 547-55 (1935). A. E. M.

Enzymic synthesis of phosphocreatine by de-esterification of phosphopyruvic acid. H. Lehmann. *Biochem. Z.* 281, 271-91 (1935).—The synthesis of phosphocreatine from phosphoglyceric acid, discovered by Parnas in muscle poisoned with CH_3CO_2H , has been studied on dialyzed muscle exts. This occurs especially well in old, long-dialyzed exts., in which there is no more spontaneous dephosphorylation, but only in the presence of adenylc acid or of adenosinetriphosphoric acid (ATP). The re-esterification takes place in 2 stages: (a) Phosphopyruvic + adenylc acid \rightarrow ATP + pyruvic acid, (b) ATP + creatine \rightarrow phosphocreatine + adenylc acid. The adenylc acid thus acts as a catalyst and promotes the esterification of 100 times its quantity of creatine. The Mg ion is necessary for both stages. Considerable amts. of phosphocreatine can thus be prepd. in the pure state. Phosphopyruvic acid is more effective for this reaction than phosphoglyceric acid. The same can be accomplished in synthesis of arginine phosphate in crab muscles. The synthesis of phosphocreatine with ATP and with adenylc acid forms a reversible system, the equil. depending upon the H ion concn., excess of creatine and the removal of adenylc acid. In an alk. medium phosphocreatine accumulates and ATP disappears, but in a neutral reaction the process is reversed, and this can be changed again by making the reaction alk. S. Morgulis

Energy relations in enzymic lactic acid formation and in the synthesis of phosphagen. O. Meyerhof and W. Schulz. *Biochem. Z.* 281, 292-305 (1935).—The anaerobic heat restitution in active muscle consists of the difference between the exothermic lactic acid formation and the endothermic phosphocreatine synthesis. If 2 mols. phosphocreatine is synthesized for 1 mol. lactic acid, this would be represented by -22,000 g.-cal. and +16,000 g.-cal., besides the heat of neutralization, 6000-8000 g.-cal. per mol. lactic acid. The anaerobic restitution of heat is, therefore, a pos. value of about 10% the initial heat production. The direction of the reaction, however, depends not on the heat but on the change in free energy, and this cannot be measured owing to the lack of information with regard to active concns. in the living muscle. In expts. with the reaction system: phosphopyruvic acid + creatine \rightarrow creatinephosphoric acid + pyruvic acid - (about) 3000 g.-cal. are involved, but the similar reaction: phosphopyruvic acid + arginine \rightarrow argininephosphoric acid + pyruvic acid is thermally practically neutral. S. Morgulis

Ultrafiltration through Cellophane under high pressure as a means of purifying enzymes and of determining their particle size. G. Gorbach and K. Nitsche. *Biochem. Z.* 281, 309-91 (1935).—Ultrafiltration under 100 atm. through Cellophane yields highly purified enzyme preps. The Cellophane is cut in round pieces, left in distd. H_2O for 24 hrs. and tested with Congo red soln. in the pressure-filtration app. The rate of filtration is about 10-15 cc. per hr. The detn. of particle size is discussed. S. M.

Optical activity of horse globin hemochromogen and of hemoglobin dissolved in 0.25 N sodium hydroxide, with special reference to its sulfur content. Istvan Simonovits

and George Balassa. *Biochem. Z.* 281, 333-8 (1935); cf. C. A. 30, 741¹.—Horse globin hemochromogen in a concn. of 0.16% in 0.25 N NaOH has $[\alpha]_D^{25} = -48.2^\circ$ and $[\alpha]_D^{25} = -45.2^\circ$, while globin + hematin (hemoglobin) under similar conditions has $[\alpha]_D^{25} = -45.7^\circ$. Neither concn. nor recrystn. affects the sp. rotation, which seems to depend upon the S content of the preps. S. Morgulis

Theory of the mitogenetic radiation. V. Yeast as detector of mitogenetic rays. M. Mosseva. *Biochem. Z.* 281, 349-57 (1935).—Discussion of methodological points. S. Morgulis

Protease action on protein of ungerminated cereal grains and its effect on the amylolytic power. Tadeusz Chrzastewski and Josef Jankowski. *Biochem. Z.* 281, 408-19 (1935), cf. C. A. 29, 1110¹.—The effectiveness of the amylase contained in various cereal grains can be increased by proteases (trypsin, pepsin, papain, rennin) to different degrees. The increase in the amylase activity depends partly upon the nature of the protein and the extent of its hydrolysis. Trypsin produces the strongest effect. However, the increase in amylase effectiveness is greater in seeds of high amylase content (wheat, rye, barley) than of a low content so that the protease action is due primarily to formation or liberation of amylase mobilizing factors, the eluto-substances, kinases, etc., rather than the destruction of the proteins. The effect is manifested principally in the saccharifying ability of the amylase. S. Morgulis

The chemical groups of proteins which show affinity for polysaccharides. VI. The role of lysine, leucine, phenylalanine, cystine, tryptophan, asparagine, aspartic and glutamic acids. St. J. v. Przytycki, H. Rafalowska and J. Cichocka. *Biochem. Z.* 281, 420-2 (1935); cf. C. A. 29, 8026².—Expts. with various amino acids seem to indicate that in the formation of the polysaccharide-protein symplexes the following groups do not play a part: $COOH$, COO^- , $CONH_2$, $CH_3CH_2NH_2$, $CSSC$, $iso-Bu$, Ph or indolyl. VII. The nature of the polysaccharide-guanidine combination. W. Giedroyc, J. Cichocka and L. Myskowski. *Ibid.* 422-30 (1935).—Arginine and tyrosine manifest strong affinity toward, and form compds. with, polysaccharides. The combination is thus ascribed to the RC_6H_5OH or $CNHC(=NH)NH_2$ groupings, which are widely distributed in the various proteins. S. M.

Hydrolysis of lactose by enzymes of liver and kidney. Carl Neuberg and Eduard Hofmann. *Biochem. Z.* 281, 431-7 (1935).—Expts. demonstrate the presence of strong lactase activity of preps. from liver and kidney. Especially strong activity has been found in the autolyzates of horse kidney. S. Morgulis

Hydrolysis of β glucosides and of conjugated glucuronates by enzymes of liver and kidney. Eduard Hofmann. *Biochem. Z.* 281, 438-43 (1935).—Autolyzates, dry alc. ether exts. and dry acetone exts. of kidney and liver were used. The enzymic hydrolysis of salicin, β -naphthylglucuronic acid, β -phenoxylglycoside, galactoside and glucoside was studied. At pH below 5 the reaction no longer seems to proceed, but the optimum pH depends upon the nature of the buffer. S. Morgulis

Cryolysis, diffusion and particle size. II. Studies on myosin. F. E. M. Lange and F. T. Nord. *Biochem. Z.* 281, 444-6 (1935), cf. C. A. 29, 8020².—The prep. of myosin solns. is described. The irreversible aggregation of the myosin colloid by freezing is shown by the progressive decrease in the diffusion coeff. with decreasing temp. However, freezing to -79° of a 0.1% soln. seems to result in a disaggregation. S. Morgulis

Effect of electrolytes on the synthesis of lactose. D. Miklin and T. Fetisova. *Biochem. Z.* 282, 26-31 (1935).—The enzymic formation of lactose is apparently increased under the influence of salts. The hydrating ions (Na , Li) increase the amt. of sugar and this is even more marked with Ca , while the K ion, with very weak hydrating power, showed the least effect on the lactose synthesis, or even caused inhibition. SCN^- inhibits the enzymic process. S. Morgulis

The micellar form of the stroma protein. A study of the structure of the red blood corpuscles. Gundo Boehm

Biochem. Z. 282, 32-46(1935).—The stroma protein is sepd. from hemoglobin and dissolved in neutral salt soln. From a study of the phys. behavior of this protein it is concluded that its micelles are fibers of length several thousand times their thickness. This explains why, owing to spatial relations, it is impossible to obtain solns. more concd. than 3-4%, where gels are formed. The 4% concn. of the stroma protein of the erythrocytes cannot, therefore, be limited to the cell membrane but must extend through the cell. S. Morgulis.

Chloroform as a serum-protein precipitant. Anders Grönwall *Biochem. Z.* 282, 85-7(1935).—The pptn. of serum proteins by CHCl_3 depends upon the H-ion concn. Optimum conditions were found at pH 4.3, 0.5, 8.1, 9.7 and 9.1. S. Morgulis.

Hydrolysis of adenylypyrophosphoric acid and of arginine-phosphoric acids in the crab muscle. K. Lohmann *Biochem. Z.* 282, 100-10(1935).—Dilysed crab muscle ext. or washed crab muscle hydrolyzes only 1 of the 2 easily hydrolyzable H_2PO_4 groups in adenylypyrophosphoric acid. The resulting adenosinephosphoric acid was isolated as the Ba salt. The dephosphorylation to adenylic acid occurred only after the addn. of a Mg salt. Hydrolysis of adenylypyrophosphoric acid thus proceeds in 2 stages and by different enzymes, as is also the case in mammalian muscle. Argininephosphoric acid is hydrolyzed by dilysed crab muscle ext. only in the presence of adenylypyrophosphoric acid or adenosinephosphoric acid. It is not hydrolyzed in the presence of adenylic acid, in which respect it differs from creatinephosphoric acid. This is due to the fact that crab muscle, in the presence of argininephosphoric acid, does not change adenylic acid to adenosinephosphoric acid or to adenosinetriphosphoric acid, but changes readily adenosinephosphoric acid to adenosinetriphosphoric acid. Crab muscle does not contain adenylic acid deaminase. S. Morgulis.

Utilization of the glass electrode to determine the pressure sensitivity of the pH of whole blood. A. Thiel and M. Gamsa. *Biochem. Z.* 282, 115-56(1935).—The measurements were made under pressure in a metal bomb. The pH of the blood was measured against a standard acetate soln. of pH 4.62. On developing the exptl. pressure (up to 100 atmospheres) the potential changed very rapidly, then remained constant for hrs. On releasing the pressure the e. m. f. returned to its former value or within 1-2 mv. of this value (the difference was probably due to the unavoidable loss of CO_2). The e. m. f. at excess pressures of 0, 50 and 100 atm. were +153, +151 and +150 mv., resp. To decide whether this is due to increased acidity of the blood or to increased alk. of the acetate soln., expts. were made on the acetate soln. against Veibel's standard (0.01 N HCl + 0.09 N KCl). The results, under the same pressure conditions, were -150, -153, -154 mv., resp., which shows that the acetate actually becomes more alk. Then, finally, the blood was compared to the Veibel standard, and the results here were +313, +311 and +314 mv., resp. From these 2 sets of expts. the pH of the whole beef blood is calcd. as 7.29 and 7.31, at 37°. Pressures up to 100 atm. are thus without any influence on the blood pH . S. M.

Experiments on the limit of growth in tissue cultures. Edmund Mayer. *Skand. Arch. Physiol.* 72, 210-58 (1935).—A new method is described whereby an enormous increase in the growth period and in the final size of the tissue cultures is attained. This depends on the renewal of clot structure and a thorough exchange of substances in the exptl. cultures. S. Morgulis.

Accelerating action of mercury and copper on the decolorization of indicators in certain oxidation-reduction systems of plant seeds. T. Thumberg. *Skand. Arch. Physiol.* 72, 243-90(1935).—Hg and Cu may accelerate rather than inhibit the decolorization of indicators used in studying oxidation-reduction systems of certain seeds. The conditions under which this reversal of effect occurs are discussed. S. Morgulis.

The amylase of Clostridium acetobutylicum. W. W. Johnston and A. M. Wynne. *J. Biol. Chem.* 101, 611 (1935).—The effect of the following factors on the rate of

hydrolysis of starch by the amylase of *Clostridium acetobutylicum* was studied. The optimum pH was 4.8-5.0. Na acetate, phosphate and chloride retarded the enzyme. There was linear relationship between enzyme concn. and velocity of reaction. The temp. coeff. was fairly constant with 0.1% starch but not with 1.0%. J. T. M.

Determination of enzymes. B. A. Rubin and L. I. Naumova. *Compt. rend. acad. sci. U. R. S. S.* 3, 83-6 (1935). cf. *C. A.* 29, 5470¹.—The activity of amylase suspensions obtained from cabbage or tomato increases with increase in diln. This is probably due to a breaking up of the equal between the micro- and macroheterogeneous portions of the enzyme and is, in its effect, equiv. to successive extns. of amylase. The effect of diln. is not as great with catalase. Pctn. of enzymes by trituration with sand diminishes rather than increases the activity of catalase. Filtration of catalase soln. through a Schleicher and Shull No. 708 paper causes a sharp decrease in the activity of the enzyme. A more active enzyme is obtained in all cases in which chalk, or its equivalent, is used for the neutralization of acids. For tomato fruits, the addn. of chalk increases the activity of catalase 7 times. W. J. Peterson.

The thickness of the wall of the red blood corpuscle. James P. Danelli. *J. Gen. Physiol.* 19, 10-22(1935).—Pricke's assumption (*Phys. Rev.* 26, 682(1925), cf. *C. A.* 20, 1218) of a dilec. const. of 1 for the erythrocyte wall is approx. correct for a solid layer of any thickness and for a liquid layer of not more than bimol thickness. Liquid layers of greater thickness may have dilec. const. several times greater than 1. The dilec. const. of the polar group of unimol films of the following types of compds. are: aliphatic compd., ester 4.2, acid 5.1, alc. 6.6, ketone 6.4, nitrite 6.7, dibasic ester 7.0, sterol compd., alc. 11, ketone 2.5. C. H. Richardson.

The escape of hemoglobin from the red cell during hemolysis. Eric Ponder and Douglas Marsland. *J. Gen. Physiol.* 19, 35-41(1935). Small concns. of saponin cause a relatively small permeability of the cell membrane to hemoglobin. Large concns. destroy the membrane so completely that the theoretical time for loss of pigment through a completely permeable membrane is nearly attained. The dependence of permeability upon lysin concn. is explainable upon existing knowledge of the rate of transformation as it reacts with the red cell envelope. When the red cells are hemolyzed by hypotonic solns., permeability of the membrane to hemoglobin is nearly constant irrespective of the tonicity used to bring about lysis. C. H. Richardson.

Electrophoresis of sterols. III. Further investigations of cholesterol surfaces. Laurence S. Moyer. *J. Gen. Physiol.* 19, 87-94(1935); cf. *C. A.* 29, 7357¹.—No significant differences exist between the electrophoretic mobilities of needle-shaped cholesterol crystals from acetone, the platelets from ale or the columnar crystals from fusion. The mobilities of cholesterol particles produced by grinding with ice at -10° are less than half that of the unground cholesterol particles. Equal of mobility is reached after grinding for 50 min. When the crystals ground with ice are dried *in vacuo* at room temp., the mobility reverts to that of the unground crystals. Both ground and unground crystals have an isoelec. point near pH 3.0. The ground crystals probably undergo a change in wetting whereby the attainment of the steady state is accelerated. The increased adsorption of water makes by the ground crystals may lessen the no. of active places at the interface available for adsorption of ions, thus decreasing the net charge per unit area. The ratio of pos. and neg. ions on the surface would only be a function of pH and the isoelec. point would remain unchanged. C. H. Richardson.

The molecular weight and isoelectric point of thyroglobulin. Michael Heidelberger and Kai O. Pedersen. *J. Gen. Physiol.* 19, 95-108(1935).—The sedimentation const. of hog thyroglobulin is 18.2×10^{-13} , essentially the same as thyroglobulin from man. The sp. vol. is 0.72, isoelec. point (native) pH 4.53 and (denatured) pH 5.0. The mol. wt. is 700,000 from sedimentation and

diffusion consts., 650,000 from sedimentation equl. data. In shape the mol. deviates markedly from the spherical.

C. H. Richardson

The accumulation of electrolytes VIII. The accumulation of potassium chloride in models. W. J. V. Osterhout and S. E. Kamering. *J. Gen. Physiol.* 19, 167-78(1935), cf. *C. A.* 26, 4841.—In models consisting of an outer and an inner aq. phase sep'd by a non-aq. phase (70% guaiacol plus 30% p-cresol), KCl enters until its chem. p. d. is much greater inside than outside. The energy for this one-sided accumulation of KCl is derived from the chem. reactions in the system and the continual supply of certain materials. The maintenance of a lower p_H inside the model by means of CO_2 is important. The analogy to conditions in some living cells is pointed out. The model differs from many living cells in that Cl does not increase inside with the increase of K^+ . As in *Valonia*, K^+ tends to pass out of the model as KCl when the ion activity product (K)(Cl) is greater inside, at the same time it enters as KOH since the activity product (K)(OH) is greater outside. The net result of these processes is the entrance of K probably because the latter process is the more rapid.

C. H. Richardson

The color reaction and the iodometry of oxidizable substances I. M. Konishi. *Okayama-Igakka Zasshi* 47, 1043-57(1935).—The color reaction and the iodometry of the aq. ext. and pressed juice of plant and animal tissues show a parallel relation in most instances, but the degree of reaction differs among different tissues. The oxidizable substances are converted into $EtOH$, Me_2CO , and CN comp'd., but not into Et_2O . They can be p'd., with basic but not with neutral Pb acetate or phosphotungstic acid. These oxidizable substances are very labile toward sunlight and H_2O_2 . The glutathione content of plant tissue is less than that of animal tissue and the I consumption of the glutathione is less than that of the glutathione-contg. oxidizable substances. The aq. exts. from lotus roots, pine needles, orange or oak leaves show sugar reaction. From the sugars osazone-like crystals in 204 208° can be prep'd. The oxidizable substances are adsorbed by animal charcoal, but not by clay. They are diffusible through collodion membrane, fish skin and parchment.

K. Sugura

Kinetics of an intracellular system for respiration and bioelectric potential at flux equilibrium. Gordon Marsh. *Plant Physiol.* 10, 681-97(1935).—A quant. connection is derived between the velocity of the oxidative reactions and the measured $e.m.f.$ of a cell or tissue on the basis of Lund's theory of bioelec. currents (Lund, *C. A.* 23, 429). The properties of the system are fully described. Twenty-six references.

Walter Thomas

Some physiological and physical aspects of the surface tension of urine. P. W. Perryman and C. F. Selous. *J. Physiol.* 85, 128-44(1935), cf. *C. A.* 29, 2019.—A modification of the max. bubble pressure app. applicable to the measurement of the surface tension of body fluids is described. The app. can be used for following the changes in surface tension with time up to 2 hrs. and also for changes with temp. The occurrence of surface tension time changes in biol. fluids is confirmed and this effect in urine is investigated quantitatively. The resulting curves are of logarithmic form. This is shown not to be due to proteins or the absorption of CO_2 . The theory is advanced that it is due to the slow adsorption of capillary active substances, some of which are related to the bile acids. The change of surface tension with temp. from 33° to 56° is of an approx. linear form up to 54° at which temp. the decrease becomes more rapid. In 16 normal subjects the daily variation in surface tension of urine was shown not to be due to the ingestion of food or liquid. A monthly cyclical variation was discovered in the female which corresponds closely to the menstrual cycle. The surface tension of urines cannot be related to sp. gr. or pathol. constituents such as blood, pus, albumin, bile, etc. There is no correlation between the surface tension and any sp. disease or group of diseases.

F. D. Walter

Postmortem change in the liver. Kwanji Momonoi. *Okayama-Igakka Zasshi* 47, 1480-95(1935).—In the

liver of rabbits the residual N, P and S gradually increased with the time after death. The rate of increase varied according to the season of the year and the atm. humidity. In general it was greatest in the summer, less in autumn and spring, and least in winter. In winter the S increased until the 40th day and the P until the 50th day after the death of the animals. No changes in these substances were noticeable after these periods. The max. change of the residual nitrogen was found in summer.

Anomalous dispersion of elec. waves (3.8 m.) in solutions of org. amphoteric ions [elec. behavior of brain and nerve substance] (Hauser) 2.

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Urea excretion IX. Comparison of urea clearances calculated from the excretion of urea, of urea plus ammonia and of nitrogen determination by hypobromite. Donald D. Van Slyke, Irvine H. Page, Alma Hill and Esben Kirk. *J. Clin. Investigation* 14, 901-10(1935); cf. *C. A.* 27, 331.—The routine procedure for the clinical detn. of the urea clearance is described. In human subjects when the proportion of urea in the urea + NH_3 must of the urine is markedly decreased by induced acidosis (with NH_4Cl) and by low-protein diet, the urea clearances calc'd from the excretion rate of urea alone suffered a parallel reduction. When, however, values for the excretion of urea + NH_3 are substituted for urea, the clearances calc'd remain at the usual levels. These results favor the hypothesis "that the NH_3 excreted in the urine of man is formed in the kidneys chiefly from urea removed from the blood, and that the work of the kidneys is excreting urea from the blood is more accurately indicated by the combined excretion of urea and NH_3 , than by the excretion of urea alone." In calcg. urea clearance by means of the standard equation the value of U (urinary concn. of urea) should include both urea and NH_3 .

J. B. Brown

Enzymic estimation of vitamins. Francesco Pirrone. *Ann. chim. applicata* 25, 292-309(1935).—Many attempts have been made to utilize measurements of enzymic activity (CO_2 evolved) as an index of vitamin value (cf. Heaton, *C. A.* 17, 1046; Kollath, *C. A.* 20, 1645, 21, 1135). P. has measured the CO_2 evolved from solns. contg. vitamins A, B, C and D. In all cases the values are roughly proportional, the vitamin value UV being approximately a linear function of enzymic activity, Ae . For vitamins A and D, $UV = (Ae - 100) 11.36 + 23$, for vitamin B $UV = (Ae - 100) 0.0833 + 2.34$, for vitamin C $UV = (Ae - 100) 0.0025 + 0.19$.

A. W. C.

Use of mice in the standardization of parathyroid hormone. effect of parathyroid on rachitic rats examined by the "line test." F. J. Dyer. *Quart. J. Pharm. Pharmacol.* 8, 513-24(1935); cf. *C. A.* 29, 7365.—The proposal of Simon (cf. *C. A.* 29, 5494) to use the antagonism between Ca and Mg salts for measuring parathyroid activity has been exam'd. The principle underlying the method is that the increase of blood serum Ca caused by injections of parathyroid into mice reduces the narcosis produced by injections of $MgSO_4$. When the method is used to compare the potency of 2 parathyroid exts. it is recommended that (1) at least 20 mice be used in each group, (2) the dose of $MgSO_4$ be 1.7-1.8 mg. of $MgSO_4 \cdot 7H_2O$ per g. of body wt.; (3) the max. no. of mice affected between 20 and 60 min. after the injection of Mg be recorded. The percentages of mice affected by the 2 exts. under comparison are then referred to the curve relating dose to effect and the corresponding abscissas found. The 2 potencies are then proportional to the abscissas, i. e., to the 2 doses of standard ext. used in prep. this curve. Until the standard powder now in course of prep. is ready, the potency of an ext. must be compared with that of a reliable prepn. such as parathormone (Lilly) used as provisional standard. Parathormone was found to supplement the calcification produced by vitamin D in the "line test." At least 10 daily injections each of 20 Collip units were required to produce a measurable effect with the para-

thyroid alone. Apart from the fact that this effect is not specific for the hormone, the expense involved would not justify the use of the line test for measuring parathyroid activity. W O E

A micromethod for blood urea and an automatic urine collector for urea clearance in infants. Lee E Farr. *J. Clin. Investigation* 14, 911-13 (1935) J B B

Micromethod for the determination of phosphoric acid. Application to the determination of phosphorus in tissues. Lucien Thivolle. *Bull. soc. chim. biol.* 17, 1427-50 (1935).—The sample contg. 0.01-2.0 mg P is boiled with 2 cc concd HNO_3 in which 2 3% Cu has previously been dissolved. Heating is continued until all the acid is evapd and the $\text{Cu}(\text{NO}_3)_2$ is decompd to CuO . The residue is dissolved in dil HCl , the P pptd as $\text{NH}_4\text{phosphomolybdate}$, and the ppt collected on a very small asbestos pad filter which has been coated with talc to make it less porous. The washed ppt is dissolved in dil NaOH and then treated with Zn (free from Fe and As) and an excess of H_2SO_4 to reduce the MoO_3 to MoO_2 . The MoO_2 is reoxidized to MoO_3 by titration with 0.025 M KMnO_4 . Comparison with a blank detn is imperative. Several variations of the method are discussed.

L E Gilson
A method of destroying organic matter applicable to the benzidine micromethod of determining organic sulfur in biology. L Revol and M Ferrand. *Bull. soc. chim. biol.* 17, 1451-4 (1935).—The sample should contain less than 5 mg S. Org. matter is destroyed by boiling with concd HNO_3 in a flask equipped with a short reflux condenser. A little H_2O_2 is added later to complete the oxidation. Vapors issuing from the top of the reflux condenser are passed down through another condenser for cooling, then bubbled through Br water in a special receiver to oxidize and fix volatile S compounds. The liquid in the receiver is finally added to that in the flask and the whole evapd to dryness. The sulfate in the residue is detd by the benzidine method. The error is less than 3% of the S present. The app. is illustrated. L E Gilson

Detection of 2,4-dinitrophenol and its elimination products in urine. A Meyer and H Drutel. *Bull. soc. chim. biol.* 17, 1455-61 (1935).—To 10 cc urine, previously defecated with $\text{Pb}(\text{OAc})_2$, add 2 cc glacial AcOH and a pinch of Zn powder, allow to react 15 min and filter. To the filtrate add 2 drops of 0.1% $\text{K}_2\text{Cr}_2\text{O}_7$ soln without shaking. If the urine contains 2,4-dinitrophenol a rose color develops immediately in the upper part of the soln (Shaking, or adding too much $\text{K}_2\text{Cr}_2\text{O}_7$ may destroy the color.) One part in 50,000 urine is readily detected. Smaller quantities can be detected by defecating 100 cc or more of urine with Patein-Dufaux acid Hg nitrate reagent, extg. with Et_2O , evapg. the Et_2O and testing the residue after dissolving in 10 cc water. Some other tests are discussed. Nineteen references. L E Gilson

A new rapid and precise method for the determination of reducing sugars. G I Solomos. *Bull. soc. chim. biol.* 17, 1465-9 (1935).—A measured quantity of standard $\text{K}_3\text{Fe}(\text{CN})_6$ soln is made alk. with NaOH , then heated to boiling and the sugar soln. (blood, spinal fluid, urine or milk, suitably defecated and dild.) added dropwise from a buret until the $\text{K}_3\text{Fe}(\text{CN})_6$ is just completely decolorized by reduction to $\text{K}_4\text{Fe}(\text{CN})_6$. The $\text{K}_3\text{Fe}(\text{CN})_6$ soln. is checked against a standard soln. of pure glucose.

L E Gilson
Determination of intracellular pH by the vital staining method. L. Lison. *Compt. rend. soc. biol.* 120, 102-4, *Protoplasma* 24, 453-65 (1935).—If substances exhibiting metachromasia (cf. C. A. 29, 4037) are present in the cells errors as great as 6 pH units are possible when basic dyes are used. Thus if a buffer soln. of pH 4.0 is tinted with brilliant cresol blue and 1/20,000 neutral Ca chondroitinsulfate is added the color changes to that corresponding to pH 10.4. When added to a soln. of pH 2.2 colored with neutral red the same comp. causes the color to change to that of a soln. of pH 7.2-7.4. Sulfuric esters of polysaccharides in general have this property. L. E. G.

A method for investigating endocrine activity by serum reactions. G Richard. *Compt. rend. soc. biol.* 120,

1 444-6 (1935).—The serum from a clotted-blood sample is divided among a series of test tubes; 3 drops is placed in each. To different tubes 2, 3, 4 and 6 drops of each of various conc isotonic exts. (Byla) of endocrine glands (thyroid, adrenal, hypophysis, gonads, etc.) are added and each mixt is dild to 1 cc with physiol. NaCl soln. After incubation at 37° for 60-90 min the hemolytic action of each mixt on a drop of 1/40 suspension of washed sheep corpuscles is detd. Humoral reactions and endocrine dysfunction. G Richard and R Biot. *Ibid.* 446-8.—In the above method the addn of even a very little of any of the endocrine exts decreases the hemolytic power of normal serum. If a certain endocrine deficiency exists much more of that particular ext must be added before the hemolytic power is decreased. L E Gilson

Determination of amylase in milk. M Manicattide, Bratescu and M Popa. *Compt. rend. soc. biol.* 120, 657-8 (1935).—A slight modification of Wolgemuth's method is described. Human colostrum contained 1000-2000 Wolgemuth units of amylase per cc. Normal human milk (80 samples) contained 128-512 units per cc. Cow milk usually contained none at all, a few samples contained 2-4 units per cc. L E Gilson

Apparatus for the microdetermination of ammonia nitrogen by distillation and aeration. I Goldberg and R F Banfi. *Rev. soc. argentina biol.* 11, 440-8 (1935).

The soln. to be analyzed is made alk. and boiled in a flask equipped with an efficient reflux condenser. A slow current of air is bubbled through the boiling soln. The air and vapors pass upward through the reflux condenser and then down through a specially designed delivery tube which dips into an acid soln. contained in a test tube or other receiver. L E Gilson

Rosenthal-Erdélyi test for vitamin A. Harry Willstaedt. *Z. Vitaminforsch.* 4, 272-6 (1935).—The Rosenthal-Erdélyi test (SnCl_4 + guaiacol) for vitamin A is not specific, is neg. with carotenoids, but may be pos. with the sterols which always are present in biol. material.

Joseph S Heppburn
Biochemical detection of carbohydrates, polysaccharides, alcohols, glucosides and other compounds. H Damm and A Lembke. *Naturwissenschaften* 23, 641 (1935).—General remarks on the possibilities of using specific enzymes derived from constitutive microbes of nonvarying species for the detection and detn. of org. substances. Use of acid-producing bacteria is suggested. At the proper temp. about 3 days is required for the reaction, it can be used as a micromethod. B. J. C. v. d. H.

Determination of chloride in biological fluids by the use of adsorption indicators. The use of dichlorofluorescein for the volumetric microdetermination of chlorides in cerebrospinal fluids and blood serum. Abraham Saifer and Morris Kornblum. *J. Biol. Chem.* 112, 117-22 (1935).—Microdetn. of chlorides in spinal fluid and in serum which has been treated with 3:1 alc.- Et_2O to remove proteins can be rapidly and accurately made by the method described in which dichlorofluorescein is used as an adsorption indicator and standard AgNO_3 (approx 0.02 N) for titration. The entire procedure is carried out in a single tube without transfer. Quantities in the range of 1 mg of NaCl in spinal fluid with a max. deviation of 1% and in blood serum of 2% can be detd. A P. Lothrop

A tungstic acid precipitation method for the extraction of estrogenic substance from urine. S Charles Freed, I. Arthur Mirsky and Samuel Soskin. *J. Biol. Chem.* 112, 143-7 (1935).—Extn. of small amts of estrogenic substance from urine can be quantitatively accomplished by preliminary pptn. with H_2WO_4 and extn. of the ppt. with alc. and Et_2O . Recovery of added estrogenic substance is uniformly complete within the biol. error of animal assay. A P. Lothrop

An improved apparatus for the determination of colloid osmotic pressure in small amounts of fluid. Reubenia Dubach and Robert M. Hill. *J. Biol. Chem.* 112, 313-18 (1935).—The app. described is an improvement of the Krogh-Nakazawa osmometer (C. A. 22, 600). It is made of brass so machined that the parts fit tightly and

do not require washers to prevent leakage around the membrane. A flat membrane is thus insured throughout the detn. and no bulging occurs which is almost unavoidable in an app. where it is held in place with a rubber washer. There is no chance of contamination of the outer fluid with the inner fluid after the detn. is completed. The arrangement described by Turner (*C. A.* 26, 4094) for making several detns. at the same time is also employed. The time required for the establishment of equilibrium varies generally from 3 to 6 hrs. and readings are begun at the end of 3 hrs. and continued at 1/4-hourly intervals until 2 successive readings check within 10 mm.

A. P. Lothrop

A modified Rehberg buret for use with titrating solutions which react with mercury. Bernard B. Longwell and Robert M. Hill. *J. Biol. Chem.* 112, 319-21 (1935).—The Rehberg microburet (*C. A.* 19, 2148) has been so modified that Hg does not come in contact with the titration fluid. The use of the buret is as simple as is that of Rehberg and a rubber diaphragm in use with thiosulfate soln. has remained in good condition for nearly a yr.

A. P. Lothrop

A new test of cortical hormone and ascorbic acid in guinea pigs with diphtheria. W. Herbrand. *Endocrinology* 16, 236-7 (1935).—With a diphtheria toxin dose sufficient to kill guinea pigs within 40 hrs. the adrenals undergo hemorrhagic destruction that cannot be prevented either by cortical hormone or by ascorbic acid administration. However, by the administration of the combination of the two substances the animals could be kept alive and the adrenals remained unaffected. The best results were obtained when the poisoned animals were given every 6 hrs. for 2 days an injection of 3 cc. Pancortex C contg. 150 mg. ascorbic acid. The method is suggested for the standardization of the cortical hormone.

S. Morgulis

Rapid staining with buffered Wright stain. Decostello. *Folia Hematol.* 53, 390-5 (1935).—The best dilg. fluid is the ordinary phosphate mixt. buffer at pH 6.2. If below 6 the erythrocytes will be too red and if above 6.4 they may be greenish, making polychromasia more difficult to detect.

John T. Myers

Studies in respirometry. IV. The use of a comparator system in refractovolumetric respirometry. Wm. R. Thompson and David M. Grayzel. *J. Gen. Physiol.* 19, 61-3 (1935); cf. *C. A.* 27, 345.—A glass buret is used as a comparator system to compensate for small changes in pressure in a respirometer (*C. A.* 27, 117, 345) adapted for the measurement of O_2 and CO_2 in continuous respiration of salamanders and other small animals.

C. H. R.

The estimation of estrin and of male hormone in oily solution. Ldith Bulbring and J. H. Burn. *J. Physiol.* 85, 320-33 (1935), cf. *C. A.* 27, 4290.—Seven dilns. of estrin, prep'd by another worker, were est'd. by the vaginal smear method, by making injections in oil. Lists of their strengths were obtained with an error varying from 3 to 30%, with an av. error of 13%. A new method of estg. estrin in oil soln. by the increase in wt. of the uterus of ovariectomized rats of 40 g. body wt. is described. Over a range of dose from 0.2 to 0.8 γ of estrin daily for 4 days, the av. increase in the wt. of the uterus is proportional to the log of the dose. The estrin is always made in comparison with a standard. The findings of Korenchevsky, Denison and Schalit (*C. A.* 27, 529) that injections of male hormone in oil cause an increase in the av. wt. of the prostate and seminal vesicles of castrated rats which is proportional to the dose, within a certain range, are confirmed. It was found unnecessary to wait 30 days after castration before making injections.

E. D. Walter

Constant-temperature device containing mercury and suitable for use in animal or plant tissue temperature determinations. Charles Sheard and Reginald Halstead (to Chemical Foundation, Inc.). U. S. 2,025,534, Dec. 24. Various details are described of a device having a thermoregulator actuated by the thermal changes in volume of the Hg and having an elec. circuit including the Hg.

C—BACTERIOLOGY

LAWRENCE H. JAMES

The isolation and some cultural characteristics of *Clostridium dissolvens*. Jun Hanzawa and Sadahiko Yoshimura. *J. Faculty Agr. Hokkaido Imp. Univ.* 39, 1-48 (1935).—*Clostridium dissolvens*, an obligate anaerobic spore-bearing bacillus, identical with that of Khovine, has been isolated from surface soil. It decompd. none of the more common carbohydrates with the exception of cellulose. Growth on cellulose was accompanied by the production of H_2 , CO_2 , pigment, HOAc, BuOH and EtOH. No indole or H_2S was detected. Vitamin B or the alc. ext. of feces was essential to the growth, probably acting as accelerators.

Rachel Brown

Action of quartz mercury lamp irradiation on various bacteriophages. C. Levaditi and J. Voet. *Compt. rend. soc. biol.* 120, 385-7 (1935).—The 3 types used (anticoxon, anti-staphylococcal and anti-dysenteric) were equally sensitive. Attenuation was produced in 5 min. and complete destruction in less than 1 hr. under the conditions described.

L. E. Gilson

Influence of the composition of "peptones" on the multiplication of *Pseudomonas aeruginosa*. Jean Régner, Robert David and Jacques Morchoisne. *Compt. rend. soc. biol.* 120, 415-18 (1935).—Pancreatic hydrolyzates of muscle and casein and peptic hydrolyzates of muscle, fibrin, mucosa and casein all produced abundant growths. Growth in gelatin digested with pancreatin was scanty. Removal of diffusible compds. from the hydrolyzates by dialysis did not decrease the rate of growth except in the case of the mucosa prep'n. Effects of glucose and mineral salts on the multiplication of *Pseudomonas aeruginosa*. *Ibid.* 418-20.—The addn. of glucose or a salt mixt. to the dialyzed preps. mentioned in the above paper produced a considerable increase in the growth rate. Less NH₄ was formed when glucose was present.

L. E. Gilson

Polysaccharides of the gonococcus. S. Muterlich and A. Grimberg. *Compt. rend. soc. biol.* 120, 557-8 (1935).—By the method described the polysaccharide was obtained as a yellowish water-sol. powder giving neg. biuret, Millon and Fehling tests. Upon hydrolysis it yielded 35-40% of reducing sugar. It acts as a haptene capable of fixing the antigonococcus antibody.

L. E. Gilson

Deamination of alanine by bacteria. E. Aubel and T. Egami. *Compt. rend. soc. biol.* 120, 684-5 (1935); cf. *C. A.* 29, 8043a.—Discussion of the previous paper.

L. E. Gilson

The concentration and preparation of bacteriophages free from albumin. C. J. Schuurman and A. M. Schuurman-Ten Bokkel Huinink. *Genesked. Tijdschr. Nederland. Ind. 75*, 1875-81 (1935).—The prep'n of bacteriophages free from albumin according to the methods of Weiss (*C. A.* 21, 3673), and that of Asheshov (*Compt. rend. soc. biol.* 98, 770 (1928)) and Kligler-Oltzky (*C. A.* 25, 5187) with subsequent concn. was not satisfactory as there was always a titer loss of at least 10^{-1} . The concn. of bacteriophages was easily accomplished by filtration of Uchinsky lysates through glacial AcOH-colloidon-membranes of specific porosity. At a concn. of 10^{11} phages per cc. the liquid becomes opalescent. A method for strengthening the membranes with Chinese paper is given.

J. C. Jurjens

Further studies of the effect of radium upon bacteria. R. R. Spencer. *U. S. Pub. Health Repts.* 50, 1642-55 (1935), cf. *C. A.* 28, 3099a.—Graphic representation of the killing effect of the β -rays as compared with the γ -rays of Ra is presented. Evidence is also presented that irradiation of bacteria over many generations may induce at times (6 out of 20 tests), but not regularly profound cultural and morphological changes. Continuous irradiation of the same culture for 30 days produced no genetic changes. Five tests in contamination-proof boxes yielded no changes. Thirteen references.

J. A. Kennedy

The cultural characteristics of *Saccharobacillus pastorianus*. J. L. Shimwell. *J. Inst. Brewing* 41, 481-7

(1935); cf. *C. A.* 30, 809⁴.—The morphology, culture, staining reactions, thermal death point, tolerance to hop antiseptics, etc., are given and a comparison with *Lactobacillus delbrückii* is described. Quick Landis.

Oxidations by acetic acid bacteria. III. Formation of a reducing sugar carboxylic acid (aldehyde-glucuronic acid) and of 5-ketoglucuronic acid. Konrad Bernhauer and Karl Irrgang. *Biochem. Z.* 280, 309-6 (1935).—Under the action of *B. gluconicum* on Ca gluconate, in addition to a small amt. of Ca 5-ketoglucuronate, about 50% is converted to a very easily sol. reducing Ca salt. Its intensive reaction with naphthoresazotinal HCl, as well as other considerations, leads to the assumption that this substance is Ca d-aldehyde-glucuronate. It is also produced in small amts. by the action of *Acetobacter xylinum* on glucose in the presence of CaCO₃ or on Ca gluconate. IV. Formation of 2 ketoglucuronic acid by *B. gluconicum*. Konrad Bernhauer and Bruno Gorlich. *Ibid.* 307-71. Under the influence of *B. gluconicum* on Ca gluconate d-2 ketoglucuronic acid is formed in addition to the main products, the d-5-ketoglucuronic and aldehyde-glucuronic acid. The substance was isolated as the well-crystallizable salt K. and was identified as the Me ester and the quinoxaline deriv. V. Comparative studies on the preparation of L-sorbose by different bacteria. *Ibid.* 376-8. *Acetobacter xylinum*, *B. xylinoides* and *gluconicum* produce L-sorbose from sorbitol, especially the last one. The yield is usually 70-80%. The best results are obtained with *B. gluconicum* in a synthetic medium in the presence of a little boiled yeast juice. By the procedure outlined practically pure sorbose is obtained. S. Morgulis.

Biochemistry of *Bacillus mesentericus hydrolyticus*, a new type of *B. mesentericus vulgaris*. Stewart Hermann and Paul Neuschul. *Biochem. Z.* 281, 219-30 (1935).—A pure strain of an organism was obtained from carrot which morphologically resembles very closely *B. mesentericus vulgaris*, but unlike this possesses marked hydrolyzing power especially in splitting sucrose and sol. starch. This organism softens and loosens the cellular bindings of a no. of vegetables (cucumber, carrot, radish, peas, etc.), an effect which can also be produced with enzyme solns. prep'd from these organisms. S. M.

Bacterial variation. An inquiry into the underlying principles governing the cell morphology of *Bacillus megatherium*. Leo F. Rettger and Hazel B. Gillespie. *J. Bact.* 30, 213-34 (1935), cf. *C. A.* 29, 1453⁴.—Relatively slight changes in environment are responsible for striking changes in cell form. The factors which stimulate cellular variation are apparently unfavorable to continued normal growth, and are the result of metabolic activity. Variation is possible only when favorable and unfavorable influences are so balanced as to permit slow growth in the face of untoward circumstances. Partial O starvation is responsible for at least certain types of cell variation. There was no evidence that cellular forms develop from finely granular or apparently structureless material.

Differences in effect of phenyl mercuric chloride upon different races of bacteriophage and similarity in effect upon a phage and its homologous organism. Norman R. Goldsmith. *J. Bact.* 30, 237-42 (1935).—Phenyl mercuric chloride in dilns. of 1:20,000, 1:40,000 and 1:80,000 had no effect on the lysing ability of either staphylococcus or *E. coli* bacteriophages when in contact for 30 min. When in contact for 6 weeks at room temp., the lysing ability of the staphylococcus phage was completely destroyed while that of the colon bacillus remained as effective as the untreated controls. The toxicity of the antiseptic on the sp. phage seemed to parallel that upon the homologous organism. John T. Myers.

A bactericidal principle in excretions of surgical maggots which destroys important etiologic agents in pyogenic infections. S. W. Summons. *J. Bact.* 30, 253-67 (1935).—A potent bactericide was collected from maggots of the species *Lucilia sericata* by washing them with a spray of water during growth. It would kill pyogenic organisms in heavy suspensions in 5 to 10 min. It is non-viable and not destroyed by autoclaving 20 min. at 20 lb. pressure.

Org. material has little effect. It produces no lysis. It retains its potency when desiccated. John T. Myers.

The occurrence of a strain of *Azotobacter chroococcum* which does not ferment mannitol. Nathan R. Smith. *J. Bact.* 30, 323-8 (1935). Because of such strains, sucrose, dextrin or starch should be substituted for mannitol in Ashby's medium, unless mannitol utilizers are shown to be present in a given soil. John T. Myers.

A growth factor for rhizobia. D. W. Thorne and R. H. Walker. *J. Bact.* 30, 331-2 (1935), cf. *C. A.* 29, 1621⁴.—Cane sugar contains a necessary growth factor, which can be ext'd. with alk. ale. Yeast contains a smaller amt.

The utilization of CO₂ by the propionic acid bacteria in the dissimilation of glycerol. H. G. Wood and C. H. Winkman. *J. Bact.* 30, 332 (1935). John T. Myers.

A method for estimating the bacterial content of the mouth by direct count. Mary C. Crowley and U. G. Rickett. *J. Bact.* 30, 395-100 (1935). The mouth was sprayed with 0.025 N NaOH to dissolve mucin and secure more uniform counts. John F. Myers.

The denaturation of staphylococcal proteins. A. P. Kreuzer and V. C. Nichols. *J. Bact.* 30, 101-9 (1935).—Staphylococcal antigens made by mech. fragmentation and ultrafiltration contain less than 10% of the total bacterial protein in the denatured form. On exposure to heat, staphylococcal native proteins are denatured, becoming insol. at the isoelectric point, *pu* 4.6, and showing increase in SH groups. The denaturation reaction obeys the mass law and has a crit. increment averaging about 41,000. Undenatured protein should be preferable for vaccines. John F. Myers.

The effect of synthetic surface active materials on bacterial growth. I. The effect of sodium disecary butyl naphthalenesulfonate on the growth of *Mycobacterium smegmatis*. Joseph Katz and Aaron Lipsitz. *J. Bact.* 30, 419-22 (1935). The Na salt of di-secondary naphthalenesulfonic acid in dilns. up to and including 1:10,000 inhibits the growth of *Mycobacterium smegmatis*. In dilns. between 10,000 and 50,000 it produces many involution forms showing that this surface-active material is unfavorable to the growth of this organism. There was no synergistic action between neutral acrylavine and Na di-secondary naphthalenesulfonate. J. T. M.

The metabolic activity of various colon group organisms at different phases of the culture cycle. Grace Mooney and C. I. A. Winslow. *J. Bact.* 30, 127-40 (1935).—A fermentable carbohydrate (glucose) stimulates the multiplication of *E. coli* and *S. gallinarum* but inhibits *S. pullorum*. NaCl will remove the inhibitive effect. There was never any increase in the CO₂ per cell per hr. which is essentially independent of the organism and the medium used, hence it seems to represent a fundamental metabolic activity of the 3 species. The rate of metabolic activity varies greatly at various phases of the culture cycle. Increases can be explained only in part by increases in cell size. John T. Myers.

The role of bacteria and other microorganisms in the decomposition of cellulose in nature. Selman A. Waksman. *J. Bact.* 30, 411 (1935).—Microorganisms capable of destroying cellulose are wide spread. The mechanism of cellulose destruction varies widely. J. T. M.

Acid production and respiratory catalysts of *Escherichia acidilactici*. Kenneth C. Blanchard. *J. Bact.* 30, 412 (1935).—*E. acidilactici* contains at least 2 O-activating mechanisms which have different functions in the metabolism of the cell. John T. Myers.

The increase in bactericidal value of vapors from irradiated essential oils. W. Reimer-Deutch and N. Molnar. *J. Bact.* 30, 411 (1935).—Irradiation of essential oils in alc. for 15 min., at a distance of 25 cm., with a Burdick air-cooled lamp increased the bactericidal power so that the vapors would kill staphylococci in 3 hrs. Such oils show a marked radiation. John T. Myers.

The influence of heat and storage on the electrophoretic migration velocities of various microorganisms. K. Pierre Dozois and Frank Hachtel. *J. Bact.* 30, 473-7 (1935).—Heat and storage did not alter the *pu* or migration rates,

below 60° Above 60° there was a slight gradual increase

John T. Myers

Cultural characteristics of *Pasteurella tularensis*
Corra M. Downs and Glenn C. Bond *J. Bact.* 30, 484-90 (1935) —All of 21 strains of *P. tularensis* fermented glucose and glycerol. All strains failed to ferment galactose, lactose, sucrose, raffinose, melzitose, arabinose, rhamnose, xylose, mannitol, dulcitol, sorbitol and salicin. It produces an alk. reaction in media not containing a utilizable carbohydrate, otherwise there is an initial acidity with an alk. reversion. It produces H_2S in media containing cystine, but not from peptone, blood or thiosulfate. No other S-contg. compds. stimulated growth.

John T. Myers

The inhibition of *Bacillus subtilis* by ultraviolet-irradiated carbohydrates Irvin H. Blank and Wm. Arnold *J. Bact.* 30, 507-11 (1935), cf. C. A. 29, 6269* —Ultraviolet radiation (2537 Å) so alters agar or agar-water gels that they will not support the growth of *B. subtilis*. This results from the formation of a nonvolatile thermostable material, capable of diffusing through and from the gel. A similar inhibition results from the addition to the medium of an irradiated soln. of any of 20 different carbohydrates.

John T. Myers

Cultural requirements of bacteria VI The diphtheria bacillus *J. Howard Mueller J. Bact.* 30, 513-24 (1935), cf. C. A. 29, 2309* —Animal tissue expts. apparently of whatever source contain substances essential to the growth of the strain of diphtheria bacillus studied. There is also present in most freshly prep'd tissue infusions a substance, perhaps glucose, which inhibits growth through the formation of acid. An alk. ext. of an aq. ext. of beef liver was highly effective but had no value in pernicious anemia. One or more substances essential to growth were adsorbed from soln. on wood charcoal, and recovered by elution with acid alc. Such charcoal elutes also contain growth stimulating substances, apparently inorg., perhaps K and Mg. VII Amino acid requirements for the Park Williams No. 8 strain of diphtheria *J. Howard Mueller and Israel Kapnick. Ibid.* 325-34 —A strain of Park 8 diphtheria bacillus grew heavily on a medium containing L-cystine, D-glutamic acid, D-valine, D-leucine, D-methionine, glycerol, inorg. salts and liver "elute". The medium is suitable for serial culture, the amt. of growth increasing with adaptation. Moderate variation in conditions under which the strain is routinely maintained may lead to differences in its amino acid requirements.

John T. Myers

The accelerating effect of manganous ions on phage action A. P. Krueger and N. S. West *J. Gen. Physiol.* 19, 75-86 (1935) —Dil. solns. of $MnCl_2$ or $MnSO_4$ accelerate the lytic effect of phage on *Staphylococcus aureus*. The acceleration results from the reduction of the quantity of phage/bacterium requisite for lysis. Mn^{++} reduces this ratio from 54 to about 12. Phage distribution is altered in the presence of Mn^{++} , in growing phage bacteria mixts., extra-cellular phage concn. is increased by Mn^{++} to about 4 times that in its absence, but phage formation is not enhanced nor is the rate of bacterial growth affected. As a consequence of the reduced lytic threshold produced by Mn^{++} , less phage is necessary to bring about the lytic destruction of the bacteria.

C. H. Richardson

Cellular reactions to waxes from *Mycobacterium leprae* F. R. Sabin, K. C. Smithburn and R. M. Thomas. *J. Exptl. Med.* 62, 771-86 (1935) —The waxes from the *M. leprae*, like those from tubercle bacilli, are remarkable stimulants of cells. The crude wax sepd. from *M. leprae* is a mixt. of lipoids and other materials, and gives reactions that include the types of cell characteristic of the response to the tubercle polysaccharide, phosphatide and wax. The wax obtained from the purification of the lepra phosphatide shows similar cellulose reactions but with a greater proportion of foreign body giant cells. Leprosin, though a glyceride, corresponds in its phys. properties to the unsaponifiable material from the tubercle bacillus. It stimulates 2 strains of cells, fibroblasts and monocytes. The cellular reaction to the leprosinic acid and to the crystn. alcs. is of 1 type only, represented by the foreign body giant cell.

C. J. West

D—BOTANY

THOMAS G. PHILLIPS

Advances in botany. F. E. Denny. *Ind. Eng. Chem., News Ed.* 13, 474-5 (1935) E. J. C.

Alkekengi. Karl Meyer *Pharm. Ztg.* 80, 1211-12 (1935) —The results of investigations during recent years on this fruit are summarized. Of particular interest is its content of vitamin C.

W. O. E.

Toxicity of ethyl alcohol for dormant and germinating seeds Mine S. Lallemand and Mlle S. Lallemand *Bull. soc. chim. biol.* 17, 1509-21 (1935) —Lentils were used. When the dry seeds were soaked in a soln. contg. 7.81% EtOH by wt. 50% were killed in 2.5 hrs. and 100% in 24 hrs. Those soaked 24 hrs. contained 6.4% EtOH by wt. Soaking 24 hrs. in a soln. contg. 2.4% EtOH by wt. killed 50%. Other concns. and lengths of time were tried. If the seeds were first soaked for 5 hrs. or longer in water, to start germination, and then placed in the EtOH solns. for various periods, in every case a larger percentage, compared to the figures for dry seeds, survived and continued to germinate, although frequently they absorbed more EtOH than dry seeds under the same conditions.

L. E. Gilson

Anatomy and chemical principles of the seeds of *Zygophyllum fabago* L. Cornelis Teedoom *Compt. rend. soc. biol.* 120, 659-61 (1935) —The seed structure is described. The seeds contain oil, mucilage, amyloid and a saponin. Starch, reducing sugars and alkaloids are absent.

L. E. Gilson

Changes in saponin content during germination and growth of the young plants of various species of Gramineae T. Solacolu and L. Welles *Compt. rend. soc. biol.* 120, 662-4 (1935) —Saponin was present in the seeds of the 7 species of grass and 2 species of *Gulch* examined. It gradually disappeared after germination and was usually all gone by the time the fifth leaf appeared. It may serve as a foodstuff for the young plant.

L. E. Gilson

Biochemical changes in phytopathology Essential oil of *Lavandula vera* from plants infected with the parasite *Septoria lavandulae* Desm. R. Salgues *Compt. rend. soc. biol.* 120, 703-4 (1935), cf. C. A. 29, 8054* —The diseased plants yielded less oil and the oil contained more cineole and less alcohols than that from healthy plants.

L. E. Gilson

Biochemical changes in phytopathology Changes in organic and mineral constituents due to parasite invasion. R. Salgues *Compt. rend. soc. biol.* 120, 780-2 (1935), cf. C. A. 29, 8054* —Analyses of healthy plants of the legume *Medicago lupulina* and plants infected with the fungus *Septoria medicaginis* Rob. are given. The diseased plants contained more protein and less ash. Differences in other constituents were small.

L. E. Gilson

Effect of carotene on the neoformation of rootlets of *Impatiens balsamina* O. Lazar *Compt. rend. soc. biol.* 120, 799-804 (1935) —The seeds were sprouted, the rootlets clipped, and the hypocotyls implanted in an agar emulsion. New rootlets formed more rapidly when a minute quantity of carotene was added to the emulsion.

L. E. Gilson

Indispensable elements of plant nutrition A. Frey-Wyssling *Naturwissenschaften* 23, 767-9 (1935) —Elements indispensable to plant life be in the periodic system on or near the line A-C-A, the "nutrient" line. Elements remote from this line are usually toxic.

B. J. C. v. d. H.

Isolation of the toxic principle from a species of *Dimorpha* *Dimorpha fruticosa* Claude Rimington and Doug. G. Steyn *Onderstepoort J. Vet. Sci.* 5, 79-80 (1935) —The cyanogenetic glucoside (*linamarin*) was isolated from the plant. The wilted leaves of the fresh plant contained approx. 1.5 g. HCN per 100 g. and the stems contained approx. 0.3 g. The dried powdered material contained approx. 0.3 g. HCN per 100 g.

K. D. Jacob

Chemical investigation of *Dichapetalum cymosum* (Hook.) Engl. I. Claude Rimington. *Onderstepoort J. Vet. Sci.* 5, 81-85 (1935) —Attempts to isolate the toxic principle of the plant in a chemically pure condition were

unsuccessful. The carboxyl, ketonic, aldehydic, hydroxyl, amino and imino groups were shown to be definitely absent from the toxin mol. The active principle almost certainly contains N but the mol as a whole does not evince basic characters. Propts., still highly toxic to rabbits, were prep'd contg no protein, amino acid or carbohydrate material. The toxic substance was thermostable, was not oxidized by $KMnO_4$ or H_2O_2 , and resisted boiling for 1 hr with 1% H_2SO_4 or 1% $NaOH$ solns. In addn. to the toxic principle the plant contains a catechol tannin, a yellow coloring matter (shown to be a methylpentoside, yielding rhamnose on hydrolysis), a histidine-like base, a base probably identical with choline and the alkaloid triconelline. K D Jacob

Hydrocyanic acid in grasses. A C Léemann *Understephot J Vet Sci* 5, 97-126 (1935).—A list is given of 88 grasses that have been investigated for the presence of cyanogenetic glucosides. A crit discussion is given of the literature on the following phases of the subject: (1) methods of extg. HCN from grasses, (2) relation between the HCN content of grasses and the lethal dose for animals, (3) conditions in the animal favoring or preventing toxicity, (4) external conditions leading to toxicity of the plant, (5) internal conditions of the plant leading to toxicity, (6) effect of free HCN on the plant, (7) HCN in glucoside or nonglucoside form and (8) HCN as an org. comp'd. Expts with *Eustachys paspalodes* and *Sorghum verticilliflorum* showed that HCl has an inhibiting effect on HCN production, so have marked alkyl and pepsin plus HCl. No HCN escapes during hay production although some may be transformed into other substances. Heating the grass to 59° (probable temp. of wilting) and 70° releases as much HCN as the $CHCl_3$ test. HCN is lost when the grass is extd. with 42.5% alc but not when 95% alc is used. Pb acetate ppt's the enzyme with denaturation and also partly ppt's the glucoside. Al and Mn inhibit formation of HCN but Fe, Mg and Ca have no effect. One hundred and twenty-seven references. K D Jacob

The influence of chlorides and sulfates on the intake of ammonia and nitrate nitrogen by plants. A V Vladimirov. *Khimizatsiya Sotzialist. Zemledeliya* (Moscow) No. 3, 14-21 (1935).—Cl enters the plant faster than the SO_4 ion and therefore is conducive to a higher absorption of K and NH_4 and a lower absorption of nitrate. Univalent cations (K and Na) effect a higher absorption of NO_3^- , Cl^- and SO_4^{--} , and a lower absorption of NH_4^+ than bivalent cations (Ca and Mg). The detg. moment of the absorption of NH_4^+ is the ratio of the quantities of complementary cations and anions which enter the plant. A high absorption of NO_3^- from NH_4NO_3 is favored either by a cation with a high entrance capacity, such as K, or an anion with the lowest capacity of entrance, such as SO_4^{--} . The reverse is true for the entrance of NH_4^+ . The behavior of NH_4NO_3 as a physiologically neutral or acid salt depends on the anions and cations of the accompanying salts. J S Joffe

A physiological study of the entrance of lime and magnesia into plants. K. P. Tulakova. *Khimizatsiya Sotzialist. Zemledeliya* (Moscow) No. 3, 22-34 (1935).—For barley the optimum concn is 182 mg. MgO per l. of soln. For flax, 263-344 mg. MgO per kg. of sand. A concn. of Ca and Mg in the ratio of 1:4 was not injurious to the plants investigated. Barley takes up from soln twice as much Ca as Mg. In barley the max. utilization of Ca takes place at the last stage of the vegetation period, of Mg, at the time of flowering. A high concn. of Ca stimulates the absorption of Mg by young barley plants. J S Joffe

Determining the germination of seeds by detecting the embryo respiration with dinitrobenzene. A. A. Gurevich. *Khimizatsiya Sotzialist. Zemledeliya* (Moscow) No. 4, 96-105 (1935).—The method is based on the property of living cells to reduce dinitrobenzene in the process of respiration. The reduction products, nitrophenylglydrolamine and nitraniline, distribute themselves through the cell tissues and reacting with ammonia the nitrophenylhydroxylamine gives a characteristic color reaction which is an indication of the germination. J S Joffe

The availability of adsorbed phosphoric acid to plants. V. I. Shtatnov and S. V. Odintsova. *Khimizatsiya Sotzialist. Zemledeliya* (Moscow) 1935, No. 5, 37-45.—Iron hydroxide gel was treated with various quantities (100-500 cc.) of H_3PO_4 , varying in concn. from 0.5 to 0.001 mols per l. The 0.001 M concn. showed complete removal of the P_2O_5 with the 100 l. or 500 l. ratio of soln. to gel. In a second series of expts NaH_2PO_4 was used in place of the H_3PO_4 . The concns. used were 0.25, 0.10 and 0.001 M, the first two were used with gels of the ratio 300:1, the last one 500:1. The excess NaH_2PO_4 was washed out and the gel with the adsorbed phosphate used in pot expts with oats. The results show that with gels of high adsorptive capacity the yields were high. Analyses of the plants and their appearance are given in tables and photographs. J S Joffe

Studies of the physiological importance of mineral elements in plants. VII. The effects of potassium and chloride ions on the diastase of broad-bean leaves. W. O. James and M. Cattle. *New Phytologist* 34, 283-95 (1934). cf *C* A 28, 3441.—The authors studied the distribution of K and Cl ions and diastatic activity in the plant and the effect of K and Cl starvation of the plant in these distributions. K as a nutrient increased the diastatic activity of leaves, although the K ion when added to the extd. enzyme does not appear to activate the enzyme. Cl ions added to nutrient have practically no effect on the diastatic activity of the leaves, but when added to the ext. increase the diastatic activity. The authors believe that the Cl ion may act as a direct activator of preformed diastase while K acts as a catalyst at some stage of the synthesis of the diastase complex. VIII. The variation in potassium content of potato leaves during the day. Norah L. Penston. *Ibid* 296:309.—The amt. of K in potato leaves increases to a max. at 3-4 p.m. and falls at night. Max. K coincides with max. dry wt., H_2O and total ash. Fluctuations in amts. of K are less when transpiration is slow. It is concluded that the K is being continuously brought into the leaf by the transpiration stream and reexported to the phloem because a loss of K occurs when transpiration slows in the evening. H. R. Kraybill

The peptidase system of Aspergillus parasiticus. Marvin J. Johnson and W. H. Peterson. *J. Biol. Chem.* 112, 25-34 (1935); cf *C* A 29, 1460.—"The aminopolypeptidase of *Aspergillus parasiticus* requires a free NH_2 group as a point of attachment for the enzyme. It hydrolyzes the peptide linkage adjacent to this free NH_2 group. Dipeptides are not attacked unless the inhibiting influence of the CO_2H group is removed by decarboxylation. Peptides composed entirely of glycine are not attacked. The mold peptidase system contains enzymes capable of hydrolyzing peptides in which the free NH_2 group is methylated or replaced with Cl. Benzoyldiglycine and triglycine are not hydrolyzed by the mold peptidase system. Although the aminopolypeptidase of mold does not attack triglycine and the leucylglycine-hydrolyzing dipeptidase does not attack diglycine, the crude mold peptidase complex splits both of these peptides. The apparent basic disocn. const. ($K_p \times 10^{10}$) of leucylglycine, leucylglycine, triglycine and diglycine have been calcd. to be as follows, resp.: 10, 15, 19 and 14. A. P. Lohrhop

Further observations on the iodine contents of Chinese marine algae. P. S. Tang and C. S. Chang. *Chinese J. Physiol.* 9, 369-74 (1935), cf *C* A 30, 132.—The iodine contents of 12 algal species are reported. L. A. M.

The histochemical detection of sodium in the plant. Maximilian Steiner. *Ber. deut. botan. Ges.* 53, 720-32 (1935).—The Na is pptd. as sodium zinc uranyl acetate. Amounts of Na as low as 0.2-0.3 % can be detected. Other inorg. salts occurring in the plant do not interfere with the test. Lawrence P. Miller

Growth substance and cell division. Ludwig Jost. *Ber. deut. botan. Ges.* 53, 733-50 (1935).—Expts with various structures, such as pods of *Phaseolus multiflorus*, showed that a no. of chemically unrelated substances, including heteroauxin (β -indolylacetic acid), can cause cell division. These presumably act as chem. stimulants. L. P. M.

The apparent nitrogen assimilation of germinating peas (The applicability of Kjeldahl method in biological nitrogen assimilation experiments) Elizabeth M. Smyth and P. W. Wilson *Biochem. Z.* 282, 1-25(1935); cf. *C. A.* 30, 801¹—Peas germinating either in distill. water or in media contg. salt solns or alkaloids invariably show an increase of 0.2 to 0.3% N in the dry residue. This increase is, as statistical studies corroborate, beyond the limits of the exptl. error. By the official Kjeldahl procedure only 90% of the total N according to Dumas can be recovered, and this varies with different modifications of the official procedure. The increase in the N is not the result of a symbiotic N assimilation during the germination but of the Kjeldahl method itself, owing to the fact that in the process N compds are formed which are more easily determinable. S. Morgulis

Effect of follicular hormone crystals on the growth of some cultivated plants K. Scharrer and W. Schropp *Biochem. Z.* 281, 314-28(1935)—Expts. were made with a variety of plants (wheat, rye, barley, oats, soybeans, sugar beet, etc.) grown in pots using follicular hormone crystals, free from the phytohormone auxin, in quantities ranging from 500 to 1000 mouse units. Undoubted increase was obtained in the growth of cereals in the following order: wheat > rye > barley > oats. In some of the plants the flowering occurred earlier under the influence of the hormone. The crop with broad beans was greatly increased, but this was not the case with soybeans. In the sugar beet 1000 mouse units caused a 14% increase in yield. S. Morgulis

α - and β -Amylase in ripening wheat grains P. S. Ugrumov *Biochem. Z.* 282, 74-8(1935).— α -Amylase rapidly dextrinizes, and β amylase saccharifies, starch. The α -component becomes inactivated during ripening and cannot be found in the dormant seed, but reappears during germination. S. Morgulis

The influence of humic acid on the assimilation of plants A. V. Blagoveschenskij and A. A. Prozorovskaya *Biochem. Z.* 282, 99-103(1935); cf. *C. A.* 29, 1134¹—Humic acid acts as a stimulant when added to the nutritive soln. It increases the permeability of the membranes to NH_4NO_3 . It has no effect on protein synthesis. S. M.

The role of glutathione in the metabolism of yeast Kenneth C. Blanchard *J. Bact.* 30, 442-3(1935).—The glucolytic and oxidative degradations of glucose are interrelated and apparently depend on the total glutathione content. John T. Myers

The formation of fatty acids by *Aspergillus niger* C. F. Schmidt, Jr. *J. Bact.* 30, 445(1935), cf. *C. A.* 29, 5478¹—Fatty acid formation is stimulated by a concn of 0.001 M NaF and inhibited by 0.0035 M. J. T. M.

Inhibition of photosynthesis in *Chlorella pyrenoidosa* by the iodoacetyl radical Henry I. Kohn *J. Gen. Physiol.* 19, 23-34(1935)—Photosynthesis in this green alga is inhibited by ICH_2COOH and $\text{ICH}_2\text{CONH}_2$, both attacking the Blackman reaction. As CH_3CONH_2 is without effect, ICH_2CO must be responsible. The ions of the acid penetrate so slowly that the results with it are without significance. The chromophore groups and probably other parts of chlorophyll are not involved in the effects of the ICH_2CO radical. As cyanide also inhibits photosynthesis by way of the Blackman reaction, this complex is probably attached at 2 different loci on the same or on different mols. The ICH_2CO radical also (1) may increase the rate of reaction with the photochem. complex if in concn. too small to inhibit photosynthesis, (2) will increase the rate of respiration in concns which inhibit photosynthesis and (3) will inhibit respiration if in concn. greater than is required to inhibit photosynthesis. C. H. R.

The reversible heat activation inducing germination and increased respiration in the ascospores of *Neurospora tetrasperma* David R. Goddard. *J. Gen. Physiol.* 19, 45-60(1935)—The ascospores of this fungus, activated by heat, may be returned to secondary dormancy by preventing respiration. From this secondary dormancy the spores may be induced to germinate by reheating. Activation brings about a large increase in respiration prior to germination, deactivation, a large decrease. Poisoning

the spores with iodoacetamide prevents germination without greatly inhibiting the increase in respiration. With the beginning of germination, a secondary rise in respiration occurs. Respiration is inhibited by HCN. The critical temp. for heat activation of the spores lies in the range of 40° to 52°; at a const. temp. within this range, the percentage of spores activated, plotted against time, gives a sigmoid population curve. C. H. R.

Physical and chemical properties of the soluble polysaccharides in sweet corn. M. W. Parker. *Plant Physiol.* 10, 713-25(1935), cf. Culpepper and Magoon, *C. A.* 18, 3632—Starch-free electroanalyzed water-sol polysaccharides of sweet-corn endosperm were found to consist of two fractions tentatively named α and β . One fraction was deposited as a gelatinous mass around the pos. membrane, whereas the other always remained in suspension during electroanalysis. A comparison of the phys. and chem. properties of the two fractions at the milk, dough and mature stages showed that with increasing maturity many of the properties of the α and β fractions of the sol. polysaccharides approached those of the α and β amylose prep. from sweet-corn starch, but differed greatly from the dextrins. It is suggested that the sol. polysaccharides of sweet corn are the units for the formation of starch grains. Twenty-five references. Walter Thomas

Seasonal march of carbohydrates in *Elymus ambiguus* and *Muhlenbergia gracilis*, and their reaction under moderate grazing use. Edward C. McCarty. *Plant Physiol.* 10, 727-38(1935)—The seasonal march of the sugars plus starch of the grasses *Elymus ambiguus* and *Muhlenbergia gracilis* grown on exptl. plots on the eastern slope of Pike's Peak was in inverse ratio to the rate of growth. Clippings made periodically indicated that the amt. of herbage growth following the clipping and also the concn. of the accumulated carbohydrates were approx. proportional to the number of days between the date of the clipping and the end of the annual growth cycle. Walter Thomas

Growth and seasonal changes in composition of oak leaves Arthur W. Sampson and Rudolf Samisch. *Plant Physiol.* 10, 739-51(1935).—N and "crude fiber" accumulated at a very early stage of growth in the leaves of *Quercus gambelii* (Utah) and *Q. kelloggii* (California), but as leaf expansion continued both N and "crude fiber" decreased on a unit-area basis during the latter part of the season. Ether-sol. substances as well as Ca and SiO_2 accumulated continuously throughout the season, whereas K increased rapidly in the spring and decreased on a unit-area basis later in the season. Walter Thomas

Observations on the cracking of cherries Z. I. Kertesz and B. R. Nebel. *Plant Physiol.* 10, 763-72(1935), cf. Hartman and Bulls, *C. A.* 24, 1883, Verner and Blodgett, *Idaho Agr. Exptl. Sta. Bul.* 184, 1931—The cracking of cherries is attributed to the forces of the swelling colloids of the flesh rather than to osmotic forces. Walter Thomas

Unfreezable and freezable water equilibrium in plant tissues as influenced by sub-zero temperatures Glenn A. Greathouse. *Plant Physiol.* 10, 781-88(1935)—Expressed in percentage of the total water, the unfreezable water values of cold hardened red clover roots decreased 1.40% with lowering of the temp. from -15° to -22° (cf. Jones and Gortner, *C. A.* 26, 1497; St. John, *C. A.* 26, 357) whereas the unfreezable water values of unhardened root tissue decreased 6.02% over the same temp. range and 13.04% over the temp. range -10° to -50° (cf. Robinson, *C. A.* 25, 5687, Thoenes, *C. A.* 19, 3497). The behavior of potato tubers was similar to that of unhardened red clover roots. Different unfreezable water values were obtained when the plants were grown under different conditions. Walter Thomas

Hormones in relation to root formation on stem cuttings Wm. C. Cooper. *Plant Physiol.* 10, 789-94(1935)—Girdled lemon-tree cuttings placed in sand below the girdle and treated with the plant hormone β -indolyl-acetic acid above the girdle according to the method of

Laibach (C. A. 30, 131¹) showed not only increased rooting with cuttings that rooted when untreated but also the formation of roots on leafless cuttings which did not ordinarily form roots. Similar results were obtained with *Tradescantia*. The expts are being continued with other plants.

Walter Thomas
Some chemical aspects of calcium-deficiency effects on *Psidium sativum* Dorothy Day *Plant Physiol* 10, 111-116(1935), cf. C. A. 24, 1139.—Ca-deficient plants weighed least on both fresh-wt and dry-wt basis. The percentage on dry matter was highest in the shoots and lowest in the roots of Ca-deficient plants. At the end of the growth period of 5 weeks the plants starved of Ca had 1/3 as much Ca as those which received the highest supplement of Ca. The addn. of NaNO₃ to the nutrient media depressed the uptake of Ca by the plant. The expts were conducted in sand cultures in a greenhouse under controlled conditions. Walter Thomas

Some effects of fuel oil on plants Geo D Tuller and Margaret R Leadbeater *Plant Physiol* 10, 817-820 (1935)—Gas oil of 3236 Baumé gravity and 55 seconds Saybolt consisting principally of said hydrocarbons had a harmful effect when applied to tomato and peach plants in amts of 1, 2, 3, 4 and 5% by vol. of the soil content of the pots in which the plants were grown. The effect is fatal when the quantity is raised above the crit. point which varied for different species of plants. The influence of the oil on the soil is unknown. The effect, however, is not necessarily the result of penetration into the tissues of the plant. If the oil has penetrated the tissues it is found in the primary xylem, and to a less extent in the secondary xylem and the intercellular spaces of the pith and cortex. Contact does not seem to be a primary cause of death. The expts are being continued. Walter Thomas

Effect of titanous chloride on the formation of chlorophyll in *Zea mays*. O. L. Inman, Geo Barclay and Malvern Hubbard *Plant Physiol* 10, 821-2(1935), cf. Nemes and Kas, C. A. 18, 1516.—Expts with *Zea mays*, in which the nutrient soln used by Siders (*Pineapple News* 4, 98(1930)) was used, indicated that in the formation of chlorophyll Ti cannot be substituted for Fe. W. T.

Sublethal damage from the arsenic acid in the white smelter smoke of the As metallurgical plant (Hüsch) 9 I fluorescence spectrochemistry of the chlorophyll pigments (Dhéré, Raffy) 3

E—NUTRITION

PHILIP D HAWK

Metabolism during an abundant protein diet I. L. D. Kasehvim, S. A. Neifakh and A. Yu. Kharit. *J. Physiol* (U. S. S. R.) 19, 508-24(1935).—Feeding expts. lasting more than a year were carried out with men metal workers and women textile workers. The men were given daily 225-250 g. of proteins, the women, 150-215 g. All the usually accepted indices of N metabolism (N balance, ratio of urea N to general N, ratio of creatinine N to total N, residual N of blood) are the same as under normal conditions.

H. Cohen
Feeding of sweet lupines through four generations (experiments on rats). A. Columbus Biedermanns Zentr. B. Tierernähr. 7, 543-57(1935).—Three kinds of sweet lupines, free from the bitter substance, were fed to 4 generations of rats. The proportion of the lupines in the total food was varied during the expts. Up to 60%, the general development of the older rats was favorable; with 80% the development was arrested and with 100% it was impaired. With 60%, the litters thrived very well; with 80% some of the young died, while with 100% breeding of litters was impossible. No essential differences were observed with the several lupines, although the litters receiving the lupine thrived better than the check litters. Dissections of the rats did not indicate that there had been any injurious effects on the organs. F. L. D.

Composition and vitamin studies of green soybeans. Carey D. Miller and Ruth C. Robbins. *Hawaii Agr. Expt. Sta. Rept.* 1933, 21-5(1934).—Cooked green soybeans are a good source of vitamins A and B. Gains in wt. in rats

on vitamin G tests of 28 g. a week resulted from feeding a daily supplement of between 1 and 2 g. of the cooked green beans daily. Green soybeans contained the following percentage compn moisture 60.1, protein 12.5, Et₂O ext. 5.2, crude fiber 1.5, ash 1.8, carbohydrates 10.1, Ca 0.063, P 0.239 and Fe 0.00253. C. R. Fellers

Vitamin C in fresh pineapple juice and in guavas. Carey D. Miller and Ruth C. Robbins. *Hawaii Agr. Expt. Sta. Rept.* 1933, 25(1934).—Guinea-pig bioassay showed fresh pineapple juice to be about 1/2 as rich in vitamin C as fresh orange juice. Fresh guava juice was equally as good as fresh orange juice, the protective level of which is stated to be 3 g. daily. One g. daily of fresh guava fruit completely protected guinea pigs from scurvy. C. R. Fellers

Relation between the vitamin A and D intake by the hen and the output in eggs. Walter C. Russell and M. W. Taylor. *J. Nutrition* 10, 613-23(1935), cf. C. A. 30, 529¹.—The output of vitamin A in eggs, calcd. as the percentage of that consumed, varied from 11 to 32%, and was det'd by the no. of units of the factor consumed, the no. of eggs produced and the potency of the yolk. The highest percentages were produced during high production. The liver vitamin A of the hens varied inversely with egg production. With vitamin D the amt which appeared in the eggs was approx 10% of that consumed. It is suggested that sunlight is more effective in increasing the antirachitic potency of egg yolk than the amt of cod-liver oil ordinarily fed. C. R. Fellers

Study of the nutritive value of mushrooms. F. W. Quackenbush, W. H. Peterson and Harry Steenbock. *J. Nutrition* 10, 625-43(1935).—Diets contg mushrooms, *Agaricus campestris*, were consumed in subnormal quantities and growth was also subnormal. The mushrooms were relatively good sources of B and G vitamins inasmuch as levels of 10 and 5% of the diet on a dry-wt. basis gave satisfactory growth. A diet contg 10% of mushrooms as the only source of vitamin B was deficient in some factor other than B and G vitamins. Preliminary data indicate that mushroom protein is incomplete. There was no evidence of a toxic principle. The investigation of the deficiencies in mushrooms was hampered by the poor consumption by the rats. C. R. Fellers

Effect of the ingestion of saline waters upon the pH of the intestinal tract, the nitrogen balance and the coefficient of digestibility. V. G. Heller, J. R. Owen and Lucille Portwood. *J. Nutrition* 10, 645-51(1935).—The use of drinking waters contg. considerable quantities of dissolved salts does not interfere with the N utilization of normal rats by the rat. Likewise the apparent coeffs of digestibility of the constituents of the ration are not interfered with, in fact, the trend of all detns indicates that assimilation or digestibility is aided by the presence of reasonable amts. of salts so long as the total content is kept below the concn where serious disturbances in growth and reproduction take place. The pH of the entire intestinal tract is not appreciably altered by the presence of alkali or acid salts in the drinking water, providing the concn. present does not exceed the amt. permitting a somewhat normal life. Observed changes are more apparent in the stomach than in the lower intestine. C. R. Fellers

Differential antirachitic activity of vitamin D milks. Robert W. Haman and Harry Steenbock. *J. Nutrition* 10, 653-64(1935).—For the chick and per unit of vitamin D, cod-liver oil and irradiated cholesterol have approx. the same order of effectiveness. Yeast milk is approx. 1/10 as effective as irradiated milk. The difference was confined to the resp. butter-fat fractions and was uninfluenced by the skimmed-milk fraction. The constituents of milk as a vehicle for vitamin D do not influence its effectiveness. The data do not support the possibility that the baby chick could be used to greater effectiveness than the rat for ascertaining the degree of antirachitic effectiveness of different D vitamins for the human being. C. R. Fellers

Studies on growth III. B and G avitaminosis in cecotomized rats. Wendell H. Griffith. *J. Nutrition* 10,

667-74(1935), cf. C A 27, 4563.—Young rats grow normally for at least 100 days after removal of the cecum. If vitamins B, C or G are synthesized by cecal microorganisms, they are not utilized by the rat except by coprophagy. The prolonged survival of young rats on vitamin G-deficient diets is not due to a cecal supply of vitamin G. IV Vitamin B and G content of the body tissues of normal and experimental rats. *Ibid* 675-82.—Young rats maintained on a vitamin B-deficient ration were readily depleted of most of the vitamin B originally present in the tissues. A corresponding loss of vitamin G did not occur in young rats on a G-deficient ration. The prolonged survival of rats on a G-deficient ration is related to the retention of tissue vitamin G. It is suggested that vitamin G may function in part as a tissue constituent.

C R Fellers

Variability of vitamin D response with temperature of environment. D Tourtellotte and W E Bacon. *J Nutrition* 10, 653-8(1935).—To a certain extent the variation in the sensitivity of the rachitic test animals is due to fluctuating lab temps during the rachitogenic and test periods. An increased severity of rachitogenesis results in vitamin D test animals when they are subjected to lab temps of 26.6° or above. By reducing the CaCO₃ in the McCollum diet no 3143 from 3 to 2%, good line test rickets have been produced in 21 days during periods of hot summer temps. It is fully as desirable to define a standard rachitic test animal in terms of response to a definite amt of a standard vitamin D prep as it is to prescribe the exact conditions for rachitogenesis and methods for administering the test prep.

C R Fellers

Supplemental value of peanuts to the laying ration (of hens). D F King and G J Cottier. *Ala Agr Expt Sta*, 45th Ann Rept 23-4(1934).—Hens fed peanut meal as the sole protein supplement deposited a very soft fat in their bodies in comparison to hens fed a supplement of skim milk. The eggs of the peanut-fed birds also contained a very soft fat. The addition of skim milk to the peanut ration so as to supply 50% of the supplementary protein resulted in higher egg production, body wt., egg size and egg quality.

C R Fellers

Absorption and utilization of carbohydrates. H B Pierce. *J Nutrition* 10, 693-716(1935).—A review with 87 references covers the absorption of carbohydrates from the stomach and intestine of man and animals, factors influencing the removal of carbohydrates, assimilation limits of different sugars and effect upon blood-sugar levels, relative ease of oxidation of carbohydrates, and the formation of glycogen and fat after the administration of carbohydrates to man or animals.

C R Fellers

Menhaden fish meal as a protein supplement for dairy cows. C F Monroe, W E Krauss and C C Hayden. *Ohio Agr Expt Sta*, *Biomonthly Bull* 176, 176-83(1935).—A grain mixt contg 8% of menhaden fish meal when compared with a check mixt contg the usual protein supplements of linseed and cottonseed meals produced slightly less milk and butter fat. The grain intake was lower on the fish meal ration. In general health and phys. appearance there was no difference in the 2 groups of animals. The reproductive history was somewhat better in the case of the cows fed fish meal over a 28-month period.

C R Fellers

Vegetable protein in turkey rations. J E. Hunter, D R Marble and H C Kandel. *Pa Agr Expt Sta*, *Bull* 321, 3-13(1935).—In the mash used as a basal ration for the period 1-13 weeks, the protein from 50% dried milk powder and 50% of either the meat or fish meal was satisfactorily replaced by either soybean-oil meal or corn gluten meal, when Ca and P losses were compensated. Corn gluten meal produced a superior fleshing condition. Fourteen % soybean-oil meal or 12.5% corn gluten meal may replace equiv amts of animal protein in the 24% turkey starter. From 33 to 66% of the total animal protein in the starting ration can be replaced without harm by soybean-oil or corn gluten meals when the Ca and P losses are compensated.

C R Fellers

Nutritional aspects of milk pasteurization. E V McCollum. *Pub Health News*, N J Dept Health 19,

1387-9(Feb. 1935); U. S. Pub Health Eng Abstracts 15, M1, 15(June 15, 1935).—There is no evidence that raw milk is superior to pasteurized milk in infant feeding. In fact, the latter is better digested by infants and possesses the added factor of safety.

C R Fellers

Effect of adrenaline on the utilization of fructose injected intravenously at a constant rate into dogs in three states of nutrition. M. Wierzechowski and H Fiszal. *Compt rend. soc. biol* 120, 377-80(1935); cf. C A 29, 5829-30. Fructose was injected at the rate of 2 g/kg/hr. and frequent analyses of the blood and urine were made. In group 1, previously given a carbohydrate diet, the assimilation of the fructose was 94%; in group 2, meat-fed, it was 90%; in group 3, fasted 10 hrs., 83%. The injection of adrenaline with the fructose as in previous expts caused large increases in the fructose and glucose contents of the blood and urine, i.e., fructose assimilation was decreased and glycogenolysis increased.

L E Gilson

Whipple's method in experimental anemias. Anemia produced by bleeding. André Arthus, M. Lourau and G Silvestre de Sacy. *Compt. rend. soc. biol* 120, 383-9(1935).—Rabbits were made anemic by bleeding. Feeding whole liver pulp hastened recovery; injections of hydro-alc. ext. of liver had no such effect. The active principle is probably different from that which is effective in pernicious anemia. Lead anemia. *Ibid* 553-4.—In rabbits made anemic by injections of Pb(OAc), the ext. mentioned above effected speedy recovery.

L E G.

Normal ascorbic acid content of the organism. A. Giroud, C P. Leblonde, R Ratsimamanga and M Rabinowicz. *Compt. rend. soc. biol* 120, 414-15(1935).—From an examn of published data from various sources the following averages for common domestic animals were obtained: adrenals 1.77, liver 0.25 and muscles 0.024 mg ascorbic acid per g fresh tissue. For rats and cats on a diet free from vitamin C the corresponding values were 1.49, 0.19 and 0.016. Probably an ascorbic acid content of less than 1 mg/g of adrenal tissue should be considered a pathol condition. Attaining a normal ascorbic acid content in animals which require ascorbic acid in their diet. *Ibid* 633-5.—The ascorbic acid of the adrenals of a normal guinea pig is between 1 and 1.5 mg/g. To maintain it at the 1 mg level the daily ration must contain an av. of 30 mg ascorbic acid and to maintain it at a higher level much more is required. Feeding expts are described. Reactions of animals, which require ascorbic acid, to increasing doses of the same. A. Giroud, R. Ratsimamanga, A Baratte and P Sylva. *Ibid* 701-3.—Guinea pigs given but 1 mg ascorbic acid per day lived and grew. Two mg per day was required to prevent anemia and malformation of the teeth. More than 5 mg per day was required to prevent hemorrhagic lesions in the joints.

L E Gilson

Action of vitamins A, C and D on the normal thyroid and on the thyroid made hyperactive by treatment with the thyrostimulin of the anterior hypophysis. Inhibiting action of vitamins A and C in experimental hyperthyroidism. A W Elmer, B. Giedost and M Schepp. *Compt. rend. soc. biol* 120, 500-2(1935).—In moderate doses vitamins A, C and D do not have any effect on the histological structure of the thyroids of normal guinea pigs. A and C arrest the hyperactivity produced by thyrostimulin.

L E Gilson

Influence of diet on milk. Chemical change and sensitization in the alcohol coagulation test. Luis Echebague and Bernardo Suarez. *Compt. rend. soc. biol* 120, 500-2(1935).—Milk from cows which had eaten large quantities of green *Xanthium caeruleum* (a weed related to the cockle bur) with other forage gave a pos. alc. coagulation test (method not described) although the acidity was normal. The effect is ascribed to an increase in the Ca content of the milk. No toxic effect on the cows was observed.

L E Gilson

The relation of adrenal cortical hypertrophy to muscular work and the vitamin B content of the food. Aladár B L. Bernák and János Perjes. *Arch ges Physiol* (Pflügers) 236, 181-9(1935).—See C A 29, 7426.

A G

The fertility vitamin E and its therapeutic importance

for gynecology. E. Gierhake. *Deut med Wochschr.* 61, 1674-6 (1935).—Malnutrition may lead to sterility in the human subject, presumably because of a deficiency of vitamin E. Its therapeutic use is therefore indicated. A G

Dicalcium phosphate [in prevention of dental caries] Fred Carmosin. *Dental Cosmos* 77, 1200-2 (1935).—Expts. on children over a period of 8 months demonstrated that addn. of CaHPO_4 and milk to the diet was superior to the use of CaHPO_4 and cod-liver oil as a preventive of dental caries. Joseph S. Hepburn

Is linoleic acid essential in the nutrition of rats? Eugene Becker. *Z. Vitaminforsch.* 4, 241-9 (1935).—Rats require small amts of linoleic acid for the maintenance of normal growth, and develop a specific deficiency disease in its absence, this disease is cured by daily doses of the acid in the form of walnut oil. Growth curves run parallel to the linoleic acid content of the oil. During its isolation from natural oils, linoleic acid may be transformed into an isomeric compd., and may also be altered with respect to this vitamin-like action. Joseph S. Hepburn

Experimental contribution to B-avitaminosis in the rat Egon Kodicek and Jiri Joachim. *Z. Vitaminforsch.* 4, 250-5 (1935).—B-avitaminosis was produced in 27 adult male rats, the majority developed the nervous type. The concn. of sugar and cholesterol in the blood and the erythrocyte count remained unaltered. The hyperglucemia, which has been reported in polyneuritic pigeons, probably was due to an increase in nonsugar-reducing compounds. Joseph S. Hepburn

Vitamin A and carotene content of human milk W. Neuweiler. *Z. Vitaminforsch.* 4, 259-71 (1935).—Human milk contains 25-300 rat units of vitamin A per 100 cc. The content is independent of the age, no. of pregnancies and daily vol of milk, is greatest in colostrum, is not essentially altered by standing for 48 hrs., increases by 100% during the day, is greater after suckling than before, and can be increased by a very high intake of vitamin A or of carotene. The carotene content of human milk is 0.005-0.4 mg per 100 cc., occurs chiefly in the colostrum and early stage of lactation, and in slight quantity or traces in the mature stage, is greater after suckling than before, and can be increased somewhat by a high intake of carotene. Joseph S. Hepburn

Dietary depigmentation of young black and pied rats, promoted by rapid growth, prevented and cured by ingestion of copper. Frederick J. Gortner. *Z. Vitaminforsch.* 4, 277-83 (1935), cf. *C. A.* 29, 7413¹.—Yeast did not always prevent or cure the depigmentation, its curative effect was proportional to its Cu content. With young growing rats and CuSO_4 , the preventive dose was 0.02-0.12 mg Cu per rat per diem, the curative dose 0.07-0.24 mg Cu per rat per diem. Other metals (Zn, Mn, Co, Ni, Fe) lacked curative power. Rapid growth on a ration rich in protein, sugar, vitamins A, B₁ and B₂ markedly increased the Cu requirement. Adult rats were less susceptible to complete depigmentation. At times depigmentation was promoted by yeast, egg white, fat horse flesh, milk, butter and cod-liver oil, and was not produced by bread and cereal products. The former foods promote growth; and the Cu of the latter foods is more readily available. Joseph S. Hepburn

Aseptic culture of insects in vitamin research E. G. van't Hoog. *Z. Vitaminforsch.* 4, 300-24 (1935).—*Drosophila melanogaster* was reared successfully from eggs sterilized by treatment for 35 min. with a mixt. of 44 cc. 96% alc. and 6 cc. 5% soln. of chloramine. These insects required the B vitamins and the active factor in the unsaponifiable fraction of fats, but did not require vitamins A, D and E, and unsatd. fat acids. Cultures of the insects were of value as a biol. test for vitamins B₁ and B₂. Joseph S. Hepburn

Vitamin C or the reducing power of the urine in health and disease. Theophil Baumann. *Z. Vitaminforsch.* 4, 334-6 (1935).—The iodometric titration of ascorbic acid in the urine is unsatisfactory since other urinary constituents react with I, the ascorbic acid content decreases with time even in a strongly acidified urine, and other

comps. which react with I are produced as urine ages. Joseph S. Hepburn

Vitamin C or the reducing power of the urine. Wolf v. Drigalski. *Z. Vitaminforsch.* 4, 350-7 (1935); cf. *C. A.* 29, 6627¹.—The iodometric titration of ascorbic acid in the urine is approx., but of value, the amt. of other reducing comps. is so slight as to be negligible. Samples should be analyzed promptly. Joseph S. Hepburn

Comparative study of the C vitamin (ascorbic acid) content of cerebrospinal fluid and of urine during C hypovitaminosis F. Plaut and M. Bulow. *Naturwissenschaften* 23, 771 (1935), cf. *C. A.* 30, 510³.—Comparative tests showed agreement between analyses of cerebrospinal fluid (*Klin. Wochschr.* 14, 1318 (1935)) and urine (Harris-Ray, *C. A.* 29, 3005²). After doses of 600 mg. ascorbic acid (Redoxan) per os daily, patients with high ascorbic acid content in the cerebrospinal fluid (1.8 to 2.5 mg %) began to excrete it in the urine the second day, those with low ascorbic acid content (0.2-0.3 mg %) not until the 7th or 9th day. The first group excreted 44 to 53 mg. daily max., the second group 158-298 mg. Prior to the feeding of ascorbic acid there was hardly any excretion and no difference between the 2 groups. B. J. C. van der Hoeven

The effects of varying amounts of animal protein fed to White Leghorn pullets II. Factors correlated with egg-size and number of eggs C. C. Rhodes, L. H. Bartel and P. E. F. Jooste. *Empire J. Exptl. Agr.* 3, 313-19 (1935), cf. *C. A.* 29, 6628¹.—Pullets receiving either low-, medium- or high-protein rations showed pos. correlations between max. body-wt. and av. annual egg-wt., but only those of the medium- and high-protein groups were significant. K. D. Jacob

Report of Wallaceville veterinary laboratory C. S. M. Hopkirk. *New Zealand Dept. Agr., Ann. Rept.* 1934-35, 25-31.—*Tympany of the rumen in dairy cows*.—There were wide variations in the CO₂, O₂, CH₄, N₂ and H₂ contents of the rumen gases from both normal and bloated cows. The picrate paper test showed no excess of HCN in the rumen contents of bloated cows. Cows given HCN in nonlethal doses did not bloat when placed on damp early-morning pasture. There were indications that bloat may be associated with a decrease in the normal acidity of the rumen contents. *Grass staggers in dairy cows*.—Grass staggers was overcome by increasing the blood Mg of the cows through the addn. of dolomite to the feed. The Mg content of pasture grass was markedly increased by treating the pastures with $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ at the rate of 800-4000 lb/acre; dolomite was less effective. The milk and bones of affected animals contained normal amts of Mg but the urine, like the blood, was very low in Mg. Pasture grasses at Waikato tend to be lower than normal in Mg, the spring grass sometimes contg. as low as 0.3% Mg, the seasonal variation is not marked, the lowest value occurring in Dec., with increased values in the growth after Feb. rains. *Morlon Mains disease of lambs*.—The blood of affected animals contained normal amts of Ca and Mg but was slightly below normal in inorg. P and total solids, there was a slight degree of imperfect calcification of the bones. *Vitamin content of New Zealand fish oils and pasture grasses*.—The vitamin D content of eel-body, ling-liver, proper-liver and red-cod-liver oil was 47, 500, 2250 and 10 international units/g., resp. Whale-body oil contained no vitamin D. The vitamin A content of fresh grass was higher than that of hay, while the vitamin D content was the same in both cases. K. D. J.

The effect of supplementing the diet with different forms of sulfur upon the wool of Merino sheep C. M. van Wyk, M. L. Botha and J. G. Bekker. *Onderstepoort J. Vet. Sci.* 5, 177-88 (1935).—Supplements of either cystine, sulfates, KCNS or S (0.12-5.00 g.), administered daily except Sunday for 1 year, had no effect. K. D. Jacob

Mineral metabolism XXXIII. Iodine in the nutrition of sheep. Second report A. I. Mahn, P. J. Du Toit and J. W. Groenewald. *Onderstepoort J. Vet. Sci.* 5, 189-200 (1935); cf. *C. A.* 27, 5381¹.—KI administered to Merino sheep at the rate of 0.002-0.06 g. daily for 30 months had no visible effects on the wts., wool production

and reproduction of the animals. It is pointed out that the ill effects ascribed to KI feeding in the earlier work were apparently aggravated by a deficiency of vitamin A in the diet. Conclusion: The addition of KI to sheep licks is unwarranted and may even produce detrimental effects under conditions of drought when a vitamin A shortage may exist. K. D. Jacob

Further studies pertaining to provitamin D of plant and animal sources. R. M. Bethke, P. R. Record and O. H. M. Wilder. *J. Biol. Chem.* 112, 231-8 (1935), cf. C. A. 28, 7311¹.—Vitamin D of irradiated cholesterol is more efficacious in preventing rachitic manifestations in chicks than the rat unit equiv. in irradiated ergosterol or in calciferol. The effects of the latter 2 substances were of the same order of efficiency. The antirachitic factor of irradiated cholesterol is as potent for chicks as the vitamin D of cod liver oil. Equiv. rat units of vitamin D from irradiated animal products such as hog brains, butter fat and lard are more efficient antirachitically for chicks than vitamin D from irradiated plant products such as wheat middlings, cotton oil, alfalfa leaf meal, yeast and fungus mycelium, indicating that the provitamins of animal and plant products are not identical. There is apparently no taxonomic difference between the vitamin D efficiency of irradiated products from higher plants (cottonseed oil, wheat middlings, alfalfa leaf meal) and irradiated plants (yeast and fungus mycelium) of the lower botanical order. A. P. Lothrop

Amino acid metabolism. I. Fate of glycine, *dl*-alanine and *d*-alanine in the normal animal. Joseph S. Butts, Max S. Dunn and Lois F. Hallman. *J. Biol. Chem.* 112, 203-74 (1935).—The ability of the amino acids to form glycogen was tested by feeding their Na salts by stomach tube to rats fasted 48 hrs. and the testing of ketolytic properties by feeding Na acetoacetate and superimposing upon this the substance whose ketolytic activity was to be studied. Glycine, *dl*-alanine and *d*-alanine are definitely glycogenic and ketolytic, *dl*-alanine being very much superior to glycine and *d*-alanine approx. twice as effective as the *dl*-form as a glycogen former and definitely superior to it as a ketolytic agent. As far as glycogenic properties are concerned, it appears that only *d*-alanine is effective and that in the racemic mixt. *l*-alanine is very ineffective. A. P. Lothrop

Feeding experiments with mixtures of highly purified amino acids. VII. The dual nature of the "unknown growth essential". Madelyn Womack and Wm. C. Rose. *J. Biol. Chem.* 112, 275-82 (1935), cf. C. A. 29, 4800¹.—The "unknown growth essential" referred to in earlier papers of this series is composed of 2 factors which can be separated by their soly difference in aq. BuOH. The more sol component is isoleucine. Failure to recognize the importance of isoleucine as a constituent of the growth-stimulating fractions delayed the identification of the other component of the "unknown growth essential" for at least 2 yrs. VIII. Isolation and identification of a new essential amino acid. Richard H. McCoy, Curtis E. Meyer and Wm. C. Rose. *Ibid.* 283-302.—The hitherto unknown growth essential has been isolated in crystalline form and identified as 1 of the 4 isomeric α -amino- β -hydroxybutyric acids. The spatial configuration around the β -carbon remains to be determined. Approx. 0.6% is the min. amt. required to induce max. growth on an otherwise adequate diet and for the first time it has been possible to rear animals on a ration containing purified amino acids as the sole source of N. Hydroxyglutamic acid and citrulline have been shown by feeding expts. to be dispensable components of the food. Expts. are under way to determine the physiological importance of the remaining amino acids: α -Amino- β -hydroxybutyric acid, in 255-7¹ with decanoin, α -Isoleucine, 27-77¹ (av. of 4 preps.), *N*-benzoyl serine, γ 151¹, *picric*, m. 139.5-141¹. A. P. Lothrop

Magnesium deficiency in animals. VII. The effects of magnesium deprivation, with a superimposed calcium deficiency, on the animal body as revealed by symptomatology and blood changes. Harry G. Day, H. D. Kruse and I. V. McCollum. *J. Biol. Chem.* 112, 337-59 (1935), cf. C. A. 28, 6815¹.—Young dogs were fed a diet deficient

in both Ca and Mg but otherwise adequate. The dietary deficiency is manifested by edema, gastrointestinal disturbance with alternate constipation and diarrhea, osteoporosis with consequent deformation of the bones, in a few cases by hyperirritability of the nervous system which led to fatal convulsions, but in the majority of cases by a marked inertness and anorexia which usually led to death from inanition. An immediate decrease in serum Mg occurs which is quantitatively similar to that which induces tetany in Mg deprivation and serum Ca likewise falls to levels usually indicative of tetany. There is a fall in alk. reserve and p_{H_2} , an increase in blood chlorides as the erythrocyte vol. falls and an increase in fibrinogen. A rise in nonprotein N and a decrease in inorganic phosphate occur terminally. There are no significant changes in serum Na and K, plasma total lipids, fatty acids, total cholesterol, cholesterol esters, lipid P, serum bile pigment and plasma albumin and globulin. The deficiency in Ca-Mg deprivation resembles more closely the low-Ca syndrome. The so-called physiologic antagonism between Ca and Mg is indicated by the prevention of symptoms of Mg tetany by the simultaneous diminution of serum Ca as serum Mg reaches abnormally low levels. Nutritive failure is more pronounced in Mg-Ca deficiency than in Mg restriction alone. Forty-six references. A. P. L.

The influence of iodides on the calcification of bones in rats in experimental rickets. Raoul Lecoq and Romuald Gallier. *Bull. sci. pharm.* 42, 528-8 (1935), cf. C. A. 29, 7412¹.—Rickets was produced by a diet rich in Ca and poor in P. The addition of P_2O_5 alone is not sufficient to cause improvement, but the addition of KI or CaI_2 produces a prompt cure. A. E. Meyer

Sugared condensed milk in artificial alimentation. P. Rudeaux. *Presse med.* 43, 753-5 (1935).—Different formulas for dilution are developed. A. E. Meyer

Vitamin C in hemorrhagic diathesis. A. Lunedei and A. Gnamoni. *Sperimentale* 89, Section Rendiconto Accademia acad. med. fis. fiorentina 20 (1935).—High doses of ascorbic acid have a favorable influence in hemorrhagic conditions. A. E. Meyer

Effect of different forms of diet on the external secretion of the pancreas. Leop. Abramson. *Acta Med. Scand.* 86, 478-85 (1935).—Results indicate that the enzyme content of the pancreatic secretion on a mixed diet or on a diet poor in protein but rich in milk and carbohydrate tends to adjust itself to the character of the diet. S. Morgulis

Studies on protein metabolism and the oxidative processes in experimental scurvy. II. Influence of ferrum hydrogenous reduction on the nitrogen balance and oxidation coefficient. L. D. Kashevin, S. A. Lidman and I. B. Friedland. *Biochem. Z.* 282, 56-61 (1935), cf. C. A. 29, 4802¹.—Daily feeding of 10 mg. reduced Fe to guinea pigs during the pre-scurvy period causes an increased N metabolism and output of urea N, while the oxidation coefficient (O/N) tends to fall. On the scorbutic ration the Fe has no effect on the excretion of protein metabolic products. A negative N balance is found at the time when the development of scurvy is complicated by the condition of partial starvation. Under the influence of the Fe there occurs an extensive deposition of fat in the then scorbutic guinea pigs. S. Morgulis

The storage of ascorbic acid in the organs of guinea pigs given crystalline ascorbic acid with a vitamin C free diet. Erik Jacobsen. *Scand. Arch. Physiol.* 72, 259-64 (1935), cf. C. A. 29, 8988¹.—The vitamin C deposits of guinea pigs are emptied when the animals have been on a vitamin C free diet for 8-15 days. On a daily administration of 20 mg. ascorbic acid the exhausted deposits of such animals may be partially restored in 4-9 days but no further accumulation occurs on this dose. Parenteral administration brings about the same result more quickly than the oral feeding but the extent of the refilling of the deposits is not affected. Better results (40% greater restoration) are obtained when the 20 mg. of ascorbic acid is given in 2 doses instead of a single dose, but storage of vitamin C

in the organs is never as complete with this amt. as in normally fed animals S Morgulis

Glaucoma and edema Hans Schroeder. *Eye, Ear, Nose and Throat Monthly* 14, 369-73 (1935).—The relationship of glaucoma to B deficiency, NaCl, nutritional and angioneurotic edema are considered. Twenty-four references

Recent advances in nutrition E. V. McCollum. *Penna Med J* 39, 61-5 (1935).—The importance of vitamins, inorg. constituents and amino acids in the balanced diet is discussed. Adults need 200-300 rat units of B daily. Feeding 3 g of yeast daily to 351 underfed women and children in poor families was followed in almost all cases by increase in wt and appetite. Pellagra is associated with deficiency in dietary flavine, which is indispensable and is not the antidermatitis factor B₂.

Diagnosis and treatment of pellagra George J. Busman. *Penna Med J* 39, 173-5 (1935).—Twenty-seven pellagrins aged 26 to 63 yrs were studied. Gastrointestinal involvements were found in 26, acilia in 21. Only 12 had been taking ale. Liver ext supplemented by an adequate diet was used in treatment. J. C. M.

Phlyctenular disease and vitamin deficiency Leonard G. Redding. *Penna Med J* 39, 158-61 (1935).—The decrease of phlyctenular disease in the United States and its increase in Europe are associated directly with the amt of vitamin A in the diet. Clinically, phlyctenula is developed in rats on an A-free diet. Large doses of cod liver oil have proved successful in treatment. J. C. M.

Some clinical aspects of deficiency diseases in adults Chester S. Keeler. *Rhode Island Med J* 18, 161-5 (1935).—Deficiency in vitamin B is associated with polyneuritis and cardiac insufficiency. The clinical aspects of avitaminosis in adults are discussed. J. C. M.

A discussion of certain types of anemia Geo. W. Parsons. *Tri State Med J* 8, 1556-61 (1935).—Adissoman pernicious anemia is a deficiency disease resulting from lack of the antianemic constituent of liver. It is clinically a distinct entity from idiopathic hypochromic anemia which results from deficiency in Fe in the diet. J. C. M.

Tissue oxidation in B₂ avitaminosis and inanition Hakan Rydin. *Upsala Lakareforenings Forhandl* 41, 1-182 (1935-36); cf. C. A. 29, 5896*.—Critical reviews of the literature indicated division of opinion whether there is a decrease in the oxidative capacity of the tissues due to B₂ avitaminosis. A review of the literature is presented. The technique used in this study with statistical evaluation of results are given in 31 tables. Pigeons were kept in cages at a uniform temp and on specific diets. Adequate diets were given in the foreperiod; during the period on restricted or no B₂ intake they were offered polished rice ad libitum or definite amts of polished rice were given by forced feeding. In other pigeons, during the hunger period, no food was offered. From time to time biopsies were performed to obtain sections of the pectoral muscle and of the liver. Blood was obtained by heart puncture. Tests were made upon the same pigeons receiving normal diet, then a restricted or B₂-free diet, or no food, followed by resumption of normal diet. Tissue oxidation was measured on the muscle, muscle press-ure and blood by the micro-respirometer method of Warburg and Barcroft, and also by the Thunberg methylene blue decolorization method. B₂ concentrate and crystals were made by the Kinnorsley, O'Brien and Peters method (C. A. 27, 4279). In some pigeons acute results were obtained. In others, chronic B₂ avitaminosis was produced. In some of the tests lactic acid or Na lactate and Ringer phosphate buffer were added. All tests were made in duplicate and results averaged. In some expts different portions of the brain were tested similarly. Variations in technique in testing different organs will produce great variations in quant. results. The brain, kidney, liver, muscle and blood cells of pigeons during a stage of hunger or of B₂ avitaminosis showed decreased O uptake by the tissue methods, as well as decreased methylene blue oxidative ability, as compared to the same animals on adequate diets. The muscle press juice showed

a decreased oxidative capacity. In the muscle of pigeons suffering from beriberi there is a decrease in one or more water-sol constituents which are present in the normal muscle. In acute beriberi the microrespirometer method showed a greater oxidative capacity than in the chronic beriberi animals. With the methylene blue method this difference was not consistently demonstrated. Inanition produced a similar decrease in oxidative capacity which paralleled results in the B₂ avitaminosis studies. The exptl results suggested that decreased tissue oxidative capacity in B₂ avitaminosis might be associated with deficient muscular nutrition. Specific decrease in oxidative capacity was found in the brain tissue. The decreased capacity for muscles did not parallel the decrease for liver tissues nor for the blood. In tests *in vitro* the crystalline vitamin B₂ showed no effect on methylene blue. In comparative studies microrespirometer results were often, but not always, in agreement with methylene blue data. The methylene blue action was not always proportional to oxidative change, so microrespiration methods appear most suitable. One hundred and three references.

Recent progress in the study of vitamins P. Karrer. *Chimie et industrie* 34, 1027-35 (1935), cf. C. A. 29, 4798*.—A review. A. Papineau-Couture.

Preparation and chemical investigation of vitamin B₂ Haruo Kakufuda. *Fukuoka-Ikudaiyaku-Zasshi* 27, 1849-99 (1934), cf. C. A. 29, 6278*.—Misawa's method was used to obtain vitamin B₂ from rice embryo ext. The following general method was used to conc. the vitamin B₂ and to obtain crystalline vitamin. To the Ag fraction of the embryo ext. platinum chloride or picric acid was added, gold chloride was then added. Finally with the aid of the acetone-alc. combination method needle-shaped vitamin B₂ crystals were obtained. The protective dose of the vitamin crystal for rats was 0.01 mg. and for pigeons 0.00258 mg. per day. Upon electrolysis the vitamin B₂ accumulates on the cathode. 0.1% soln of vitamin B₂ shows a strong diazo reaction. The mols of vitamin B₂ contain S but no amino N. On exposure to ultraviolet rays, it loses its activity, but Röntgen rays are ineffective. The absorption line of the spectrum of its acid salts lies at 280-265 mμ. K. Sugura.

An effect of choline upon the weights of young rats E. W. McHenry. *J. Physiol* 85, 343-9 (1935), cf. C. A. 29, 6930*.—In feeding expts. on 120 young rats it was found that a diet low in choline and vitamin B₂ results in a failure to increase in wt after an initial period of about 2 weeks. The addition of either choline or vitamin B₂ to this diet does not cause a continued increase in wt. However, when choline and vitamin B₂ are supplied together the wts continue to increase. This complementary effect appears to be lessened when older rats are used. Rats which do not receive choline develop an appearance which is similar to that which has been attributed to a deficiency of vitamin B₂. E. D. Walter.

Constitution of vitamin D₂ (Windaus, Thele) 10.

Artificial growth and inhibition of growth J. Freud. *Nederl. Tijdschr. Geneeskunde* 79, IV, 4977-90 (1935).—A review discussing the influence of sex hormones on the growth of accessory organs, etc. R. Beutner.

Phosphorus metabolism after work in healthy individuals and in cardiac patients J. C. J. Burleson. *Nederl. Tijdschr. Geneeskunde* 79, IV, 5704-9 (1935).—In the normal resting muscle phosphoric acid is tied up as a lipoidal ester. When work is done a part of it is split off. At the same time the muscle membrane becomes more permeable, which condition allows the split off phosphoric acid to diffuse into the blood stream. If the muscle subsequently returns to the resting condition, phosphoric acid again enters into chem. combination with the muscle lipoids, hence the circulating phosphate is taken up by the muscle. On the basis of these considerations B explains his exptl. findings. He observes an increase of the blood

phosphates, up to 50%, after muscular work of 3 to 4 min duration at least in patients with cardiac decompensation. (Also, the blood lactic acid is markedly raised.) Subsequently with resting muscle, the phosphate values not only return to normal but decrease materially below the normal level, later they slowly rise up to it again.

Phenols in some biological fluids and their relation to phenolemia. Mariano F Castex and Alberto I Arnaudo. *Rev assoc med argentina* 49, 1063-70(1935).—Phenols from ascitic and pleural fluids were detected by Theis and Benedict's method (cf C A 18, 3398) for phenols in blood. They were found in the same concn as in blood.

E S G B

The renal elimination of bilirubin. Adolfo L. Ravces and Carlos Velasco Suarez. *Rev med quir patol femenina* 5, 559-77(1935).—No bilirubin was found in the urine of normal persons. The elimination of bilirubin in the urine depends on the total concn of bilirubin in the blood. The bilirubin giving direct van den Bergh reaction seems to increase the kidney permeability for bilirubin. No threshold for bilirubin elimination by the kidney was found.

E S G B

The renal threshold for dextrose in man. James W Sherrill and Eaton M MacKay. *Arch Internal Med* 56, 877-83(1935).—The renal threshold is dependent on many variables so that it may be misleading to give a normal av. The av for a group of persons who did not have diabetes was 128 mg glucose/100 cc, with a group of diabetics it was 149 mg/100 cc.

J B Brown

Changes in the blood and circulation with changes in posture. The effect of exercise and vasodilatation. John B Youmans, J H Akeroyd, Jr, and Helen Frank. *J Clin Investigation* 14, 739-53(1935).—"The exchange of fluid between the blood and tissues, primarily controlled by capillary and colloid osmotic pressure, is greatly influenced by a no of secondary factors, particularly by posture. The great tendency to edema in the erect posture is opposed by a rising colloid osmotic pressure and by an increasing tissue pressure in the feet and legs. With muscular activity an even greater vol of filtrate than occurs on quiet standing is prevented from accumulating by a more active lymphatic drainage. Variations in these secondary factors will influence the exchange of fluid between the blood and tissues and, in the presence of even slight changes in the serum proteins and capillary pressure, may det the appearance or nonappearance of edema."

J B Brown

The nature of the substance(s) producing pain in contracting skeletal muscle. Its bearing on the problems of angina pectoris and intermittent claudication. L N Katz, E Lindner and H Landt. *J Clin Investigation* 14, 807-21(1935).—The amt of exercise required to cause pain and fatigue in the muscles of the arm of normal subjects was studied. The rate of accumulation of pain-producing substance was affected by the time allowed for recovery between contractions. The substance is a product of metabolic activity of the muscle, it diffuses in and out of the blood stream; it is nonvolatile since it persists after passing through the lungs, it is dependent not only on local production but also on the amt. transported from other regions, it is acid in nature, it is retarded by alkali, training tends to lessen its activity, possibly by altering the buffer action of the muscle concerned.

J B Brown

A clinical and experimental study of the stability of colloid osmotic pressure of serum protein. Kintaro Yanagi. *J Clin Investigation* 14, 853-62(1935).—Colloid osmotic pressures of sera have been measured by means of an osmometer which permits observations at any desired interval of time. In sera with normal protein concns, when the pressure was once developed it remained constant for 16-18 hrs. Pressures of sera with low protein were found to be unstable, rising to a max in 3-5 hrs, and then falling, this effect, however, could be produced in normal sera by dilg them with physiol saline or ultrafiltrate. Furthermore, concn of hypoproteinemic sera by

ultrafiltration produced stable osmotic pressures.

J B Brown

The Addis sediment count and blood urea clearance test in normal pregnant women. C. A. Elden and J W Cooney. *J Clin Investigation* 14, 889-91(1935).—The lower limit of normal urea clearance is somewhat less in pregnant than in non pregnant women.

J B Brown

Intubation studies of the human small intestine. IV. Chemical characteristics of the intestinal contents in the fasting state and as influenced by the administration of acids, of alkalis and of water. W. G Carr, W. Osler Abbott and Albert B Sample. *J Clin Investigation* 14, 893-900(1935).—By a new method of intubation (cf Miller and Abbott, *Am J Med Sci* 187, 595(1934)) the chem characteristics of the contents of the small intestine of man were studied. After fasting the flow of contents into any part of the small intestine is usually less than 1 cc/min, acidity is greatest in the duodenum, diminishing toward neutral or even alk in the lower ilium, bicarbonate is related to reaction; the duodenal contents, if acid or tending toward neutral, are hypotonic, but if neutral or alk, they tend toward the isotonic state of the ileac contents. After administration of acid orally, the contents of the stomach pass slowly into the duodenum where they are neutralized by bicarbonate and become isotonic. After bicarbonate ingestion (isotonic) the stomach evacuates rapidly. With hypertonic bicarbonate the stomach evacuates much more slowly. After administration of 400 cc of water the gastric contents pass into the duodenum rapidly enough to render the duodenal contents acid and to lower their osmotic pressure.

Rachel Brown

Follicular hormone and ovulation inhibition. Gunnar Dahlberg. *J Obstet Gynaecol Brit Empire* 42, 953-61(1935).—D postulates that the Zondek-Aschheim reaction is due to the fact that follicular hormone in the urine is resorbed and consumed more quickly than is prolactin. Therefore the effect of prolactin predominates. The percentage of high follicular hormone in the urine is not continuously high enough to prevent ovulation.

Rachel Brown

Resistance to proteolysis found in the blood serum of aborting women. Evan Shute. *J Obstet Gynaecol Brit Empire* 42, 1071-81(1935).—Seventy three % of 44 spontaneously aborting women had blood serum which showed a characteristic type of resistance to the proteolytic action of commercial trypsin. The resistance appeared to be directed against its protease fraction. Eight % or less of 128 pregnancies and self-induced abortions presented the

same phenomenon. It is suggested that many spontaneous abortions are provoked by excess of this ability of the normal blood to impede proteolytic activity. The maternal resistance is not due to serum antitrypsin, since it resists heating at 80° for 30 min. Sixty-one references. R B

Is estrin the cause of the resistance to proteolysis found in the blood serum of aborting women? Evan Shute J. *Obstet Gynaecol Brit Empire* 42, 1085-95(1935) —A substance closely resembling estrin is the factor in the maternal blood serum responsible for resistance to proteolysis in many cases of spontaneous abortion. The concn of this antiproteolytic principle is greater in the placentas of women whose pregnancies terminate prematurely than in more mature placentas. R B

Relation between the site of injection of androsterone and the comb response in the fowl. A W Greenwood and J S S Blyth *Quart J Exptl Physiol* 25, 267-77 (1935) —Injections of androsterone directly into the substance of the capon's comb produced a response greater than that elicited by the same dose injected intramuscularly in the pectoral region. Two females responding to the treatment showed less increase in the comb size than the capons. A normal male showed no response, while an incompletely castrated male gave a marked response. Rachel Brown

Effect of asphyxia on the sinus and conducting tissue of the frog heart. G Kingsepp *Quart J Exptl Physiol* 25, 291-302(1935) —Asphyxia of both the normal and of the iodoacetic acid-poisoned sinus causes alterations in the frequency which closely resemble the changes produced by asphyxia on the mechanical response of the ventricle. Asphyxia in the normal heart produces a great decrease in the rate of auriculoventricular conduction, while in the iodoacetic acid-poisoned heart asphyxia produces less interference with conduction. This difference is probably due to the production of lactic acid in the former case and its absence in the latter case. R B

The oxidation coefficient of lactic acid in the animal world. V Borsuk *J Physiol (U S S R.)* 19, 549-62 (1935) —The processes of decompn and resynthesis of glycogen in a number of invertebrates are studied. H Cohen

Metabolism during muscle work. I. Fat metabolism. A. Kharit and A Shretter *J Physiol (U S S R.)* 19, 540-8(1935) —The fat content of arterial blood during work diminishes on the av. 15.6%, compared to rest. This is an indication that fat is required during work, not by muscles, but by other organs. H Cohen

The nature of the union of the sodium and potassium in the gray matter of the human brain. L M Georgievskaya *J. Physiol. (U S S R.)* 19, 571-4(1935) —The Na and K of the gray matter of the cortex are quantitatively separated by electrodialysis. The Na and K, therefore, occur in the brain in a salt-like combination. H Cohen

Estrogenic activity of the urine of cows during pregnancy. M. M. O. Barrie, J. B. E. Patterson and S. W. F. Underhill. *Quart. J. Pharm. Pharmacol.* 8, 424-8 (1935) —The amt of estrin secreted in the urine of cows during pregnancy is less than 50 international units per l during the 1st 21 weeks of gestation. Estrin can be readily detected in the urine at the 23rd week, when the concn. is about 100 units per l. At the 30th week 700 units was obtained, at the 32nd about 9000 units, at the 34th 4000 units, and at the 37th 17,000 units per l. The variations in the amt. present in the last weeks of pregnancy are probably due to variations in the concn of the urine. W. O E

Metabolism of women during the reproductive cycle. VI. A case study of the continuous nitrogen utilization of a multipara during pregnancy, parturition, puerperium and lactation. Helen A. Hunscher, Frances Cope Hummel, Betty Nims Erickson and Icie G. Macy. *J Nutrition* 10, 574-97(1935); cf. C. A. 27, 1033 —This case study for an 8-year period of child-bearing and child-rearing has been continued during another complete reproductive cycle. During the last 145 days in gestation there was an av. net storage of 3.1 g. and a maternal retention of

2.6 g. of N daily, resulting in a total observed accumulation of 446 g. at term. On the day of delivery the chemically detd. maternal loss of N in blood, placenta, amniotic fluid and vomitus amounted to 46, 20.1, 0.08 and 0.24 g., resp., the total loss from the body beyond the food consumed was 54.6 g. of N in addn to that contained in the fetus. The 9 daily balances during the lying-in period showed an av. daily loss of 5 g. of N. From the 10th to the 53d day of milk flow the gestatory reserve N had been reduced by delivery, puerperium and lactation losses of 54.6, 44.6 and 38.3 g., resp., leaving a total of 310 g. of N stored only in the last half of pregnancy. When the approx fetal content of 58.6 g. of N is deducted from the final maternal reserve, the accountable losses of the reproductive cycle by the 53rd day of lactation had left a maternal reserve of 250 g. of N for future dissipation or enrichment of the maternal body at termination of the reproductive cycle. C R Fellers

Diabetogenic action of the anterior hypophysis independent of the adrenals. B A Houssay and L F. Leloir. *Rev. soc. argentina biol.* 11, 464-73, *Compt. rend. soc. biol.* 120, 670-2(1935) —Ext of anterior hypophysis (bovine) produced the usual prolonged hyperglucemia in dogs with the adrenal medulla or the whole adrenals removed, or the adrenals denervated, and in toads after cauterization or removal of the adrenals. L E G.

Effects of large doses of follicular hormone on the structure of the ovary and anterior hypophysis of the white rat. L Desclin. *Compt. rend. soc. biol.* 120, 520-8(1935). L E Gilson

Glutathione of the tissues of hypophysectomized dogs. Further evidence of hypophyso-thyroid and hypophyso-testicular association. Léon Binet, Léon Képinov and Georges Weller. *Compt. rend. soc. biol.* 120, 589-90 (1935) —Hypophysectomy was followed by a marked decrease in reduced and total glutathione of the liver, thyroid and testicles. L E. Gilson

Occurrence of lipides in the urine of dogs after removal of the lumbar-sacral portion of the spinal cord. H Hermann, J. Dechaume and J. Vial. *Compt. rend. soc. biol.* 120, 648-9(1935) —For the first few days after the operation the urine contained 60-650 mg. ether-extractable lipid per l. Later the quantity dropped to 20-60 mg./l. An intermittent lipuria persisted for months. The lipide was principally olein. It contained no phospholipide. L E. Gilson

Concentrating action of the gall bladder. Glutathione of the bile. G. Baltaceanu and C. Vasiliu. *Compt. rend. soc. biol.* 120, 666-8(1935) —The normal liver bile of 48 dogs contained 10-200 mg. % of glutathione and the bladder bile 300-600 mg. %, usually between 5 and 15 times as much as the liver bile. The liver tissues of the same dogs contained 115-450 mg. %. L. E. Gilson

Progressive changes in the structure of the uterus and tubes of rabbits treated, from birth, with repeated injections of folliculin. A Lacassagne. *Compt. rend. soc. biol.* 120, 685-9(1935). L E. Gilson

Effect of carbon dioxide on cerebral blood vessels. J J Bouckaert and F. Jourdan. *Compt. rend. soc. biol.* 120, 788-90(1935) —In the dog head the addn. of CO₂ to the perfusing blood caused a marked dilation of the blood vessels of the brain. L E. Gilson

Experiments on biological test objects concerning the nature of the vagomimetic substance present in sweat. K v. Mëgay. *Arch. ges. Physiol. (Pflügers)* 236, 159-65 (1935) —The pharmacological (and menotonic) effects of sweat are due to the presence of acetylcholine and K salts. Arthur Grollman

Acetylcholine and choline in tissue extracts. F. Plattner and H. Tszdamura. *Arch. ges. Physiol. (Pflügers)* 236, 175-80(1935) —No correlation was found between the ratio of the amount of choline to the amount of acetylcholine present in various tissues of the cat. Extirpation of the adrenals, thyroid or parathyroids did not affect the tissue contents of choline or its derivatives. A. G.

The physiology of the blood glycogen. G. Golandas. *Arch. ges. Physiol. (Pflügers)* 236, 230-8(1935). —The basal glycogen contents of the blood of man, dog and

rabbit are 6.7 to 12.2, 8.6 to 15.3 and 6.4 to 14.4 mg. per 100 cc. resp. Most of the glycogen is adsorbed on the formed elements of the blood. It disappears in sterile shed blood. A. G.

Secretory phenomena in the oviduct of the fowl, including the process of shell formation examined by the microincineration technic K. C. Richardson *Phil Trans Roy Soc (London)* B225, 149-95 (1935).—The ovalbumin and glucoprotein fractions of egg white are secreted by the glands and lining epithelium of the egg-white region. The ovokeratin shell membranes have their origin in fiber-like strands of viscous material secreted by the tubular glands in the corium of the isthmus. The products of uterine activity include the org. shell matrix with its mammillae and cuticle, the thin part of the egg white and the calcification of the shell. The source of the secretory fluids contain Ca (e.g., for the calcification of the shell) has not been further localized. Thirty-three references. Joseph S. Hepburn

Continuing metabolism of nitrogen in animals H. Borsook and G. L. Keighley. *Proc Roy Soc (London)* B118, 488-521 (1935).—The continuing metabolism is the N metabolism on any 1 day which is already present in the tissues—distinguishing it from exogenous N. It is not related to the endogenous or "wear and tear" metabolism. In a man in N equil. with a daily urinary N of 10-11 g., the continuing metabolism constitutes more than half the total urinary N. The continuing metabolism is a function of the previous dietary history, and is directly proportional to the level of N intake. In an adult in N equil., extensive synthetic processes involving amino acids are continually in operation. In man, NH_3 may serve as a precursor of urinary uric acid. Neither endogenous nor continuing N metabolism is stimulated by amino acids. Fifty-five references. Joseph S. Hepburn

The male sex hormones L. Ruzicka *J. Chem. Education* 13, 3-6 (1936).—A review. E. H.

The serum calcium response to ingested calcium S. Freeman, E. R. Kent and A. C. Ivy *J. Biol. Chem.* 112, 1-7 (1935).—A slight but reasonably const. elevation of serum Ca (5-6%) occurs in fasting human subjects 2 hrs. after ingestion of moderate doses daily of CaCl_2 or Ca gluconate (2.3 and 10 g., resp.). In fasted normal dogs dosage of Ca influences the serum Ca response over a range of intake varying from 0.05 to 0.25 g. of Ca per kg. of body wt. CaCl_2 produces a greater max. rise than a corresponding dose of Ca gluconate but the latter compound maintains a greater rise 4 and 6 hrs. after ingestion. A. P. Lothrop

Equulin prepared from pregnant mare urine Geo. F. Cartland and Roland K. Meyer *J. Biol. Chem.* 112, 9-14 (1935).—Equulin was prepd. from mare urine collected during the last 2 months of pregnancy making possible much higher yields than those previously reported. Removal of a small amt. of theelin was accomplished by repeated recrystallizations from EtOH and the purified product had a slightly higher $[\alpha]_D^{25}$ (325°) than that reported by Girard, *et al.* (*C. f. C. A.* 26, 4090). Biol. assays in spayed rats showed that the equulin is approx. 75% as active as standard theelin when injected in aq. 10% alc. contg. 0.5% Na_2CO_3 ; it is only 30% as active if injected without addn. of the Na_2CO_3 . Colorimetric assay indicates an activity of only 11% so that this method is quite unsatisfactory. A. P. Lothrop

Ketosis VII Quantitative studies on β -oxidation Glycogen formation from various fatty acids Harry J. Devel, Jr., Joseph S. Butts, Lois F. Hallman and Charles H. Cutler *J. Biol. Chem.* 112, 15-23 (1935). *C. f. C. A.* 29, 5166.—A profound difference exists in the glycolytic activity of odd- and even-chained fatty acids, significant amts. of glycogen are deposited in the liver after feeding 0.173 mole per sq. m. of body surface of the Na salts of propionic, valeric, heptic and nonylic acids and no rise above the control level is noticed after ingestion of diacetic, butyric, caproic and caprylic acids by fasting male rats. The process of β -oxidation applies to the acids with an odd no. of C atoms with degradation to propionic acid which serves as a building stone for glucose or glyco-

gen. Trivalerin is a significantly better glycolytic agent than tributyrin, the glycogen from the latter coming largely, if not entirely, from the glycerol component. Oleic acid does not bring about significant formation of glycogen, indicating that cleavage at the double bond forming 2 mols. of nonylic acid cannot be a primary change in the metabolism of oleic acid. A. P. Lothrop

Distribution of calcium and phosphorus in the diverse organs and tissues of the rat during excess and deficiency of parathyroid hormone Pietro Molinar-Tocatti *Arch. ital. biol.* 93, 140-64 (1935); *C. f. C. A.* 29, 1158.—The parathyroids have a certain influence on the Ca and P content in organs and tissues, as shown by comparative figures. It is not possible to establish definite rules or to assert whether the action is a direct one or secondary to changes produced in the bones. A. E. Meyer

The elimination of nitrogen-containing products of metabolism in gastric and duodenal juice A. Allodi, A. Cronini and A. Robecchi *Arch. sci. med.* 60, 1-16 (1935).—The noncoagulable N in gastric and duodenal juice during rest as well as after stimulation is higher than in the blood. The contents in urea and uric acid are very low. The gastric elimination cannot act as a substitute for the function of the kidney in cases of disease of the latter. A. E. Meyer

Hypophysectomy-endocrine relations VI Hypophysectomy and pancreas R. Rivaire. *Presse med.* 43, 757-61 (1935), *C. f. C. A.* 30, 148.—A review. A. E. Meyer

The skin in experimental hyperparathyroidism R. Leriche, A. Jung and C. Sureyya. *Presse med.* 43, 777-81 (1935).—Injections of large doses of parathormone cause skin lesions consisting in infiltrations, indurations and loss of hair. The H and Ca are increased. A. E. Meyer

Permanent arterial hypertension and endocrine glands Paul Halbronn and H. Pierre Klotz. *Presse med.* 43, 913-15 (1935). A. E. Meyer

Mucin and equilibrium of gastric acidity R. H. Monceaux. *Presse med.* 43, 908-9 (1935).—Mucin absorbs all acidity beyond the physiol. pH . This acid becomes available again at onset of digestion before fresh HCl is secreted. A. E. Meyer

The phosphatase elimination in normal rats and in hyper- and hypo function of the parathyroid Guido Mellini and Lyda Annesi. *Sperimentale* 89, 311-20 (1935).—The phosphatase elimination is increased in rats after thyroparathyroidectomy as well as after application of high doses of parathyroid hormone. It is concluded that in both conditions an increased phosphatase production in the bone occurs. A. E. Meyer

The functional variations of the vegetative brain centers by local application of hormones and pharmacodynamic substances following electrocardiographic changes L. Rocchetti. *Sperimentale* 89, 348-71 (1935). A. E. Meyer

Is the creatinine clearance an expression of filtration through the glomeruli? Poul Iversen and Tage Bjerring. *Acta Med. Scand.* 86, 459-68 (1935).—The glucose excretion and the mg. % of glucose in the blood above the threshold value stand in linear relation to each other. The clearance of different sugars may be taken as the rough expression of the filtration. The clearances of urea and glucose are of the same order of magnitude above the threshold value and are equiv. to the filtration corresponding to that found by the creatinine clearance. S. Morgulis

Partitioning of chloride in blood in relation to the acid-base equilibrium, and the clinical significance of the separate chloride determination in plasma and corpuscles T. N. Feldmann and R. L. Ulanovskaya. *Acta Med. Scand.* 87, 65-79 (1935).—The role of NaCl in the regulation of the acid-base equil. is discussed and it is pointed out that with a preponderance of acid the Cl^- migrates into the erythrocytes, where it combines with the proteins. The Na^+ combines with, and neutralizes, the acid valences. The ratio of cell chloride to plasma chloride, which normally falls between 0.47 and 0.54, is an early sign of acidosis when it increases. The shift in the alkali reserve follows later. In acute nephritis with no manifest insufficiency there is no evidence of an acidotic condition. A change

in the ratio has been found in chronic nephroses when they become acute, but in severe affections there is actual acidosis as shown by the shift in the Cl^- ratio as well as in the alk. reserve. S Morgulis

Intermediate metabolism of glands of internal secretion IV Proteolysis and ammonia formation in endocrine organs S Epstein and S Mima *Biochem Z* 281, 229-41 (1935) —At the reaction of the organ, proteolysis is very weak in thyroid, thymus and adrenal, but is much increased in an acid reaction. The proteolysis is considerable in pancreas. In short autolysis at an alk reaction NH_3 is formed in pancreas, adrenal medulla and thymus of young animals. S Morgulis

Electrokinetic potential of thrombocytes Hans D Cremer *Biochem Z* 281, 315-8 (1935) The electrokinetic potential of thrombocytes falls between 20 and 42 mv, with the majority of measurements ranging from 25 to 35 mv. No definite relationship could be found between the variations in potential and the protein content, the albumin/globulin ratio or viscosity of the serum. S Morgulis

Calcium excretion through the pancreas Gunnar Agren *Biochem Z* 281, 336-62 (1935) The blood Ca level after intravenous injections of 5-10 mg CaCl_2 per kg rises higher in normal rats than in those treated with uretin. The pancreatic juice has always a higher Ca content than the serum but as the rate of secretion increases the Ca concn. tends to approach that of the serum. There is evidence that the pancreas is very permeable to Ca, and the Ca concn. of the pancreatic juice is high even when the velocity of secretion is great, if the serum Ca is much increased by injection of CaCl_2 . S Morgulis

Uric acid and urea excretion through the pancreas and liver under the influence of secretin Gunnar Agren *Biochem Z* 281, 363-6 (1935) —Both the pancreas and liver are permeable to uric acid and urea. Injected intravenously in large amts these substances appear in considerably increased amts also in the liver and pancreas excretions. S Morgulis

Cyclic changes in the liver glycogen of adrenalectomized rats. Gunnar Agren *Biochem Z* 281, 367-9 (1935) —The rhythmic changes in the liver glycogen of rats disappear when the animals have been adrenalectomized. S Morgulis

Studies on acetylcholine sensitivity and the velocity of acetylcholine splitting by the human blood G Ingvarsson *Biochem Z* 281, 379-6 (1935) —In the blood from persons of widely different sensitivity to acetylcholine, both before and after an injection of acetylcholine, no variation in the speed of the acetylcholine cleavage was observed. The difference in sensitivity is, therefore, attributed not to the degree of inactivation in the blood but rather to the condition of the peripheral organ acted upon. S Morgulis

Excretion of oxalic acid by guinea pigs Stig Bergström. *Biochem Z* 281, 377-82 (1935) —Oxalic acid fed by mouth is very largely excreted through the intestine, but much larger amts. are excreted when the oxalic acid is injected subcutaneously. It is suggested that since the excretion of oxalic acid is quantitative, the substance is not oxidized in the organism. However, the complete elimination of oxalic acid given by mouth or subcutaneously requires about 14 days or 6 weeks, resp. The results obtained in expts. over brief periods of time lead to erroneous conclusions. S Morgulis

General theory of the solubility of volatile acids in blood. Ferdinand Ince *Biochem Z* 281, 383-93 (1935). S Morgulis

Occurrence of adenine nucleotide in the tissues II Heart muscle K. Lohmann and Ph. Schuster. *Biochem Z* 282, 104-8 (1935) —Calf hearts were immediately packed in crushed ice and ground 12-15 min. later in a chilled machine and at once extd. with an equal amt. of ice-cold 10% $\text{CCl}_3\text{CO}_2\text{H}$. The residue was pressed out and again extd. with 4% acid. The solns were filtered through kieselguhr and adjusted with NaOH to pH 8. To this was added solid $\text{Ba}(\text{AcO})_2$ (25 g. per kg. substance) and 10% alc. and the ppt. was centrifuged off. The ppt

was dissolved in dil. HNO_3 and reprecip. with a HNO_3 — $\text{Hg}(\text{NO}_3)_2$ mixt., the ppt. decompd. with H_2S and the soln. aerated, neutralized with $\text{Ba}(\text{OH})_2$ and fractionated with Ba . Two fractions are thus obtained: a difficulty sol. and an easily sol. portion. The largest part of the adenine-nucleotide obtained from calf hearts is adenylpyrophosphoric acid, but small quantities of adenyridiphosphoric and adenylic acids were found also. S. M.

Cleavage, oxidation and energy metabolism in dogs

III Absorption and assimilation of hexoses in organs on continuous intravenous injection of galactose, maltose and glucose, compared with hexolysis M Wierzechowski and H. F. Iv. *Biochem Z* 282, 124-47 (1935). —When galactose and glucose are injected over a long period into a peripheral vein the liver tissue takes up the largest amt. of sugar per unit of time and per g. tissue, next in order are the organs of the portal vein system, then the head organs and last the tissues of the extremities. Only in the case of maltose does the liver seem to play a small part in the metabolism. Glucose, which in the fasting state originates in the liver, is taken up most from the blood per g. of tissue by the head organs, less by the organs of the portal vein system and least by the motor system (extremities). Simultaneously lactic acid is produced and eliminated by the organs, 40-60% of the absorbed glucose by the muscles, 14-17% by the head organs and 95-104% by the organs of the portal vein system. From injected glucose or maltose these organs return 5-15% as lactic acid to the blood. The absorption of glucose is not const. during a protracted injection, but at first the absorption is small and associated with a considerable excretion in the urine, but becomes greater in the later phase. During the absorption of injected galactose the individual organs use up glucose at about the same rate as in the fasting condition, and the liberation of glucose from the liver ceases. About 40% of the injected galactose absorbed by the tissues is partly utilized and partly excreted by the urine when the injection is completed. The expts. were made under amylar narcosis. This by itself does not affect the total assimilation of sugar. Only after laparotomy and loss of blood does the assimilation of glucose and maltose decrease much, while the assimilation of fructose is little affected and that of galactose not at all. However, of the sugars injected under amylar narcosis fructose is best utilized. S Morgulis

Passage of hormones into milk S Konsulov *Endokrinologie* 16, 237-40 (1935). —Thyroidin administered to the lactating mother passes into the milk and causes a great increase in the CO_2 production of the young. S Morgulis

Determination of the copper content of plasma and red blood cells by the Warburg cysteine-oxidation method Jannik Bjerrum and Vald. Henriques. *Skand. Arch. Physiol.* 72, 271-82 (1935) —In rabbit blood the Cu is uniformly distributed between plasma and corpuscles. On injecting Cu into the blood, this penetrates into the cells until the concn. becomes the same as in the plasma, and later falls again until the normal value for the Cu concn. is reestablished. S Morgulis

Experimental studies on the irritability of the rabbit heart muscles with variation of the carbon dioxide content of the respired air and vagus stimulation. Rune Olsson and Nils Gustav Persson. *Skand. Arch. Physiol.* 72, 295-303 (1935) —A perfusion method is described whereby it has been possible to demonstrate that the irritability of the rabbit heart muscle is practically unaltered whether the animal breathes pure O_2 or an O_2 + 20% CO_2 mixt. No evidence was found that the stimulation of the vagus directly affects the irritability of the cardiac muscle. S Morgulis

The erythrocyte and its relation to blood pressure. H. McGuire Doles. *Virginia Med. Monthly* 62, 489-96 (1935) —Studies were made upon 10 normal human beings, 5 showing hypotension and 125 showing hypertension. Enlargement of erythrocytes in hypertension is due to increased Fe , possibly assoc. with kidney damage. In nephritis the actual blood pressure varies from that called from the blood findings. During treatment there was an

increased erythrocyte count, associated with decrease in cell size and in contents of hemoglobin and Fe. Plasma and urinary Fe should be determined in hypertension.

James C. Munch
A study of the megakaryocytes in the circulating blood of rabbits inoculated with benzene and with saponin. E. M. Medlar. *Folia Haematol.* 53, 397-406(1935).—Saponin causes a much greater alteration in the blood picture than does benzene. The megakaryocytes are markedly increased after a few days.

John T. Myers
The glutathione content of muscles following cutting of the motor nerves. Alajos Schöda. *Magyar Orvosi Arch.* 36, 327-30(1935).—Frog and rat muscles show an increase in both reduced and oxidized glutathione content of the paralyzed muscle.

Henry Tauber
The occurrence of several kinds of hemoglobin in human blood. R. Brinkman and J. H. P. Jonxis. *J. Physiol.* 85, 117-27(1935), cf. *C A* 28, 6471¹.—By measurement of the rate of alkali denaturation, 3 forms of human hemoglobin have been found. One type is present in fetal blood. This is completely replaced by the less resistant adult form at about 7 months after birth. At 3 years of age a "resistant" type of adult hemoglobin appears and remains present in adult life. The extent of surface layers of various human hemoglobins after 1 min. of spreading on *M*/300 phosphate buffers in relation to pH is summarized.

E. D. Walter
The action of ovarian hormones on the uterine muscle measured *in vivo* and *in vitro*. J. M. Robson. *J. Physiol.* 85, 145-58(1935), cf. *C A* 29, 8101¹.—In most of the experiments the reactivity to oxytocin was the same for the uterine muscle in the intact animal and for the muscle suspended in physiologic solution. The results obtained with the longitudinal muscle *in vitro* offer an accurate indication of the state of the uterus *in situ*. Estrin increases the rhythmic activity both *in vitro* and *in vivo*, but the inhibitory action of a luteal hormone on the spontaneous contractions is only observed in the intact animal.

E. D. Walter
Separation of the pubic bones following the administration of estrogens to male mice. Harold Burrows. *J. Physiol.* 85, 159-61(1935).—Diminution in size and separation of the pubic bones was found in castrated and non-castrated male mice and in noncastrated female mice following the prolonged administration of estrin and equilin.

E. D. Walter
The effect of food and of exhaustion on the pituitary, thyroid, adrenal and thymus glands of the rat. Dorothy H. Andersen. *J. Physiol.* 85, 162-7(1935). E. D. W.

The carbohydrate metabolism of intestine muscle. B. N. Prasad. *J. Physiol.* 85, 239-48(1935).—The colon of the cat and the ileum of the rabbit were used in this study. Isolated intestine muscle contains about 0.25% of carbohydrate available for glycolysis. In the presence of O_2 the isolated muscle oxidizes about 1 mg. of carbohydrate per g. per hr. In the presence of glucose it produces considerable quantities of lactic acid both under aerobic and anaerobic conditions. Na iodacetate (1-10,000) inhibits glycolysis of glucose in Ringer solution in contact with the intestine muscle. Periodic electric stimulation increases the glycolysis about 12%. The mechanical activity of intestine muscle under anaerobic conditions. *Ibid.* 249-66.—Asphyxial arrest of the mechanical movements of intestine muscle is not due to accumulation of acid but to exhaustion of its labile carbohydrate store. The mechanical experiments confirm the biochemical findings that the intestine muscle has only a small reserve of available carbohydrate. Intestine muscle probably uses a mixed fuel of carbohydrate and noncarbohydrate material in aerobic respiration. Its activity is maintained best when it is supplied with both glucose and O_2 . Iodoacetic acid-poisoned intestine muscle has a very limited activity under anaerobiosis. This suggests a small phosphagen content.

E. D. Walter
The chemical transmitter of the sympathetic nerve to the uterus. M. A. F. Sherif. *J. Physiol.* 85, 298-308(1935), cf. *C A* 29, 4437¹.—After injection of eserine, acetylcholine or some allied substance can be detected in the blood in the uterine vein of the female dog. The

concentration is increased by stimulation of the hypogastric nerve. Eserine increases the contraction of the uterus produced by stimulation of the hypogastric nerves. Conclusion. Acetylcholine acts as a chemical transmitter of this effect of the hypogastric nerve on the uterine muscle. Since the motor effect is not paralyzed by nicotine, the nerves concerned are probably postganglionic.

E. D. Walter
The response of the chemical receptors of the carotid sinus to the tension of carbon dioxide in the arterial blood in the cat. Adli Saman and G. Stella. *J. Physiol.* 85, 309-19(1935), cf. *C A* 29, 6933¹, 8149¹.—At tensions of CO_2 in the arterial blood at or below 32-35 mm. of Hg the receptors are at rest. Above that level they begin to discharge, and the intensity of the latter is the greater the higher the tension of CO_2 . The response to variations of CO_2 tension in the arterial blood is very prompt.

E. D. Walter
The blood flow through the skeletal muscle in relation to its contraction. G. V. Anrep and E. V. Salfeld. *J. Physiol.* 85, 375-99(1935).—Potent vasodilator substances appear in the venous blood emerging from a contracting muscle. These substances are stable in blood for at least half an hour. They are produced and released from the muscle during its contraction.

E. D. Walter
Appearance of histamine in the venous blood during muscular contraction. G. V. Anrep and G. S. Barsom. *J. Physiol.* 85, 409-20(1935), cf. preceding abstract and *C A* 29, 8042¹.—No difference was found between the histamine concentration of the arterial blood and that of the venous blood emerging from a resting skeletal muscle. When the blood supply to the muscle was diminished the histamine concentration of the venous blood rose above that of the arterial blood. Muscular contraction is accompanied by an increase of the histamine concentration in the venous blood and of the total excess of histamine in the blood emerging from the active muscle. The excess histamine is greater the stronger the contraction of the muscle and the longer its duration.

E. D. Walter
The alleged occurrence of "Krampfstoffe" in acetone extracts of mammalian brain. Eric Holmes. *J. Physiol.* 85, 400-8(1935).—The effects of the intravenous injection into animals of the material obtained from the fresh brains of animals, killed during convulsions, by acetone extract, observed by Kroll (*Z. ges. Neurol. Psychiat.* 143, 780, 146, 208, 147, 316(1933)), and attributed by him to the presence of a substance affecting the central nervous system, are not due to any such effects, but are the result of a depressant action of the material on the heart.

E. D. Walter
Assimilation of iron in the course of embryonic development of chicken. Anna Szejman-Rozenberg. *Acta Biol. Exptl.* 8, 32-44(1933) (French summary).—The absolute increase of Fe assimilation in the total chicken embryo has two maxima in the daily curve, viz., on the 12th and 18th days, and one minimum between the 15th and 16th days of development. In the latter period assimilation of Fe is completely inhibited. This inhibition coincides with intensive increase of dry substance and albuminous substances. The ratio of Fe content of the body of the embryo to that of the membrane shifts continuously in favor of the body of the embryo. The percentage content of Fe in the liver is approximately equal to that of the total embryo. In the whole hatching period about 96% of Fe present in the egg is assimilated.

G—PATHOLOGY

H. GIDEON WELLS

Duodothyonine and the thyroid gland. I. Snapper. *Nederl. Tijdschr. Geneeskunde* 79, IV, 5711-12(1935); cf. *C A* 29, 5161¹.—The injection of iodized horse serum into rabbits leads to the formation of antibodies which precipitate iodized serum protein. This precipitation is prevented by the addition of duodothyonine and by thyroxine, but not by duodothyonine in spite of its very close chemical relationship.

R. Beutner

Role of pressor substances in arterial hypertension

R. B. Capps, E. B. Ferris, F. H. L. Taylor and Soma Weiss. *Arch. Internal Med.* 56, 864-76 (1935).—The urine of patients with hypertension does not contain increased amts. of pressor substances, nor is the response of test animals different to expts. of urine from normal and hypertensive patients. Acetone extn. of urine was not a satisfactory method of removing pressor substances, the acetone fraction contained more pressor substance and less depressor than the EtOH fraction. The pressor substance is not adrenaline or pituitary, it is a water-soluble substance which acts centrally rather than upon the peripheral nerve endings or on the vascular system. The methods of expt. the pressor substance are too inaccurate to permit of observing differences unless they are large.

J. B. Brown

Effect of low-calorie diets and resultant loss in weight on plasma cholesterol in the obese. Charles A. Poindester and Maurice Bruyer. *Arch. Internal Med.* 56, 884-90 (1935).—"The cholesterol content of the plasma in uncomplicated obesity and in obesity complicated by metabolic, arthritic or endocrine disease is not altered primarily by reduction in wt. with a low-calorie diet." In some obese patients the régime of low-calorie diets causes a definite increase in plasma cholesterol for several weeks, this effect being explained as the well recognized starvation effect, a common observation in man and animals.

J. B. Brown

Interpretation of abnormal dextrose-tolerance curves occurring in toxemia in terms of liver function. S. Soskin, M. D. Allweiss and I. A. Minsky. *Arch. Internal Med.* 56, 927-34 (1935).—The results of intravenous administration of diphtheria toxin in normal dogs caused a definitely abnormal prolongation of the dextrose-tolerance curve. In depancrectomized dogs the diabetes became more severe. The toxin affects the liver, not the pancreas, by interfering with the mechanism by which the liver decreases its supply of blood sugar in response to an influx of exogenous sugar.

J. B. Brown

Hyperglucemia and glucosuria associated with disease of the biliary tract. Herman Lande and Herbert Pollack. *Arch. Internal Med.* 56, 1097-1105 (1935).—In exptl. studies on the liver as a blood-sugar-regulating mechanism there was a direct correlation between the disturbance of carbohydrate metabolism and the degree of impairment of liver function. Restoration of normal liver function by biliary drainage resulted in disappearance of diabetic symptoms.

J. B. Brown

Idiopathic steatorrhea. James F. Weir and Mildred Adams. *Arch. Internal Med.* 56, 1109-16 (1935).—Data are presented on a metabolic study of a case of nontropical sprue with steatorrhea. Loss of fat in the stools corresponded to that reported by others, a low fat tolerance was shown. A low fat intake reduced the frequency of the stools with symptomatic relief. In spite of an abnormally high loss of N in the feces, the patient was able to store N on a high N intake with simultaneous increase in serum protein.

J. B. Brown

Cancer as a problem of metabolism. Howard H. Beard. *Arch. Internal Med.* 56, 1143-70 (1935).—A review and discussion.

J. B. Brown

Carbohydrate tolerance and intestinal flora. I. A. clinical study based on sixty cases. T. L. Althausen, J. B. Gunnison, M. S. Marshall and S. J. Shipman. *Arch. Internal Med.* 56, 1263-80 (1935).—A clinical study of cases with carbohydrate intolerance shows no correlation between this condition and the intestinal flora.

J. B. Brown

Obesity: Etiology and metabolism. C. G. Lambie. *Brit. Med. J.* 1935, II, 885-9.—An abridged report of a lecture.

J. B. Brown

Hypoglycemia in the neuroses. M. S. Jones. *Brit. Med. J.* 1935, II, 945-6.—Three cases of hypoglycemia of different origins are presented and discussed in relation to functional nervous disorders.

J. B. Brown

A study of gastric pepsin in various diseases. Clinton R. Mullins and Charles A. Flood. *J. Clin. Investigation* 14, 703-7 (1935).—The peptic activity of the gastric

contents after standard test meals was detd. by the method of Anson and Minsky (*C. A.* 27, 117). A high degree of correlation was observed between pepsin and HCl, but there were numerous exceptions. Patients with duodenal ulcer secreted more pepsin than patients without ulcer. Pepsin detn. in carcinoma of the stomach was of little value in prognosis. In pernicious anemia the pepsin secretion was diminished.

J. B. Brown

The effect of splanchnic nerve resection and sympathetic ganglionectomy in a case of paroxysmal hemoglobinuria. A. Carlton Ernstene and W. James Gardner. *J. Clin. Investigation* 14, 799-805 (1935).—In a patient with paroxysmal hemoglobinuria, hemoglobinuria could be produced at will by the application of ice packs from the feet to the level of the anterior superior spine of the ilium or ensiform cartilage, this effect disappearing with spinal anesthesia. Apparently the sympathetic nervous system played a significant role in the attacks of hemoglobinuria.

J. B. Brown

The relationship of the blood glucose to the concentration of lactose in the milk of lactating diabetic women. Edward Tolstoi. *J. Clin. Investigation* 14, 803-6 (1935).—In a study of 5 lactating diabetic women it was shown that the concn. of lactose in the milk was remarkably const., despite marked elevation or depression of the glucose level of the blood.

J. B. Brown

Dietary protein in hemorrhagic Bright's disease. II. The effect of diet on serum proteins, proteinuria and tissue proteins. B. Henry Keutmann, Samuel H. Bassett, Geraldine E. Julian, Clara H. Present and Helen E. Van Alstine. *J. Clin. Investigation* 14, 871-88 (1935), cf. *C. A.* 27, 130.—The protein balances of 3 patients with degenerative Bright's disease with proteinuria and hypoproteinemia were measured by superimposing on a basal diet different proteins or more calories as carbohydrate or fat. When the caloric and protein needs were met all patients stored large amts. of protein, indicating previous tissue protein depletion. In one patient on a protein intake of 0.8 g. per kg. daily when the caloric intake was 1½ times the basal requirement, some protein was stored, this was increased by increasing the caloric intake to twice the basal. Small supplementary feedings of egg white and serum proteins were more efficient than large. Lactalbumin and liver protein were utilized equally well on the 50- or 100-g. level. Increase of protein intake increased the albuminuria, this was due perhaps to a higher serum protein level or to increased blood flow through the kidney. In 2 patients the intensity of the renal disease remained the same with increased protein intake. In the 3rd case the lesion improved.

J. B. Brown

Studies on the anemia of pellagra. Tom D. Spies and A. B. Chunn. *J. Clin. Investigation* 14, 911-4 (1935); cf. *C. A.* 29, 1872.—The peripheral blood findings of anemia were found to occur in 63% of 30 "alcoholic" pellagrins.

J. B. Brown

The experimental production of cholesterosis of the gall bladder with observations on the cholesterol absorptive properties of the gall-bladder wall. Louis M. Rousselot and Louis Bauman. *Surgery, Gynecol. and Obstet.* 61, 585-90 (1935).—When 0.2% solns. of cholesterol in 4% bile salts are placed in the gall bladder of the dog, the ducts of which have been so ligated as to render them leakproof, about 50% of the lipid disappeared in 24 hrs. A pathol. lesion appeared which resembled human cholesterosis. Cholesterol esters increased. There was no apparent increase in the cholesterol content of the bladder wall. Under such conditions cholesterol was apparently absorbed.

J. B. Brown

Study of blood globulin with respect to its complement activity. Maurice Doladhe. *Compt. rend.* 201, 689-90 (1935).—CO₂ pptts. from fresh serum dild. with H₂O globulins (I) contg. the midpiece of complement while the endpiece is left in soln. If a stream of CO₂ is passed through a physiol. salt soln. of I, proteins (II) are pptd. which are insol. in H₂O or physiol. salt soln. The proteins remaining in soln. (III) contain the midpiece. When

obtained from swine serum II contains 0.2036 and III 0.0782 parts per 100 of P.

Synovial fluid in chronic arthritis Douglas H. Collins *J. State Med.* 43, 652-7(1935).—Pathological exam of synovial fluid in chronic arthritis should include the determination of sugar which will be lowered with bacterial contamination, total protein which is high with high cellular content, total cell count, and percentage of polymorphonuclear leukocytes which vary with the type of arthritis.

Further evidence for the presence of a toxic factor in pernicious anemia G. E. Wakelin and H. D. Bruner. *Science* 82, 494-5(1935).—The urines of 8 pernicious anemia patients when injected intramuscularly into pigeons in amounts of 0.1 to 1.5 cc per 100 g induced a decrease in the reticulocyte count to an av. of 2%. Normal counts were never less than 5%. These urines heated at 100° for 2 hrs lost this property. After the primary decrease in reticulocytes, most of the surviving pigeons showed a subsequent reticulocytosis. This effect was partially retained by the heated urines. The unheated urines were toxic for pigeons. Normal heated or unheated urines and the urines from 2 treated pernicious anemia patients gave no evidence of the toxic reticulocyte-decreasing substance.

A chemical reaction characteristic of formalin treated toxin filtrates H. Goldie. *Compt. rend. soc. biol.* 120, 313-16(1935).—The anatoxins obtained by treating filtered tetanus and diphtheria toxins with a little HCHO seem to have an oxidizing action, or at least upon addition of the Na salt of H acid (1-amino-8-hydroxynaphthalene-3,6-disulfonic acid) and boiling a dark red color develops similar to that produced by the action of H₂O₂ on H acid. The original toxins have a reducing action and do not give the red color. Dil. NH₄OH and peptone soln to which a little HCHO has been added also give the color reaction with H acid; hence the effect is probably due to nonspecific substances in the anatoxin solns.

Liberation of histamine-like substances in intestinal infarcts G. Ungar, X. J. Contades and R. G. Palmer. *Compt. rend. soc. biol.* 120, 326-8(1935), cf. C. A. 29, 6649.—Emboli were produced by injecting a suspension of lycopodium into a branch of the mesenteric artery of the chloralosed atropinized dog. A histamine-like substance was liberated in the blood which caused increased gastric secretion when the blood was transfused into another dog by the method previously described. AgNO₃, injected in the same way, produced a similar effect by its irritating action without formation of emboli. Liberation of histamine-like substances by excitation of the peripheral portion of the splanchnic nerve. Hemorrhagic lesions of the intestine produced by the intraarterial injection of histamine. G. Ungar, X. J. Contades and A. Grossiord. *Ibid.* 328-30.—Elec. excitation of the nerve produced hemorrhagic lesions of the intestine (cf. Reilly, et al., *Ann. med.* 37, 339(1935)). Injection of histamine into an intestinal artery produced the same lesions, hence the nerve must have secreted histamine. That this was the case was proved by cross-circulation expts. Intervention of a neuro-humoral process, involving histamine, in the pathogenesis of pulmonary infarcts. G. Ungar, A. Grossiord and J. Bruncourt. *Ibid.* 632-3.—When pulmonary emboli were produced in dogs histamine appeared in the blood. Excitation of either the peripheral or central portion of the phrenic nerve, in dogs and guinea pigs, produced hemorrhagic lesions in the lungs and the appearance of histamine in the circulating blood.

Regulation of serum protein imbalance by injection of blood albumin Experiments on animals. G. Lefrou and P. Bonnet. *Compt. rend. soc. biol.* 120, 342-3(1935).—Experiments on man. *Ibid.* 424-7.—In 19 lepers, with serum albumin below normal, 10-20 twice-weekly subcutaneous injections of 10 cc of 2% blood albumin soln produced a slight increase in the albumin content of the blood serum and a slight decrease in the globulin content.

Amino acid content of the blood of rabbits infected with

Yersin type tubercle bacillus E. S. Panayotopoulou. *Compt. rend. soc. biol.* 120, 604-5(1935).—Three weeks after the beginning of the infection the blood amino acids, detd. after fasting for 18 hrs., reached 9.5-9.8 mg. % (normal is 6-7 mg. %).

[Increase in] the tyrosine index of the serum polypeptides in rabbits infected with Yersin type tubercle bacillus E. S. Panayotopoulou. *Compt. rend. soc. biol.* 120, 695-6(1935).

Excessive dental calculus formation. Joseph N. Finn and Jacques S. Gottlieb. *Dental Cosmos* 77, 1173-6(1935).—Calculus which enveloped the crowns of the lower teeth contained CaCO₃, Ca oxalate and phosphate, and mucin.

Metabolism of damaged tissue Hermann Druckrey. *Naturwissenschaften* 23, 796-9(1935).—A review dealing especially with the metabolism of cancer tissue and its analogy to that of mechanically damaged tissue.

Report of chemistry section. B. J. C. van der Hoeven and C. Aston. *New Zealand Dept. Agr., Ann. Rept.* 1934-35, 60-5, cf. C. A. 29, 6306.—**Bush sickness in sheep**—The livers and blood of affected animals were not deficient in Cu. Healthy sheep drenched daily with 1 fluid oz. of a 1% soln of CuSO₄ for 3 months without access to Fe compds lost condition and became very bush-sick. In some cases bush sickness was temporarily cured by administration of As. The As content of grass from pastures in bush-sick and in healthy areas showed the same range, 0.1-0.7 p. p. m. All evidence points to Fe deficiency as the cause of bush sickness. Pampas grass contained total reducing substances (as glucose) 4-5, total hemicellulose 13-24, cellulose (Cross and Bevan) 37-41 and lignin 17-19%. The dry matter of the green leaves and the succulent bases contained 10 and 5% protein, resp. **Renal calculi**—A sheep renal calculus from Kiriokopunt consisted principally of Ca phosphate, SiO₂, uric acid and pigment. Renal calculi from a cow at Moerewa were composed chiefly of Mg NH₄ phosphate, fat and pigment; another contained SiO₂, CaCO₃, cystine and Ca phosphate. **Destructor ash** from Auckland contained 18% total CaO (of which about 9% was CaCO₃) and about 1% each of H₂O sol. K₂O and total P₂O₅. The chem. compn. of soils from littoral lands in New Zealand is briefly discussed.

Biochemistry of buras III Chlorine and nitrogen in the blood. F. Rabboni. *Biochim. therap. sper.* 22, 536-46(1935); cf. C. A. 29, 1875.—Buras cause in rabbits a continuous decrease of the Cl in the blood, which becomes more accentuated toward death. The blood N shows a corresponding continuous increase. The administration of hypertonic NaCl soln. does not influence the decrease of blood Cl.

Edema and imidazoles M. Looper, E. Bloy, M. Perreault and A. Varay. *Presse med.* 43, 697-9(1935).—Edematous fluids are frequently rich in imidazoles. They are formed by breakdown of tissue, especially of the liver and the kidneys.

Bromine in the blood C. I. Urechia and Retezeanu. *Presse med.* 43, 701-3(1935).—The Br level in the blood has been studied in a large no. of affections. A decrease was observed only in manic-depressive psychoses.

Iso-glucose curves in obesity Pedro B. Landabure and José A. Pangaro. *Semana med.* (Buenos Aires) 1935, II, 1293-8.—While some obese persons show a diabetic glucose curve after administration of sugar, others develop little or no hyperglucemia followed by prompt return to normal or even lower levels. Such curves occur especially in young persons with endocrine disturbances. They represent a latent hyperinsulinism.

The acetal reaction and the buffering power of necrotic tissue. Giovanni Baldassi. *Sperimentale* 89, 330-47(1935).—Rabbit kidneys rendered necrotic by ligation of the artery and necrotic skin from guinea pigs and rats (by bacteria and viper toxins) have a buffer system, carbonate CO₃. The alkyl can be detd. only after removal of the CO₂, which shifts the p_H beyond 8. The

alk. reaction of necrotic tissue explains its frequent calcification.

A. E. Meyer
The influence of liver and spleen medication on development of far cancer in the mouse. G. I. De Gaetani and G. Panchianco. *Sperimentale* 89, 404-16 (1935).—The development of malignancy is accelerated by medication with spleen or liver either by mouth or subcutaneously.

A. E. Meyer
Experimental studies on gastrogenic anemias in dogs. III. Review of certain experimental findings. Svend Petri, Axel S. Ohlén and David Heggild. *Acta Med. Scand.* 87, 14-32 (1935).—After surgical removal of different portions of the ventriculus and duodenum 3 different types of anemia appear: (1) hypochromatous condition with a polycythemic tendency after the extirpation of the pylorus and of the Brunner gland region in the duodenum, (2) simple but severe anemia, developing with great rapidity and generally ending in death, after the extirpation of the entire ventriculus and Brunner gland region, and (3) simple but extensive stationary anemia after the extirpation either of the fundus or of the fundus and of the entire duodenum. In no instance was a hyperchromatous condition, megalocytosis or leucopenia noted. The anemias were due to the loss of a specific antianemic function which is made up of 2 components (a hemoglobin and an erythrocyte-forming function) with definite regions of localization. In all 3 types of anemia the dogs manifested a more or less pronounced reaction to Fe but not to ventricule or liver preps. The relation of these anemia types to pernicious anemia is discussed. In one dog a condition actually developed which has a very close resemblance to human pernicious anemia and will be described in a subsequent paper.

S. Morgulis
Effect of cations on the fermenting ability of tumor cells. V. Calcium and magnesium. 1. A. Lasutski and O. Rosenthal. *Biochem. Z.* 281, 395-401 (1935).—Neither Ca nor Mg affects anaerobic fermentation by rat implantation tumors under conditions under which K causes an increase.

S. Morgulis
Partitioning of the phosphorus fractions in blood plasma of sarcomatous chickens. 1. Pentimalli and G. Schmidt. *Biochem. Z.* 282, 62-73 (1935).—Tumor-bearing chickens have a 50% higher total P content in plasma than normal chicks (15.2 and 11.6 mg. %). The lipid P and acid-soluble P are likewise 24 and 18% higher (8.6 and 6.9 mg. %, 5.5 and 4.5 mg. %, resp.). A protein P occurs in the plasma of the sarcomatous but not of the normal chickens. The origin of this P compd. is not known, but it may come from the tumor.

S. Morgulis
Sex function in relation to the water content, especially in diabetes insipidus. Luigi Beltramini. *Endocrinologie* 16, 241-56 (1935).—The sex hormone exerts a definitely antidiuretic action. In a patient with an acquired diabetes insipidus of luteal origin the diuresis shrank from 12,000 to 100 cc. in 24 hrs. on the administration of folliculin. Several other similar experiences are cited. Since, however, it has been found that patients which are refractory to treatment with pituitrin are likewise refractory to the action of the sex hormone, it is suggested that the latter exerts its antidiuretic effect reflexly through its action on the hypophysis.

S. Morgulis
Biochemical investigations on the summer encephalitis in Japan. S. Naka, N. Okumura and G. Kakiyama. *Fukuoka-Ikudaiyaku-Zasshi* 27, 1499-523 (1934).—Biochemical study was made upon 30 cases of summer encephalitis. In the delirious and comatous state most of the patients showed a mild or high degree of blood acidosis, but in convalescence the blood seemed to incline toward alkalosis. This acidosis was mostly compensated because the blood pH showed no distinct reduction. The P_{H_2O} of the spinal fluid seemed to increase, i.e., turned more to the alkaline side. Most patients showed slight but seldom high hyperglycemia. The albumin of the spinal fluid increased slightly, but it did not reach the pathological limit. The residual nitrogen of the fluid greatly increased.

H—PHARMACOLOGY

A. N. RICHARDS

"General factors" and "internal therapy" in cancer patients. G. A. K. von dem Borne. *Nederl. Tijdschr. Geneeskunde* 79, IV, 1956-61 (1935).—"General factors" include blood P_{H_2O} above 7.40, slightly higher blood sugar, markedly higher cholesterol content of the blood and failure of cancer blood to produce lysis of cancer cells (Freund and Kanner). The only therapy mentioned is that of Fischer using autolyses of spleen, lymph glands, thymus and bone marrow of young animals; the success is doubtful.

R. Reutter
Dumenformone in large doses for the treatment of primary rheumatoid arthritis. F. C. Kuipers. *Nederl. Tijdschr. Geneeskunde* 79, IV, 5122-35 (1935).—Dumenformone, the benzox and ester of the follicular hormone, was given to two female patients with fair results.

R. Reutter
Basic narcosis with rectidone. S. J. Gosses. *Nederl. Tijdschr. Geneeskunde* 79, IV, 5547-50 (1935).—Rectidone, the Na salt of sec-amylhomomallylbarbituric acid, was used as a rectal anesthetic in the place of avitin in 504 cases.

R. Reutter
Effect of theophylline ethylenediamine on experimentally induced cardiac infarction in the dog. W. M. Fowler, H. M. Hurevitz and Fred M. Smith. *Arch. Internal Med.* 56, 1212-19 (1935).—Theophylline ethylenediamine promotes the development of the collateral circulation in cardiac infarction in the dog.

J. B. Brown
Theophylline in the treatment of disease of the coronary arteries. Fred M. Smith, Herbert W. Ruthe and W. D. Paul. *Arch. Internal Med.* 56, 1230-42 (1935).

J. B. Brown
Mandelic acid in the treatment of urinary infections. D. M. Lyon and D. M. Dunlop. *Brit. Med. J.* 1935, II, 1096-7.—The oral ingestion of mandelic acid as its Na salt has proved in 16 cases to be a valuable aid in producing urinary antiseptics.

J. B. Brown
Further observations upon the changes in the electrolytes of the urine following the injection of parathyroid extract. Read Ellsworth and Wm. M. Nicholson. *J. Clin. Investigation* 14, 823-7 (1935).—After injection of parathyroid ext. to 4 human subjects, the urine became more alk., attended by increased inorg. phosphate, bicarbonate, Na and K. NH₄ was slightly decreased. Two theories to account for these changes are proposed.

J. B. Brown
The action of dinitrophenol and insulin on the metabolism of ethyl alcohol. Henry W. Newm and Windsor C. Cutting. *J. Clin. Investigation* 14, 945-8 (1935).—Concns. of dinitrophenol one in 5-20 million increased the rate of alc. metabolized by rat liver tissue *in vitro* about 5-10%. In the absence of the liver no increase occurred. Insulin and insulin-free pancreatic tissue affect the oxidation of EtOH in the absence of liver tissue; in therapeutic doses in man they are capable of increasing alc. metabolism 50%. Isolation of the principle responsible for this action may yield a useful accelerator of EtOH oxidation in cases of alcoholism.

J. B. Brown
Recollections on asthma with a few suggestions as to its treatment in childhood. W. D. Allan. *Glasgow Med. J.* 6, 225-31 (1935).—Asthma in children has been successfully treated by the administration of male and female sex hormones to males and females, resp.

R. B.
Chemotherapy. The progress of thirty years and the prospect. C. H. Browning. *Glasgow Med. J.* 6, Trans. Roy. Med.-Chir. Soc. Glasgow 30, 1-16 (1935-36).

Rachel Brown
Treatment of diabetes mellitus. S. Vatcher and M. Douglas. *J. Trop. Med. Hyg.* 38, 278-83 (1935).—Insulin and diets in the treatment of diabetes mellitus. *Ibid.* 289-95.—A high-carbohydrate, low-fat diet is employed and insulin is given in all cases to control the blood-sugar level.

Rachel Brown
Synergy of adrenaline and acetylcholine on the pulmonary blood vessels in the rabbit. G. Harold Ettinger and G. Edward Hall. *Quart. J. Exptl. Physiol.* 25,

259-65(1935)—Acetylcholine is capable of producing powerful constriction of the pulmonary blood vessels in the rabbit. The constriction depends upon an initial tone of the blood vessels. In the perfused blood vessels repeated injections of acetylcholine produce a condition in which the muscle fails to respond, probably because acetylcholine promotes dilatation following the constriction. The sensitivity may be restored by adrenaline, Ba or histamine. In the living animal the tone is probably mediated by the sympathetic nerves or by adrenaline. The hypothesis is offered that major changes in the caliber of the pulmonary artery and arterioles of the rabbit are brought about through parasympathetic activity.

Rachel Brown

Effect of low oxygen pressures on frog cardiac tissue. A. J. Clark and G. Kinnerep. *Quart J Exptl Physiol* 25, 279-80(1935).—The lowest O pressure which produces any measurable delay in asphyxia of the normal sinus is 5 mm. Hg and in the case of the iodoacetic acid-poisoned sinus it is 10 mm. Normal activity can be maintained in both cases by an O pressure of 20 mm. The corresponding figures for the auricle and ventricle are somewhat greater. The effect of O pressure above 0.015 atm. is in accord with Warburg's formula, but the formula does not appear to hold for lower pressures. The relative effects of asphyxia on the different functions of the heart can be correlated with differences in metabolic rates.

Rachel Brown

Pharmacology of physostigmine. Charles R. Linegar, James M. Dille and Theodore Koppanyi. *Science* 82, 497(1935).—In exptl animals in which the peripheral vagus was rendered nonresponsive to weak faradic stimulation by barbitalurates or nicotine salicylate, 3 min. after intravenous administration of physostigmine salicylate, weak stimulation of the vagus produced marked cardiac inhibition.

Rachel Brown

Cobalt salts as prophylactic and therapeutic antidotes in cyanide poisoning. V. M. Rozhkov, N. S. Stepanenko and K. M. Usova. *J Physiol (U S S R)* 19, 582-4(1935).—Co salts, like $\text{Co}(\text{NO}_3)_2$, CoCl_2 , CoSO_4 , produce a prophylactic and therapeutic effect on white mice poisoned by NaCN. The mortality rate sinks from 83-85% to 7-11%.

H Cohen

Methemoglobin builders as antidotes in fluoride poisoning. O. G. Vinogradova and V. M. Rozhkov. *J Physiol (U S S R)* 19, 585-6(1935).—The subcutaneous injection of NaNO_2 into white mice poisoned by fluorides causes a drop in the death rate from 82% (control) to 26%. The methemoglobin produced by the NaNO_2 unites with the fluoride, lowering the concn of the latter in the blood.

H Cohen

The role of fats and lipins in the blood during the absorption of some indifferent narcotics. A. I. Brusilovskaya. *J Physiol (U S S R)* 19, 587-93(1935).—The expts were performed on dogs and rabbits. The amt. of fats and lipins in the blood does not influence the absorption of benzene or benzine by the breathing organs. Contrary to the prevailing view, a diet rich in fats does not affect the concn of benzene or benzine in the blood.

H Cohen

Action of sulfurous acid on the bactericidal capacity of blood. H. Cremer. *Z. Untersuch. Leberm.* 70, 315-17(1935).—A long-continued addn of very small amts of H_2SO_3 lowers strongly the bactericidal power of rabbit blood to staphylococci.

F. L. Dunlap

Fixation and elimination of ascorbic acid. A. Giroud, R. Chue, R. Ratamamanga and C. P. Leblonde. *Compt rend soc. biol.* 120, 330-3(1935).—When 50 mg. ascorbic acid (I) was injected intravenously into guinea pigs already well stocked with I much was excreted in the urine during the next 2 hrs. and very little thereafter. The I content of the kidneys rose to 10 times normal in a few min. after the injection and then declined rapidly, beginning less than a half hr. later. The I contents of the liver and adrenals showed a rapid rise for 2 hrs. then a slow decrease. No significant change in muscle I was found.

L. E. Gilson

Blood changes produced by subcutaneous injections of glucose. G. Delrue and P. Hollebeke. *Compt rend soc.*

biol. 120, 529-30(1935).—When rabbits received daily subcutaneous injections of 300 cc. of 10% glucose soln. they died after a few days. Changes in blood compn. observed were similar to those in nephritis with N retention and were probably the result of the anuria provoked by the glucose injections.

L. E. Gilson

Effects of repeated injections of glucose on the muscle glycogen of normal frogs. A. Moschm. *Compt. rend. soc. biol.* 120, 531-3(1935).—The injection of 1-2 cc. of 25% glucose soln. daily under the skin or into the lymph sac caused a rapid increase in muscle glycogen (max. observed 2.56%). Effects of repeated injections of glucose on the muscle glycogen of frogs under different experimental conditions. *Ibid.* 533-5.—Injections similar to the above increased muscle glycogen, though to a smaller degree, in pancreatized frogs. In the muscles of the leg, glycogen increased as usual when the sciatic nerve had been recently cut, but if the nerve had been cut long enough for tissue degeneration to take place (3-5 weeks) there was little or no increase in glycogen following the glucose injections.

L. E. Gilson

Effects of thyrostimulin on the histological appearance of the endocrine glands. B. Giedosz. *Compt. rend. soc. biol.* 120, 555-6(1935).—Guinea pigs were used. Hyperemia and other evidences of stimulation of the thyroid, hypophysis and adrenals were noted. In the ovaries ovogenesis was suppressed and numerous follicular cysts were formed. Effects of vitamins A and C on the histological appearance of the endocrine glands. *Ibid.* 557-9.—Rabbits were used. Both vitamins increased the activity of the ovaries, adrenals and anterior hypophysis. In the case of the thyroid A seemed to arrest, while C stimulated, hormone production.

L. E. Gilson

Effects of picrotoxin on the reflex excitability of the [frog] medulla. H. Schreyer and G. Perschmann. *Compt. rend. soc. biol.* 120, 625-6(1935).

L. E. G.

Effects of the continuous injection of adrenaline on blood urea, cholesterol and calcium. A. Baudouin, H. Bénard, Y. Lewin and J. Sallet. *Compt. rend. soc. biol.* 120, 629-31(1935), cf. C. A. 29, 5316*.—Dogs were used as before. Even when the adrenaline was injected in large doses there was no significant change in blood urea, cholesterol or Ca.

L. E. Gilson

Antagonism of cryogenin and 2,4-dinitrophenol. A. Leulier and G. Béruard. *Compt. rend. soc. biol.* 120, 650-1(1935).—Pigeons were given 10 mg./kg. dinitrophenol and 170-250 mg./kg. cryogenin (phenylsemicarbazide) at the same time. The temp. rise was about 1° less than that produced by the same dose of dinitrophenol alone.

L. E. Gilson

Further experiments with lipides considered from the viewpoint of a theory of the pharmacodynamic actions of the alkali and alkaline earth metal ions. Jakob Wajner. *Compt. rend. soc. biol.* 120, 707-9(1935), cf. C. A. 29, 4229*.—In the system $\text{aq. } 100\text{-}\mu\text{MNH}_2\text{-peanut oil-oleic acid}$ the interfacial tension, deid. as in previous work, is 11.6 dynes. The addn of NaCl and KCl to 0.1 N concn. decreases the interfacial tension to 7.8 and 8.0 dynes, resp., while CaCl_2 , 0.1 N, increases it to 14.2 dynes. Remarks on the above paper. L. Lapicque. *Ibid.* 709-10.

L. E. Gilson

Hemolysis by x-rays and effect of cholesterol. B. S. Levin and C. Piffault. *Compt. rend. soc. biol.* 120, 712-14(1935).—The resistance of dil. guinea-pig blood to hemolysis by x-rays was much greater if the animal had received an intramuscular injection of 3 cc. of a 4% soln. of cholesterol in olive oil 2-10 days before the blood sample was taken.

L. E. Gilson

Pharmacological reactions of the cerebral blood vessels. J. J. Bouckaert and F. Jourdan. *Compt. rend. soc. biol.* 120, 790-2(1935).—Discussion. Twenty-three references.

L. E. Gilson

Changes in arterial pressure produced by repeated injections of streptococcus toxin in dogs. E. Dickel. *Compt. rend. soc. biol.* 120, 793-5(1935).—Daily injections caused an increase in blood pressure, an irregular increase in azotemia, and albuminuria. The effects were much like

those observed in human cases of scarlatina and infected tonsils. L. E. Gilson

Effect of Congo red on bleeding time W. de Weerd and W. van Hecke. *Compt rend soc. biol.* 120, 795-6 (1935)—In rabbits the intravenous injection of 0.5 cc./kg. of a 1% soln. of Congo red in distd. water caused a 23% decrease in bleeding time. If the Congo red was dissolved in 0.9% NaCl soln. instead of distd. water it had no effect on bleeding time. L. E. Gilson

Absorption of bilirubin, Bengal rose and tetrabromosulfonaphthalen by the liver M. Royer. *Rev. sci. argentine biol.* 11, 482-8 (1935), *Compt rend soc. biol.* 120, 809-12 (1935)—Bilirubin gives the most satisfactory results in the hepatic insufficiency test. L. E. Gilson

Adrenal cortex therapy in the toxemias of pregnancy W. Herbrand. *Deut. med. Wochschr.* 61, 1682-3 (1935)—A review of clinical reports bearing on the supposed efficacy of adrenal exs. Arthur Grollman

Pharmacology of ergometrine G. L. Brown and Henry Dale. *Proc. Roy. Soc. (London)* B118, 446-77 (1935)—Ergometrine produces central excitation with general sympathetic stimulation. It exerts merely a trace of specific paralyzing action on motor sympathetic effects, produces cyanosis of the cock's comb without gangrene, and increases body temp. in toxic doses. Its action on arterial pressure varies with the conditions of anesthesia and of the integrity of the brain, a pressor action is exerted on the spinal cat. Its most characteristic action, and sole action in small doses, is the initiation of a long-persistent rhythm of powerful contractions in a uterus normally quiescent as in the early puerperium. It apparently has a peripheral action of sympathomimetic type on several organs. It is less toxic than ergotamine, and is far more readily absorbed on oral administration. Joseph S. Hepburn

The relation between dielectric polarization and pharmacological action [of medicinal compounds] K. W. Rosenmund. *Angew. Chem.* 48, 701-5 (1935)—The following synthetic lactones were investigated for their anesthetic action: anisole lactone (I), *o*-, *m*- and *p*-cresol ether lactone (II, III, IV), phenol lactone (V), *p*-cresol lactone (VI), thymol lactone (VII) and thymol ether lactone (VIII). Their action upon leeches and ascariids compared with that of santonin was greater for I, II, V, weaker for IV, VI and no action was shown by III, VII and VIII. Their phys.-chem. behavior in relation to their medicinal action was investigated and it was found that surface tension showed no direct beneficial influence, and that surface activity is only an auxiliary property, promoting penetration to the interior of the cells. The surface tension of H_2O is lowered by equimol. solns. (concn. 0.00075 g. mol. per l.) as follows: V 1.3, I 3.3, VI 7.9, IV 8.5, III 8.8, II 9.2, VII 13.3 and VIII 15.4%. Swelling expts. with casein and gelatin in H_2O and Ringer soln., with and without addn. of lactone, also did not show any relation to medicinal action, the behavior of the lactones as excitants being the opposite to that of narcotics. The permeability of fresh and dried human ovarian membranes to methylene blue and red beet ext. was detd.; all lactones increased the permeability, particularly those contg. a free OH group. A numerical relationship was found to exist between the influence exerted upon swelling and permeability, but no relation between medicinal activity and permeability. All lactones promoted gel-sol transformation and retarded sol-gel transformation, but noticeable differences in their action could not be found. The effects of alternating polarities at the C atoms in the benzene ring, as induced by substituents, and their possible application to a theoretical explanation of the relation between constitution and medicinal action are discussed at length. They lead to the conclusion that the most active compds. are those possessing complete additive polarity, without any shielding by neighboring polar groups. The two medicinally active lactones II and IV possess the strongest polarity, as all induced charges are additive throughout the whole mol., while in the inactive III a weakening of the polarity results from superimposition of opposite charges. The most effective compd. is II,

and the somewhat lower effectiveness of IV is explained by the steric shielding which is exerted upon the strongly polar lactone group by the $-OCH_3$ group in *o*-position to it. Steric shielding likewise occurs in III by the $-CH_3$ group in *o*-position to the lactone group. Further examples shown are the six isomeric dihydroxybenzoic acids in their retarding action upon the yeast fermentation of dextrose as a function of polarity distribution. Five references. Karl Kammermeyer

The administration of iron G. H. W. Lucas and V. E. Henderson. *Can. Med. Assoc. J.* 34, 53 (1936)—A general review of the efficacy of the administration of Fe in large doses and a report of some expts. which showed that by cooking vegetables in heavy Fe pots, the Fe content of vegetables could be increased as much as 10 to 40 times. This Fe appears to be as available as the Fe in the vegetables themselves. G. H. W. Lucas

New investigations on the antidotism between hydrocyanic acid and sodium tetrathionate S. Sapiezna. *Arch. intern. pharmacodyn.* 51, 44-62 (1935)—A freshly prep'd soln. of equal vols. of $Na_2S_2O_4$ + $5H_2O$ (20 g. %) and 10% I₂ in 13% NaI (which results in $Na_2S_2O_4$ 5.3 g. % and NaI 12.4 g. %) injected intravenously in dogs and rabbits saves animals that have been given 5-6 times the m. l. of cyanide. The dose of the antidote is 11-13 cc./kg. body wt. P. F. Mettild

Osmotic changes in the muscle in contraction caused by veratrine and nicotine I. Gentile. *Arch. ital. biol.* 93, 190-6 (1935)—The faculty of absorbing water is reduced. A. E. Meyer

The ratio dehydroascorbic acid/ascorbic acid in tissues after administration of thyroxine Emilio Martini and Fernando Copello. *Biochim. therap.* 22, 529-35 (1935)—Repeated treatment with thyroxine produces in the guinea pig a reduction in ascorbic acid. The dehydroascorbic acid is increased in a higher degree. As a consequence, the total content of the tissues in vitamin C is increased and the quotient shows a large increase. A. E. Meyer

Treatment of coma caused by barbiturates Ch. Flaudin. *Presse med.* 43, 803-4 (1935)—High doses of strychnine, blood letting, artificial respiration and adrenaline by rectum are recommended. A. E. Meyer

Prophylaxis of accidents caused by arsenobenzenes. U. Reboud. *Presse med.* 43, 899-900 (1935)—The addn. of glycocoll, as recommended by Bénech (cf. C. A. 29, 3731⁹), is less reliable than the use of the aminoacids derived from liver. A. E. Meyer

The action of urine extracts on adrenals and ovaries of the rabbit Max Aron. *Presse med.* 43, 1044-6 (1935)—Urine from cancer patients causes typical histological changes of homogenization in the adrenals. The left adrenal is removed for biopsy before injections are begun and is compared with the right gland after treatment. Cancer urine gives a pos. Aschheim-Zondek reaction in 80% of the cases. A. E. Meyer

Total cinnamon of balsam of Peru and choline camphorate; a therapeutic synergism. P. Logeais. *Rev. med.* 52, 125-30 (1935)—Cinnamon consists of a mixt. of benzyl cinnamate, benzyl benzoate and some resinotannins. It is an amber-colored liquid of characteristic odor and taste. Solns. in oil are suitable for therapeutic use by injections. It causes a considerable augmentation of the leucocytes. Choline camphorate dissolved in an isotonic soln. of *d*-camphor is applied intramuscularly. It has a cardiotoxic and sympatheticoptic action, causes an increase of the erythrocytes and mononuclear cells, increases the cholesterol in the blood and neutralizes bacterial toxins. An alternating medication with both substances gave excellent results in infections, especially tuberculosis, in anemias, asthenias and during convalescence. A. E. Meyer

Action of lachesis venom Gustavo Escobar. *Semana med.* (Buenos Aires) 1935, II, 1479-84—The viper *Bothrops* (Yarará) and its habits are described. The venom is an odorless, slightly greenish and opalescent liquid of acid reaction and sp. gr. 1.03-1.05. It is stable and of little toxicity if taken by mouth. It is inactivated

at 65° and contains 65-80% H₂O, besides proteins, fat, Cl, phosphate, Ca, NH₄ and Mg. Light is without influence on the dried product but destroys it in soln. The symptoms of poisoning, as described, involve almost the whole organism. A 2% soln. of the venom dissolves many bacteria. The therapeutic dose includes dilns from the 6th decimal and following, up to 30 drops daily. It is used in cancer treatment and in appendicitis.

Ergotone in the treatment of some mental diseases Antonio Carelli *Semana méd* (Buenos Aires) 1935, 11, 1571-2.—1-ergotone gave favorable results in hysterical crisis, delirium, excitation and manias. A. E. Meyer

Intravenous animal charcoal in physiological and some pathological conditions Giovanni Selvaggi *Sperimentale* 89, 346-403(1935).—The charcoal is deposited in the following sequence: spleen, liver, lungs, less in the lymph glands, and the bone marrow. There is no sp. stimulation of the reticulo endothelial system. A loci of infection with staphylococcus are surrounded by a "filter" of C particles. The elimination takes place in the liver. A. E. Meyer

Observations on the insulin-adrenaline treatment by the Clausen method T. Thune Andersen *Acta Med. Scand.* 86, 361-6(1935).—Diabetic patients were treated according to Clausen, by injecting 0.1 mg. adrenaline with every 5 cc. insulin. No hypoglycemic symptoms occurred in the patients so treated, in a considerable proportion of cases the glucosuria greatly decreased and the fasting blood sugar was lower than before the treatment.

Biological assay of adrenal cortical preparations with the use of white rats and mice G. Widström. *Acta Med. Scand.* 87, 1-13(1935).—Adrenalectomized white rats, under controlled conditions and on the third postoperative day, when exposed for 4 hrs. to a temp. of +3° show a fall in body temp. In about 65% of the animals this fall exceeds 9°. Treated with cortical preps during the interval after adrenalectomy the rats on exposure to cold either show no fall in temp. or the fall depends upon the dose administered. This reaction has been utilized in working out a method for assaying the cortical prep. White mice are less suitable for this assaying than rats.

Polylyzate therapy I. N. Kazakov. *Acta Med. Scand.* 87, 33-49(1935).—The lyzates are products of artificial hydrolysis of different organs with acid or alkali under 12-15 atm. pressure. The organs are obtained from freshly killed animals. These lyzates were tested on 4000 patients. The effect of these preps has been detd. from the point of view of the dispersion state of the colloidal systems of the organism, the metabolism of the nervous tissue, the increase in blood immunity and increase of oxidative processes. Basedow patients (700) were treated with a combination of 5 lyzates (anterior hypophysis, parathyroid, adrenal cortex, ovaries and liver) to which brain lipoids and several other lyzates were added. Only in 5% of those treated was there no change, but in 17% there was complete healing, in 50% definite improvement and in 28% some improvement. Results in a number of other clinical conditions are recorded.

Studies on the physiological chemical action of peat extract (humic substances) administered perorally or intravenously Rudolf Schmidt *Biochem Z.* 281, 329-32(1935).—Humic substances can be fed to rabbits with impunity. A small part is absorbed. Intravenous injection of sterile aq. exts. from peat is tolerated, if the concn. is less than 1%; otherwise they cause death.

Hormonal effects on alcohol metabolism Erik M. P. Widmark. *Biochem Z.* 282, 79-84(1935).—No definite effect on the metabolism of alc. in dogs has been found either from thyroxine, pituitrin or adrenaline. Insulin activates strongly the alc. metabolism in dogs with a sluggish metabolism, which may become doubled within 200 min. But in dogs with an initially strong alc. metabolism the insulin injection has no effect.

Treatment of hyperthyroidism with gold salts L. Benito Iuertes *Indoktrinologie* 16, 257-64(1935).—

In about one-half of the cases treated with Au salts there has been improvement of the hyperthyroid condition with lowering of the basal metabolism which persisted even after the treatment. The salts are best administered by frequent small doses intramuscularly. S. M.

A theory of the sensitization to acetylcholine, and the effect of fluoride in raising the irritability G. Kahlson and B. Uvnäs. *Skand Arch Physiol.* 72, 215-39(1935).—

Acetylcholine acting on muscles of the frog or leech previously treated with physostigmine calls forth contractions, but in untreated muscles is destroyed within a small fraction of a second. This explains the ineffectiveness of small doses of acetylcholine or the prolongation of its action in physostigminized muscles. The phenomenon, however, cannot be interpreted simply as a case of inhibition of esterase function. This would leave open the problem why the acetylcholine sensitive gastrocnemius can be sensitized like the rectus muscle by physostigmine. Furthermore, the enzyme inhibition by NaF has no effect in making the leech muscle sensitive to acetylcholine. The inhibition of the esterase activity can at best only cause a prolongation of the acetylcholine effect, but the increased sensitivity must result from other conditions. The fluoride inhibition is not complete even in very great concns. and F⁻ produces a strong increase in the acetylcholine sensitivity of the rectus muscle even in such concn. as *in vitro* does not inhibit the esterase. I. e., the sensitivity to acetylcholine may be increased either by F⁻, which only partly paralyzes the enzymic action, or by physostigmine, which produces complete paralysis. The pharmacological effect of the fluoride is discussed. S. M.

Effect of phlorizin on the isolated kidney and isolated liver Linar Lundsgaard *Skand Arch Physiol.* 72, 265-70(1935).—In a lung kidney prep. complete phlorizin poisoning was obtained by a dose of 0.5-1.0 mg. per g. kidney. The glucolytic power of a kidney poisoned with a moderate dose of phlorizin is not affected. The concn. of phlorizin which completely inhibits the glucose reabsorption in the kidney is probably less than that necessary to prevent esterification by muscle pulp or yeast. Severe phlorizin poisoning of rabbits or the addn. of a moderate amt. of phlorizin to blood perfused through the liver does not affect its carbohydrate metabolism. S. Morgulis

Paraldehyde idiosyncrasy Gilbert Brown *Brit J. Anaesthesia* 13, 25-7(1935).—Prolonged, deep, unconsciousness developed in a man aged 20 and weighing 123 lbs. with a blood pressure of 120/78, after the rectal administration of 4 drachms of paraldehyde in 5 oz. of saline soln. Complete loss of all reflexes developed, assoc. with rapid respiration and very slight fall in blood pressure. Elimination methods led to recovery. James C. Munch

Studies in kala-azar P. K. Guha *Calcutta Med J.* 30, 193-218(1935).—By the levulose test normal liver function was found in 15 cases of kala-azar before treatment, and 8 cases after treatment. Pos. van den Bergh tests were obtained in 4 of the 15 untreated cases. Urobilinuria was observed in all patients. Quinquevalent antimonials proved clinically effective. Sixty-eight references. James C. Munch

Veratrum viride in the treatment of eclampsia R. D. Bryant *Calcutta Med J.* 30, 237-42(1935).—In treating 127 cases of eclampsia during the last 8 yrs., veratrum exts. have proved useful, death has not been observed in the last 56 patients. Veratrine, MgSO₄ and alkalis are given with large vols. of fluid. The blood pressure fell to 50 mm. systolic and the heart rate to 40 beats per min. Emesis was observed in many patients. Atropine or morphine was useful as an antidote. Marked variation in susceptibility was observed. James C. Munch

The treatment of gonorrhea with flavadin H. O. Loos *Dermatol. Z.* 72, 149-56(1935).—In treatment of gonorrhea in females, 10 injections of a 2% aq. soln. of flavadin, an arsenical acridine deriv., proved effective. Similar effective responses were observed in involvements of the cervix and urethra. James C. Munch

The effects on the rabbit of repeated large intravenous doses of glucose H. E. Harding. *Guy's Hospital Repts.* 85, 372-6(1935).—The intravenous injection of 20

to 25 cc. of a 50% soln. of glucose in distd. water 4 or 5 times daily to rabbits, continued until vein damage made it impossible, produced severe loss in wt. This resulted from dehydration of the tissues and was prevented by oral administration of dil. saline soln. Similar effects were observed in connection with intravenous injection in human beings. The blood sugar of a rabbit was 141 mg. % before injection, 5 min after intravenous injection of 23 cc of 50% glucose, 955 mg. %, 110 min later, 140 mg. %. Four additional doses totaling 92 cc were given on the same day, the following day the blood sugar was 145 mg. % Of the injected glucose, 80-90% was retained.

The use and abuse of digitalis. Arthur G Sullivan
J Arkansas Med Soc 32, 107-9(1935)

Cyclopropane a new gas anesthetic. Report of 120 cases. George S Mechleng *J Oklahoma State Med Assoc.* 28, 436-9(1935)—Cyclopropane has proved as safe as any inhalation anesthetic. The explosive range for cyclopropane-oxygen extends from 25 vols % cyclopropane plus 75 vols % oxygen to 71 vols cyclopropane and 29 vols of O.

Treatment of malaria. C D de Langen and C J Storm *S African Med J.* 9, 677-8(1935)—See *C A* 29, 6953.

The efficiency of trypanamide in the second stage of sleeping sickness. M Bonnet *Trop Disease Bull* 32, 17(1935)—Trypanamide proved clinically effective in 150 patients.

Urotropine intravenously associated with arsenicals in the treatment of second- and third-stage sleeping sickness. Lieurade *Trop Disease Bull* 32, 19(1935)—In studies on 12 patients, the intravenous injection of 20-30 mg of urotropine per kg at weekly intervals, assoc. with trypanamide treatment, proved more effective than trypanamide treatment alone.

Sodium hyposulfite in the treatment of ocular troubles due to trypanocides. Ringeard *Trop. Disease Bull* 32, 19-20(1935)—Intravenous injection of Na hyposulfite produced relief in 20 of 26 cases showing ocular involvement after atoxyl or trypanamide and also in 9 of 12 patients developing blindness.

Action of quinine iodobismuthate on *T gambiense*. P. Lassabriere and A. Peycelon. *Trop Disease Bull* 32, 20-1(1935)—Intramuscular and subcutaneous injection of quinine iodobismuthate to guinea pigs infected with *T gambiense* failed to produce definite prolongation of life. This drug appears to be a valuable adjuvant, but is decidedly inferior in curative action to the arsenical compd.

Subsequent histories of six cases of *Trypanosoma rhodesiense* infection treated with "Bayer 205" or "Fournneau 309." A. J Keevill *Trop Disease Bull* 32, 21(1935)—Six patients were found to be in normal health 2 years after treatment, and 2 of these appeared to be normal 8 years after treatment. When trypanosomes had been found in the spinal fluid, a combination of trypanamide and Bayer 205 is more effective than either drug alone.

The dosage of moranyl in the treatment of gambiense sleeping sickness. A. Sice and H. Mercier. *Trop. Disease Bull* 32, 21-2(1935)—The oral or intravenous administration of 1 g. of moranyl weekly for 8 wks. produced a degree of sterilization corresponding to that produced by orsanine. However, moranyl produced marked or severe albuminuria. The combination of moranyl and trypanamide produced more favorable results.

Mode of action of germanin in trypanosomiasis. N. von Jancso and H. von Jancso. *Trop. Disease Bull* 32, 22-4(1935)—Failure to demonstrate trypanocidal action of Bayer 205 is attributed to difficulties in maintaining viable trypanosomes *in vitro*. A special technic is recorded for growing trypanosome on sheep serum-glucose-Ringer soln. The heart blood of infected rats, guinea pigs or mice is mixed with 1% of heparin to prevent coagulation and inoculated. No difficulty was encountered in maintaining

live cultures for 50 to 70 hrs. Bayer 205 in a concn. of 1:60,000 destroyed all parasites after a latent period of 24 hrs., acting by the production of atresis through interference with nutrition of trypanosomes. Arsenoxides act in a different manner, producing immediate effects. Germanin rendered trypanosomes fit for phagocytosis by reticulo-endothelial cells. The chemotherapeutic index on normal animals was 1:270, in animals after splenectomy and blocking the reticulo-endothelial system with colloidal Cu, the index was 1:135.

Report of the Jamaica yaws commission for 1932-1934. T B Turner, G M. Saunders and H. M. Johnston, Jr. *Trop Disease Bull* 32, 50-2(1935)—Consistent controlled studies have indicated that neosarsphenamine and bismuth compds are proving effective in the treatment of yaws.

Treatment of yaws by intravenous injection of copper sulfate. A Occhino and Y Kernkamp *Trop. Disease Bull* 32, 56(1935)—Daily injection of 0.6% CuSO₄ for 10 to 25 days proved effective in the treatment of 200 patients.

Detoxification of strychnine by pentobarbital sodium. Edward E Swanson *J Am Pharm Assoc* 24, 959-61(1935)—In single equiv doses, pentobarbital Na has a less effective antidotal action in strychnine poisoning than has Na amytal (cf. *C A* 27, 4304).

Influence of various substances on the lactic acid dehydrogenase in the heart muscle. Ichiro Yamamoto *Fukuroka-Ikudaisigoku-Zasshi* 27, 2767-72(1934)—The inhibitory effect of oxalic acid on the lactic acid dehydrogenase is independent of the Ca-ptg action of oxalic acid. NaF and Na citrate have no influence. In oxidation the formation of the macroscopic salt of lactic acid is not necessary. Lactates of Na, Li, K, NH₄ and Ca are readily oxidized. Ag, Hg and Cu possess a marked inhibitory effect, but alkaloid, insulin, adrenaline and nicotine have no influence on the lactic acid dehydrogenase.

Effects of sodium citrate on the alkali reserve and coagulability of the blood. David De Souza and F. D. M. Hocking. *J. Physiol.* 85, 168-72(1935); cf. *C. A.* 29, 5159.—Repeated small intramuscular injections of Na citrate have a cumulative effect in increasing the alkali reserve and the coagulability of the blood. Relatively large injections increase the alkali reserve and diminish the coagulability of the blood, after in some cases an initial increase. Changes in the coagulability of the blood produced by citric acid and some of its decomposition products. *Ibid* 173-8.—Intramuscular injections of citric acid or NH₄ citrate increase the alkali reserve and the coagulability of the blood. Similar injections of acetonedicarboxylic acid or acetic acid do not affect the alkali reserve, but may increase or diminish coagulability. Intramuscular injections of Na acetonedicarboxylate or Na aconitate increase the alkali reserve and the coagulability of the blood. Injections of MeCO have no effect on alkali reserve or coagulability.

The action of adrenaline on the respiratory quotient. Edward M Bridge and H. R. Noltie. *J. Physiol.* 85, 334-42(1935); cf. *C. A.* 24, 1425; 25, 3081.—Continuous intravenous injection of adrenaline into unanesthetized rabbits causes a fall of R Q to the protein-fat level. The low values of both liver and muscle glycogen, found at the end of such expts., suggest that the action of adrenaline on glycogen is a purely lytic one.

Choline and liver respiration. O. A. Trowell. *J. Physiol.* 85, 350-74(1935); cf. *C. A.* 29, 4413.—Choline in concns. of 0.012% and above increases the O consumption of liver slices, as measured in differential manometers of the Barcroft-Dixon type. The greater the choline concn. the greater the effect. The effect is uninfluenced by either added fatty acid or glucose. Choline increases the O consumption of kidney slices. It decreases the O consumption of spleen and cardiac muscle. It has no effect on the O consumption of brain. Choline is oxidized by washed liver pulp with the uptake of approx. 1 atom of O per mol. of choline. It has no effect on the O uptake of an aq. ext. of liver. In concns. of 0.01% and

above choline inhibits the acetoacetic acid production of liver slices, and at 1.0% the inhibition is practically complete. In the presence of added fatty acid the inhibition is still marked. It is, therefore, probable that choline decreases the rate of oxidation in the liver. The effect of choline on the O uptake of liver slices is probably the algebraic sum of 2 step processes (1) oxidation of choline itself by the liver, (2) inhibition of the normal fat oxidation in the liver. These findings afford no explanation of the action of choline in the prevention and cure of various types of fatty liver. They do, however, rule out the explanation that choline acted by accelerating fat oxidation in the liver. These conclusions apply to the rat only.

R. D. Walter

Influence of active substances of endocrine glands on hemolysis. Edward Falik *Acta Biol Expil* 8, 73-9 (1933) (German summary).—The active substances of endocrine glands, viz., adrenaline, thyroxine, insulin, hypophysin anterior and hypophysin posterior raise alone or in mixts with each other the resistance of the red blood corpuscles toward osmotic influences. The expts induce the assumption that these corpuscles become permeated by hormones, and that the stroma-colloids change their state of dispersion producing a denser stroma surface, whereby the blood corpuscles become more resistant and give off their dye only in a strongly hypotonic medium.

J. Wiertelak

The influence of lecithin upon the isolated heart of poikilothermic animals. W. S. Holobut and Z. Bielinski *Acta Biol Expil* 8, 178-85 (1933) in French (1933).—Lecithin perfused in 0.001 to 1% solns in Ringer reagent accelerates the action of the heart of poikilothermic animals (frogs and tortoises) and increases contractions. If beforehand the parasympathetic endings in the heart are paralyzed by means of 0.0004% atropine, lecithin in the same doses as above acts in the opposite direction, slowing the action of the heart and diminishing its contractions. The phenomenon is explained by the action of lecithin as an agent paralyzing the autonomic system, the parasympathetic as well as the sympathetic of the heart, with a greater affinity toward the parasympathetic part.

J. Wiertelak

N.C. Derivatives of barbituric acid. E. Gryszkiewicz-Trochowski *Arch Chem Farm* 2, 1-8 (1934) (German summary).—Action of $\text{C}_6\text{H}_5\text{CH}_2\text{NEt}_2$ (I) on N-Na derivs of C-substituted barbituric acid gives the corresponding alkylamine derivs. Thus the following compds are prepd: 5,5-diethyl-3-(diethylaminoethyl)barbituric acid $\text{C}_{14}\text{H}_{20}\text{N}_4$, by heating 0.1 g. mol of Bayer's "Veronal-Natrium," the Na deriv of diethylbarbituric acid, in 100 cc abs EtOH and 0.1 g. mol of I during 5 hrs on a water bath, HCl salt colorless, m. 225-6°, easily sol in EtOH and H_2O ; 5-ethyl-5-butyl-3-(diethylaminoethyl)barbituric acid, $\text{C}_{18}\text{H}_{26}\text{N}_4$, prepd similarly from the Na salt of ethylbutylbarbituric acid and I, HCl salt easily sol in H_2O and alc, m. 212-3°, 5-methyl-5-(1-cyclohexenyl)-3-(diethylaminoethyl)barbituric acid (II), $\text{C}_{18}\text{H}_{24}\text{N}_4$, from I and the Na salt of 5-methyl-5-cyclohexenyl-3-methylbarbituric acid, HCl deriv white, cryst, easily sol in EtOH and H_2O , m. 150-1°, 5-ethyl-5-phenyl-3-(diethylaminoethyl)barbituric acid (III), $\text{C}_{18}\text{H}_{20}\text{N}_4$, from I and the Na salt of ethylphenylbarbituric acid, HCl deriv white, cryst, easily sol in H_2O , difficultly sol in EtOH, m. 245-6°, III, injected intravenously into cats in an amt of 50 mg/kg of body wt of the animal, causes rapid decrease of the blood pressure to 0 mm Hg and arrests respiration, causing death of the animals. After a dose of 25 mg/kg of body wt the blood pressure sinks to 8 mm Hg and respiration becomes extremely slow. Within several min the cats return slowly to their normal state. Analgesia in cats is not observed. Peroral doses in cats and dogs have but slight narcotic effects. Subcutaneous doses of 50 mg. in cats cause death in 24 hrs., in dogs only a dose of 80 mg/kg shows considerable toxic effects. Prepn II is much less toxic. Fifty mg/kg causes a slight decrease of the blood pressure, followed by strong hypertension.

Juniperus thurifera L. and its essence (Revol) 17

1 Chem and physicochem analysis of the mineral waters of Valleverde [therapeutic value] (Marotta, Sorrentino) 14.

I-ZOOLOGY

R. A. GORTNER

Effect of temperature on the glutathione of cold blooded animals. Léon Binet and Georges Weller. *Compt rend soc. biol* 120, 289-90 (1935); cf. C. A. 29, 6933¹.—Three lots of frogs (*R. temporaria*) were kept 2 hrs at 0°, 20° and 32°, resp., then killed. The reduced glutathione contents of the livers of the 3 groups were 44, 46 and 29 mg. %, resp. No difference in muscle glutathione was found. Three lots of goldfish were kept 5 hrs at 8-10°, 18-20° and 28-30°. The reduced glutathione was found to be 10.5, 15.4 and 12.3, and total glutathione 18.2, 16.8 and 14.5 mg. % (whole fish) for the 3 lots in the order given.

L. L. Gilson

Colloid-osmotic pressure of blood of marine fish. Paul Meyer. *Compt rend soc. biol* 120, 303-5 (1935).—The method of Krogh and Meyer was used (*Ergebnisse Physiol* 34, 15-111 (1932)). For selachians, 4 species, the range was 3.1-6.4, and for teleostean, 5 species, 14.6-25.0 cm water. Colloid-osmotic pressure of the "blood" of marine invertebrates. *Ibid* 305-7.—Values are given in cm of water. *Sipunculus nudus* 0.7-1.2, *Pinnia nobilis* 0.8-1.2, *Murex* species 1.2-1.9, *Septa officinalis* 2.8-3.6, *Ocenebra vulgata* 3.1-3.8, 4 species decapod crustaceans 2.1-4.4 and 2 species of tunicates 1.2-2.3.

L. E. Gilson

Ammonia contents of the internal liquid media of various invertebrates. Mme. J. Souteret. *Compt. rend. soc. biol* 120, 453-5 (1935).—The method is described. The following values in mg. % of ammonia N were obtained: starfish 0.104-0.350, sea urchin 0.096-0.210, *Sipunculus nudus* blood 0.1-0.5, crab blood 0.3-1.4, hemolymph of various marine shellfish 0.07-0.22, *Helix pomatia* hemolymph 0.87-0.95, *Septa officinalis* blood 0.43-3.85, urine 82.3-138.9 and digestive fluid 6.8-13.9.

L. E. Gilson

Distribution of glutathione in organs of various marine invertebrates. A. Monier. *Compt rend soc. biol* 120, 456-8 (1935).—In echinoderms, worms, crustaceans and mollusks the hepatopancreas is richest in glutathione, contg 90-340 mg. % total glutathione. The genital organs contained 65-270, muscles 35-85 and blood 3-12 mg. %. The largest quantities were found in *Septa officinalis*. In every case nearly all the glutathione was in the reduced form.

L. E. Gilson

Effects of removal of the mediolateral organ on the respiration of Lepidopterae (adult moths). Anne Raffy and Gabriel Guignon. *Compt. rend soc. biol* 120, 785-6 (1935).—O consumption was greatly reduced. Nicotine caused a much smaller increase in O consumption than it did in normal moths.

L. E. Gilson

Regulation of respiration in the flea, *Xenopsylla cheopis*, Roths (Pulicidae). V. B. Wigglesworth. *Proc. Roy Soc (London)* B118, 397-419 (1935).—In decreased concns of O, the frequency of opening and closing of the spiracles is increased, and the closed period is shortened more than the open period. Increased concns of O prolong both periods. The spiracles remain permanently open in concns of O less than 1%, or in concns of CO₂ approx 2%. Low concns of CO₂ slightly shorten the closed period and considerably increase the open period. Introduction of lactic acid into the blood produces a rapid rhythm-like O want or permanent opening of the spiracles. The opening of the spiracles is governed chiefly by O want, the duration of the open period by the time required for diffusion away of the CO₂. Reduced concn of O gives rise, in sequence, to accumulation of metabolites in the blood, increase in its osmotic pressure, extrn of H₂O from the ends of the tracheoles and an increase in respiratory surface.

Joseph S. Hepburn

The carotenoids of *Rana esculenta*. Otto Brunner and Rosa Sten. *Biochem Z* 282, 47-50 (1935).—The liver, skin and fat body contain β -carotene and lutein, the latter only in the form of its esters. In the ovaries, how-

ever, lutein is present both in the free and esterified condition. The pigment content of these 4 organs has been detd. in 6 frogs. The abs amts of β -carotene and lutein vary greatly as does also the lutein/carotene ratio

S Morgulis

The problem of the formation of wax in the bee organism. Georg Buchner. *Fettsäure Umschau* 42, 203-9 (1935).—A brief theoretical discussion of biol syntheses of fats, fat acids and waxes from hexoses and of wax alcs from fat acids

J W Perry

Increased permeability to water of aging unfertilized eggs (*Arbacia punctulata*). A J Goldfarb. *J Gen Physiol.* 19, 149-65 (1935).—In did sea water at const temp, p_H and time, these eggs swell progressively faster with age. Swelling results from the permeability of the eggs to water. Methods are described

C H R

The chemical and energy metabolism in the course of development of insects II. The ratio of heat production to the respiratory processes in the course of postembryonic

development of insects (*Lymantria dispar* L. and *Bombyx mori* L.). N. Balzani. *Acta Biol. Exptl.* 8, 59-72 (1933) (German summary); cf. C. A. 27, 5827.—The caterpillars of *Lymantria dispar* L. and *Bombyx mori* L. show high evolution of heat during growth at comparatively low respiration dropping to a lower value during molting. In the pupal stage the heat evolved is half of that evolved in the larval stage, the lowest value being at the mid-point of the pupal stage

J Wiertelak

Duration of the acid reaction in the digestive vacuoles of *Paramecium caudatum* as a function of the p_H of the external medium. M. Chejfec. *Acta Biol. Exptl.* 8, 186-95 (1937 in German) (1933).—The duration of an acid reaction (p_H 1.6-2.0) in the digestive vacuoles is but slightly dependent on the p_H of the external medium. In the same individual no synchronization of p_H in different vacuoles is observed. The death of the individual produces instantaneous deacidifying of all vacuoles.

J. Wiertelak

12—FOODS

F C BLANCK AND H A LEPPER

Foodstuffs and drinks used in Brazil. A de Paula Rodrigues. *Rev quim farm (Brazil)* 1, 51 8 (1935).—A review

E S G B

Certified colors for foods. J R Hall. *Food Ind* 8, 24-5, 52 (1936). cf. C. A. 30, 165.—The uses and properties of the primary food colors and the conditions under which each will remain stable are described

C R F

Determination of salt in foodstuffs. J D Filippo. *Chem Weekblad* 32, 558 (1935).—A previous method (cf. C. A. 9, 3303) for detg. NaCl in bread by means of HNO_3 was found suitable for cheese, coffee, sausage, butter and mustard. To 5 g substance in a 50-cc volumetric flask are added 35 cc of 1 to 1.5 N HNO_3 , and the mixt is shaken for some time. After 5 to 10 min the flask is filled up and the contents are filtered. Cl is detd in 20 cc of filtrate by the Volhard method. Dark filtrates are cleared with H_2O_2 and heating

B J C v d H

Cyanogenetic glucosides in food products. Ulas Hordh. *Anal. Assoc. quim Argentina* 23, 67 86 (1935).—Cyanogenetic glucosides (I), encountered in a no. of foods and fodders, are very toxic, and strict regulations as to permissible content of HCN allowed must be enforced, or the sale of such products prohibited if products free from I can be obtained. Plants, foods and fodders which contain I are reviewed, with data on the content of I, including oil of bitter almonds, and com substitutes. Regulations in force as to permissible contents are given, with special reference to certain prohibited materials. Methods of analysis used in the Argentine Government lab are reviewed

E M Symmes

Protein studies [on wheat and barley]. W F Geddes. Can. Dept. Trade & Commerce, Dominion Grain Research Lab., *8th Ann. Rept.* 1934, 6-15.—Data are given on the protein contents of the 1934 western Canada hard red spring wheat crop, the 1933 and 1934 western Canada Amber Durum wheat crops, the 1934 western Canada barley crop and export cargoes of contract grades of hard red spring wheat

K D Jacob

Milling and baking studies. W F. Geddes. Can. Dept. Trade & Commerce, Dominion Grain Research Lab., *8th Ann. Rept.* 1934, 15-31.—Data are given on the milling and baking characteristics of the 1934 western Canada hard red spring wheat crop and on the comparative quality of cargoes of corresponding grades of hard red spring wheat ex Atlantic and Pacific ports. The carotene contents of the flour were 1.72-2.23 p p m and increased with decrease in the grade of flour. As indicated by H_2O absorption, loaf vol., grain and texture there were no significant differences in the baking strengths of the 1st 5 or statutory grades of flour. However, the com. grades gave higher absorption, lower loaf vol., inferior crumb color and grain and texture. The protein contents of normal and weathered wheats from the Peace River

district were practically equal and weathering had no significant effect on the diastatic activity and baking strength of the flour

K D Jacob

The physical chemical characteristics of flour. F. DeRege. *Giorn. risicoltura* 25, 10-18, 132-42, 174-80, 204-13 (1935).—The "pneumodynamometer" is used for testing semolina and flour for absorption, cohesion, consistency, etc. The theoretical parts relate, e g., to the influence of temp. upon the phys. properties of doughs. Tables are given showing the amt. of water necessary for doughing 100 g semolina and the logarithm of the "doughing constant". The dough used in the tests is prepd. by adding to the semolina such an amt. of 3% NaCl soln. as will make a dough contg. 42.5 parts of H_2O (the flour is assumed to contain 14% moisture).

J A Le Clerc

Moisture determination in flour by means of dielectric constant. P. Cohen Henriquez and A. W. Renaud. *Chem. Weekblad* 32, 526 (1935).—In order to obtain good results in the direct a. detn. with flour a const. packing condition must be used with 1 cc. powder weighing at least 0.8 g. The resulting accuracy is 0.1% H_2O . The dioxane method is unsatisfactory for flour

B. J. C. v. d. H.

Detection of rice in wheat flour. Riccardo Tuffi and Elena Borghetti. *Ann. chim. applicata* 25, 351-4 (1935).—Admixts. of rice in wheat flour can be detected by dyeing with equal parts of 0.2% methylene blue and 0.1% eosin A soln. and exang. with a microscope. Rice flour is dyed a greenish blue with groups of violet-tinted granules, whereas, the wheat flour remains colorless, or is dyed a pale blue, while the accompanying proteins are dyed violet. Admix. of 1.0% rice flour can be detected by this method

A. W. Conti

Animal experimental investigation of the action of flour-treating agents II. Effect on the vitamin of flour and on the animal organism when bread is fed exclusively. István Vitéz. *Z. Untersuch. Lebensm.* 70, 258-65 (1935), cf. C. A. 29, 1890, 3738.—The results obtained in these expts confirm those previously obtained. The increase in wt. due to vitamin addn. was highest with Na perborate. This large increase, as well as the considerable retardation in development which had occurred during the feeding expts in the same group, permits the conclusion that the Na perborate injures the vitamin of the flour more than the other treating agents. Therefore, vitamin A was lacking first in the organism of the rats belonging to this group and the animals reacted to vitamin addn. with a large increase in wt. The low wt. value obtained with NH_4 persulfate may possibly be explained by the fact that it liberates O more quickly than Na perborate, perhaps through the influence of the moisture of the flour, so that the flour remains in contact with the O for a shorter time, whereby the vitamin is exposed to the destructive influence in a lower degree. Although these treating agents destroy

the vitamin of the flour, that does not mean harm to man with a satisfactorily balanced diet, which supplies the vitamin requirements of the body. However, even under these circumstances, they lower the food value of the flour, not in the sense of calories, but with respect to the vitamin value, by diminishing its availability which is no longer sufficient, in the case of a one-sided diet, so that severe harm may be done. The ash content permits conclusions as to the metabolism of the bones. III. Effect of oxidizing flour treating agents on the vitamin of flour. *Ibid* 265-9.—Na perborate and benzoyl peroxide damage one vitamin of the flour to a high degree. The injurious action of the treating agents is not compensated for by special doses of vitamin B, but by vitamin A. The compensating action of vitamin A permits the conclusion that the treating agents tested destroy the vitamin A of the flour, that is, its carotene. F. L. Dunlap

Determination of sugars in flour and bread. Angela Vercillo *Ann chim applicata* 25, 379-84 (1935).—Most procedures for detg. sugar in flour or bread call for extrn. with water without making any provision for inhibiting diastase action during the extrn., which consumes some of the sugar present. By extrn. in the presence of basic Zn or Pb acetate, which is then eliminated by addn. of H_2SO_4 , and then detg. the sugars, after clarifying the soln. with $ZnFe(CN)_6$ (made by the interaction of $K_4Fe(CN)_6$ and $Zn(AcO)_2$), the above objection is eliminated. A. W. Contieri

The physicochemical properties of bread doughs. Giovanni Insoglio *Ann chim applicata* 25, 274-92 (1935), cf. C A 28, 1782a.—A tension hysteresometer is described for measuring the hysteresis of bread dough after tension has been applied. It gives a measure of the viscosity, modulus of elasticity and hysteresis of the dough. A. W. Contieri

Milk and milk products at Warsaw (Poland). Zygmunt Leyko *Wladomosci Farm* 62, 503-6, 520-2, 531-4, 545-52 (550-2 in German) (1935).—The work of controlling milk and milk products in Warsaw is described. Of 28,812 samples exam'd 7.83% were adulterated and 1% contaminated or spoiled. By examg. the f. p. of the milk even less than 5% of added water can be detected, provided Na_2CO_3 has been used to neutralize natural acids. However, since both ingredients are usually added the cryoscopic method does not suffice. In such a case fractionation of the serum is very helpful. Adulterants such as flour are easily recognized in cream and butter with chemicals or under the quartz lamp. Good butter shows, under the lamp, a canary-yellow color, which is changed by surface oxidation into yellow-gray. It is, therefore, necessary to exam. samples taken from the interior of the lot, to obtain the pure yellow color given by fresh butter. Rancid butter is adulterated by neutralizing with soda, washing, and flavoring with butyacet. J. Wiertelak

Inspection of milk at point of production. Jorge de la Earp *Rev. Dept. mod. produccion animal* 1, 177-98 (1934).—An outline of known methods. O. W. W.

Quantity and quality of milk from grade cows. M. H. French *Tanganyika Territory, Ann. Rept. Dept. Vet. Sci.* 1934, 73-8.—Data are given on the contents of fat and solids-not-fat in the milk of various breeds of cows in Tanganyika. K. D. Jacob

The influence of streptococcal infection of the udder on the flavor, chloride content and bacteriological quality of the milk produced. C. S. Bryan and G. M. Trout *J. Dairy Sci.* 18, 777-92 (1935).—The av. percentages of Cl in 2 streptococcal infected herds were 0.192 and 0.2263, resp., while noninfected samples from the same herds averaged 0.1374. Most samples of mastitis infected milk tasted salty. Streptococcus infection seemed to affect the quality of milk from noninfected quarters of the same cow. Philip D. Adams

Flavors of milk and their control. C. L. Roadhouse and J. L. Henderson *Calif. Agr. Expt. Sta., Bull.* No. 595, 5-30 (1935).—Full rations of green or dry alfalfa hay, or corn silage fed 1-2 hrs. before milking produced strong, undesirable feed odors in milk. If these feeds were withheld during the 5 hr. interval before milking, no

objectionable flavor was observed. In general, feed flavors were strongest in the milk about 45 min. after feeding. Improperly cured hay having a musty odor transmitted a musty flavor to the milk. Wheat bran seemed to improve the flavor of milk. Salty taste was observed in milk from cows late in lactation and also from 1 or more quarters previously affected with mastitis. Rancid milk was produced by certain cows that had been milking for longer than the usual lactation period. Lipase in the milk produces this defect. Lipase is normally present in the blood of cows but the conditions governing its presence in milk are not known. Pasteurization destroys lipase in milk. Milk which has been in contact with certain corrodible metals may develop oxidized flavors. Cu and its alloys are the most common causes of oxidized milk. Exposure of milk to sunlight may produce tallowy flavors. C. R. Fellers

Determination of the freezing point of milk. C. A. Koppejan *Chem. Weekblad* 32, 657 (1935).—The newer method of f. p. detn. of Gangl and Geschke (C A 29, 1891a) is much faster than that of Dekhuizen (C A 8, 1624, 2007, 3602) and is also very reliable. If the milk is kept at melting ice temp. for some time, there will be no noticeable difference in the f. p. of the milk whether it has previously been skimmed or not. N. Bekkedahl

The addition of mineral salts and vitamins to milk. Ir. P. Schoorl *Nederland. Tijdschr. Geneeskunde* 79, IV, 4887-91 (1935).—Mineral deficiency of cow milk is remedied by the addn. of salts to the milk rather than by the addn. of the salts to the diet of the cow. The iron and copper contents of the milk cannot be influenced by the diet. Vitamin A and D deficiency can be improved by selecting foods rich in these vitamins for the cow. To increase the vitamin B content the addn. of this vitamin to the milk is recommended. R. Beutner

Relation between the vitamin A content of the dairy ration and that of milk. Walter C. Russell, M. W. Taylor, D. F. Chichester and Logan T. Wilson *N. J. Agr. Expt. Sta., Bull.* 592, 3-11 (1935).—High-grade field-cured alfalfa, or machine-dried alfalfa, and corn silage contributed 98% of the vitamin A value of a dairy ration in which, in addn. to these constituents, there were beet pulp and a grain mixt. contg. yellow corn and corn gluten. Corn silage supplied $1/2$ to $1/3$ of the vitamin A content of the ration and therefore it can be classed as an important source of vitamin A in the dairy ration. When the daily vitamin A intake was of the order of 900,000 to 1,200,000 U. S. P. X 1934 units, the vitamin A potency of the milk from mixed breeds was of the order of 2500 units per qt. In another instance the feeding of 850,000 units produced a milk of 1600 units potency. In no instance did the output of vitamin A in the milk exceed 3.5% of the intake in the ration. The percentage of the factor which appears in the milk decreases as the amt. of the factor in the ration is increased and the increase in vitamin A content of the milk is not proportional to the increased consumption. C. R. Fellers

Study of the lecithin content of milk and its products. B. E. Horrall *Ind. (Purdue) Agr. Expt. Sta., Bull.* 401, 31 pp. (1935).—The Mojonnier modification of the Rose-Gottlieb method was used to ext. the org. P along with the fat from dairy products. The colorimetric method of Deniges modified by Truog and Meyer (C A 23, 4163) was found to be an accurate method for the detn. of org. P in dairy products. The lecithin content was calc'd from the P obtained by multiplying it by 25.94, which is the factor for the oleyl-stearyl type of lecithin. The lecithin contents of the milk from 3 dairy cows show that the fat contains a fairly const. percentage of lecithin after the fourth day of the lactation period. The colostrum milk fat contained a higher percentage of lecithin than did the fat of the milk later. The lecithin content increased after the calf was dropped, then decreased rapidly until the amt. was fairly const. Factory milk contained a higher percentage of lecithin in the fat than did that of the fat from milk coming from normal individual cows. The av. increase was 0.21%. Udder infections (mastitis) caused an increase in the percentage of lecithin in the fat

of the milk when compared to that coming from normal quarters of the cow. The lecithin content of skim milk was 13.91% of the fat. Raw sweet cream contained 0.428% lecithin in the fat while raw sour cream contained 0.422%. Pasteurized sweet cream butter contained an av. percentage of 0.232 lecithin in the fat while that of pasteurized neutralized sour cream contained 0.170%. Buttermilk from pasteurized sweet cream contained 19.66% lecithin in the fat while that of pasteurized, neutralized raw cream averaged 17.88. The percentage of lecithin in the fat of separator slime averaged 12.38. The results of a trial show that the lecithin content decreased materially in butter from sour cream while that of sweet-cream butter remained practically the same over a storage period of 24 days. The detn. of the lecithin content in hen eggs shows that the fat contains on the av. 26.64% lecithin and is fairly const. A method is given for the detn. of the amt. of eggs in ice-cream mix. Fifty-eight references. C. R. Fellers

Identification of vegetable lecithins as substitutes for eggs in alimentary pastes. Domenico Costa. *Ann. chim. applicata* 25, 355-79 (1935).—A detn. of the I_1 value of the lecithins in alimentary pastes by itself is not enough to distinguish whether eggs or vegetable lecithins have been used, since it is possible to dissolve the lecithins in such fats that the I_1 value is the same as if eggs had been used. However, the vegetable lecithins commercially known as "Plantins" can be identified by (1) the deficiency of cholesterol in proportion to the lecithin-phosphoric acid contents, and (2) by the absence of lecithin-phosphoric acid combined with albumin. A. W. C.

Substances adsorbed on the fat globules in cream and their relation to churning. IV. Factors influencing the composition of the adsorption "membrane." Charles E. Rimpla and L. S. Palmer. *J. Dairy Sci.* 18, 827-39 (1935); cf. C. A. 28, 1785.—The percentages of protein and phospholipides in the fat globule "membrane" are not const. for various samples of cream but are essentially const. for any given sample after the fourth through at least the tenth washing. The "membrane" found on butter-fat globules emulsified in sweet rennet-whey, skim milk or buttermilk differs from the natural "membrane" in its percentage and proportion of protein and phospholipides, and the Van Slyke N distributions of the "membrane" proteins are not the same. A large part of the phosphatase activity of natural cream is in the "membrane" material and is not removed by water washing. In the synthesis of milk the "membrane" is not derived from the milk plasma. The "membrane" proteins of natural cream and of artificial creams appear to contain a prosthetic group, so far not identified, which causes the N content to be abnormally low as compared with other known proteins of similar complexity. Philip D. Adams

Preparation of a nondesiccated sodium caseinate sol and its use in ice cream. E. W. Burd, H. W. Sadler and C. A. Iverson. *Ida. Agr. Expt. Sta., Research Bull.* 187, 179-208 (1935).—The body and texture of ice cream are improved by the replacement of dry skim milk by Na caseinate sols. This improvement was shown up to 2.5 to 5.0% replacement, depending on the compn. of the mix. The flavor of ice cream was progressively improved by the replacement of dry skim milk by Na caseinate sols up to 3 to 4% replacement, depending on the compn. of the mix. This flavor improvement was due to the careful pH control used in the prepn. of the Na caseinate sols. The type of melting of the ice cream was altered by the replacement of dry skim milk by Na caseinate sols. The use of Na caseinate sols increased the initial and max. overrun and decreased the whipping time of the ice creams produced. From 1.5 to 3.0% replacement of dry skim milk by the Na caseinate sols is necessary to effect sufficient improvement in whip to warrant their use. A 3% replacement would be necessary with a mix contg. 14% fat and 10% serum solids. The use of Na caseinate preps as adul. solids, i. e., in addition to the amts. of serum solids (8 to 10%) commonly used by the trade, has been suggested. The amts. of milk protein that would be required to yield sufficient improvement in whip and in body and

texture score would be large enough to make their use questionable. C. R. Fellers

Butter, fats and fatty oils. H. M. Langton. *Food* 5, 147-8 (1935).—A very brief review of recently published Brit. standard specifications, U. S. specifications for olive oil at present under consideration and recently published work on I and thiocyanogen values of butter fat, and Ac_1 in butter cultures. A. Papineau-Couture

Butter, its classification on a scale of points. Beatriz G. de sa Earp. *Rev. dept. nacl. producao animal*, 1, 199-208 (1934).—A discussion of organoleptic tests. O. W. Wilcox

A new index for butter. Renato Lucenutti and Elsa Drago. *Ann. chim. applicata* 25, 388-91 (1935).—A new test is proposed to replace the Reichert-Meissl test. The acids sol. in a satd. soln. of K_2SO_4 are detd. in terms of cc. of 0.1 N NaOH. The test is carried out as follows: 5 g. of melted and filtered butter is saponified by heating with 2 cc. of 50% KOH soln. (carbonate free) and 20 cc. of pure glycerol for 10 min. The whole is transferred to a segg funnel, 12 cc. of H_2SO_4 (conc.) added, and the fats are extrd. with Et_2O . The Et_2O is distd. off, and 100 cc. of a satd. soln. of K_2SO_4 added to the residual fat. The soln. is heated for a few min., then filtered and the filter washed with the K_2SO_4 soln. above. The soln. is then titrated hot with 0.1 N NaOH, with phenolphthalein as indicator. Genuine butters give acid nos. of 18 or over (18.6-20.9 reported), while suet, cacao butter and hydrogenated cacao butter, common adulterants, have values of about 3, 5 and 4, resp. A. W. Contieri

Study of the various standards adopted for the examination of Indian butter and ghee. S. D. Sunawala. *Agr. Live-stock India* 5, 480-8 (1935).—The recommended standards are H_2O content less than 0.7% (with ghee only), butyrefractometer reading 42.0-42.5 at 40°, Reichert-Meissl value not less than 20, Polenske value not more than 2.5, Kirschner value not less than 16, sapon. value not less than 218, I value 30-38 and free fat acids less than 1%. K. D. Jacob

The vitamin A activity of butter produced by cows fed alfalfa hay and soybean hay cut in different stages of maturity. J. H. Hilton, S. M. Hauge and J. W. Wilbur. *J. Dairy Sci.* 18, 795-800 (1935).—Artificially dried hay is superior to the corresponding field-cured hay in vitamin A value. Hay from young plants has greater vitamin A value than hay from older plants. Alfalfa plants have higher vitamin A value than soybean plants. Cows fed artificially dried young alfalfa hay produced butter having 45 vitamin A units per g. Philip D. Adams

Reduction of acetylmethylcarbinol and biacetyl to 2,3-butyleneglycol by the citric acid fermenting streptococci of butter cultures. B. W. Hammer, G. L. Stahly, C. H. Werlman and M. B. Michaelian. *Ida. Agr. Expt. Sta., Research Bull.* 191, 381-407 (1935).—When acetylmethylcarbinol or biacetyl was added to a tomato-bouillon culture of 1 of the citric acid-fermenting streptococci normally present in butter cultures, there was a rapid disappearance of the added reagent and an increase in 2,3-butyleneglycol. The amt. of the glycol produced accounted, in a general way, for the acetylmethylcarbinol or biacetyl that disappeared. The added reagent did not usually disappear completely. In trials with acetylmethylcarbinol the change of the carbinol to the glycol was delayed when H_2SO_4 was added in amts. to yield a pH of 3.8-4.0. There was also a change of acetylmethylcarbinol or biacetyl to 2,3-butyleneglycol when 1 of these reagents was added to a milk culture of 1 of the organisms. When various amts. of H_2SO_4 were added to milk cultures of the organisms, acetylmethylcarbinol was not produced at the higher pH values but was produced at the lower values, while 2,3-butyleneglycol was produced at both the higher and lower pH values. There was less of the glycol formed at the lower pH values than at the higher ones. The addn. of 0.65% citric acid to a milk culture of 1 of the organisms resulted in an increase in both acetylmethylcarbinol and 2,3 butyleneglycol. The reduction of acetylmethylcarbinol, which had been added to a milk

culture of 1 of the organisms, to 2,3-butylene glycol was not delayed by KNO_3 but was delayed by the largest amt of H_2O_2 employed. The increased production of acetyl methylcarbinol is accounted for by a decrease in the reduction of the carbinol to the corresponding glycol, rather than to an aldehyde condensation involving, in part, the added aldehyde. In butter cultures the decrease in acetyl methylcarbinol was accompanied by an increase in 2,3 butylene glycol, and there was commonly an increase in the total molalities of the 2 compts. When ripened butter cultures were neutralized to a low acidity there was a rapid decrease in the acetyl methylcarbinol, and in some of the trials this was followed by an increase. H_2O_2 , Na fumarate and ice-water temps. delayed the reduction in either neutralized or unneutralized cultures, but the reduction was more rapid with neutralization than without.

C. R. Fellers
Rapid casein determination in buttermilk porridge. F. Th. van Voorst. *Chem. Weekblad* 32, 478-9 (1935).—The method of Kauffmann-Havinga (*Handelingen Genootschap Melkkunde* 1931) was modified for more rapid work. To 50 g. porridge, weighed in a porcelain dish, 25 cc. H_2O is added, 10 cc. NaOH and a few drops of phenolphthalein; the mixt. is heated to 40° on a water bath, cooled and again heated to 40° . After cooling the mixt. is washed with about 250 cc. 1% Na oxalate soln into a 500-cc. volumetric flask, left for 1 hr. after repeated shaking and filled up with Na oxalate soln. The next day 10 cc. is pipetted into a 100-cc. Kjeldahl flask, heated with 2 cc. 96% H_2SO_4 until all H_2O has evaporated and then cooled, 1 cc. 30% H_2O_2 added and heated until the soln. becomes colorless, and the vol. reduced to half. The contents are then diluted with H_2O , transferred to a 300-cc. Erlenmeyer flask, neutralized, first with 4 N NaOH, then with 0.1 N NaOH to exact neutrality to methyl red. Ten cc. neutralized (to phenolphthalein) formaldehyde is added and the mixt. titrated with 0.1 N NaOH to phenolphthalein. The titration figure, 2-3.5 cc. usually, multiplied by 0.715, gives the casein percentage. B. J. C. v. d. H.

The solubility-freezing point relationships of water solutions saturated with respect to sucrose and dextrose in relation to the storage of sherbet and water ice. Alan Leighton and Abraham Leviton. *J. Dairy Sci.* 18, 801-3 (1935).—The ternary eutectic temp. of the system sucrose-dextrose-water is -17.9° and the proportion of sucrose to sucrose is 1 to 4.11. Philip D. Adams.

Chemical composition of duck eggs. A. K. Danilova and V. A. Nefedova. *Biochemisches Zentr. B. Tierernähr.* 7, 532-42 (1935).—A study has been made of the eggs of 2 kinds of ducks. Peking ducks and Runners. The egg wt. as a whole and the wts. of the single constituents (egg white, egg yolk and shell) changed during the laying period. The highest values were found in the eggs of the Peking duck in May, those of the Runner in June. Probably this is related to the cycle of increasing egg production. The wt. of the egg white and egg yolk of the eggs from Peking ducks changed regularly in relation to egg production, eggs of ducks with a high production contained more egg white and yolk. Such a relationship between the constituents of the eggs of the high- and medium-producing Runner was less apparent. The chem. compn. of the eggs changed during the producing period. The H_2O content in the egg white and yolk of the eggs of the Runner increased during the summer months. The protein content of the egg white increased in June and decreased in July. The ash content varied little. Protein content and ash of the egg yolk decreased in the summer months. The fat content of the egg yolk is highest in June. The contents of H_2O and fat in the eggs of Peking ducks are highest in the summer months. The influence of egg production on the change in chem. compn. of the eggs of Peking ducks is without importance. As to the Runner, the nutritive value of the egg yolk increases with increasing production. The egg white of small eggs has a smaller nutritive value. The content of H_2O is higher, while the content of protein and ash is smaller. The nutritive value of the egg yolk is higher; the H_2O content is smaller and that of the fat is higher. The shrinkage in wt. on keeping the eggs for 2

months was 19% in the case of the Runner and 12% in that of the Peking duck eggs. F. L. Dunlap.

Recent meat researches. Arthur W. Ewell. *Refrigerating Eng.* 30, 367-8 (1935).—Growth of bacteria common to meat surfaces ceased at humidities below 92% but the bacteria grew with great rapidity at the highest attainable humidity, viz., 99%. There was some evidence that with continued exposure to ozone mold became acclimated to it and growth was to a smaller degree checked. Time of storage can, however, be very appreciably increased by the use of ozone because of decrease in the spread of infection rather than on account of destruction of microorganisms. A. H. Johnson.

Lead determination in preserved meat. N. V. Shurokov and D. S. Mündina. *Z. Unters. Lebensm.* 70, 245-51 (1937).—A colorimetric sulfide method is described in which it is unnecessary to remove other metals which may be present. By this method, it is possible to detect 0.25 mg. and to det. 0.5 mg. of Pb in 1 kg. of preserved meat. The method is simple and an analysis can be finished in 2-2½ hrs. Thirty-eight references.

F. L. Dunlap
Starch determination in sausage. N. V. Shurokov and M. K. Milovidova. *Z. Unters. Lebensm.* 70, 251-5 (1935).—The method of direct inversion gives satisfactory results. The method is not troublesome and results can be obtained in about 2 hrs. P. L. Dunlap.

Effect of method of manufacture on the composition of haddock fish meal proteins. S. R. Pottinger, Roger W. Harrison and Andrew W. Anderson. U. S. Bur. Fisheries. *Investigational Rept.* 31, 1-14 (1935).—There are 3 general conditions encountered in the manuf. of nonoil fish meal which have an effect on the compn. of their proteins. These are (1) difference in the proportion of head and backbone wastes, (2) the removal of water-sol protein material by the wet process and (3) method of drying. The backbone portion of haddock-fillet waste has a larger percentage of protein than the head portion of the waste, and the proteins of the backbone material contain higher percentages of tyrosine and tryptophan. Thus variations in the proportion of head to backbone material will not only give meals of different protein contents but proteins of different amino acid compns. Meals contg. the greater proportion of backbone waste will have a higher protein content and, because of the higher tyrosine and tryptophan percentages in the protein, should have higher biol. values. The water-sol proteins removed by the wet process are relatively devoid of tyrosine, tryptophan and cystine. The wet process yields meals of lower protein content, but the protein of such meals has a slightly higher percentage of the 3 essential amino acids being considered. The proteins of wet-process meals might be expected to show slightly higher biol. values than the proteins of dry-process meals. Drying causes a diminution of cystine if the meals are heated much over 38° . Tryptophan apparently is affected by drying temp. also, but to a smaller extent. Tyrosine is probably not affected at all, unless extreme temp. conditions are encountered. Because of the apparent effect on cystine and tryptophan, fish meal proteins would be expected to be of slightly lower quality than the original protein in the raw material. The relative diminutions of the 3 amino acids caused by the various methods of drying, however, indicate that appreciable difference in protein quality should not be expected unless rather extreme conditions of drying are encountered. C. R. Fellers.

Studies on drying cod and haddock waste. Andrew W. Anderson, Roger W. Harrison and S. R. Pottinger. U. S. Bur. Fisheries. *Investigational Rept.* 32, 3-41 (1935).—In the manuf. of ground-fish meal difficulty is encountered with material sticking to, and baking on, the walls of the drier. Steam pressure and vacuum cause variation in the amt. of cake formed. High steam pressures and high vacuum, both conducive to high rates of heat transfer, produce the greatest amt. of cake. Cut raw waste produces thinner cake than uncut raw waste. A charge of cut waste can be dried to a 9% moisture content more rapidly than a similar amt. of uncut material. The 5 gal. agitator produces better agitation than the scraper type

but the more complicated construction does not permit as great a charge. A spiral agitator with adjustable scraper edges probably would be more efficient. Very little cake forms with wet-process methods and none becomes detached. Raw haddock waste averages 77% moisture. Com. centrifuge cake and lab centrifuge cake average about 64% moisture. Equipment, operating and fixed costs are greater for dry-reduction plants than for wet-reduction plants of similar capacity. Dry-process methods yield 25% meal while wet-process methods yield only 20% meal from a given amt. of raw material. Providing 1500 tons or more of raw waste is utilized during the season, the 25% greater meal yield by the dry process more than counteracts the greater production cost. This advantage increases with increase in amt. of waste utilized and price of meal. Two-ton reduction plants offer the max. opportunity for profit per ton of raw waste processed, but 1-ton plants show a greater advantage for the dry process. C. R. Fellers

Comparative study of commercial pectins. G. J. van der Die. *Chem. Weekblad* 32, 557-8 (1935).—Several com. samples of citrus and apple pectins were exam'd for ash content (1.75-11.65%), furfural phloroglucide yield (Tollens, 19.5-37.1%), MeOH content (Fellenberg, 3.1-10.8%), Ca pectate yield (Harricotte, 47.9-92.4%), CO₂ evolution (Lefevre, 10.9-19.0%), gelling power (Tarr-Baker), viscosity of aq. 0.75% soln. at 27° (1.71-6.59), η_{sp} of this soln. (2.8-4.2) and acidity (0.5-1.3 cc. 0.1 N alkali). The presence of impurities in practically all samples was evident. The MeOH-CO₂ ratio for completely esterified carboxyl groups should be 0.727:1, it was from 0.703 to 0.233:1. The Ca pectate to CO₂ ratio, theoretically 4.4:1, was between 4.39 and 5.07:1. One pectin with abnormally high viscosity and poor gelling power had been acid-treated. B. J. C. v. d. H.

The cool storage of plums. First progress report. G. B. Tindale, S. A. Trout and F. H. Heulin. *J. Dept. Agr. Victoria* 33, 552-4 (1935).—As compared with the controls, the storage life of plums was reduced by 1 week in the presence of 5% CO₂ and by 2 weeks in the presence of 10% CO₂. Serious browning of the flesh occurred in the presence of 15% CO₂. K. D. Jacob

Concentrated grape juices from California. Ernst Vogt. *Z. Untersuch. Lebensm.* 70, 307-8 (1935).—Analytical data are given for 3 samples, which are designated as Riesling, Muscatel and Burgundy. F. L. Dunlap

Black-current flavor. H. Stanley Redgrave. *Am. Perfumer* 31, 94-5 (1935).—The characteristic flavor of the black current, as also of the leaf, is either attractive or repellent, according to the taste of the resp. individual. In France the sirup known as "cassis" is made up by exg. the flavoring material from black currents with alc. & dilg. the ext. with more alc. and mixing with sugar and H₂O. Sometimes flavoring materials derived from other fruits are added, or the flavor may be modified by the addn. of cloves and cinnamon. As a cold drink the sirup is used in admixt. with ice water, either alone or with the addn. of white wine, suze (a gentian ext.), etc., and is remarkably palatable and refreshing. Various formulas are presented as artificial substitutes for black current flavor, but the genuine flavor is so readily prep'd. that such substitutes, as passion fruit flavor, cannot seriously compete. W. O. E.

Preparation of and regulations concerning fruit and vegetables for export in California. Th. Frémont. *Bull. soc. sci. hyg. aliment* 23, 282-323 (1935). A. P. C.

Variations in keeping qualities of different varieties of vegetables and the reasons therefor. B. A. Rubin and V. E. Trupp. *Compt. rend. acad. sci. U. R. S. S. [N. S.]* 3, 225-8 (1935).—In this attempt to connect the variation in keeping qualities of vegetables with inner biochem. varietal characteristics, varieties of onions and cabbages with poor and excellent keeping qualities were stored and exam'd. every 40-45 days for loss in wt., wt. of dried substance, monosaccharides, sucrose, sol. sugars, cellulose, total N, protein N, catalase and invertase. Tabulation showed that the Misterski onion, a biennial with good keeping qualities, has a high sugar loss but that, in contrast

to the poorly keeping Spanish variety, its protein complex is unchanging. Similarly, the variety of cabbage characterized by its good keeping qualities loses considerably more sugar during the period of keeping than the variety that spoils quickly. Also, the ratio of disaccharides to monosaccharides is greater in the stable varieties of both onions and cabbage. The biochem. nature of good keeping quality lies neither in weakened metabolism nor in a lowered energy expenditure of the plant substance but in the high expenditure of sugar reserves. C. R. A.

Vitamin C content of the Russet Burbank potato. Ella Woods. *Ida Agr. Expt. Sta. Bull.* No. 219, 3-29 (1935).—The raw, baked or boiled potato was usually protective at the 8-g. level. New immature potatoes contained fully twice as much vitamin C as fresh mature potatoes. Storage of 3-8 months had little effect on vitamin C content. Marked tissue changes in guinea pigs occurred before outward signs of scurvy were manifest. C. R. Fellers

Chemical determination of the quality of canned green peas. Zoltan I. Kertesz. *N. Y. Agr. Expt. Sta. Tech. Bull.* No. 233, 3-26 (1935), of C. A. 28, 6870¹.—An attempt to evaluate the quality of canned peas by the detn. of total, water-insol. and alc-insol. solids in raw peas was unsuccessful. In canned peas the scores for maturity and tenderness, on 1 hand, and flavor on the other, are strictly proportional, thus conclusions regarding the flavor might be drawn from the maturity score. A study was made of the possible use of contents of total solids, alc-insol. solids, and water-insol. solids of canned peas for the detn. of maturity. Of these, the content of alc-insol. solids is best suited for the evaluation of maturity and quality of canned peas. Two possible grading systems are proposed in which the detn. of the alc-insol. solids replaces the organoleptic evaluation of maturity plus tenderness and the flavor in addn. The correlations between results obtained by the chem. methods and by the standard method of the U. S. Dept. Agr., *Circ.* No. 164 (1931), are shown and discussed. C. R. Fellers

Composition of Hungarian beans. István Szanyi. *Z. Untersuch. Lebensm.* 70, 200-74 (1935).—See C. A. 29, 2615¹. F. L. Dunlap

Composition of pumpkin and squash varieties as related to the consistency of the canned product. D. M. Doty, J. H. McGilivray and H. R. Kraybill. *Ind. (Purdue) Agr. Expt. Sta., Bull.* 402, 28 pp. (1935).—The consistency of canned pumpkin and squash is markedly affected by variety, maturity and chem. compn. Of the 4 varieties studied, Boston Marrow squash, Kentucky Field pumpkin and Connecticut Field pumpkin yielded fruit producing rather low-consistency packs all 4 years of the investigation. Golden Delicious squash yielded fruit producing a very high-consistency pack the first 2 years, but a low-consistency pack the last 2 years. Fruits from all varieties yield a pack of higher consistency if canned when slightly immature or barely ripe. The contents of starch and of solids in all pumpkin and squash varieties reach a max. at about the same time that the fruit yields a pack of max. consistency. This indicates that starch and solids, especially insol. solids, affect the consistency of the canned product to a great extent. It is possible markedly to increase the consistency of the pack from low-consistency varieties by pressing or by blending with a high-consistency variety having high total solids and starch. In the com. canning of pumpkin and squash as carried out in Indiana factories, large amts. of sol. solids are lost during the wilting process and during the pressing process after wilting. During storage, pumpkins and squashes rapidly lose solids, especially starch, by respiration. Indirectly this causes a decrease in the consistency of pumpkin and squash canned after storage, so this practice should be avoided by canners as far as possible. C. R. Fellers

Analyses of corn and buckwheat. W. F. Geddes. *Can. Dept. Trade & Commerce, Dominion Grain Research Lab., 5th Ann. Rept.* 1934, 35.—Samples of the Nos. 1, 2 and 3 grades of the 1934 crop of Canadian buckwheat contained crude protein 11.4, 11.0, 10.9; crude fat 2.7, 2.8, 2.6; crude fiber 8.6, 8.9, 9.1; ash 2.0, 2.1, 1.6;

and N-free ext. 61.8, 61.7, 62.3%, resp., calcd. to the basis of 13.5% moisture. K. D. Jacob

Composition of Italian honeys Giovanni Canneri and Renato Salani *Ann. chim. applicata* 25, 397-406 (1935).—Twenty-two honeys were examd. The ratio of fructose to glucose varies from 1.011 to 1.684; thus the criterion that the ratio should be greater than 1.00 is in error. The Schiff-Sorensen test for proteins gives low results, so a mix of picric and citric acid was used to ppt. the proteins. This test gives results which agree fairly well with Lund's method. A. W. Conner

The vitamin content of honey Zofia Markuze *Arch. Chem. Farm.* 2, 175-82 (1935) (English summary).—Two samples of Polish honey, investigated for vitamins, show the presence of vitamin B₁. Vitamins A, B₂, C and D are not found. J. Wiertelak

Identification of cacao shells in cacao Wilhelm Flahl *Z. Unters. Lebensm.* 70, 289-90 (1935). I. L. D.

Study of the wet fermentation of coffee A. Fritz *Agron. col.* 24, 41-7, 72-81 (1935). *Chimie & Industrie* 34, 1197.—The object of the wet fermentation of coffee is to permit a perfect cleansing of the seed from the particles of mesocarp still adhering when they have passed through the depulpers. The optimum temp. is 33-40°, as pectinase possesses max. activity at 35-45°. The activity of fermentation increases with the amt. of pulp remaining on the seed, but in practice the advantage of active fermentation is offset by difficulties in the subsequent washing when there is an excessive amt. of residual pulp. Normal fermentation requires 26-36 hrs., but in practice it is limited to 12-14 hrs. to avoid the action of diastases, produced by certain molds, which act on the periphery of, and even inside, the seed to convert starch into pectin. To decrease the duration of fermentation, after depulping the seed is treated with a little lime to accelerate the conversion of pectic acid into Ca pectate and to activate the pectinase. Air is also injected into the mass up to the point at which butyric fermentation sets in. The fermenting mass is washed at the end of 12 hrs. to remove waste materials which interfere with the action of pectinase. As pectic acid is sol. in alkali carbonates and in (NH₄)₂CO₃, the mucilaginous tissues covering the seed after depulping can be removed without fermenting by covering the seed with water to a depth of 1-2 cm., sprinkling finely ground Na₂CO₃ and washing after allowing to stand for 15 min. Stirring by means of mech. agitators or compressed air is advisable. It is preferable first to soak the seed in a weak milk of lime. The Na₂CO₃ treatment can also be applied after a 12 hr. fermentation. Fermentation may be preceded by a 30-60 min. treatment with papain, which decomps. proteins with formation of amino acids.

Tea leaves III. Chemical constitution of tannin in tea leaves Yasuyoshi Oshima *J. Agr. Chem. Soc. Japan* 11, 750-6 (1935); cf. C. A. 28, 1115¹.—Gallic catechol was isolated from tea leaves. Pentacetyl-gallic catechol was converted by Me₂SO₄ and 50% KOH into gallocheatechol pentamethyl ether (I) colorless prisms, m. 184°, [α]_D²⁰ = -15.2°. Reduction of I by Na and methylation by Me₂SO₄ and KOH gave white plates, m. 91°, of α-2,4,6-trimethoxyphenyl-α-3,4,5-trimethoxyphenylpropane (II). 3-Hydroxy-5,7,3',4',5'-pentamethoxyflavylum chloride, violet needles, m. 204-6°, was prepd. from II and phloroglucinolaldehyde dimethyl ether. Reduction with Pt black and AcOH gave 5'-hydroxy-catechol pentamethyl ether, which was identified with I. Thus the cryst. tannin isolated from tea leaves is 5'-hydroxy-catechol. IV. Enzyme chemistry of manufacture of black tea. Yasuyoshi Oshima and Kaneo Hayashi *Ibid.* 757-9.—When the ext. of the bud was added to colorless gallocheatechol with McIlvaine standard buffer soln. in the presence of O₂, the color of the soln. changed to reddish brown. When the ext. was boiled or the soln. was treated in a N₂ atm., the coloration was very faint. A reddish brown powder obtained from d-catechol and gallocheatechol by the enzyme of the tea bud was proved to be their oxidation products. Y. Kihara

Short method for determination of sodium chloride in

mustard. F. Th. van Voorst. *Chem. Weekblad* 32, 498 (1935).—Five g. mustard (liquid) is transferred with 100 cc. warm H₂O into a 200-cc. volumetric flask. After cooling 5 cc. N.K.₂Fe(CN)₆ and 5 cc. 2 N Zn(AcO)₂ are added, the flask is filled up to the mark, the contents are filtered, 25 cc. 0.1 N AgNO₃ is added to 150 cc. filtrate and this is titrated back with KCNS. The percentage of NaCl is 0.156 times the no. of cc. AgNO₃ used.

B. J. C. van der Hoeven
Treatment of molasses for the production of foods, feeding stuffs and fertilizers T. Gaspar y Arnal *Agricoltura* (reprint) 1934, 8 pp. (Aug.-Sept.); *Chimie & Industrie* 34, 931.—Beet molasses keeps indefinitely when undiluted; dilute to a concn. of about 20% it rapidly acquires a repugnant odor and taste. To prevent this decomposition, the soln. from the diffusers is defecated with K₂Fe(CN)₆, which removes NH₃, amines, Rb, Cs, etc. The excess reagent is removed with Mn sulfate, the ppt. is thrown down by centrifuging and the Mn is recovered by treating with CaO.

A. Papineau-Couture
Simple graphic aid in the practical feeding of cattle II. The calculation of feed mixtures with the desired starch value and content in digestible protein by means of nomograms E. Brouwer and A. M. Frens *Biedermanns Zentr. B. Tierernähr.* 7, 496-505 (1935); cf. C. A. 29, 6027².—In practical feeding it is often necessary to prep. with the aid of 2 feeding stuffs, a mixt. with a definite quantity of starch equiv. and digestible crude or pure protein. Usually the solution is found with the aid of 2 equations and with 2 unknown quantities. By means of the principle worked out by B. and F., the desired amt. of both feeding stuffs can be detd. without any computation. Some further applications are also indicated. III. A clear comparison of price values of feed-concentrates without the work of calculation A. M. Frens and E. Brouwer. *Ibid.* 506-16 (1935).—The relation between price and feed value of concentrates is usually estd. in Holland with reference to starch values and protein content. By the application of a system of double scales on a diagram, corresponding to Neubauer's "Feeding Price Table," a nomogram can be constructed, by means of which and without calcs., it is possible to survey the prices of an arbitrary no. of feeding stuffs, in relation to their starch values and protein contents. Some practical applications of nomograms are discussed. F. L. D.

Acidified potato tops as a feed for milch cows J. Schultz, H. Augustin and H. Finzenhagen *Biedermanns Zentr. B. Tierernähr.* 7, 517-31 (1935).—Cold fermentation of chopped potato tops proved to be favorable, but the addn. of some mineral acid or food sugar is to be recommended. A utilization trial with 2 wethers indicated that the ensilaged potato tops had the following digestion values: org. matter 49, crude protein 48, pure protein 33, amides 97, crude fat 58, crude fiber 41 and N-free ext. 52%. The ensilaged potato tops were fed to dairy cows and after a certain period, they ate, on an av., 8 kg. per day. No unfavorable influence was noticed on the state of health, live wt. or milk yield. F. L. Dunlap

Effect of manufacture on the quality of nonfishy fish meals Roger W. Harrison, Andrew W. Anderson and Samuel R. Pottinger U. S. Bur. Fisheries, *Investigational Rept.* 30, 1-30 (1935).—The nutritive value of fish meal produced by haddock and cod wastes is influenced by the process of manuf., the method of drying and the portion of the waste used. The removal of the water-sol protein by the wet process had little effect on the ultimate efficiency of the protein, but decreased the vitamin G value. High drying temps. are detrimental to the quality of the protein and vitamin G, particularly the latter. The head portion of the waste is richer in vitamin G than the backbone portion, but the latter is of higher quality. Flamed-dried nonfishy meals are of inferior quality and should be replaced by meals dried at low temps. The mech. difficulties encountered in drying nonfishy fish wastes without removal of the water-sol extractives can be reduced materially by careful control of steam pressure and vacuum. Under optimum conditions of drying, the cost of rendering 1 ton of waste is greater for the dry than for the

wet process. In the prepn. of dry-process nonoil fish meals, the conditions required for most efficient operation are most conducive to improvement in nutritive value. Vacuum-drying possesses no appreciable advantage over steam drying, either from the standpoint of quality of meal or cost of production.

C. R. Fellers

Maize silage M. H. French, Tanganyika Territory, *Ann. Rept. Dept. Vet. Sci.* 1934, 86-90.—Silage made in Tanganyika from maize cut 73 days after planting contained crude protein 6.20-7.45, Et_2O ext. 1.93-3.20, N-free ext. 52.71-53.26, crude fiber 31.43-31.90 and ash 5.03-6.85% on the SiO_2 -free dry basis. As detd by expts with oxen, the digestibility coeffs. were for crude protein 23.53-36.06, Et_2O ext. 69.37-78.44, N-free ext. 61.78-74.70, crude fiber 60.42-71.74, org. matter 61.06-71.89 and dry matter 60.99-71.31%. The aq. exts. of the crop and of the silage contained volatile org. acids (calcd as AcOH) 0.107-0.955, 0.165-1.070, nonvolatile org. acids (calcd as lactic acid) 1.23-1.33, 5.27-7.38, amino acids (calcd as crude protein) 0.88-1.45, 1.73-4.10, and volatile bases (calcd as crude protein) 0.080-0.095, 0.16-0.74%, resp., calcd on the basis of 100 g. dry matter.

K. D. Jacob

The chemical composition of grass veld. M. H. French, *Farming S. Africa* 10, 346, 348 (1935).—P is deficient in the grass pastures of most of the drier parts of S. Africa, and in those of many of the parts which have a higher rainfall. The young grass is generally not in itself deficient in P, but the old and mature grass even when green, from Nov. onward, contains less than 0.3% P_2O_5 and often less than 0.2%. After the first frosts the P_2O_5 content falls to 0.03-0.07%. Ca is on the low side without being actually deficient throughout the S. African veld. A few species contain more than the usual 0.5% CaO. Grasses on granite soils are generally very poor in Ca. The Ca content increases in grasses with the advancing season. Na is decidedly deficient over wide areas.

K. D. Jacob

The nutritive value of groundnut cake made by primitive methods. M. H. French, Tanganyika Territory, *Ann. Rept. Dept. Vet. Sci.* 1934, 83-5.—On the dry basis, samples of groundnut cake made in Tanganyika by primitive methods and modern methods contained crude protein 53.19, 46.24-51.31; true protein 51.36, 44.50-50.51, amides 1.83, 0.80-1.74; Et_2O ext. 9.89, 4.71-4.76, N-free ext. 27.86, 33.31-36.75, crude fiber 4.76, 4.77-5.64; total ash 5.30, 5.85-6.66, and SiO_2 0.68, 1.51-2.24%, resp. As detd by expts with sheep, the digestibility coeffs. of the samples were for crude protein 91.08, 92.20-93.62; Et_2O ext. 82.88, 83.08-94.39, N-free ext. 96.36, 95.62-99.58; crude fiber 80.74, 82.08-90.77; org. matter 91.36, 92.57-95.83; and dry matter 87.26, 89.54-94.09%, resp.

K. D. Jacob

Some so-called "salt licks" of Tanganyika Territory. M. H. French, Tanganyika Territory, *Ann. Rept. Dept. Vet. Sci.* 1934, 69-72.—Samples of "edible earth" from 16 localities contained H_2O 1.27-19.26, loss on ignition 1.02-15.53, H_2O -sol. material 0.02-60.46, material sol. in dil. HCl 0.21-62.46, CaO sol. in dil. HCl 0.03-1.03, P_2O_5 sol. in dil. HCl trace-0.94, H_2O -sol. sulfate (expressed as SO_4) 0.07-10.55, sulfate sol. in dil. HCl 0.22-11.93, H_2O -sol. Cl 0.003-9.87, H_2O -sol. Na_2O 0.03-20.17, HCl -sol. Na_2O 0.05-22.61, H_2O -sol. K_2O 0.004-0.83, HCl -sol. K_2O 0.008-0.83 and H_2O -sol. carbonate (expressed as CO_2) trace-14.18. Na was the chief H_2O -sol. cation in all the earths. Chlorides, carbonates and sulfates were the most important anions.

K. D. Jacob

The nutritive value of the pods of *Acacia arabica* and *Dichrostachys glomerata*. M. H. French, Tanganyika Territory, *Ann. Rept. Dept. Vet. Sci.* 1934, 79-82.—On the dry basis, the pods of *A. arabica*, *A. spirocarpa* and *A. albidia* contained crude protein 12.86, 12.54, 8.82; true protein 11.62, 11.54, 8.19; amides 1.24, 1.04, 0.63; Et_2O ext. 2.51, 1.82, 1.44; N-free ext. 63.82, 57.90, 61.73; crude fiber 15.21, 22.37, 24.40; total ash 5.00, 5.63, 3.60; SiO_2 0.39, 0.50, 0.34; CaO 7.2, 1.37, 0.91; and P_2O_5 0.33, 0.56, 0.52%, resp. As detd. by expts with sheep the digestibility coeffs. of the 3 species were for crude protein 51.72, 46.23, 51.04; Et_2O ext.

1 88.17, 73.93, 71.42; N-free ext. 79.01, 70.65, 74.84, crude fiber 21.21, 42.03, 16.47; org. matter 66.22, 64.44, 56.21, and dry matter 64.50, 62.87, 56.72%, resp. On the dry basis, the pods of *D. glomerata* contained crude protein 10.82, true protein 8.82, amides 2.00, Et_2O ext. 1.42, N-free ext. 55.76, crude fiber 26.64, total ash 5.36, SiO_2 0.41, CaO 0.71 and P_2O_5 0.45%. The digestibility coeffs. were for dry matter 59.21, org. matter 61.15, crude protein 37.24, Et_2O ext. 68.96, N-free ext. 67.32, crude fiber 55.31 and ash 32.60%, resp. K. D. Jacob

Detn. of the water contents of [foodstuffs] (Richter) 7
HCN in grasses (Lémann) 11D Use of cleaners in the dairy plant (Barnum, et al.) 13 Sizing and sepg. fines from crude materials such as flour (U. S. 2,026,318)
1 Clarifying beverages (Ger. pat. 558,369) 16 App. for treating fish to recover oil from them and to prepare 3 them for canning (U. S. pat. 2,026,022) 27.

Preserving food Halvor S. Egeberg (Dortheus Andreas Hansen, inventor) Ger. 621,350, Nov. 6, 1935 (cl. 53c 3 03) Addn. to 593,054 (C. A. 28, 3148*) See Brit. 382,644 (C. A. 27, 3261)

Metal-vulcanizing vacuum chamber or container suitable for holding foods, etc. Eugene L. Schellens (to Shell-wood-Johnson Co.) U. S. 2,024,065, Dec. 10 A wall metal such as iron is used with a sealing metal, such as Cu, of lower m. p. than, and alloying affinity, for the wall metal and sealing is effected by heating in a nonoxidizing atm. Various mfg. details are described.

Cereal foods Edmund L. Griffith U. S. 2,026,034, Dec. 31 Cereal material such as bran is mixed with a flavoring sirup and with a small proportion of paraffin and mineral oil to coat the particles of the product and 5 act as an intestinal lubricant.

Milled products from seeds of *Ceratonia siliqua*, etc., for food purposes. Moritz Bienenstock, Ladislav Csaki, Julius Pless, Adalbert Sági and Eugen Sági U. S. 2,025,705, Dec. 31 Milled germinal substance of the seeds of *Ceratonia siliqua* or the like is mixed with a material such as citric acid which reduces the water-binding power of the germinal substance and forms a mixt. which is suitable for use in macaroni and various 6 baked foods.

Bread Herbert Schou Tr. 786,088, Aug. 26, 1935 The particles of dough are greased and sepd. by the addn. of a very viscous emulsion of water or aq. liquid in an oily constituent, the ratio of aq. liquid to oily constituent being above 1/5.

Apparatus for preparing alimentary pastes. Mario Braibanti and Giuseppe Braibanti U. S. 2,026,667, Jan. 7 Various structural, mech. and operative details.
7 **Baking yeast** Károly Dinich Brit. 434,249, Aug. 28, 1935 Bakers' yeast is made from brewers' yeast by using it to ferment dil. mash first at 4-7°R., then in stages at 7-10, 10-13, 13-16, 16-19, 19-22 and 22-25°R. and finally at 25-28°R., the aged and weak cells being at the same time artificially destroyed and the yeast freed from these dead cells which would cause it to spoil. Cf. C. A. 29, 2638*

8 **Deodorizing milk, cream, etc.** Fritz G. Cornell, Jr. U. S. 2,025,196, Dec. 24. A preheated stream of the liquid is flowed and expanded into a sub-atm. pressure zone, the liquid is then collected into a confined stream within this zone, steam is injected into the stream and discharged into the zone, and evolved vapors and gases are withdrawn. App. is described.

Treatment of cream W. & H. Kühle G. m. b. H. Ger. 621,378, Nov. 6, 1935 (Cl. 53c 5). Churned cream 9 for use in making confectionery is stabilized and prevented from sepg. into layers by adding to the cream a small proportion of a flour prep. by baking and grinding a dough not contg. sugar, salt and leaven. The flour or a part of it may be rebaked before it is used.

Emulsifying apparatus suitable for making reconstructed cream. Torris H. Alfréd (to Herbert J. Taylor) U. S. 2,026,604, Jan. 7 Various structural and mech. details.

Margarine Benjamin R Harris U S 2,024,355, Dec 17. A triglyceride such as hydrogenated cottonseed oil or oleostearin is partially saponified with an alkali such as NaOH and the soap thus formed is in part at least decomposed as by treatment with water and HCl or other suitable acid, and the resulting pasty product is incorporated in oleomargarine to improve its texture and spreading properties, etc.

Margarine Advin D Joyce (to Durkee Famous Foods, Inc.) U S 2,024,647, Dec 17. In making margarine from a margarine base selected from edible oils and fats substantially free from milk solids, the base is congealed to a supercooled uncrystallized form and incorporated with a milk component.

Margarine Herbert Schou Fr 787,373, Sept. 21, 1935. A product more closely resembling butter in taste is obtained by going to the final product in the melted state a viscosity of at least 36 centipoises at 50°. This is attained when the water used for the water-oil emulsion is finely distributed, and in a stable manner at 50° and higher, in the exterior phase.

Margarine Gerrit Westervink Ger 621,326, Nov 5, 1935 (Cl 53A 102) Addn to 582,141 (C A 27, 5122). The churn used in the process of Ger 582,141 is replaced by a mixing and kneading vessel capable of winging about a hollow horizontal axis, the latter being connected to a suction device.

Margarine Nohlee & Thorl G m b H Ger 621,327, Nov 5, 1935 (Cl 53A 103). In the manufacture of margarine containing a small proportion of lecithin, the latter is added as lecithin-oil-glycerol mixt obtainable as described in Ger 599,639 (C A 28, 7574) or 602,935 (C A 29, 9504). The tendency of the lecithin to decompose is thus restrained.

Rindless cheese Franz Zwick (trading as Schachtel-Käsefabrik Franz Zwick) Brit 434,321, Aug 29, 1935 See C A 29, 8168.

Preserving liquid egg material Goran A Moller Brit 435,242, Sept 17, 1935 See Fr 780,903 (C A 30, 7841).

Frozen egg products Benjamin R Harris and Marvin C Reynolds U S 2,026,631, Jan 7. Egg material which when frozen and subsequently thawed has increased viscosity and improved emulsifying value in cake batters, etc., is prep'd by adding hydrophilic lipins such as fat acid esters of a polyglycerol, glycerol, sugars, mannitol and other alk sugars and hydroxy carboxylic acids. Several examples with details are given.

Lecithin from vegetable raw materials Samuel O Sorensen and Geo I Beal (to American Lecithin Co.) U S 2,024,398, Dec 17. For obtaining lecithin free from bitter impurities and suitable for use in foods, raw material such as crushed soybeans is ext'd with a volatile hydrocarbon solvent such as hexane, preferably with a b p not over about 60°, the solvent is driven off from the ext and water vapor is passed into the residual oil to cause coagulation of the lecithin and the latter is sep'd.

Preserving fruit Alexander Gerner-Rasmussen, Brit 435,587, Sept 24, 1935 See Fr 778,633 (C A 29, 4851).

Food jellies Speas Mfg. Co Brit 435,033, Sept. 9, 1935 See Fr 770,163 (C A 29, 5191).

Gelatin food preparations Royal Baking Powder Co Brit 435,258, Sept. 17, 1935 This corresponds to U.S. 1,993,269 (C A 29, 24109). The moisture need not be removed.

Cake-batter ingredients Benjamin R Harris U S 2,024,357, Dec. 17. With a batter for making baked products such as cake, there is incorporated a hydrophilic lipid such as a sulfate or phosphate deriv. of fat acid materials or corresponding alcs, or esters or ethers or salts of such derivs, which gives a smoother batter and permits use of an increased proportion of water. Numerous examples are given.

Confections Benjamin R Harris U S 2,025,985, Dec 31. In making confections such as those containing sugar, cocoa powder and a fat, the viscosity of the mixt is reduced by adding a small proportion of a nonnitrogenous phosphoric acid ester of glycerol in which at least one OH group of the glycerol is esterified with a higher unsat'd. fat acid radical (various details and examples being given). U. S. 2,025,986 relates to confections of generally similar character.

Confections such as icings and candy Benjamin R Harris U S 2,024,356, Dec. 17. Materials such as sugar, cocoa powder and milk powder are dispersed in fatty material as cacao butter and there is incorporated in the product a viscosity reducing ingredient comprising a higher fat acid ester of polyglycerol. Various examples are given.

Cacao Richard Dierbach Brit 434,750, Sept. 9, 1935 See Fr 772,566 (C A 29, 1531).

Flavorings Royal Baking Powder Co Brit 435,272, Sept 18, 1935. A flavoring prep'n, e.g., for use in prep'g gelatin deserts, is obtained by forming an emulsion of a flavor with the inclusion of a substantially nontoxic H₂O-sol org. comp'd of higher b. p. than the flavor for reducing the volatility of the flavor, e.g., octyl or nonyl alc, dibutylcarbinol, phenylbutyl alc, l-tartrate, benzyl benzoate, diamyl ether, dibutyl ketone, benzophenone, p-methoxybenzaldehyde. The emulsion may be made in H₂O with addn of an emulsifying agent, e.g., gelatin, albumin, an oleate, a gum. An edible hygroscopic agent, e.g., invert sugar, glucose, glycerol, may also be added.

Removing objectionable flavor from soybeans Lowell O Gill (to A. E. Staley Mfg Co.) U S 2,026,676, Jan 7. Whole or broken soybeans are moistened without ext'g their solubles, then heated to above the b. p. of water (suitably to about 160°) to remove the natural flavor but without scorching and for a sufficient time for the stated purpose, and the temp for final drying is reduced before the increased moisture content is eliminated.

Apparatus for treating grain with conditioned air or gas Marcel Mallet. Fr 787,827, Sept 30, 1935.

Fodder Hans Fettingner. Austrian 143,318, Nov. 11, 1935 (Cl 53c). Sludge from the sats of beet-sugar juices is mixed with bran, subdivided hay, ground oil cake, fish meal or like materials, and the mixt is worked up into granules, flakes or like products containing about 10% of water.

15—CHEMICAL INDUSTRY AND MISCELLANEOUS INDUSTRIAL PRODUCTS (PLASTICS, RESINOIDS, INSULATORS, ADHESIVES, ETC.)

HARLAN S. MINER

The Italian chemical industry in 1934 Grete Blumen-thal *Chimie & Industrie* 34, 909-73 (1935) A P-C

Some aspects of the Polish chemical industry Constantin de Kownacki *Chimie & Industrie* 34, 974-6 (1935) —A brief discussion bringing out the general tendency toward increased production A P-C.

Acetylene in the chemical industry A. F. G. Cadenehead *Can Chem Met* 19, No 12, 325 (1935) —C₂H₂, black and AcOH and MeCO are the principal products at the present time from C₂H₂. Biacetyl, acetylacetone,

dimethylfuran, dihydro-p-tolualdehyde and 1,3 butylene-glycol-diacetate are by-products for which uses must be sought W. H. Boynton

Reactions with oxygen A. H. Behnke *Chem. Weekblad* 32, 611-15 (1935). —A theoretical discussion of various systems comprising O alone, O in conjunction with 1 and 2 oxidizable, 1 and 2 nonoxidizable substances and mixts of oxidizable and nonoxidizable substances O. W. Wilcox

Further progress in production and use of high grade

zinc; oxide situation interesting. Frank G. Breyer. *Mining Met* 17, 24-6(1936).—The following are the major developments in the Zn field in 1935 in the order of their importance: (1) construction of further continuous vertical-retort smelting capacity in the U. S. and Germany, (2) expansion of fractional distill capacity in the U. S., (3) great expansion in the Zn-base die-casting industry in the U. S. and abroad, (4) wide acceptance of heavy galvanizing by the steel industry, (5) construction of first commercial wire electroplating plant, and (6) expansion of use of Zn dust as a reducing agent in org. chem. industry. In the field of Zn compds., the following were the major developments: (1) further decrease in the use of ZnO in rubber compounding, (2) wider appreciation of the value of leaded ZnO in paint, (3) threat of Ti-inert combinations to lithopone in the bulk whitening field, and (4) threat to TiO₂ of ZnS for concd. whitening. Alden H. Emery.

Industrial minerals record progress over a wide front. Oliver Bowles. *Mining Met* 17, 28-33(1936).—Recent developments in the following fields are reviewed: barite, heat insulation, glass, mortars, synthetic stone, cement, clay, feldspar, fluor spar, fuller's earth, gypsum, cyanite, lime, nephelite, novaculite, olivine, potash, pyrophyllite, Na₂SO₄, and S. and talc. Alden H. Emery.

Asbestos. Hans Diegmann. *Tek Tid, Uppl. C, Bergenskaps* 65, 86-8, 89-94(1935).—A description of the applications of asbestos in the electrochemical and the chem. industry, as heat-insulating material, floor- and wall-covering, brake lining, etc. Its origin, mineralogy, mining and main occurrences on the earth are reviewed. D. Thuesen.

Asbopekohlite, a new high-quality lamellar material. E. I. Barg and K. M. Bekreneva. *Plasticheskie Massy* 1935, No. 3, 30-1.—This asbestos-pitch material surpasses textolite for many uses. H. M. Leicester.

New views for seeking substances useful in chemical warfare. M. Procházka. *Chem. Listy* 29, 271-2(1935).—P. presents and extends the views of Hackman (C. A. 29, 519⁴). For destroying the effectiveness of the filters of gas masks P. shows that a high concn. of gases (arsine) effected by a large no. of gas cylinders can exhaust the absorption capacity of the filters very quickly and that the unstable Fe(CO)₅ yields CO against which the filters are ineffective. Following Nekrasov, P. shows the poor relation between the structure and the physiol. properties of org. compds.: an increase in the no. of halogens decreases the irritability of a compd. but increases its suffocating power; sym. halogens are more irritable than unsym. ones; compds. with a halogen at the end are more active physiologically than those with a halogen in any other position, an introduction of a NO₂, —NOH, or —C≡N group into the org. nucleus reinforces the physiol. action of such a nucleus; unsatd. compd. are more effective than satd. compds. The action of dichloroform-oxime and derivs. upon the eyes and the respiratory organs is presented; the stinging sensation produced by dichloroacetone and trichloroacetophenone is described, the changes produced by an NH₂ group substituted into adamante are analyzed. In an attempt to produce a yperite deriv. which would remain active on the terrain for several hrs., P. shows that in order to have a physiol. active prepn. the halogens must be in the β-position, that the α-H atoms cannot be replaced or substituted, that the S must be bi- or quadri-valent, and that the EtCl group is the most potent group in its present position.

Detection of poison gases. André Kling and Maurice Rouilly. *Compt. rend.* 201, 1373-5(1935).—Vesicant and suffocating gases (e. g., COCl₂, yperite, lewisite, etc.) are all distinguished by a very labile halogen. In contact with H₂O they hydrolyze, producing a marked diminution in *pH*, readily detected by bromothymol blue. Accordingly to test a suspected atm. 8-10 l. is aspirated through H₂O to which this indicator has been added. If the atm. contains more than 1% CO₂, the H₂O must be warmed. C. A. Suberrad.

The two-piece protective suit. Pepp Seidl. *Gasmasken* 7, 95-8(1935).—The suit is designed to protect its wearer

against mustard gas. A description of the suit is combined with detailed directions for putting it on and taking it off. A series of photographs illustrate these directions.

A. L. Kibler. Escape apparatus. Karl Ed. Pütter. *Gasmasken* 7, 89-92(1935).—Escape apparatus is designed primarily for the use of miners who are caught in mine air containing insufficient O and dangerous amounts of CO₂, such as result from mine explosions. The requirements of such an apparatus are discussed and various types are described.

A. L. Kibler. Silicosis. Wm. D. McNally and W. L. Bergman. *Ind. Med.* 4, 61-5(Feb., 1935). *U. S. Pub. Health Eng. Abstracts* 15, IHS, 10(Nov. 2, 1935).—A new theory is advanced that the fibrosis in silicosis is produced by chem. action of NaF in blood upon the SiO₂. Si dusts become more harmful as the amt. of SiF₄ is increased in the dust. A chem. examn. of normal and silicotic lungs is given.

C. R. Fellers. The chemical stability of phenol plastics. E. Tlevich, B. Polyatzkma and M. Glikina. *Plasticheskie Massy* 1935, No. 3, 22-6.—Numerous Russian lacquers were found to resist the action of H₂SO₄ and H₃PO₄ much better than that of org. acids. Monolith and carbolite swell more in weak than in strong acids. H. M. Leicester.

The acid stability of plastic compounds for accumulators based on coal tar pitch and hydroxynaphthene acids. V. M. Shalfeev and M. M. Katzin. *Plasticheskie Massy* 1935, No. 3, 26-9.—A good material is obtained from 48% coal-tar pitch, 12% hydroxynaphthene acids free from H₂SO₄, 10% cotton waste and 30% kieselsol. H. M. L.

Transparent plastics for aircraft windows. Gordon M. Kline. *Ind. Eng. Chem., News Ed.* 13, 479-80(1935).—Light weight and flexibility of transparent plastics have made them desirable for aircraft windows, but since their surface hardness is not great laminated glass is still used where clear vision is essential. Com. plastics, trade names, compn., Army and Navy specifications and ideal properties to be attained are listed, cooperative efforts on the part of government agencies and private manufacturers are in progress to improve the plastics for aircraft. W. C. Ebaugh.

The application of furfural and its derivatives to the manufacture of plastics. Paul F. Bruns. *Iowa State Coll. J. Sci.* 10, 51-3(1935).—S. derivs. of C₄H₃OCHO are accelerators for vulcanization of rubber. Polythiofurfural is formed by bubbling H₂S into dil. aq. solns. of C₄H₃OCHO and coagulating the suspension by means of HCl. It is an ultra-accelerator producing high tensile strengths in rubber at 104.5° but was not effective at 100°. Diethyl ethylene secured as a residue from the vacuum distn. of polythiofurfural is not an accelerator. Then the accelerating action must be due to the C and S grouping. Furfural was prepd. by passing NH₃ into C₄H₃OCHO. When 19.3% of the C₄H₃OCHO was converted to furfural, the resulting mixt. was set to a gel, in a few min., by the addn. of HCl, and in an hr. had become firm, hard, black and shiny without heating. Fillers such as corncstalk, cob flour, wood flour, asbestos and oat hull residues were added and molded articles produced from the mixts. The resultant material had a density of 1.44, a tensile strength of 500 lb./sq. in., a compressive strength of 3500 lb./sq. in. and a resistivity of 2 × 10¹⁰ ohms per cc. It does not burn with a flame and resists the action of all ordinary acids and alkalis. The acid has not been successfully removed from the finished product. Slow drying or baking gives the best results. F. E. B.

The use of wood tar from gas generators for the preparation of plastic compounds. I. P. Losev, G. S. Petrov, K. A. Andrianov and P. I. Panasyuk. *J. Chem. Ind. (Moscow)* 12, 1171-6(1935).—The phenol fraction extd. from such tars consists mostly of xylenols and can be condensed with CH₃O or MeCHO to give good resins if 23% of coal-tar PhOH is added to the mixt. The pitch from the tars can replace asphalt pitch in making battery plates.

H. M. Leicester. A new plasticizer, benzyl dihydroxyacetate. S. N. Ushakov and A. A. Rozenfel'd. *Plasticheskie Massy*

1935, No 3, 4-8.—Ground rosin is treated with Na_2CO_3 soln. and chlorinated. The aq reaction mixt is then heated in an autoclave for 6 hrs at 150° . The resulting Na salt of dihydroxyabietic acid is heated with PhCH_2Cl for 16-18 hrs to yield 80-7% of benzyl dihydroxyabietate, a viscous oil. It is a good plasticizer with cellulose esters, but is insol in cellulose ethers. H M Leicester

The use of hydroxy-naphthene acids in the production of plastic compounds from phenol-aldehyde resins. G S Petrov and N B Kruglaya. *Plasticheskie Massy* 1935, No 3, 16-20.—The acids obtained by oxidizing paraffin oil, sp gr 0.860, can be condensed with PhOH and CH_2O or furfural. H M Leicester

A method for determining the fluidity of celluloid and other thermoplastics. L F Aksberg and A V Shelton. *Plasticheskie Massy* 1935, No 3, 20-2.—The celluloid is pressed under standard conditions in a Raschig press, and the fluidity is measured by the length of the column obtained. H M Leicester

Thermoplastic resins from aniline condensation products. Karl Frey. *Kunststoffe* 25, 305-8 (1935).—A brief review (1) of the chemistry of the conversion of PhNH_2 and CH_2O into thermoplastic resins and (2) of the mech and elec properties of the latter and of products made from them, e g, impregnated paper. J W Perry

Synthetic resins from vinyl chloride. H I Waterman, J J Leendertse and P J G Colthoff. *Chem Weekblad* 32, 550-3 (1935).—The process of working up ethylene to resins is analyzed. $\text{C}_2\text{H}_4\text{Cl}_2$ is made from C_2H_4 by passing cooled C_2H_4 into liquid Cl_2 at -78° until sat'd, keeping the temp rise down to $3-5^\circ$. The product is washed with dil. KOH and with water, and then dist'd; the yield is 93%, it b $84.9-85.5^\circ$ and has $n_D^{20} = 1.4444$. The $\text{C}_2\text{H}_4\text{Cl}_2$ with AlCl_3 (10%) at $45-55^\circ$ gives HCl and a resin mass which, after washing and drying and extrn by $\text{C}_2\text{H}_4\text{Cl}_2$, yields 40% of a brown transparent resin, decomps at 250° , it is brittle and impure. If vinyl chloride is made from $\text{C}_2\text{H}_4\text{Cl}_2$ (Kogerman method, C A 25, 487) a 91-93% yield is obtained. The $\text{C}_2\text{H}_4\text{Cl}_2$ is then polymerized either under pressure in sunlight, (one month required, good yield) or by AlCl_3 in different solvents. In $\text{C}_2\text{H}_4\text{Cl}_2 + \text{C}_2\text{H}_4$ soln little polymer is formed up to 18° . If C_2H_4 is used as solvent a HCl evolution takes place (Friedel Crafts reaction) between 0° and 18° , a soft resin is obtained and also other reaction products distg up to 115° with 2 or 3 rings. Hydrogenation of the latter compds gives, among other compds, diphenylethane. With toluene as solvent at -78° the AlCl_3 reaction gives similarly a mixt of 50% resin and 50% double-ring by-products. B J C van der Hoeven

Light-colored coumarone resins. A Roustchinsky. *Chem & Industrie* 34, 766-72 (1935).—Ordinary com solvent naphtha obtained in the distn of crude benzene gives chiefly dark-colored coumarone resins. A much higher proportion of light-colored resin can be obtained by prep't of the solvent by stearic distn of the crude benzene. A Papineau-Couture

The use of artificial resins in various branches of technology. Ludvík Šprk. *Chem Listy* 29, 273-6 (1935).—Reviews formaldehyde resins and discusses their use as mordants in tanning and textile industries, as protective films in ceramics, as fillers or matrixes in articles, as substitutes for rubber, as catalysts for vulcanizing, as insulating materials and as a replacement for nonbreakable glass. Frank Mareš

Establishing types and standards for pressed materials of artificial resin. R Houwink. *Kunststoffe* 25, 313-14 (1935).—The desirability of detg and standardizing mech and elec properties is emphasized. J W Perry

Improving pressed objects from artificial resins by additional heating. V T Renne and V V Pasunokov. *Plasticheskie Massy* 1935, No 3, 31-2.—The elec resistance of monolith objects is increased and their hygroscopicity is decreased by heating them to 120° for 16 hrs after pressing them. H M Leicester

Preparation of mixtures of phenol resins and rubber. H I Waterman, C van Vlodrop and A R Veldman,

1 *Chem. Weekblad* 32, 622-4 (1935).—When an alk. mixt. of a phenolic resin and latex (with fillers if desired) is acidified with dil. AcOH , a mixt of resin and rubber is pptd. as a finely divided powder; after filtering, washing and drying it can be used as a molding powder. A flow sheet for a factory process is given. O. W. Wilcox

Use of the dielectric constant in the chemical industry. B van Steenberghe. *Chem. Weekblad* 32, 466-78 (1935).—The Ebert app for rapid detn of the dielec const is described and various applications of the ϵ detns are discussed, such as moisture detns on active charcoal, dextrin, tobacco, cement, lime, marmalade, etc., detns of permeability of lacquers for water, absorption of H_2O by surfaces, distn control and sedimentation analysis. B J C van der Hoeven

Wetting and spreading properties of aqueous solutions—oleic acid-sodium carbonate mixtures. H L Cupples. 3 *Ind Eng Chem* 28, 60-2 (1936); cf. C. A. 29, 8173.—Surface tensions, interfacial tensions and spreading coeffs on a refined paraffin oil were detd for aq. Na_2CO_3 -oleic acid mixts contg 1.0%, 0.3%, and 0.1% oleic acid and with varying alkali-fatty acid ratios. These mixts are much less sensitive to variation of this ratio than are the corresponding NaOH -oleic acid mixts. The spreading coeff, S , of a soap soln over the standard oil is defined by the equation $S = T_B - T_A - T_{AB}$, where T_B = surface tension of oil (30.5 dynes/cm at 25°), T_A = surface tension of soap soln, and T_{AB} = interfacial tension. At a given concn the wetting properties of the carbonate mixts are much less sensitive to variations in the alkali-fatty acid ratio, which should make it easier to maintain a consistently high value of the spreading coeff in the prep'n of the carbonate solns. There should also be less uncontrolled variation in the wetting properties because of acidity or alkali of the water used in dilg the mixt. W H Boynton

Analysis of the causes of variations in the results of tests of properties of (molded) articles. A I Gold'shtein. *Zavodskaya Lab* 4, 918-23 (1935).—Attempts were made with the aid of statistical data and their interpretation to relate the frequent variations in the results of tests of elec properties of phenolic moldings to the methods of manuf and controllable and uncontrollable factors of examn. No pos results could be obtained at this stage of investigation. Chas Blanc

Basalts from Dorges Bobriza, Ukraine from the viewpoint of their suitability for casting. A Gunzberg. *Trav Inst petrog Acad. Sci U S S R* 4, 83-91 (1933), *Neues Jahrb Mineral Geol*, Referate II, 1934, 864.—Chem and microscopic data on andesite basalts show their usefulness as telephone insulators. J F Schauer

7 Detection of the break point in the determination of retentivity of activated charcoal. Franz Krczal. 2. *ges. Schiess-Sprengstoffw* 30, 354-6 (1935), cf. C. A. 30, 1878.—Another app is described in which the break point of the charcoal filter is detected by means of the pptn of the gas in liquid or solid form on a 60-cm brass rod immersed in a mixt of ether and solid CO_2 at one end and in a mixt of water and ice at the other end. The app. must first be calibrated empirically. Other methods are described for detecting the break point by means of indicators, either in soln or deposited on test papers. These are adapted to specific gases. Methods of prep't the test papers are given and the sensitivity of the tests is indicated. A L Kibler

Comparison of various methods of determining the humidity of air. O R. Monod. *Ann serv tech hyg Paris* 15, 61-82 (1934), *Chimie & Industrie* 34, 1082.—9 Absorption method. The air is passed over pumice impregnated with H_2SO_4 , the increase in wt of which is detd. With pumice 2-3 mm in diam packed in a straight tube 12 cm long and 10 mm in diam, absorption is complete in the 1st tube when the air is passed rapidly (2 l per min), when the air is passed slowly the H_2O seems to follow the air stream and is absorbed only in the 2nd and 3rd tubes. The method has an accuracy of 1-1.5 mg Dew-point hygrometer.—The air passing through a volatile

liquid (Et_2O) cools a polished metal surface, and the temp. of the liquid is noted on the metal. The moisture content is obtained from Regnault's tables. The various instruments tried out by M. gave satisfactory results, provided the plates were wiped carefully and observations were effected at a certain distance to avoid interference by the observer's breath, etc. These 2 methods (the only ones which give directly the moisture content) furnish comparable results. *Psychrometers*—The readings given by these instruments (both stationary and sling types) are affected by the velocity of the air current, and insufficient wetting of the bulb introduces a further error. In the Assmann suction psychrometer the velocity of the air is constant and all thermal effects are eliminated by means of polished metal nuts, nevertheless, it gives very irregular results as compared with the Alluard dew-point hygrometer. *Hair hygrometers*—These instruments indicate relative humidity, not moisture content. The hairs should at intervals be placed in an atm. sat'd with H_2O vapor. They give reliable results only over a rather narrow range in the neighborhood of the point at which they were standardized (generally around 40%). At 80% the readings of these instruments are discordant, the error easily reaching up to 20%.

A. Papineau-Couture
Coal dust and rock dust as constituents of air M. Stipanac Berg- und Hütten-männisches Jahrbuch 83, 77-92 (1935)—Three groups of dust are distinguished: (1) coarse dispersion, particles larger than 0.1 micron, (2) colloids, 0.1 micron to 1 millimicron, (3) mol dispersoids, particles smaller than 1 millimicron. The existence of dust, its nature and detn. in different mines are described, sizes, fineness, wt and structure of the particles were detd. The capacity to fly is detd. by the ratio of vol. to surface. The danger of explosion increases also with increasing surface ratio. The behavior of colloidal dusts in the ventilation of mines and the distribution of dust over the section were detd. The nature of coal-dust explosions is discussed as a colloid-chem and colloid-physics phenomenon; the effect of rock-dusting as preventive means for explosions is described. M. H.

Use of cleaners in the dairy plant H. J. Barnum, P. S. Lucas and Bruce Hartsuch Mich. Agr. Expt. Sta., Special Bull. No. 262, 24 pp (1935).—On the basis of their compn. cleaners are classified into modified or neutral soda, soda ash, special alkalis, Na_2PO_4 and colloidal materials. Some of the cleaners were highly buffered and therefore resistant to reduction in their cleansing ability. The modified sodas were most stable in buffer action; next were soda ash and colloidal materials. The special alkalis were most caustic, Na_2PO_4 was second, soda ash and colloidal cleaners were equal, and modified sodas least caustic. The emulsifying power was detd. with butter fat. In order of decreasing emulsifying power the cleaners ranked special alkalis, soda ash, colloidal cleaners, modified sodas and Na_2PO_4 . Soda ash was most efficient as a water softener; next were colloidal cleaners, modified sodas, special alkalis and Na_2PO_4 . Al, Cu and tinned steel were severely scratched by the volcanic ash content of some of the cleaners. Chrome-Ni steel was not affected. Special alkalis were most severe in their tarnishing action and corrosiveness; next were Na_2PO_4 , soda ash and colloidal cleaner. Tinned steel and Al were corroded most severely. A table of properties of the cleaners is given. C. R. Fellers

Fumigation of ships by Clayton gas in Egypt. J. Gil-mour. Bull. mens offic. intern. hyg. pub. 26, 271-82 (1934), U. S. Pub. Health Eng. Abstracts 15, P. 2 (Aug. 10, 1935).—Expts. on ship fumigation showed that with a concn. of 1% Clayton gas for 3 hrs all rats were killed. At a concn. of 2% with exposure for 2 hrs. all rats were dead within 1 hr. It was found impossible to obtain theoretical calcd. concns. of gas in ship compartments, even if all dead spaces were opened. It is believed that for complete elimination of the rats the pumping of the SO_2 must be continued into the ship until a concn. of 2% is attained in the upper parts of the compartments for at least 2 hrs. A new buret for the estn. of gas concns. correct to approx. 0.1% is described. C. R. Fellers

Catalytic hydrogenation of phenolic oil of low-temp. tar [manuf. of synthetic resins] (Andé) 21. Varnishes and plastic compns (Fr. pat. 787,690) 26. Purifying oils, waxes and synthetic resins (Brit. pat. 434,672) 22. Recovery of H_2SO_4 and resins from acid tar produced in purifying benzene hydrocarbons with H_2SO_4 (U. S. pat. 2,026,450) 18. Oxygenated org. compds. from hydrocarbons [use as plastics] (U. S. pat. 2,024,954) 10. Hydrogenation of tertiary alkyl-phenols to form hydroaromatic alcs [use as plasticizers for coating and molding compns] (U. S. pat. 2,026,668) 10. Thiocetraphosphates [as a detergent] (U. S. pat. 2,025,503) 18

Chemical and physicochemical treatments I. G. Far-benaid A-G Fr. 786,128, Aug. 27, 1935. The reaction vessels are submitted to very rapid mech. oscillations whereby increased speed of reaction is obtained

Plastic masses Studien- und Verwertungs-G m b H (Franz Fischer and Otto Horn, inventors). Ger. 618,500, Sept. 16, 1935 (Cl. 12a 26 02) Coal-like fuel is submitted to the action of PhOH or phenolic mixts. at temps. below the decompn. temp. of coal to give a plastic mass. The reaction may take place under pressure and in the presence of a condensing agent. Thus, lignite is heated to 180° with cresol to give a plastic mass useful as a filling, softening or flowing agent. Cl. C. A. 30, 185

Plastic material Ange Lamguasco Fr. 787,142, Sept. 17, 1935. A transparent and noninflammable material is prep'd by dissolving a metal perchloride, chloride or oxide (1-10 g.) in pure white acetone (500-1000 cc.), adding cellulose (5-10 g.), mixing in the cold and adding carefully cellulose tetracetate (5-50 g.) and continuing to stir until complete soln. The product may be used as a substitute for glass or for making cinematographic films

Plastic compositions, lacquers, etc. Deutsche Hydrierwerke A-G Brit. 435,058, Sept. 13, 1935. Varnishes, filaments, films, etc., from cellulose esters and ethers and natural and synthetic resins contain as solvent or softening agent a monoether of glycerol or polyglycerol with an aliphatic alc. contg. not less than 8 C atoms or a cycloaliphatic alc. or an ester obtained from such an ether by esterifying free OH groups with org. acids. Among examples, (1) cellulose nitrate moistened with methylated spirit is dissolved in AcOBU contg. dodecyl glycerol ether acetate, Albertol resin and PhMe to form a lacquer and (2) nitrocellulose, diglycerol octadecyl ether and Ph_3PO are worked in a kneading machine and the mass is rolled into sheets

Plastic composition for doll faces, etc. John O. Baker (to Sweets Laboratories, Inc.). U. S. 2,024,124, Dec. 10, 1935. Roll-milled rubber which has been broken down to a considerable degree is used with a resin of high stability such as coumarone resin, an oil which is nonvolatile at room temps. and of high chem. stability such as a mineral oil, and a natural chloride, blended together to a substantially homogeneous mass.

Plastic composition suitable for coating walls Michael J. Batelja U. S. 2,025,369, Dec. 24. Ground oats are mixed with a fibrous filler such as wood, paper or rag pulp, water, a substance such as a cement having the property of setting after being wetted, PbO , $\text{K}_2\text{Cr}_2\text{O}_7$ and a waterproofing substance such as linseed or China wood oil or varnish

Sheets or films from plastic composition containing cellulose derivatives Du Pont Viscoid Co. Ger. 621,048, Oct. 31, 1935 (Cl. 39a. 16). See Brit. 393,957 (C. A. 28, 321)

Plastic rubber derivative suitable for molding Trefy F. Ford (to B. F. Goodrich Co.). U. S. 2,024,987, Dec. 17. A mixt. such as may be formed of rubber, an aldehyde such as polymerized formaldehyde and a phenol such as PhOH , is heated (suitably to about 135°) in the presence of a small proportion of an aromatic sulfonic acid such as p -phenolsulfonic acid.

Synthetic resin Roy H. Kienle and Paul F. Schlingman (to General Elec. Co.). U. S. 2,025,538, Dec. 24. A

phenol is treated with an excess of paraformaldehyde at a temp not exceeding 130° (suitably about 120°) in the presence of a relatively small proportion of sol alkyl resin catalyst of an acid number between about 140 and 210, until the free CH_2O content is less than about 6% and a liquid resinous product is produced and the product is cast and cured at a temp of 65-125°

Synthetic resin Roy H Kienle (to General Elec Co). U S 2,025,539, Dec 24. In forming articles such as gaskets, washers, etc., a totally cured resin formed from initial materials such as glycerol, phthalic anhydride, etc., is compounded with a partially cured resin which has a cure point of 20-25 sec at 150° and which is formed by the reaction of a phenol and an excess of aldehyde in the presence of a fusible, sol., acidic alkyl resin of an acid number about 200, and the compounded mixt is cured at 150-200° to a homogeneous, flexible product.

Synthetic resins Sydney L M Saunders Brit 434,850, Sept 10, 1935. These are prep'd by heating a phenol with a phenol di-alc in the presence of an acid catalyst and in the presence or absence of a vegetable oil, natural resins or their esters and, if desired, in the presence of an inert gas. The products may be used in the manuf of lacquers and varnishes. Among examples, (1) p-cresol di-alc (1) and cresylic acid, (2) PhOH and the di-alc's derived from cresylic acid and (3) I, diphenylmethane and China wood oil, are heated in the presence of HCl. Cf. C A 30, 189^{1,2}.

Synthetic resins Compagnie française pour l'exploitation des procédés Thomson-Houston Fr 787,562, Sept 25, 1935. Resins of the alkyl type are prep'd from polyhydric alcs and homologous derivs of phthalic acid or anhydride prep'd by synthesis from maleic acid or anhydride and comp'ds of diolefinic structure. Thus, a comp'd called euprene prep'd by passing C_2H_4 over Cu powder at 200-60° under the influence of elec discharges is heated with maleic anhydride and the product is caused to react with glycerol. In the same way C_2H_4 , isoprene and their partly polymerized comp'ds, China wood oil, and α - and β -oleostearic acid are caused to react with maleic acid or anhydride and then condensed with glycerol, glycol, pentaerythritol, mannitol, polyglycerols, etc.

Synthetic resins I G Farbenand A-G 787,374, Sept 21, 1935. Solid, pulverizable, fusible and transparent resins are obtained by submitting to the polymerizing action of catalysts, of the "Friedel-Crafts" type, liquid hydrocarbons obtained by cracking in the vaporized state the products rich in H from the destructive hydrogenation of carbonaceous materials.

Synthetic resin compositions Irvin W Humphrey (to Hercules Powder Co) U S 2,025,947, Dec 31. An ester of abietic acid, such as the ethyl, methyl or glycerol ester is treated with maleic anhydride.

Resinous compositions suitable for use in lacquers, etc Ernest A Rodman (to E I du Pont de Nemours & Co) U S 2,025,612, Dec 24. See Can 351,668 (C A 29, 666⁹).

Synthesizing resins with aluminum chloride Stewart C Fulton and John Kunc (to Standard Oil Development Co) U S 2,025,738, Dec 31. A cracked petroleum tar or distillate from such a tar is agitated with a polymerizing agent such as AlCl_3 at a suitable polymerizing temp (which may be about 120-180°) and the metal halide sludge is allowed to settle and is drawn off, the sludge free reaction product is treated with H_2SO_4 , the acid sludge is removed and oily constituents are dist'd from the remaining product to obtain a resin as dist'n residue. App is described.

Paracoumarone resins Karl H Engel (to Barrett Co) U S 2,024,568, Dec 17. Light-colored resins are produced from oil contg polymerizable constituents of the styrene-coumarone indene type by effecting polymerization with a mixt of H_2BO_3 and H_2SO_4 .

Arylated esters and synthetic resinous compositions Merlín M Brubaker (to E I du Pont de Nemours & Co) U S 2,025,642, Dec 24. Oxidation-resistant products suitable for use in coating comp's and for other purposes are formed by dissolving materials such as abietic

acid, ester gum, alkali-refined linseed oil, or cottonseed oil in a solvent such as C_6H_6 , toluene or xylol and heating the soln with anhyd AlCl_3 which is gradually added. A product thus formed may be further treated with a polyhydric alc. and a polycarboxylic acid. Numerous details and examples are given.

Resinous condensation products Ernst Elbel and Fritz Seebach (to Bakelite Corp) U S 2,024,212, Dec 17. A heat hardenable resinous phenol-aldehyde condensation product in a state of advancement characterized by soly. in acetone and infusibility but softening on heating is formed and then is ppt'd from soln in a solvent such as cyclohexanol by adding a diluent such as ligroin. The product is suitable for various uses.

Pressing fibrous masses impregnated with synthetic resins Allgemeine Elektricitäts Gesellschaft, Ger 618,708, Sept 13, 1935 (Cl 39a 19 06).

Electrical insulating tubes Gordon R Langley (to General Elec Co) U S 2,025,540, Dec 24. Paper having an inner metallic coating is wound on a mandrel and over this there is wound paper coated with fused phenolic condensation product, and the materials are heat cured.

Electrical insulating material Guard T. Kohman (to Bell Telephone Laboratories, Inc) U S 2,026,316, Dec 31. A cellulosic material to be used as insulation, such as paper, is exposed to water or alc vapor at temps of 50-150° and then immediately immersed in a bath of chlorinated naphthalene and the moisture is removed from the material at an elevated temp.

Electric conductors Henry Dreyfus Fr 787,456, Sept. 23, 1935. The conductors are insulated by a covering of thread made from a cellulose deriv (acetate) contg staple fibers.

Heat insulation suitable for use on underground steam conduits Earle R. Williams (to Johns-Manville Corp) U S 2,023,986, Dec 10. Juxtaposed sheets are used of water-permeable, water-resistant insulation such as asbestos paper and a water-permeable, wrapping and retaining material of good wet strength and which includes a wire reinforced woven asbestos fabric.

Heat- and sound-insulating material Soc anón française Eternit, Fr 787,396, Sept. 21, 1935. A binder such as cement is emulsified to give it a cellular texture and fibrous material, preferably asbestos, in a floccular state is incorporated therewith by appropriate mech. treatment.

Adhesive Frank H Shoals (to Modern Panels, Inc) U S 2,025,180, Dec 24. An adhesive suitable for use with veneers is prep'd by hydrolyzing starch, controlling the viscosity of the starch during the hydrolyzing stage by adding a mixt of borax and soda, dilg with water, adding an alk latex-coagulating-control agent and allowing the mass to cool to room temp., adding latex soln and gently agitating during the addn of the latex.

Wetting agents etc Imperial Chemical Industries Ltd, Alfred W Baldwin and Henry A Pigott Brit 435,039, Sept 12, 1935. Sulfuric esters having wetting, cleansing, foaming and emulsifying properties are prep'd by treating with an addn product of SO_2 and a tertiary amine the aliphatic hydroxysulfides obtained by causing alkyl mercaptans having 10-30 C atoms to react with halohydrins. Among examples, cetyl mercaptan is caused to react with ethylenechlorohydrin in the presence of MeONa and the 2-hydroxyethylcetyl sulfide produced is sulfonated by means of Na pyrosulfate and pyridine.

Wetting agents, etc Deutsche Hydrierwerke A-G Brit 435,290, Sept 18, 1935. Products having wetting, washing, emulsifying, foaming and dispersing properties are prep'd by (a) treating glycols having at least 6 C atoms with H halide, converting 1 of the ester groups so introduced into a sulfonic group by means of a sulfite or a sulfide followed by oxidation, and causing the other ester group to react with NH_3 or primary or secondary amines, (b) treating glycols having at least 6 C atoms with polybasic O-contg mineral acids and causing 1 of the ester groups so introduced to react with NH_3 or primary or secondary amines including heterocyclic bases, e.g., piperidine, (c) esterifying only 1 OH of the higher glycols

by means of H halide or polybasic O-contg. mineral acids, causing the ester group to react with NH_3 or primary or secondary amines and esterifying the remaining OH with a polybasic O-contg. mineral acid, (d) treating the higher glycols as in (c), but instead of esterifying with polybasic O-contg. mineral acids in the final step, esterifying with H halide and treating with sulfites or with sulfides followed by oxidation. Among examples, 1,6-hexanediol or trioleole al is esterified with HCl , treated with Pt/NH_3 and the resulting amuro-alk converted into the sulfure ester. Cf. C. A. 29, 1179¹.

Wetting agents. I. G. Farbenindustrie A.-G. Brit. 433,885, Sept. 10, 1935. Products having wetting, washing and dispersing properties are obtained by sulfonating, neutralizing and extracting with organic solvents, comprising fatty acids and alcohols having a carbonyl value of 10 or below, that are derived from nonaromatic hydrocarbons containing more than 12 C atoms by (a) oxidation of said hydrocarbons in the liquid phase and subsequent hydrogenation until the carbonyl value is reduced to 10 or below, or (b) oxidation in the liquid phase in the presence of H_2O_2 , AcOH , EtOH or their anhydrides. Among examples, a middle oil obtained by the hydrogenation of lignite is oxidized in the presence of Mn stearate and the carbonyl value is reduced to 8 by hydrogenation in the presence of a Co catalyst, the product is dissolved in benzene, treated with ClHSO_4 in Li_2O , neutralized with aq. Na_2CO_3 , the benzene soln. sepd. and the soap soln. extrd. with benzene. Cf. C. A. 29, 697¹.

Wetting and other agents. I. G. Farbenindustrie A.-G. Fr. 786,334, Aug. 31, 1935. Auxiliary agents for the textile and allied industries consist of compounds the mol. of which contains at least 1 N atom, 2 or more radicals fixed directly to the N and in which the N exists in a state of oxidation more complete than in "free" derivatives of NH_3 , and which contains at least one aliphatic radical of at least 8 C atoms. Such compounds include methyldecylhydroxylamine (by heating dodecylmonooctethylamine in EtOH with H_2O_2) and compounds obtained by oxidizing dimethyldecylamine, cetyldecylamine, octadecylamine, dodecylamine, dodecylamine of β -methylaminoacetic acid and olefin-N-diethylthienediamine in the same way.

Wetting and other agents. Moritz Treiberer. Fr. 786,391, Sept. 2, 1935. Auxiliary products for the textile industry are obtained by disaggregating albuminous and albuminoid substances to a degree beyond that of protalbumin and hyaline acid but not reaching that of amino acids.

Wetting and other agents. I. G. Farbenindustrie A.-G. Fr. 787,305, Sept. 24, 1935. Primary or secondary unsatd. aliphatic amines of high mol. wt. are treated with acylating and sulfonating agents in any order. Examples are given in the prepn. of sulfonated benzoyldecylamine and butyric methyldecylamide.

Esters of hydroxy carboxylic acids (wetting, foaming, emulsifying and detergent agents). Benjamin R. Harris. U. S. 2,023,884, Dec. 31, 1935. Esters such as mono- and palmate, the stearic acid ester of tartaric acid, etc., are prepd. by the reaction of an acid such as succinic acid or tartaric acid with an acid halide such as palmityl chloride or stearyl chloride in a vehicle such as dry pyridine. Various examples are given.

Molding composition suitable for making various articles. Carlo Stresino (to A. O. Smith Corp.). U. S. 2,028,107, Dec. 31, 1935. Wood which may be in the form of chips or shavings is impregnated with sulfite liquor and the impregnated material is heated with phosphorus chloride to effect chem. reaction.

Molding materials. Edward Weatherford (to The Borden Co.). Brit. 434,573, Sept. 4, 1935. In molding a foundry core or other article from sand or the like mixed with a binding material, the latter comprises milk, buttermilk or whey, which may be used with other binders, e. g., core oil. The milk, etc., may be in concd. or powd. form and used with H_2O .

Molding objects from polystyrene. Siemens-Schuckertwerke A.-G. Fr. 787,318, Sept. 20, 1935. Rough-shaped hollow objects are pressed to their final shape by fluid under

pressure at the same time as the walls are stretched so that their fragility is reduced and their flexibility increased.

Inlaid designs on molded articles such as molded table tops. Carlo Stresino (to A. O. Smith Corp.). U. S. 2,028,105, Dec. 31, 1935. A varnish carrying a pigment is applied to a sheet or resin-impregnated material, the varnished sheet is placed in contact with a pattern formed of resin-impregnated material of different color than the varnish to block out all portions of the designs in which the pigment is not to show, and the varnished sheet and pattern of resin-impregnated material are united by the action of heat and pressure, and are used so as to provide an inlaid surface.

Artificial leather. Vereinigte Schmirrenwerke Vosssteher & Bunge Fr. 786,049, Aug. 24, 1935. Fibrous material is impregnated with a liquid contg. rubber latex, the material being alternately compressed and allowed to expand until completely and uniformly impregnated. App. is described.

Impregnated fibrous articles or sheets such as leather substitutes. George A. Richter and Milton O. Schur (to Brown Co.). U. S. 2,024,600, Dec. 17, 1935. A material such as paper has its pores and interstices partially impregnated with regenerated cellulose and is further impregnated with a solid, fluxed water-repellent material such as an asphalt or rubber compn., etc.

Apparatus for making leather substitutes by treating fabrics with suitable compositions. James G. Grower. U. S. 2,024,284, Dec. 17, 1935. Various structural, mech. and operative details.

Condensation products of ureas, aldehydes, etc. Leon Lilienfeld. U. S. 2,024,972, Dec. 17, 1935. Condensation products which are suitable for Lms., etc., are produced by heating to 40-60° a mixt. comprising urea, thiourea or dicyanamide, and aldehyde such as CH_3CHO and a halogen deriv. of a polyhydric alk. such as α -dichlorohydrin. Numerous examples are given.

Cleansing composition. Gilbert F. Lavery. Fr. 786,241, Aug. 29, 1935. The compn. contains river tuff (35, white soap (72% of oil) 25 and H_2O 10%.

Cleansing composition for internal-combustion engines. International Hydrocarbon Patents Co. Ltd. Fr. 787,321, Sept. 24, 1935. Asphalt and resinous materials are removed by destructively hydrogenated solvent naphthas. These are prepd. by treating gas-oil or kerosene, or preferably a strongly cracked fraction of gas-oil or kerosene or an ext. therefrom by means of liquid SO_2 , PhOH , PhNH_2 or 2-furaldehyde, with H at above 480° in the vapor phase. The products, called "hydrocresols," b. between 215° and 238° may be mixed with other solvent oil, preferably a lubricating oil of relatively high b. p.

Detergents. Johann Bertram and Erich Schieweck. Brit. 434,846, Sept. 10, 1935. See Ger. 616,443 (C. A. 29, 7331¹).

Washing agents. I. G. Farbenindustrie A.-G. Fr. 787,819, Sept. 20, 1935. Washing agents contain water-sol. salts of aliphatic carboxylic acids of high mol. wt. in which at least 1 atom of N is situated between the carboxylic group and the aliphatic radical and which are rendered neutral or acid by adding compds. of acid action, e. g., borax, citric, tartaric or oxalic acid or NaHSO_4 . The acids contg. N include octadecylaminoacetic acids, oleylsuccinate and the saponates of coco-oil fat acid.

Washing and rinsing liquids. Rutgerswerke A.-G. Fr. 787,546, Sept. 24, 1935. The liquids contain alkylated naphthalene sulfonic acids or sulfonated fat alks. or their salts in admixt. with acid salts or having an acid reaction, particularly F compounds, e. g., NaHF_2 , KHF_2 , NH_4HF_2 and $(\text{NH}_4)_2\text{S}_2\text{F}_8$.

Cleaning and polishing composition. Alfred Herrmann. Fr. 787,223, Sept. 27, 1935. The compn. contains, e. g., beeswax 1, paraffin 2.5, turpentine oil 6, sawdust 3, sand 10, yellow ochre 0.5 and vinegar 0.02 kg.

Foaming agents. I. G. Farbenindustrie A.-G. Brit. 435,331, Sept. 19, 1935. Finely distributed dust, especially rock dust in mines, is pptd. by means of foam prepd. by introducing air or other gases in fine division into aq. dispersions contg. wetting agents and solvents having the

formula $R'OCH_2(CH_2OCH_2)_nCH_2OR$, in which R' is H or alkyl, R is H, alkyl, aralkyl or aryl and n is a whole number, if R' and R are H, zero or a whole number, urea, thiourea, degraded albuminous compounds, etc., favoring foam-production, may be present. In an example, oleic acid-*N*-methylaurine, contg. about 30% of inorg. salts, diethyleneglycolmonoethyl ether and urea or thiourea are used for the prepn of foam.

Electromagnetic metal I G Farbenind. A.-G. Fr. 787,781, Sept. 28, 1935. Magnetic cores, etc., are made from the powder obtained by reducing the powd. metal oxide coming from the calcination of the corresponding carbonyls.

Printing plate Edgar J Wright. U. S. 2,024,840, Dec. 17. A matrix of a printing surface is rotated in an inclined plane and during rotation its surface is sprayed with liquid material such as molten metal capable of hardening until a substantial body of type material is built up, and a backing is subsequently applied to the deposited material.

Polychromatic printing plate Serge Tchechounin. U. S. 2,025,559, Dec. 24. A printing plate for polychromatic reproduction comprises an ale-sol. base such as gum-lac, soap, a fatty material such as linseed oil, naphthalene, HOAc and a pigment, etc. Cf. C. A. 29, 4107³.

Etching metal printing forms Robert A. Zarse. U. S. 2,026,603, Jan. 7. A surface to be etched such as one of Cu carrying an enamel is etched by immersion in an aq. soln. contg. NaCl and Fe chloride.

Magnetic cores I G Farbenind. A.-G. Fr. 787,557, Sept. 25, 1935. The metal powders, particularly those obtained by pyrolytic decomposition of the carbonyls, are coated by an insulator comprising polystyrene, either alone or in conjunction with other insulators, particularly gum-lac or mixed polymerization products of vinyl chloride and acrylic esters.

Protection of pipe joints such as those of pipe lines in the ground Robert G Roberts (to Barrett Co.). U. S. 2,024,602, Dec. 17. A preformed coupler housing of substantially waterproof satd fibrous material such as pitch-satd felt is mounted around a pipe coupling and serves to retain molten protective material such as pitch during its application and until hardened.

Porous products from liquid slags Carl H. Schol. U. S. 2,024,308, Dec. 17. A porous product suitable for insulation, etc., is obtained by applying a thin layer of a swelling liquid such as water to a wide smooth even supporting surface and spreading out the hot fluid melt such as a liquid slag in a thin layer on the layer of swelling liquid. App. is described.

Transparent sheets or coatings Kraft-Phoenix Cheese Corp. Brit. 434,993, Sept. 12, 1935. Films are prep'd. by bringing casein into aq. soln. of such high concn. e. g., 15%, and viscosity that the mineral salts and other impurities become insol therein, filtering, treating with a deficiency of a setting agent, e. g., CH_3O , $(CH_3)_2N$, trioxymethylene, aldehydes, Cr salts, tannic acid, Me_2CO , coating a base with the soln. and drying the coating. The film produced may be rendered moisture proof by coating with a cellulose lacquer.

Corrosion-preventing coatings Chemische Fabrik R. Baumbach A.-G. Brit. 435,003, Sept. 12, 1935. See Fr. 779,878 (C. A. 29, 5549⁹).

Carrier belt for casting transparent sheet material such as gelatin or casein sheets Edouard M. Kratz (to Marbo Products Corp.). U. S. 2,024,826, Dec. 17. A laminated fibrous web carries a smooth flexible nitrocellulose coating on its top surface and a pigmented cellulose ester coating on its back to prevent curling.

Metal cement Nelson W. Larmore (to Clifford W. Frederick). U. S. 2,026,475, Dec. 31. Al powder 2, is mixed with hydraulic cement 12, whitening 24, iron filings 80 and lacquer 28 parts.

Oil-proofing materials such as paper containers James K. Delano. U. S. 2,025,729, Dec. 31. As an oil-proofing compound there is used a mixt. of salts of glyceric acid and salts of homologous acids derived from ext. of glycer-

rhiza, such as the K, Na, NH₄ and Ca salts, in admixt. with an albuminoid material such as a glue.

Luminescent paper Michel A. A. Binetti. Fr. 786,474, Sept. 2, 1935. Paper is made impermeable by a soln. of rubber, and then given a coat of luminous paint obtained by mixing a luminous sulfide (of Sr, Zn or Cd) in a soln. of rubber. The luminous layer is protected by a thin film of rubber.

Hectograph copying pads Wm B. Whitmore (to Ditto, Inc.) U. S. 2,024,408, Dec. 17. A gelatinous mass formed of a gelatinous substance such as gelatin together with water and glycerol (with a major proportion of glycerol) is treated with a minute proportion of a light-sensitive tanning agent such as $(NH_4)_2Cr_2O_7$ and subjected to the action of concd. ultraviolet light to effect tanning.

Artificial sponge I G Farbenindustrie A.-G. Brit. 435,128, Sept. 16, 1935. A viscose sponge mass contg. a fusible or sol. pore-forming substance is applied to a support consisting of or contg. cellulose, e. g., paper, fabrics, wood, so as to become united to the cellulose and is then treated to produce the viscose sponge. In this manner wooden articles may be enwrapped in, or lined with, the sponge. The process may be applied to the production of polishing cloths, window rubbers, mops with wooden handles, spongy filler cloths, floor coverings, in-soles, etc.

Vinyl derivatives Georges E. Zelger. Fr. 780,495, Sept. 3, 1935. In condensing polyvinyl alc. with CH_3O in the presence of a catalyst to obtain products which are entirely sol. in appropriate org. solvents and given solns. of a high degree of viscosity, the max. dose of catalyst giving a product still insol. in the solvent chosen is det'd. experimentally, and this amt. is used with a slight excess. The excess is below 1% if HCl is the catalyst and if ordinary temp. is used. Cf. C. A. 29, 539⁹.

Hardening gelatin and other plates Telefunken Ges. für drahtlose Telegraphie m. b. H. Ger. 618,822, Sept. 16, 1935 (Cl. 42g. 15 01). Gelatin, casein and similar hardening plates of albumin compounds, used for gramophone records, etc., are hardened by enclosing them in a container with a water-sizing reagent and CH_3O -generating reagent, the latter being glowing Pt and MeOH.

Molded friction material such as brake lining Joseph N. Kuzmick (to Manhattan Rubber Mfg. Division of Raybestos-Manhattan, Inc.). U. S. 2,025,951, Dec. 31. Dry fluffy asbestos fibers are mixed with a potentially reactive synthetic resin and a plasticizer such as toluene-sulfonamide to produce a relatively dry mixt. which is then subjected to heat and pressure to render the synthetic resin infusible and produce a molded product of the desired shape.

Braided material suitable for brake lining Philip D. Cannon (to Johns-Manville Corp.). U. S. 2,025,038, Dec. 24. Strands of reinforced asbestos yarn are provided with a continuous coating of viscous impregnating material such as a rubber compn. and are formed into a braid (various details of app. and operation being described). U. S. 2,025,039 relates to an automobile brake lining material or the like formed of strands of wire reinforced asbestos yarn and other material such as a rubber compn.

Friction material suitable for brake lining Fred L. Hess (to Johns-Manville Corp.). U. S. 2,025,052, Dec. 24. Reinforced asbestos yarns are braided into a tube of loose fabrication; a semiplastic friction binder of hardenable character such as a described rubber compn. is placed within the tube, the tube and binder are pressed into a flat band, and the binder is hardened *in situ*. App. is described.

Gritty material for treating ice-coated roads Wm R. Collings (to Dow Chemical Co.). U. S. 2,026,121, Dec. 31. Moist sand at least 80% of which will pass through a No. 10 sieve is mixed with about 6-36% of comminuted partially dehydrated $CaCl_2$ contg. not more than 23% of water and which will pass through a No. 40 sieve.

Artificial wood Théophile Gerber. Fr. 786,282, Aug. 30, 1935. Glue, NH_4Cl , resorcinol, salicylic acid, NH_4OAc or other mineral or vegetable tanning agents are mixed with sawdust, wood fibers or cork waste and plaster. The

whole is mixed and submitted in an autoclave to the action of Cl_2O gas

Pitch composition. Max Singher Tr. 786,216, Aug. 29, 1935 Bitumen or pitch from petroleum or coal is mixed with oocerite to form a paste very suitable for fixing wood parquets to cement and which may be mixed with cork grains, sawdust, peat or fibers for various uses

Composition for cleaning the hands Roman Kornmann Austrian 143,657, Nov. 25, 1935 (Cl. 23b) A mixt. of calcined soda, soft soap, turpentine and water is heated to below the b. p., mixed with sawdust, cooled, dried and mixed with pumice powder

Composite dental plates Stefan Loos U. S. 2,025,750, Dec. 31 Various operative details are described for making composite plates of a plurality of layers of metals such as Cu, Ag and Au

Cellulose acetate projection screens David F. Newman (to Trans-Lux Daylight Picture Screen Corp.) U. S. 2,024,382, Dec. 17 A sheet formed mainly of cellulose acetate material contains an agent such as triphenyl phosphite for imparting flexibility and a light-diffusing agent such as ZnO and cobalt blue proportioned so that a substantial amt. of light traverses the screen when it is included in a rear projection system Cl. C. A. 29, 258⁷

Shoe-bottom filler composition Harry H. Beckwith (to Beckwith Mfg. Co.) U. S. 2,025,432, Dec. 24 A compn. which is plastic and spreadable at room temp. comprises an aq. dispersion of rubber contg. rosin mixed with granulated cork particles which are coated with waterproofing material such as bitumen Cl. C. A. 29, 1544⁴

Insecticide suitable for use on poultry perches Arthur H. Teigen (to Pratt Food Co.) U. S. 2,024,897, Dec. 17. A nonvolatile, sticky, adherent fluid contains free nicotine and corn oil

Material for tobacco-pipe bowls Michael A. Dorian and Leo Roon (to Roxahin Flexible Lacquer Co.) U. S. 2,025,811, Dec. 31. A moisture-permeable tobacco-pipe bowl such as one formed of wood carries on its exterior surface a coating of a heat-resisting, nonthermoplastic compn., permeable to water vapor, which may be formed from nitrocellulose, ethylcellulose and specified solvents.

Colloidal compositions. Hubert Degude Fr. 787,267, Sept. 19, 1935. Animal and vegetable waxes such as beeswax, Carnauba wax and candelilla wax are treated with $\text{Ba}(\text{OH})_2$ to obtain compds. which when heated with turpentine, white spirit or other mineral oil form colloidal sols. which may advantageously be used for making polishes, etc. The colloidal gel obtained by heating Ba soaps with CCl_4 is used as a fire extinguisher. Ba stearate, obtained by the action of $\text{Ba}(\text{OH})_2$ or stearins, is used in making varnishes and is added to stearins, paraffins, waxes, etc., to increase their m. p.

Fire extinguishers H. Th. Böhme A.-G. Brit. 434,856, Sept. 10, 1935 See Fr. 779,096 (C. A. 29, 4558⁹)

Fire-resisting hydrocarbonaceous material suitable for impregnating fibrous materials James H. Young (to H. H. Robertson Co.) U. S. 2,025,929, Dec. 31. A normally nonfluid hydrocarbonaceous material such as asphalt, Montan wax, etc., is mixed with a sufficient proportion of chlorinated biphenyl to render the compn. fire-resisting

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Operation of the Athens water supply. R. W. Gausmann. *J. Am. Water Works Assoc.* 27, 1458-76(1935).—The bacteriological quality is influenced by rainfall. Treatment at the plant includes aeration, coagulation, sedimentation, filtration and chlorination. The water is not corrosive. D. K. French

Water supply of the city Schleswig for 400 years. E. Peter. *Gas u. Wasserfach* 78, 849-55(1935).—History, geology and present status are presented. R. W. R.

Chemical character of ground water in Pennsylvania. W. D. Collins. *J. Pa. Water Works Assoc.* 6, 81-8(1934); *U. S. Pub. Health Eng. Abstracts* 15, W, 74(July 13, 1935).—The analyses of 500 Pa. ground waters are discussed. Ca and Mg are responsible for the hardness. The Ca exceeds in brines assoc. with oil but the opposite is true in sea water. The Fe content is av., while the hardness of the waters as a whole is less than av. for other states. C. R. Fellers

Municipal ground water supplies of Ontario. W. B. Redfern. *J. Am. Water Works Assoc.* 27, 1533-46(1935).—See C. A. 29, 5057⁴. D. K. French

Improved method for rating and sampling wells. Paul F. Howard. *Water Works and Sewerage* 82, 422-3(1935).—App. and method are described for detg. the quantity of water delivered at the normal operating rate of the well. Samples for water analysis are taken at the pt. of discharge. G. H. Young

Some first-year experiences at Easton, Pa. R. W. Haywood, Jr. *J. Pa. Water Works Assoc.* 6, 68-77(1934); *U. S. Pub. Health Eng. Abstracts* 15, W, 74(July 13, 1935).—A summer musty taste was not removed by 6 p. m. of C, but prechlorination at 4 p. m. was entirely effective. Changes in C dosage did not affect the Cl conen. reaching the filter but did affect that in the effluent. No treatment eliminated taste at the time the ice broke up, but filtration through a granular C filter was effective on a lab. scale. With no change in the alk., the pH may rise in the summer months from 7.4 at daybreak to more than 9.0 in midafternoon owing to algal attack on carbonates and bicarbonates. This action is reversed during the night. C. R. Fellers

Coagulating the water of the Delaware River at Easton, Pennsylvania. R. W. Haywood, Jr. *J. Am. Water Works Assoc.* 27, 1572-80(1935).—Reactions and formulas governing coagulation are accepted. Flocculation conformed with generally accepted rules controlling coagulation. Wide variations in pH of the river water had no measurable effect on coagulation requirements. Alky., turbidity and org. load were the 3 main factors in coagulation, and are stated in order of importance. D. K. French

Chemical and physicochemical analysis of the mineral waters of Valleverde (Abruzzo). Domenico Marotta and Ermenegildo Sorrentino. *Ann. chim. applicata* 25, 324-50(1935).—Complete analyses of these waters are given. They have a therapeutic value in treatment of gout and uremia, probably on account of the small amts. of Ag present. A. W. Conti

Detection of heavy water in French and some other (Norway, Sweden) mineral waters. Klaus Hansen, Erling Rustung and Johan Hvedung. *J. pharm. chim.* 21, 538-41(1935); cf. C. A. 29, 5594⁴; Bonhoeffer, C. A. 28, 967⁷, Richards and Shipley, C. A. 6, 2219.—The D_2O concn. of 7 samples examd. did not differ from that of ordinary H_2O . S. Waldbott

Milwaukee's water-purification plant. L. R. Howson. *Water Works and Sewerage* 82, 403-10(1935).—A description of plant lay-out and equipment. G. H. Y.

Decalcification of drinking water by filtration processes. P. Hirsch. *Wasser* 17, 243, 255(1933); *Gesundh. Ing.* 57, 171(1934); *U. S. Pub. Health Eng. Abstracts* 15, W, 32(Apr. 6, 1935).—The use of MgCO_3 (magnesite calcined at about 1000°) for the decalcification of water is superior to that of marble, which can only affect decalcification up to the lime- CO_2 equil. Magnesite by treatment with water contg. lime acquires the ability of decalcifying water beyond this equil. C. R. Fellers

Lime demand of acid water. Lewis V. Carpenter and Geo. R. Lyle. *J. Pa. Water Works Assoc.* 6, 47-8(1934); *U. S. Pub. Health Eng. Abstracts* 15, W, 64(June 29, 1935).—The simplest method for detg. lime demands of water is to run the methyl orange detn. for free mineral

acids and the Fe content by titration with KMnO_4 . In making the Fe detn., 20 cc of 1 to 3 H_2SO_4 is added to all waters to clear up the soln., e. g., sufficient lime is added to ppt the Fe in the Fe^{+++} state and neutralize the mineral acids to methylorange. The av. of 14 waters with acidities of 40-865 p. m. required an av. of 0.000562 g. of CaO per l. of water for each p. m. of acidity, which is equal to 4.67 lb. per million gal. C. R. Fellers

The practical determination of the hydrogen ion concentration of water. E. Naumann and Käte Naumann. *Gas u. Wasserfach* 78, 901-3 (1935).—Colorimetric and potentiometric methods of detg the pH of water are reviewed, and a new portable potentiometric indicator is described. A new non fluid type of bridge is used between the 2 cells. A KCl , HCl , quinhydrone electrode is used for comparison. R. W. Ryan

Preparation of water for the textile industry. removal of algae and sterilization. G. Ornstern. *Melliand Textilber* 16, 760 (1935).—Addn of a soln of a Cu salt, or over-chlorination followed by the removal of the excess Cl with active charcoal is the method used to remove algae from textile industrial waters. F. H. Moser

A new method of chemical determination of small amounts of silver in water. J. Just and A. Szmolis. *Arch. Chem. Form.* 2, 170-5 (1935) (English summary); cf. J. Just and A. Szmolis, *C. A.* 29, 7538¹.—Acidity 100 ml. or more of clear or filtered water to be tested with 5-10 drops of HCl (1:1) and add 2 drops of KI (1:10). Filter, after mixing, through a membrane filter of $1\text{-}\mu$ porosity and 2.5 cm. diam. placed in a Kollikwitz filter app. for detn. of plankton. Moistened the ppt on the filter with 1.2 ml. of freshly prep'd H_2S water, suck dry the colored disk, dry it in air and compare with standard disks prep'd. of known Ag salt soln., e. g., 0, 5, 10, 15 and 20 γ Ag per l. Thus Ag contents down to 2.5 γ Ag in the sample can be det'd. By prep'g standards nearer each other and decreasing the area of the membrane greater accuracy can be obtained. The soly of AgI is about 0.0011 p. m. and is greatly reduced by the presence of I^- ions. The natural color of H_2O up to 40 p. m. Pt has no visible influence. J. Wiertelak

Base exchange in the subterranean vadose waters of Tunisia. M. Schoeller. *Bull. soc. géol. France* [5], 4, 389-420 (1934).—The base-exchange theory as applicable to the case under consideration is sketched, and by comparison of numerous analyses of the waters with those of the strata from which the waters are derived and through which they pass, is shown to explain the comp'n of the waters. Full details are given for 3 areas the vadose waters of which are characterized, resp., by their content of (1) alkaline earth chlorides, (2) Na_2SO_4 , and (3) NaHCO_3 . Lastly it is shown that the predominance of waters contg. much Na_2SO_4 in the south, and of waters contg. much alkaline earth chloride in the north of Tunisia is explicable by the smaller rainfall and greater evap'n in the south as compared with the north. C. A. Silbert

Solid matter in boiler water foaming. III. Effect of calcium carbonate and magnesium hydroxide precipitated inside the boiler. C. W. Foulk and H. C. Brill. *Ind. Eng. Chem.* 27, 1430-5 (1935); cf. *C. A.* 28, 2814¹.—Expts were conducted at a pressure of 17.6 kg./sq. cm. (250 lb./sq. in.) and at an evap'n rate of 450-500 cc./min. in an exptl. boiler identical with that described by Christman, Holmes and Thompson (cf. *C. A.* 25, 3748). Coarse granular CaCO_3 pptd. by decomp'n of $\text{Ca}(\text{HCO}_3)_2$ within the boiler reduced priming (i. e., the amt. of liquid carried over into the steam line). The fluffy ppt. of CaCO_3 formed by pumping CaCl_2 soln. into Na_2CO_3 soln. increased priming, while the CaCO_3 ppt. formed by pumping Na_2CO_3 soln. into CaCl_2 soln. had little effect. After contact for several hrs. with the hot boiler water, even the fluffy CaCO_3 lost its ability to increase priming and became more granular. $\text{Mg}(\text{OH})_2$ pptd. by pumping MgCl_2 soln. into NaOH soln. reduced priming. A similar effect was noticed when $\text{Mg}(\text{OH})_2$ was pptd. along with fluffy CaCO_3 by Na_2CO_3 . Oscar T. Qumby

Removal of silica from solution at boiler temperatures. Frederick G. Straub. *Ind. Eng. Chem.* 28, 36-7 (1936);

cf. *C. A.* 26, 5245; 27, 1426.—Removal of SiO_2 from soln. at 182-232° was investigated. Heating 0.00376 molar SiO_2 and 0.015-0.050 molar NaOH did not ppt. SiO_2 . Addn. of $\text{Ca}_3(\text{PO}_4)_2$ did not ppt. SiO_2 . MgO reduced SiO_2 to 0.001 molar. NaAlO_2 reduced SiO_2 to 0.0003-0.0005 molar. Addn. of excess NaOH or small amts. of NaCl or Na_2SO_4 did not increase the soly of SiO_2 . The Al_2O_3 content did not exceed 0.0005 molar until SiO_2 had been pptd. to that level. Foster Dee Snell

2. Analcite. Preparation and solubility between 182° and 282°. Frederick G. Straub. *Ind. Eng. Chem.* 28, 113-14 (1936), cf. preceding abstr.—By heating suitable solns. of Na_2O , SiO_2 , and Al_2O_3 rounded crystals of analcite, $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot 2\text{H}_2\text{O}$, were obtained of a comp'n similar to the natural analcite. The solubilities in H_2O up to 0.00625 molar with NaOH are given and indicate greater soly. with increase of temp. and slightly greater with increase of NaOH . The $\text{SiO}_2/\text{Al}_2\text{O}_3$ ratio of the dissolved material is not the same as in analcite. Results indicate that with SiO_2 below 0.0022 molar, 120 p. m. of analcite scale will be prevented. Foster Dee Snell

The chlorine-ammonia treatment at Houston, Texas. L. P. White. *Southwest Water Works J.* 17, No. 9, 13-15 (1935).—Contrary to the usual practice Cl added before the NH_3 gave the best results. The distribution of N in H_2O with no residual Cl followed 1 of 3 changes: The free NH_3 and albuminoid N increased; free NH_3 decreased, albuminoid N increased and sometimes nitrates occurred, free NH_3 decreased with formation of nitrates and nitrites. Reducing the ratio of NH_3 to Cl from 1.45 to 1.60 increased residuals and decreased H_2S odors. O. M. S.

Ammonia dosage in ammonia-chlorine treatment of water. M. L. Koschkin. *J. Am. Water Works Assoc.* 27, 1477-91 (1935).— Cl absorption drops as the NH_3 dosage rises. A higher content of org. matter increases the amt. of NH_3 required. Increasing the Cl dosage necessitates an increase in NH_3 . Slightly acid water (pH 6.7) demands more NH_3 than when reaction is slightly alk. (pH 7.2). Bactericidal effect of Cl is retarded by NH_3 . Dosing NH_3 according to the amt. of Cl cannot guarantee success in all instances. D. K. French

Effect of organic load on chloramine sterilization. A. C. Beyer. *Western Construction News* 9, 334 (1934); *U. S. Pub. Health Eng. Abstracts* 15, W, 66 (June 29, 1935).—A higher velocity sterilization was obtained with both Cl and chloramine at pH 6.6 than at either pH 7.4 or 8.2. With org. loads above 60 p. m., chloramines showed a marked superiority over Cl in the sterilization efficiency. C. R. Fellers

Ferric sulfate coagulation. Philip J. Horton, Jr., and Elwood L. Bean. *Waterworks & Sewerage* 81, 229-32 (1934); *U. S. Pub. Health Eng. Abstracts* 15, W, 64-5 (June 29, 1935).—Dry, com. "Ferrisul" now used contains 94% FeSO_4 . If tanks and feed lines are lined with rubber, disintegration from chem. action is largely prevented. The coagulant is introduced into the raw water at Providence, R. I., aerated, treated with $\text{Ca}(\text{OH})_2$, to the point of slight causticity, mixed, settled and filtered. The pH of the filtered water is maintained at 9.2-9.6 to stop corrosion in the distribution system. C. R. F.

Experience with fluorine in water. Jane H. Rider. *J. Am. Water Works Assoc.* 27, 1510-24 (1935).—A brief review of the published data relative to F in drinking water supplies, and its physiological effects. In children of susceptible age, 0.9 to 1.0 p. m. F will cause mottled enamel. No satisfactory, economical methods of removing F have been developed. D. K. French

Removal of iron and manganese from humus-containing water in a closed system at high filtration rates. R. Marschner. *Gas u. Wasserfach* 78, 833-5 (1935).—Open filtration plants for purifying this water have previously operated at rather low filtration rates. The raw water contained 2.7 mg. of Fe_2O_3 and 0.2 mg. Mn per l. and was highly colored. The exptl. filter consisted of 2 units, each provided with a 1.5-m. depth of filter sand. The sand in the coarse filter was 2 to 3 mm. and reduced the iron content to 0.35 mg. Fe_2O_3 per l., while the fine filter contained 0.5-0.8 mm. sand and reduced the iron

content to less than 0.1 mg. Fe O₂ per l. When Mn-coated sand was used in the fine filter, the Mn content was reduced to traces, at a max velocity of 15 m per hr with an operating period of 60-70 hrs. R. W. Ryan

A modern turbidimeter. Grant Laughlin *Water Works and Sewerage* 82, 423 (1935).—Brief description of a portable turbidimeter using a photoelectric cell hook-up, and calibrated to read p. p. m. directly from a galvanometer deflection. Comparisons are made against distd. H₂O as having zero turbidity. G. H. Young

Filter-washing experiments at the Chicago experimental filtration plant. Herbert E. Hudson *J. Am. Water Works Assoc.* 27, 1547-63 (1935).—Descriptions are given of many experiments on filter washing. All available information indicates the desirability of keeping filter sand as clean as possible. Backwashing failed to keep filters clean though the higher the rate the greater the success. Surface washing in addition kept filters in very good condition. Much detailed information is given of installations in various cities. D. K. French

Operation of filter plant at Pottstown before and after new sedimentation facilities were installed. E. K. Grubb *J. Pa. Water Works Assoc.* 6, 33-8 (1934). *U. S. Pub. Health Eng. Abstracts* 15, 72 (July 13, 1935).—The turbidity varies from 10 to 1000 p. p. m. As the water is pumped into the sedimentation basin it first passes through the screen chamber and then to the rapid sand filters. The filters are washed every 10 hrs. The plant capacity is 6 million gal. per day. The mixing chamber has a retention period of 20 min. and the sedimentation basin one of 5 hrs. Since the new installation the turbidity on the filter has been reduced from 40 p. p. m. to 15, the coagulant has been reduced by 30%, the wash water by 80%, and the power consumption by 25%. Sedimentation vastly improved the quality of the effluent. C. R. Fellers

Pipe cleaning. Charles Haydock *J. Am. Water Works Assoc.* 27, 1566-71 (1935).—Soft waters, those low in total solids and those most desirable for domestic and industrial purposes are the most corrosive in pipe lines. Ordinarily pipe cleaning is to remove tuberculation. Mech. processes have been most generally used, although chem. processes have been used in certain cases. Pipe cleaning is not expensive when the benefits derived are considered. D. K. French

Lime reclamation at Winston-Salem sewage plant. R. M. Rogers *Munic. Sanit.* 5, 408 (1934). *U. S. Pub. Health Eng. Abstracts* 15, 5, 30 (July 6, 1935).—A dosage of 800 p. p. m. of lime gives a quick-settling floc and excellent clarification. It is suggested that the CaO be reclaimed by using CO₂ generated from the calcining sludge to ppt. the excess CaO. The pptd. CaO would be re-calcined and then fed back to the incoming raw sewage. C. R. Fellers

Operation of the North Toronto sewage-treatment works. Geo. Phelps. *Can. Engr.* 69, No. 16, 33-4, 40 (1935).—Industries are urged to pretreat their trade waste to make it similar to domestic waste. Operating data showing the extra cost of high-degree treatment and photographs are given. Ann Nicholson Hird

Danger of gasoline in sewerage system. J. R. Donald. *Can. Engr.* 67, No. 21, 13 (1934); *U. S. Pub. Health Eng. Abstracts* 15, 5, 33 (July 6, 1935).—As a result of a series of explosions in a 2-mile length of sewer in Ottawa, it was called that 150 gal. of vaporized gasoline would create an explosive mixt. in the 6-ft. sewer. In order to secure an explosive mixt. of coal gas, approx. 826,000 cu ft., or 1/3 of the amt. manufd. in the city daily, would be required. C. R. Fellers

Operation of Guelph's new activated-sludge sewage plant. H. S. Nicklin. *Can. Engr.* 69, No. 16, 29-32 (1935).—In the summer the sludge is treated with powder lime the day after pumping, to avoid odors. After 8 days the dried chips are raked off. Photographs are shown. Ann Nicholson Hird

The Menomonee Falls (Wis.) activated-sludge sewage-treatment plant. Robert Cranmer, Jr. *Water Works and Sewerage* 82, 418-21 (1935).—Lay-out and equipment are

described and data obtained on test runs given.

G. H. Young
Industrial wastes and pollution of inland waters. J. Ricardo Alves Gumaes, Arcanio Faria and Francisco Bergamin. *Rev. dept. nuch. producao animal* 1, 71-104 (1931).—Distillery slop from cane molasses distilleries in Brazil was added to aquarium H₂O in the proportions of 50, 40, 30, 20, 10, 5 and 2 1/4%. The 1st 4 dilns quickly killed all fish of several species placed therein. Only the females of 1 species (*Phallopterus januaris* Hensel) survived the 10% diln for 24 hrs. *P. januaris* (agam females only), *Geophagus brasiliensis* Q. and G. and *Fundulus sensuensis* Agassiz survived the 5% diln. The 2 1/4% diln was practically harmless to all species, this also appears to be the limit of tolerance for water insects, tadpoles, microcrustaceans and worms. The limit for subaqueous plants is about 5%, floating plants 30%, protozoans 50%. Neutralization greatly diminishes the toxicity. When subjected to biol. purification (Calmette) the slop is innocuous in the proportion of 20%. Chem. analyses are given. O. W. Wilcox

Clarification of polluted water with particular reference to colliery waste and sewage. R. D. Gifford *J. Inst. Engrs.* July 1934. *Sewage Works J.* 6, 1187-7 (1934). *U. S. Pub. Health Eng. Abstracts* 15, 5, 26 (Mar. 16, 1935).—The paper describes a process for the rapid settlement and dewatering of sludge developed by R. A. Henry of Liege, Belgium, and adopted for the treatment of the sewage of Micheroux, a city of 100,000. Basically the process consists of the use of starch and NaOH as a coagulant after establishment of a condition of alkali approximating pH 11.0. It is highly advantageous to use frozen starch and imperative that the lime be thoroughly incorporated with the water. It is preferable to grind the lime under water so as to subdivide it into minute particles and thus present a relatively large surface to the water. The Micheroux sewage works have a series of lime crushers in the sewage channels. The lime causes the sludge to settle at once and the sludge and scum are removed without delay to a conical settling tank where rapid conn. is effected by the use of frozen starch and NaOH, and the dewatering of the sludge by vacuum filtration. C. R. Fellers

Preliminary report on the disposal of oil field brines in the Ritz-Canton oil field, McPherson County, Kansas. C. J. Wilhelm and Ludwig Schmidt. *Bur. Mines, Rept. of Investigations* No. 3297, 20 pp. (1935).—Pos. disposal of brine is accomplished by return of brine to subsurface formations. Pptn. of Fe compds. and salts in soln. may seal the formation. Controlled diln. of the brine by pumping into surface streams is possible. Alden H. Emery

Distillery wastes. Chemical and filtration studies. C. R. Hoover and F. K. Burr. *Ind. Eng. Chem.* 28, 39-41 (1936).—Chem. pptn. of distillery wastes by coagulation is not economically satisfactory on the basis of reported results with CaO and Fe or Al salts. Filtration at 1,000,000 gal. per acre per day on a 10-ft. deep trickling filter built of laths gives 90% reduction of B. O. D. with clarified grain waste, or relatively clear apple brandy or molasses ale wastes. For treatment these are dtd. below 2000 B. O. D. The result is 98-100% complete in 6 ft. Intermittent sand filters are inefficient because of clogging and low capacity. Coke breeze of 1-mm. effective size is more satisfactory than sand. A 4-ft. depth gave 98% reduction of the above wastes at 200,000 gal. per acre per day. Temps. of 18-30° did not affect the results obtained. Foster Dee Snell

Garbage reduction and incineration combined in Philadelphia plant. Joseph E. Gill. *Am. City* 50, No. 12, 57-8 (1935).—Stored garbage, instead of awaiting rubbish for combustion, is digested and the tankage used as fuel. G. H. Young

Gas cleaning and sludge-recovery system (Wille, Mohr). 21 Waste products of city dumps as fertilizer (Schecklein). 15 Use of Zn alloys for water pipes (Cazaud, Petot). 9 Rotary-drum app. for filtering and dewatering slimes such as those from sewage (U. S. pat. 2,024,358). 1. Exhaust

Purifying water Douwe N. Kuipers Brit 434,015, Aug. 23, 1935 H₂O is purified by aerating and filtering through a series of filters the 1st and last of which have a slower speed of filtration than the others

Clarifying tanks for water purifying apparatus Karel L. Hagemans and N. V. Machiniefabriek Reneveld Brit 434,030, Sept. 10, 1935 H₂O to which reagent has been added is supplied to a settling vessel through a trough fitted with baffles a central tube, lateral passages and annular chambers

Apparatus for clarifying water Karel L. Hagemans and N. V. Machiniefabriek Reneveld Fr 787,518, Sept. 24, 1935

Apparatus for filtering water through granular material such as gravel Willis H. Jones U. S. 2,024,646, Dec. 2, 1935 Structural and operative details

Filtering water by granular layers with means for clearing grains of sediment Norton Co Fr 786,310, Aug. 11, 1935

Softening water Christopher G. Marshall Brit 434,012 Aug. 21, 1935 A H₂O softening plant is provided with an app. for indicating the correct flow of H₂O during backwashing

Apparatus for softening water Bengt Rybo and Aktiebolaget Filtrum Brit 434,535, Sept. 4, 1935 Brine for regenerating base-exchange material in a main container is

formed from salt in an inner container through which H₂O is forced as an upwardly directed rotating stream

Treating waste waters, sewage, etc. René A. Henry Fr 787,831, Sept. 30, 1935 A suspension of clay in an aq. soln. of lime is added, the amt. of clay being detd. by the amt. which can be adsorbed by the org. material, colloids, etc., present The amt. of lime is sufficient to give a pH value of 11 and this value is maintained sufficiently long to destroy living organisms. App. is described

Apparatus for treating sewage Wm. A. Dundas and Philip Harrington Jr. 787,813, Sept. 30, 1935 The residues are freed from their moisture content and incinerated and the heat of combustion is used for driving a further patch

Apparatus for sewage purification by aeration, settling, etc. Henry Elrod U. S. 2,024,345, Dec. 17, 1935 Structural and operative details

Apparatus for treatment of sewage by aeration and sedimentation Augustus C. Durbin, Jr. (to Chicago Pump Co.) U. S. 2,024,986, Dec. 17, 1935 Various structural and operative details

Sewage sludge treatment Henry J. Stehli U. S. 2,020,306, Dec. 31, 1935 Sewage sludge is sep. into fragments which are surface-coated with dry material or surface-dried to prevent them from adhering to one another, the fragments are dried, the upper portions of the dried fragments are heated (suitably on a perforate-bottom carrier) and heated gases from such portion are passed through the lower portion of the fragments without burning the latter to distill noxious gases and the latter are burned. App. is described

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

Summary of work done under the agricultural chemist and soil physicist, Agricultural Research Station, Sakrand, for the year 1933 34. V. A. Tamhane Ann. Rept. Dept. Agr. Serv. (India) 1933 34, 111-20—Soils—Ca is the predominant exchangeable base in the solonchets group of Sind soils. In the kalar (salt) soils the Ca is as high as 0.0, as compared with 7.5-8.0 in the normal soils. The N-fixing power of the normal soils in the natural condition is low but is greatly increased by addn. of org. matter in the form of green manure. The N-fixing power is not enhanced by addn. of (NH₄)₂SO₄ without org. matter. The N-fixing power of kalar soils is almost negligible and is not enhanced by addn. of org. matter. In general, the amts. of total and of injurious soil salts in kalar soils were significantly decreased by leaching the soil with 32 acre-inches of water applied at the rate of 8 acre inches per week. The treatment markedly reduced the NaCl content of the soil and permitted the growth of a good crop of cotton. Good results were also obtained by scraping off the incrustation of salts prior to flooding the soil. Very bad kalar soil was not improved in 1 season by treating with alum at the rate of 800 lb./acre and flooding with water. CaCl₂ was more effective than either gypsum or superphosphate in improving kalar soil. Capillary rise of soil salts in soils that had been leached previously with water was checked by the addn. of green manure to the soil. Effect of soil salts on wheat—In pot tests no growth of wheat was obtained in the presence of 0.5% of either NaCl, KCl, MgCl₂, CaCl₂, Na₂CO₃, K₂CO₃, or (NH₄)₂SO₄. The toxicities of other salts decreased in the order NaNO₃, KNO₃, K₂SO₄, Na₂SO₄, MgSO₄, the last having comparatively little toxic effect. In the earlier stages of growth wheat was adversely affected by the presence of 0.3% NaCl, but addn. of NaCl during and after the flowering stage seemed to have no adverse effect on the crop. K. D. Jacob

The proton in soils and soil degradation I. D. Sedletskii Khimicheskii Sotsialist. Zemledel'ia (Moscow) 1935, No. 5, 20-27—A theoretical discussion on the mechanism of the entrance of the H⁺ ion into the crystal lattice of the micelle, as contrasted to surface adsorption

of other ions, this causes the disruption of the micellar nucleus and brings about degradation. J. S. Joffe

Fundamental amelioration of solonchets N. I. Belkin Khimicheskii Sotsialist. Zemledel'ia (Moscow) 1935, No. 6, 45-55—Pot. exps. were conducted with soil taken from the columnar B horizon of a solonchets. After addn. of gypsum or org. matter plants were grown 3 years in succession, analyses being made on the soil for change in reaction, nitrification and structure. It is concluded that about 14 tons of gypsum or 240 tons of manure per hectare changes the soil fundamentally and adapts it for cropping. A hay crop of sweet clover is suggested for the first 2 years after ameliorating the solonchets condition. J. S. Joffe

Experimental results on the chemuration of marsh soils in the far north P. A. Turnas and A. F. Karatnikova Khimicheskii Sotsialist. Zemledel'ia (Moscow) 1935, No. 6, 15-22—Apatite and nephelite wastes can be used for the neutralization of acidity in high-moor peat soils just as efficiently as lime. A mixt. of these 2 materials also supplies P and K. Burning virgin moors brings enough haves into circulation to obviate the necessity of adding neutralizing agents. Equiv. applications of apatite and acid phosphate give the latter the preference for the first year. In the years following the differences are obliterated. A double portion of apatite gave just as good results as a single portion of acid phosphate. The K in nephelite was found to be as effective as the standard K salts. The low moors did not respond to K applications. J. S. Joffe

Observations in connection with atmospheric additions of sulfur to arable soils Gabriel Bertrand. Bull. soc. chim. [3], 2, 2102-5 (1935)—See C. A. 29, 6098a.

G. G. The influence of phosphates on the cation-exchange capacity of the fundamental soil types of the U. S. S. R. K. Kh. Aidiyan Khimicheskii Sotsialist. Zemledel'ia (Moscow) 1935, No. 4, 13-22—Soils of the chernozem, gray forest steppe, podzole, solchets, chestnut and red earth zones were said with Na, treated with NaH₂PO₄ or NH₄H₂PO₄, the absorbed P was detd., the soils were electrodyalyzed and the exchange capacity was detd.

The red soil absorbed appreciable quantities of P and increased the exchange capacity. Treatment of chernozem with $\text{NH}_4\text{H}_2\text{PO}_4$ decreased the exchange capacity from 28.8 milliequiv., as detd by NH_4Cl treatment, to 20.9 milliequiv. J. S. Joffe

Relations among the exchangeable acidity and the exchangeable substances in the soils. Chikabumi Ichikawa. *J. Agr. Chem. Soc. Japan* 11, 817-24 (1935).—When the acidity of the soils by the KCl method increased, the quantity of Al_2O_3 in the KCl ext increased, while that of CaO decreased. There is a reciprocal relation between the exchangeable acidity, the exchangeable Al_2O_3 and the exchangeable CaO . Y. Kihara

Determination of hydrolytic acidity by various methods on soils of the Sverdlov region. V. A. Serdyukov and A. D. Kazantsev. *Khimicheskaya Setkalist Zemledel'ya* (Moscow) 1935, No. 4, 68-71.—Podzol soils of different degrees of podzolization and several varieties of chernozem were tested by the Csiky (C. A. 25, 3756) and Kappen methods for hydrolytic acidity to det their lime requirements. The Csiky method gave results which were closer to the actual condition, whereas with the Kappen method the factor 1.75 had to be applied to compare with the results by the Csiky method. J. S. Joffe

The present position of the mechanical analysis of soils. A. Srenivasan. *Madras Agr. J.* 23, 443-51 (1935).—A review with 68 references. K. D. Jacob

The methods of determining potassium in soils for agro-chemical purposes. Ya. V. Peise. *Khimicheskaya Setkalist Zemledel'ya* (Moscow) 1935, No. 6, 71-83.—A modification of the $\text{K}_2\text{NaCo}(\text{NO}_3)_6$ method is presented. The K is extd from a 1:2 soil- NaCl mixt., and absorbed NH_3 in the soil does not interfere with the detn. J. S. Joffe

The Gedroz potash method for mass analyses of the absorption capacity of carbonate soils. B. V. Ostroumov. *Khimicheskaya Setkalist Zemledel'ya* (Moscow) 1935, No. 6, 61-71.—The Gedroz method (see the 3rd edition of his book "Chemical Analyses of Soil," C. A. 20, 2223) of using K_2CO_3 on soils contg carbonates for the detn of the exchange capacity by titrating the carbonates formed in the exchange reactions has been modified by using potentiometric titration. In this manner it was found possible to use this method on solonchic soils. J. S. Joffe

A new method of determining the adsorbed potassium in carbonate soils. D. Guseinov. *Khimicheskaya Setkalist Zemledel'ya* (Moscow) 1935, No. 5, 53-7.—The efficiencies of AcONH_4 , CaCl_2 , AcONa , NH_4Cl and $(\text{NH}_4)_2\text{SO}_4$ were compared in extg K from soils rich in carbonates. It is shown that the $(\text{NH}_4)_2\text{SO}_4$ is the most efficient reagent and may be used as an index of the available K in soils. J. S. Joffe

Soil, field-crop, pasture and vegetable-crop management for Eustafson. New York. I. Soils and field crops. A. F. Gustafson. N. Y. (Cornell) Agr. Expt. Sta., Bull. No. 639, 5-55 (1935); cf. C. A. 29, 853.—Characteristics of the 12 soil types present are given in detail and their value for crop production is outlined. As a result of exptg 201 soils, the use of lime on most soils is recommended. In general, moderate application of superphosphate to most soils and crops was profitable. II. Pasture improvement and management in Erie County. D. B. Johnstone-Wallace. *Ibid.* 56-67.—Pasture improvement is best accomplished by the application of 500-800 lb. of superphosphate per acre once in 3-5 years. III. Vegetable crops. F. O. Underwood. *Ibid.* 87-115.—The soils yield good crops of potatoes, peas, sweet corn, beans, cauliflower, cucumbers and tomatoes. IV. Soil map and soil-type descriptions. C. S. Pearson, F. B. Howe and A. F. Gustafson. *Ibid.* 115-20. C. R. Fellers

Some bacteriological and chemical effects of calcium and magnesium limestones on certain acid lowa soils. Harold L. Dean. *Iowa State Coll. J. Sci.* 10, 69-71 (1935).—In greenhouse and lab. expts., conducted to compare the effects of high-Ca and high-Mg limestones and pure carbonates of Ca and Mg, the results obtained indicate: (1) the early effects of Ca limestone are superior,

(2) after a long period there is no difference, (3) the time order of effect is pure carbonates, fine limestone, coarse limestone, (4) the soil contained enough of either Ca or Mg so that the addn. of large amts. of either did not produce deleterious effects. F. E. Brown

Fixation of atmospheric nitrogen in the soil and the utilization of molasses as a fertilizer. N. R. Dhar and S. K. Mukerji. *Proc. Acad. Sci. United Provinces Agr. Oudh, India* 5, 61-70 (1935); cf. C. A. 30, 555, 556.—Sterile mixts of soil and sucrose illuminated in sunlight under sterile conditions in quartz vessels showed an increase in NH_3 and total N. Appreciable amts. of NH_3 were formed when sterile air free from N oxide was passed through solns of glucose and sucrose in the presence of freshly pptd $\text{Fe}(\text{OH})_3$. This indicates that fixation of atm. N can take place without bacterial action provided energy is supplied by photochem. or induced oxidation of sugars. The exposure of sterile molasses soil mixt. to sunlight leads to an increase in NH_3 up to a limiting value. This is true of soil in the field, and expts. show that molasses applied as fertilizer increased the yield of sugar cane up to 36% and exerted a beneficial effect upon rice culture. C. E. P. Jeffreys

Metabolism of soil fungi. Unto Vartiavaara. *Suomen Maataloustieteellisen Seuran Julkaisuja Acta Agraria Fennica*, 32, 107 pp. (in English 108-12) (1935) (reprint).

Various fungi were grown on synthetic media with cellulose and other substances as C sources. *Sporotrichum carnis* produced a max. yield of mycelium and effected a max. decompn of cellulose at 24°, while with *Monospora daleae* the temp. was 20°. If the mycelium is first grown at an optimum temp., cellulose decompn. proceeds at 5° at only a slightly reduced rate. Both species produced the highest yield of dry matter between pH 4 and 7. Good aeration was essential for good growth. Wide, shallow culture vessels were the best. Both species grew well on dihydroxyacetone, pentoses, hexoses, disaccharides, dextrins, higher alks., certain org. acids, and particularly on fructose, maltose and sol starch. Technically purified cellulose was decompd. effectively by both species. Maltose at 2-5% of the cellulose promoted the decompn. of the latter, while higher amts. of maltose inhibited it. Both species readily decompd. straw, roots, wood, leaves and needles, but lignum was only slightly attacked. The use by the fungi of morg. N compds. greatly changed the reaction of the medium, NH_3 making it acid, and nitrates added. The amt. and soly. of N compds. in the mycelium decreased markedly with the age of the mycelium. When dried fungus material was used as N fertilizer for oats, the amt. of N taken up by the plants corresponded to the degree of mineralization in parallel decompn. expts. in sand. J. J. Williams

The influence of varying the time interval of applying sylvinit on the agro-chemical properties of the soil and the yield of potatoes. E. A. Zhorikov. *Khimicheskaya Setkalist Zemledel'ya* (Moscow) 1935, No. 4, 32-6.—Application of sylvinit to a podzolic sandy soil increased the active acidity by replacing the H ions, decreased the Ca and Mg in the soil complex of the upper horizon, decreased the nitrification energy, and prevented the absorption of Ca and Mg by the potato, thereby decreasing the yield. The injurious effects of this KCl bearing mineral could be avoided by applying it in the fall. J. S. Joffe

The causes of the mobilization of phosphoric acid upon liming podzolic soils. S. S. Yarusov and I. S. Treilikh. *Khimicheskaya Setkalist Zemledel'ya* (Moscow) 1935, No. 5, 28-37.—Iron phosphates with different ratios of basoid to acidoid were prepd. by washing the Merck prepa. with water, a higher basoid content being thus obtained, and by pptg. salts of Fe and phosphate at various pH values. The phosphates were used in culture expts. by applying the method of isolated feeding, with oats as the exptl. plant. The pH of the inner pots was kept const. by adding $\text{Ca}(\text{OH})_2$, NaOH or H_2SO_4 . From the series of expts. run during 1928-1931 it is indicated that the phosphates with a high basoid content are less sol. and available than the ones with a low basoid content. The soly. of phosphates of low basoid content does not change up to a pH

4.0 when acid is added and down to a pH 7.0 when alkali is added. In the pot expts the high-basoid phosphate became more available upon the addn of NaOH. The low basoid phosphate did not become more available upon the addn of NaOH. Addns of Ca(OH)₂ decreased the availability of the low-basoid phosphates, but increased the availability of the high-basoid phosphate. The genesis of podzols is conducive to the formation of high-basoid phosphates, hence the addn of lime makes the P₂O₅ available. J. S. Joffe

The effect of liming on the liberation of potassium in some Iowa Soils. Hartzell C. Dean. *Iowa State Coll. J. Sci.* 10, 73 (1935), cf. *C. A.* 29, 3760².—The expts were conducted in both lab and greenhouse. Analysis of 12 high Ca soils revealed large amts of CO₃, N and K, but 11 of the 12 were deficient in available K. An acid Tama silt loam had a smaller exchange capacity than a high Ca soil, was unsatd with respect to bases, released more K on liming, and acquired the K-exchange characteristics of a high Ca soil within 6 months after the addn of 6 tons of lime per acre. Sterile un inoculated soils contained more available K than sterile inoculated soils under similar treatment. The action of microorganisms contributes to the unavailability of K, but depressed hydrolysis and reversion of K to insol forms are also factors. F. E. Brown

The significance of potassium in the system of fertilizing sugar-beet rotations. F. A. Lut. *Khimskaya Soiznitsa Zemledeliya* (Moscow) 1935, No 6, 33-40.—Exptl results over a period of 12 years on the effect of K on sugar beets in the rotation prompted the following conclusions. In the chernozem zone K and P are first in order for sugar beets. The need for N is not clearly marked in the rotation with clean fallow, grain or legumes. The more often sugar beets appear in the rotation, the more often it is important to add K. The beneficial effects of K on sugar beets are especially marked when grasses are in the rotation. The other crops in the rotation, especially winter wheat, benefit from the residual effects of the K added to the sugar beets. J. S. Joffe

The effect of reaction and lime content of soil on the yield and composition of several leguminous green manure crops and green corn. Rokuro Kawashima. *J. Sci. Soil and Manure* (Japan) 9, 389-410 (1935).—Varieties of leguminous green-manure crop were found to be indifferent to the relation between the growth of the crop and the reaction as well as the Ca content of the soils. With several manure crops and green corn (soy bean, lupine, common vetch, hairy vetch and serradella) the optimum ranges of Ca content and reaction of the soils to the plant-growth were different. Y. Kamoshita

The problem of fertilizing eroded slopes. Ya. V. Korney. *Khimskaya Soiznitsa Zemledeliya* (Moscow) 1935, No 5, 12-19.—Erosion removes more N and less P from the lower portion of the slope than from the upper, hence the lower portion responds more to N and less to P fertilizers. The reverse is true for the upper portion of the slope. J. S. Joffe

A general summary of experiments with sugar cane. W. G. Taggart, C. B. Gouaux, F. C. Simon, C. W. Edgerton, L. C. Tims, P. J. Mills, W. E. Hinds and B. A. Osterberger. *La Agr. Expt. Sta., Bull. No. 267*, 2-16 (1935).—To avoid serious deterioration (loss in sucrose content) cane should be delivered to the sugar mill without delay after cutting. An application of 100 lb of NaNO₃ per acre was found most profitable for most La. cane soils. The resistance of the various canes to mosaic and other diseases is discussed. Among the controls proposed for the sugar cane borer, *Diatraea saccharalis*, is dusting in July with high-grade light Na₂SiF₆. C. R. Iellers

The methods and time of introducing fertilizers. A. S. Koruzhev. *Khimskaya Soiznitsa Zemledeliya* (Moscow) 1935, No 4, 23-8.—Exptl results are presented showing that acid phosphate gives better results when ground to a fineness of less than 2 mm. Nitrophoska of less than 1 mm gave better results than larger particles. Local application was usually superior to broadcasting. Physiologically acid fertilizers gave poorer results with local

application on podzol soils, whereas Nitrophoska gave better results. On a limed podzol soil raw phosphates when applied locally gave good results in combination with (NH₄)₂SO₄. J. S. Joffe

Artificial fertilizer inspections—report for 1935. W. C. Robertson. *J. Dept. Agr. Victoria* 33, 608-13 (1935), cf. *C. A.* 29, 2046².—Analyses of fertilizers and fertilizer materials sold in Victoria are tabulated and discussed. K. D. Jacob

The waste products of city dumps as fertilizer. S. L. Shebekin. *Khimskaya Soiznitsa Zemledeliya* (Moscow) 1935, No 4, 62-7.—Analyses of a no. of dump materials and their composts are given. J. S. Joffe

Sulfates and chlorides as fertilizers. VII. Influence of both salts on the physical constitution of paddy-field soil fertilized annually for five years with the same fertilizers. Isenosuke Onodera and Hiroshi Hasegawa. *J. Sci. Soil and Manure* (Japan) 9, 357-64 (1935), cf. *C. A.* 28, 2452¹.—Fertilizing the soils (paddy field soil of alluvial loam) with several combinations of sulfates (NH₄ and K), chlorides (NH₄ and K), Na phosphate, Ca superphosphate, farmyard manure, etc., caused an increase in the amts of fine and coarse sands in the soils. The amt of clay was observed to be large in the soils of chloride plots but not in those of sulfate plots, the cases were reversed for the amts of fine sand and silt. The minute soil particles seemed to be attacked by farmyard manure and dissolved by chloride applied as fertilizer. Y. Kamoshita

Nephelite as a fertilizer. N. D. Smirnov. *Khimskaya Soiznitsa Zemledeliya* (Moscow) 1935, No 6, 23-32.—Vegetation and field expts. with a no. of crops on moss, peat, sandy loam and loam podzol soils show that nephelite can serve as a neutralizing agent and as a source of K and P. J. S. Joffe

Potassium from Solikamsk and the use of mixed fertilizers. B. S. Rozenberg. *Kalif* (U. S. S. R.) 1935, No 5, 26-31.—A discussion of economic advantages of the use of mixed fertilizers (N, P₂O₅ and K₂O). Tables are given of the proportions and amt of different formulas of fertilizers for different districts of U. S. S. R. A. P.

Potassium fertilizers for flax and hemp. V. M. Filippenya. *Kalif* (U. S. S. R.) 1935, No 4, 50-2.—K fertilizers increase the yield of flax and improve its quality, 45-60 kg of K₂O per hectare is required. For hemp planted on peat soil (reclaimed from marshes) the best amt was 90-120 kg K₂O per hectare. A. Pestoff

Physicochemical basis of obtaining complex potassium fertilizers. A. G. Bergman and L. B. Polyakova. *Kalif* (U. S. S. R.) 1935, No 8, 24-8.—The polytherm of the diagonal cross section KNO₃-NH₄Cl-H₂O of the mutual system NH₄NO₃ + KCl = KNO₃ + NH₄Cl was studied in the range of +30° to the freezing of soln, -16.4°. The eutectic at -16.4° contains 6.1% KNO₃, 18.7% NH₄Cl and 75.2% H₂O (by wt). The triple nonvariable transmutation point at +23.4° contains 21.9% NH₄Cl, 25.6% KNO₃ and 52.5% H₂O (by wt). Four references. A. Pestoff

Cementation in the storage of fertilizing salts. N. E. Pestov. *Kalif* (U. S. S. R.) 1935, No 7, 28-31.—The causes of cementation of fertilizer salts in storage are hygroscopicity of the salt, climatic conditions, humidity, time of storage; form of the particles of the salt and the character of the surface. The smooth sphere is the best form. Other important factors are size of particles; homogeneity of the size of particles, size of the pile and pressure developed on a part of the mass. Isolation from the air and admixt with different materials often inhibits cementation. The prevention of cementation is accomplished by the manu. of salts in the form of large crystals (finely cryst salts must be granulated). Addn of oils, CaO, MgO, CaSO₄, and other materials in small quantities is often beneficial. A. Pestoff

The utilization of by products containing copper and ores of a low copper content as fertilizers for marsh soils. A. V. Zenyuk. *Khimskaya Soiznitsa Zemledeliya* (Moscow) 1935, No 5, 45-53.—Expts with CuSO₄ at the rate of 25-30 kg per hectare on marsh soils during 1939-1932 have proved the stimulating effects on wheat,

barley, flax and oats. In 1933-34 other Cu compds. were tested: nitrate, oxide, chloride, acetate, carbonate, malachite and a prepn. AB the compn of which is not stated. In all cases there were large increases. Upon the addn. of a complete fertilizer the yield did not increase unless an extra dose of Cu was added. Chalcedony flux contd. about 0.4% CuO at the rate of 300 to 1200 kg. per hectare and 2 or 3 contg. 1 to 1.5% CuO at the rate of 300 kg. per hectare were used in pot and plot expts. In both cases the results compared favorably with those of CuSO_4 . The chalcedony flux was especially effective in increasing the yield of grain. In general, Cu was more effective in marsh soils rich in P. J. S. Joffe.

Insecticide tests to control the codling moth at the Vincennes, Indiana, laboratory during 1934. L. F. Steiner, R. F. Szama and J. E. Fahey. *Trans. Indiana Hort. Soc., 74th Ann. Meeting 1935*, 66-71.—None of the materials tested gave satisfactory control, but those appearing equal to Pb arsenate without leaving objectionable residue or causing injury were 1% summer oil with nicotine sulfate (1800) in the 2nd-brood sprays and nicotine benzoate (1.25 lb./50 gal.) with summer oil during 2nd-brood spraying or throughout the season. Washing was necessary wherever Pb arsenate or cryolite was used after the 1st cover spray. Natural and synthetic cryolite gave as good results as Pb arsenate but caused some reduction in size of fruit and left a residue load that could not be removed by ordinary washing methods. CuCN and oil gave the best control of both worms and stings but caused serious russeting of the fruit. Lab. tests showed that larvae were able to enter fruit from the tops of the trees much more readily than fruit taken from the lower half, the Pb and As residues were nearly twice as heavy on fruit from the lower half of the tree as on fruit from the top. All materials, particularly Pb arsenate, had extremely low efficiencies against 1st-brood larvae, apparently because of the rapid growth of the fruit and the difficulty of immediately building up an effective deposit as the eggs start to hatch. K. D. Jacob.

The significance of supplementing controls in combating the codling moth. J. J. Davis. *Trans. Indiana Hort. Soc., 74th Ann. Meeting 1935*, 72-82, cf. C. A. 29, 2648.—A material suitable for treating cracks and cavities in trees for the purpose of killing overwintering codling-moth larvae is prep'd by heating together α -naphthylamine 1 and Parawax 2 parts and adding hydrated lime, with const. stirring, until the mixt. has the consistency of very thick batter. The mixt. is applied, hot if necessary, to the cracks and cavities, taking care to avoid covering very much live bark. K. D. Jacob.

Environmental and control studies of the common scab disease of potatoes caused by *Actinomyces scabies* (Thaxter). Guss B. J. Dippenaar. *Univ. S. Africa Dept. Agr., Sci. Bull. 136*, 78 pp. (1933).—In greenhouse expts., soil pH values of 5.0 and lower either controlled or reduced the disease in severely scab-infested soils but did not eliminate scab. However, pH values of 4.78 and lower also had an adverse effect on the potato plant. The amt. of scab occurring in soils of pH 5.3 and lower was negligible under field conditions. The max. rate of increase of the scab organism under field conditions occurred in soils of pH 5.9 and above. The limiting acid reaction of the S. African strain of the scab organism was found to be approx. pH 5.17. Flowers of S, alone or in combination with green manure, applied at the rate of 300-1200 lb./acre, failed to control scab in field expts. during 3 seasons. Green pea vines, $(\text{NH}_4)_2\text{SO}_4$, applied at the rate of 120-360 lb./acre, and $\text{Al}_2(\text{SO}_4)_3$, at the rate of 360-1080 lb./acre, also failed to control the disease. Treatment of severely scabbed tubers with 0.2% HgCl_2 plus 1% HCl for 5-10 min. gave as good control of scab as did treatments with 0.1% HgCl_2 for 1.5 hrs. or cold formalin (1:240) for 2 hrs. In 1 expt. the first treatment proved to be far superior for the control of *Rhizoctonia*. Forty-one references.

Relative effects of calcium and acidity of the soil on the occurrence of potato scab. F. M. Blodgett and E. K. Cowan. *Am. Potato J.* 12, 265-74 (1935).—When they

were added in varying amts. to a sterilized acid soil (pH 4.48) that was then inoculated with the scab organism, Ca compds. (CaSO_4 , CaCO_3 and $\text{Ca}(\text{OH})_2$) had no significant effect on potato scab other than through their effect on the acidity of the soil. In greenhouse expts. with a soil treated with either H_2SO_4 or Na_2CO_3 to give initial pH values ranging from approx. 4.0 to 8.5, there was a pos. correlation between the pH of the soil and the percentage of scabby tubers. The pH values of the soils, 2 det'd by the quinhydrone electrode, at the time the first 2 crops were dug ranged from 4.71 to 7.39, this indicates that the scab organism tends to change the soil toward a neutral reaction which is more favorable for its growth. When a heavily infected soil (original pH of 7.2) which produced only scabby potatoes was limed with $\text{Ca}(\text{OH})_2$ to pH 8.5, 47% of the tubers were clean, when it was limed to a pH of 9.0, 91% of the tubers were clean. Growth of potatoes did not occur in soil limed to pH 9.3.

K. D. Jacob.
The eradication of gublaar (*Dichapetalum cymosum*). A. C. Lémann. *Farming S. Africa* 10, 233-6 (1935).—The plant can be controlled by ringbarking the main stem below the surface of the ground, moistening the ringbarked portion with CaCl_2 soln. (0.5 lb./gal. H_2O), enclosing the ringbarked portion with small stones and packing into the enclosure a mixt. of finely powdered CaCl_2 , 2, crude com. CuSO_4 , 1 and soil 2 parts applied at the rate of 1 lb./1-in. diam. of stem. The hole is then filled with soil to the surface of the ground. K. D. Jacob.

Fruit fly in citrus results with sodium fluosulfate bait. L. B. Ripley and G. A. Hepburn. *Univ. S. Africa Dept. Agr., Sci. Bull. 143*, 8 pp. (1935).—Promising control of the insect (*Pterandrus rosa*) was obtained by spraying the trees with a soln. of Na_2SiF_6 (0.25 oz.) and white sugar (0.5 lb.) in water (1 gal.), applied at the rate of 4-12 oz. per tree according to size. The spray is applied in the form of comparatively large droplets to areas on each side of the tree. Complete coverage of the tree is not necessary because the insects are attracted to the sprayed portions. Terpinyl acetate was a powerful attractant for male flies but not for females, and there were strong indications that only unmated males are attracted by it. K. D. Jacob.

Spraying, pruning and die-back (of roses). H. R. Rosen. *Am. Rose Ann.* 1935, 43-7.—Bordeaux mixt. (4.4 50), Cu acetate (1-2 lb./50 gal. H_2O) and Palustris sulfonate B (2 tablespoonfuls/gal. H_2O) were approx. equally effective in controlling powdery mildew and black-spot when Aresco was added as a wetting agent at the rate of 1 teaspoonful/gal. of spray. At the rate of 2 lb./50 gal., Cu acetate gave no observable spray deposit on the leaves, but it burned the foliage badly and caused much leaf shedding, no injury occurred when it was used at the rate of 1 lb./50 gal. With Palustris sulfonate B serious burning of the leaves occurred on bushes sprayed with the last of the material remaining in the tank, the material also had a marked tendency to gum up the spray equipment. K. D. Jacob.

Chlorosis of *Hydrangea hortensis*. G. H. Poesch. *Ohio Agr. Expt. Sta., Bimonthly Bull.* 175, 142-3 (1935).—Plants growing in soil with neutral reaction responded to applications of FeSO_4 and $\text{Fe}_2(\text{SO}_4)_3$. The Fe^{++} gave quicker response and returned chlorotic plants to a normal green color within a short time. MnSO_4 and ZnSO_4 were not effective in controlling chlorosis. C. R. Fellers.

The cause of chlorosis, or yellowing (of roses). K. N. Clapp. *Am. Rose Ann.* 1935, 41-2.—Chlorosis of roses growing in alk. soil (pH 8.5) was temporarily overcome by spraying the plants at 4-6-week intervals with a soln. of $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ (0.5 oz./gal. H_2O). The condition was permanently overcome by neutralizing the soil with S applied at the rate of 1 lb./sq. yd. and dug into the soil. With soils having pH values below 8.5 satisfactory results were obtained by the application of $\text{Al}_2(\text{SO}_4)_3$ (1 lb./sq. yd.) with repetition at 10-day intervals if necessary.

K. D. Jacob.
Injury (to roses) from spray materials. L. M. Massey. *Am. Rose Ann.* 1935, 35-40.—Finely divided S, either from sprays or dusts, is likely to cause burning at atm.

temps of 60° or higher. High temps and humidities favor the formation of H₂O-sol. As on the leaves of plants sprayed or dusted with mixts of Pb arsenate and S, foliage is injured by the sol. As. K D Jacob

Heart and dry rot of beets. L Kraus. *Deut. Landw. Presse* 62, 297 (1935). *Rev. Applied Mycol* 14, 733—Good results in treating beets for heart and dry rot were obtained by using 15 or 30 kg of borax per hectare. The yield from one series of plots increased from 244 to 470 S and 528 S kg, respectively, and from another series from 430 to 458 and 463 S kg. Oden E Sheppard

Physiological diseases of beets. III. Further field tests in the study of the effect of borax on sugar and fodder beets. K de Haan. *Middelst. Inst. Suikerbietenelt* 4, 92-102 (1934). *Rev. Applied Mycol* 14, 733—Treatment with borax at the rate of 40 kg per hectare decreased heart rot of beets from 66 to 0.1%. At 10 kg per hectare borax increased the sugar yield and content by 34 and 10%, resp. and reduced incidence of heart rot to 2%. Leaf yield was increased 25 and 50% by 10 and 40 kg borax, resp., while corresponding figures for roots were 22 and 26%. Fodder beets showed an increased sugar yield and content of 65 and 16%, resp., with application of 20 kg borax per hectare. NaNO₃ (contg. 0.6 kg borax per 1000 kg) showed good results in mild cases of heart rot. Oden E Sheppard

Successful combating of heart and dry rot of sugar beets with borax. K Meyer-Hermann. *Deut. Zuckerrind* 60, 1019 (1935). *cf. C. A.* 29, 4509—After the symptoms and the known causes of these diseases are enumerated, data are given of the increase in beet yield after treating the suspected fields with 10-15 kg of borax per acre. F R Bachler

The woolly aphid parasite. Effect of orchard sprays on *Aphis mali*. N S Noble. *Agr. Gaz. N. S. Wales* 46, 23 (1935)—In lab. expts., emergence of the wasps was not significantly affected by spraying parasitized woolly aphids (*Eriosoma lanigerum*) with either miscible white oil (1:40), nicotine sulfate (1:600-800) plus soap (1 lb./25 gal.), nicotine sulfate (1:600) plus miscible white oil (1:200) or lime-S (1:35). K D Jacob

"Kelsey spot" on plums. B J Dippenaar. *Farming Africa* 10, 333-6 (1935)—Applications of N, P and K fertilizers had no effect on the incidence of the disease. K D Jacob

Efficiency of commercial sodium cyanide and sulfonic acid in liberating hydrocyanic acid gas for fumigation. M Shaikh and A Amer. *Ministry Agr. Egypt, Tech. Sci. Service Bull.* 160, 5 pp (1935)—Satisfactory evolution of HCN was obtained by treating 1 part NaCN with a soln. of 0.9 part conc. H₂SO₄ in 1.6 parts ordinary tap water. K D Jacob

Lead arsenates—analyses of samples, 1935-36. W C Robertson. *J. Dept. Agr. Victoria* 33, 538-41 (1935). *cf. C. A.* 28, 7410—Calcd. on the dry basis, 14 samples of pastes and powders contained As₂O₃ 30 (32-62), PbO 61 (20-67) and H₂O-sol. As 0.17-0.43%. The percentage of As remaining in suspension after standing 5 min was 71.2-98.4 and after 30 min 33.92-87.00. The amt. of As₂O₃ in suspension 5 min after agitation was 2.41-3.54 g/gal. The acidity of the preps was 1.0-42.0 cc 0.01 N NaOH per 2.5 g.; the acidity exceeded 5.2 cc in only 1 sample. K D Jacob

Studies on contact insecticides. VIII. Technique for tracing penetration of petroleum oil in insect eggs. Some determinations of oil penetration into insect eggs. W C O'Kane and W C Baker. *N. H. Agr. Expt. Sta., Tech. Bull.* 60, 1-12 (1934). *cf. C. A.* 28, 6921—Two procedures were followed to trace the penetration of a petroleum oil into grasshopper eggs: (1) An unstained oil is applied to the egg, and sections are cut and stained in such a way as to make visible any globules of petroleum oil present within the sections. (2) A stained oil is used, after fixation with Bouin's soln., sections are cut and given each subsequent treatment as will differentiate any petroleum oil present. The stains used were osmic acid-red O, the Rohrbach stain of Nile blue sulfate-red O (C. A. 28, 1373), and osmic acid Nile blue sulfate-red O

The petroleum oils used for sprays definitely penetrate the eggs of both the grasshopper, *Chortophaga* sp., and cockroach, *Periplaneta americana*. IX. Further determinations of oil penetrations into insect eggs. *Ibid.* 62, 3-8 (1935).—Further staining studies showed penetration of petroleum spray oils into the eggs of the snowy tree cricket, *Oecanthus nivicus*, the Mexican bean beetle, *Epilachna corrupta*, the squash bug, *Anasa tristis*, the pine leaf aphid, *Delicoccus pinei*, the lacewing, *Chrysopa oculata* and the cecropia moth, *Platysamia cecropia*. A predominance of oil was found in the micropylar region of the eggs. X. Penetration of arsenic into insects. W C O'Kane and L C Glover. *Ibid.* 63, 1-5 (1935)—Careful lab. tests showed definite penetration of As in all organs of the cockroach, *Periplaneta americana*, after contact with As₂O₃. The As content of the different parts of the insect was detd. by a micro Gutzeit test. Neither paralytic nor corrosive action was observed. The mechanism of penetration is unknown. C R Fellers

Treatment of molasses for the production of fertilizers (Gaspary A Arnal). 12. Prepn. of a high percentage Ca cyanamide by the action of NH₃ and CO on Ca oxide and Ca carbonate (Postnikov, et al.) 18. Rept. of Wallaceville veterinary laboratory (Hopkirk) 11E. Rept. of chemistry section [on soils from littoral lands] (Aston) 11G

Fertilizer. Heinrich Tramm (to Rubchemie A-G). U. S. 2,025,915, Dec. 31. An ammoniacal soln. of NH₃-NO₃ is added to a mixt. of acids and other substances such as H₃PO₄, KCl, etc., until substantial neutralization of the NH₃ is effected, and the temp. of the reaction is controlled by passing a strong current of NH₃ over the reacting mixt. to produce a mixed fertilizer. U. S. 2,025,916 relates to a process in which HNO₃, H₃PO₄, a fertilizing K salt and NH₃ are simultaneously introduced into a melt comprising a reaction product of HNO₃, H₃PO₄ and NH₃ in such proportions as to maintain continuously a slightly acid or neutral reaction in the melt, to form a fertilizer. App. is described.

Fertilizers. Zjednoczone Fabryki Zmazków Azotowych w Moszczach i w Chorzowie. *Austrian Pat.* 143,305, Nov. 11, 1935 (Cl. 16). In the manuf. of granular fertilizers by spraying a melt contg. NH₄NO₃, a phosphate or carbonate of Ca, and not more than 20% of a flux, e. g., Ca(NO₃)₂ or Mg(NO₃)₂, nonhygroscopic products are obtained by adding to the melt, immediately before it is sprayed, a substance which reacts with the flux to form a water-insol. compd., e. g., (NH₄)₂SO₄ or (NH₄)₂HPO₄.

Fertilizer. Hubert Kappen. *Ger.* 618,644, Sept. 12, 1935 (Cl. 16 G). Mg salts with water of crystn. are treated with CO₂ and NH₃ to give a fertilizer contg. MgCO₃. In examples, MgCl₂·6H₂O and MgSO₄·7H₂O are used, giving a mass contg. MgCO₃ together with NH₄Cl and (NH₄)₂SO₄, resp. *cf. C. A.* 30, 563.

Phosphates and fertilizers. Soc. d'études pour la fabrication et l'emploi des engrais chimiques (Robert Flatt, inventor). *Fr.* 787,201, Sept. 19, 1935. Natural phosphates are treated with HNO₃ of such a concn. and in such amt. that the Ca(NO₃)₂ and H₃PO₄ formed remain dissolved. The unattacked muds are sepd. and the clear liquor is neutralized by the addn. of substances more basic than Ca(H₂PO₄)₂ (CaO, CaCO₃, Na₂CO₃, NH₃, CaH₂PO₄, or Ca₃(PO₄)₂) which causes the Ca(H₂PO₄)₂ to ppt. and the nitrates remaining dissolved are transformed in known manner. In a variation the amt. of HNO₃ used is sufficiently small or (and) sufficiently strong to cause the Ca(H₂PO₄)₂ to ppt. during the attack of the crude phosphate, thus Ca(H₂PO₄)₂ is sepd. or not sepd. from the liquor with the muds before continuing the process as above.

Continuous apparatus for making superphosphates. René Moritz. *Fr.* 787,620, Sept. 20, 1935.

Insecticide. Leon C. Heckert (to Rohm & Haas Co.). U. S. 2,024,098, Dec. 10. An aromatic thiocyanate the org. residue of which contains a neg. substituent comprising a carbonyl group, an aryl radical, an unsubstituted org. radical, a nitro group, a halogen, a cyanide group, an alkyl group

or an org. radical bound to O as in groups of the type of alkoxy and ester groups, such as benzyl thioacetate, *p*-thiocyanodimethylaniline or the like is used as a vapor or spray ingredient

Insecticides Herbert Schotte and Karl Görmütz (to Schering-Kahlbaum A.-G.) U. S. 2,024,392, Dec. 17, 1935. Rotenone and veratrine or drugs containing them are used with talc, etc.

Insecticides Erik G. A. Wikström Brit. 434,660, Sept. 6, 1935. Horticultural, etc., insecticides consist of cymol, or sulfonated, chlorinated, nitrated or other deriv. thereof, together with the active constituent of pyrethrum, derris or quassia, or an equiv. vermin-destroying agent of vegetable origin. Etheral oils, soap and emulsifying agents may also be added. In 434,661, Sept. 6, 1935, the cymol or deriv. is mixed with an etheral oil, e. g., eucalyptus, cedar wood or citronella, that has been chlorinated

or sulfurated by treatment with aqua regia, liquid Cl₂, aq. Cl₂ soln., H₂SO₄, S chloride or an alkali sulfide or polysulfide. Soap and an emulsifying agent may also be added.

Insecticidal and fungicidal solutions James W. Van Meter (one-half to G. Edward Fetter). U. S. 2,025,365, Dec. 24, 1935. Reactive agents such as S and Sb in a container are immersed in an absorbent liquid such as water and heat to promote desired reaction is induced by local heating such as use of a fuse and Mg primer. App. is described.

Fumigant which can be used on seeds, bulbs, foods, etc. Richard T. Cotton and Harry D. Young (to the Government and People of the U. S.) U. S. 2,024,027, Dec. 10, 1935. For combating insects such as *Tribolium confusum*, etc., solid CO₂ is used with ethylene oxide, CS₂, or other fumigants. Various examples and operative details are given.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Theories of fermentation. A critical study and review S. S. Epstein and S. Laufer. *Am. Brewer* 68, No. 1, 14-15, 31, No. 2, 22-3, No. 3, 22-5, No. 4, 22-5, No. 5, 24, 26-7 (1935).—The old and new theories of fermentation are reviewed with particular reference to brewing practice. S. Laufer.

The production of solvents by fermentation I. S. Logotkin and B. N. Cheboksarov. *J. Chem. Ind. (Moscow)* 12, 828-37 (1935).—The operation of the Gromenskii acetone-butyl alcohol factory is described.

Fermentation method for production of *d*-lactic acid E. L. Tatum and W. H. Peterson. *Ind. Eng. Chem.* 27, 1493-4 (1935).—*d*-Lactic acid is prep'd by fermenting a medium containing 3% cereose and 3% malt sprouts, with a *d*-lactic acid culture (mostly *L. delbrückii*) at 30-37°, depending on the organism, after 24 hrs. an excess of sterile CaCO₃ is added and fermentation continued 6 days with frequent shaking. The yield of pure *d*-acid was 90-95% of sugar used. Malt sprouts with glucose in concn up to 10% may also be used. O. W. Wilcox.

Influence of vitamin C on yeast fermentation and lactic acid formation in *Aerobacter aerogenes* cultures and in muscle pulp K. Zipf and M. Thurnau. *Biochem. Z.* 282, 51-5 (1935).—Ald. yeast fermentation is not affected by vitamin C which, however, inhibits lactic acid formation by *Aerobacter aerogenes* (in concn of 1/250 or more). The lactic acid formation in muscle pulp is likewise inhibited by vitamin C (concn. 0.02 M or more) but this effect does not materialize on the addition of glycogen.

The reesterification reaction of phosphoryluric acid in alcoholic fermentation of sugar. O. Meyerhof and W. Kiessling. *Biochem. Z.* 281, 240-70 (1935).—The velocity of cleavage of phosphoryluric acid depends upon the fermentation velocity of the sugar which is esterified with the liberated H₂PO₄. When hexose is no longer fermented in the presence of fluoride, 2 mols. each of CO₂, alc., hexosediphosphate and phosphoglyceric acid arise and 2 mols. of phosphoryluric, hexose and H₂PO₄ disappear. In the presence of CH₃CO-H the velocity of fermentation is the same but only 1 mol. hexosediphosphate is formed and the acetaldehyde remains unchanged. A revised scheme is offered for the fermentation reaction. S. M.

Enzymic synthesis of some glucosides. I. Vantileen, C. N. Ionescu and A. Klyk. *Bul. soc. chim. Roum.* 17, 131-6 (1935).—To prep. trimethylglycol- α -glucoside (I), 50 g. glucose, 100 cc. H₂O, 250 cc. trimethylglycol (II) and 100 cc. of a 10% yeast suspension are added to a vol. of 500 cc. and fermented for 6 weeks. Distn. of the filtrate at 15 mm. pressure removes II at a temp. of 135-140°. Unbound glucose is removed by dissolving the residue in 500 cc. H₂O and after the addn. of 2-3 g. fresh yeast allowing fermentation to proceed further for 8-10 days. Subsequent decolorization with charcoal

and further distn. under reduced pressure leave a residue (III) which fails to crystallize. Acetylation of III with Ac₂O in C₆H₆N gives the pentaacetyl deriv. (IV) of I, m. 84°, with [α]_D²⁰ 112.62° (EtOH). Sapon of IV with Ba(OH)₂ gives I, m. 96°, with [α]_D²⁰ 137.48° (AcOEt). Mannose- α -monoglucoside, m. 140°, with [α]_D²⁰ 83.41°, is obtained by a similar fermentation method, but in this case the unbound reactants are sep'd. by fractional crystaln. in alc., this obviates the necessity of acetylation.

Calcium gluconate from juice of full and surplus apples. Clifford Frost, J. L. St. John and H. W. Gerritz. *Ind. Eng. Chem.* 28, 75-9 (1936).—A study has been made of the relative fermentative capacity of apple juice when subjected to the action of gluconic acid forming organisms as *B. xylinus*, *B. aridus*, *P. dextranum*, *P. purpureum* and *B. citrinum*. The first 3 grow poorly, the last 2 grow well in apple juice. The best yields were obtained with *P. citrinum*. Calcd. in terms of glucose employed, good yields of gluconic acid resulted through fermentation by *P. citrinum*. Based on total sugar used, however, the yield was low. Fermentation by *P. citrinum* produced gluconic acid from sucrose and glucose solns. but not from fructose soln. This probably explains the low yield of gluconic acid based on the total apple-juice sugars destroyed. W. O. E.

Study on hops F. M. Dupont. *Am. Brewer* 68, No. 11, 21-3 (1935).—Problems of improving the quality of American hops are discussed, and recent investigations on the bitter principles are reviewed. S. L.

Pa and its importance in brewing. Max Wallerstein. *Am. Brewer* 68, No. 11, 23-8, No. 12, 52-4 (1935).

The "break" of unstable albuminoids (in brewing). P. Petit. *Brasserie & malterie* 25, 273-7 (1935).—A brief discussion of the mechanism of and principal factors which affect the "break" of albuminoids in brewing.

Hydrogenation of freshly distilled spirits. Carroll A. Hochwalt, Charles A. Thomas and Ernest C. Dyball. *Ind. Eng. Chem.* 27, 1404-7 (1935).—In the aging of whisky 2 distinct processes are recognized: (1) removal of unpleasant odor and taste (greenness) which is here shown not to depend on oxidation; and (2) maturation, involving chem. esterification and polymerization, imparting body and mellow taste. The rates of 1 and 2 are different, 2 being the faster. It is found that 1 can be accelerated by hydrogenation (reduction) in vapor phase (Ni catalyst) or in liquid phase (Pt black); 3 lb. Ni is sufficient for 1500 gals. freshly distd. spirits. After hydrogenation the whisky can be mellowed in much less than the usual time. O. W. Wilcox.

A simple micro-method for the determination of arsenic in must and wine. Joseph Burkard and Bernhard Wallerstein. *Z. Unters. Lössm.* 70, 308-15 (1935).—This

method depends on the distn of the As as $AsCl_3$ and the conversion of the latter into H_2AsO_4 . This is detd by the Zinzadse colorimetric method (C A 24, 5255). The method described can be used in series detns for As in foodstuffs and other materials. The accuracy of the colorimetric method of Zinzadse can be considerably increased so as to det 0.01-0.05 mg. of As. P. L. D.

Changes in whisky stored for four years. Peter Valaer and W. H. Frazier. *Ind Eng Chem* 28, 92-103 (1936).—The largest increase of acids, esters, solids and color is during the 1st 6 months of storage. There was no fixed relationship between the acids and esters as found by Crampton and Tolman (C A 2, 685) at the end of 4 years. The acid-ester ratio did not reach a ratio of 1:1. There was an actual gain in acids over the 4-yr. period of 24.9-56 g. per 100 l. (av 40 l.) when calcd to original vol. Similarly, there was an actual gain in esters of 7.4-21.3 g. per 100 l. (av 15.5). There was an actual loss of fusel oil during the aging period which varied from 6.9 to 58.4 g. per l. (av loss 28.6), when calcd to the original vol. Quick-aging by a heat treatment increased the color, solids and acids of whisky. Storage of whisky in glass usually caused a decrease in acids and a tendency for esters and color to increase. Practically all the slop taste and odor disappeared after aging for 4 years in glass. The constituents of whisky are constantly undergoing changes during the aging process. The increase in acids in charred bbl is due partly to fixed acids extd. from the wood but mostly to the formation of volatile acids during the aging process. A total of 198 samples drawn from 11 different distilleries was used in this investigation. Approx 1584 detns. were made on these samples.

Carcinæ (in beer). P. Petit. *Brasserie & Malterie* 25, 290-4 (1935).—A brief discussion of the cause of the presence and development of carcinæ in beer.

Has beer a temperature of maximum density? Philip P. Gray. *Am Brewer* 68, No. 6, 16-18 (1935).—The temp. of max. density was detd for a no. of samples of market beer with results indicating a range of 0-2° for this value. The amt. of real ext. affected the density, while the alc. content was without influence. S. L.

Areometric determination of the yeast content of wort and its application to the separation of yeast in yeast factories. Wital Heller. *Przemysł Chem* 19, 3-9 (1935).—The yeast content can be detd areometrically, with a mean error of 0.25-0.5%, according to the d. of the wort. A no. of formulas are given, connecting the ds. of solns. with their yeast contents, they are applicable to the control of the various stages of yeast production.

Ability of yeast to assimilate higher- and lower-molecu-

lar nitrogen compounds. Niels Niel-en. *Compt rend trav lab Carlsberg, Ser Physiol* 21, 139-50 (1945), (C A 30, 232).—The N compds. of beer wort were sep'd by dialysis through collodion and then used in nutrient media. Yeast could assimilate the lower-mol. fractions far better than the higher. Probably not more than half the N in wort is assimilable by yeast. J. J. W.

Alcoholic fermentation of hydrol. David A. Legg (to Commercial Solvents Corp.). U. S. 2,226,237, Dec 31 Hydrol. at a sugar concn. suitable for yeast fermentation, is subjected to acid hydrolysis, and a mash prep'd from the product is subjected to fermentation with yeast (suitable after adding NH_3 to produce a suitable pH and with admixt. of relatively small proportions of ground corn products or the like which may be hydrolyzed with the hydrol). Various details and modifications of procedure are described.

Lining ferroconcrete fermentation vessels and like containers with composition sheets containing asphalt, wax, pitch, etc. Borsari & Comp. Ger. 621,288, Nov 4, 1935 (Cl 6b 17). A method of procedure is described.

Apparatus for aerating fermentation vats. Strauch & Schmidt. Ger. 621,350, Nov. 6 1935 (Cl 6a 15 03).

Aerating and deaerating means for rotary drying or malting drums. J. A. Topf & Söhne. Ger. 621,449, Nov 7, 1935 (Cl 6a 4).

Fermentation of worts. Joseph Revelin and Jean Mercier. Fr. 787,666, Sept. 26, 1935. Means is described for supplying SO_2 to the vats to moderate the fermentation.

Wort-clarifying vat. Friedrich Schmatz. Ger. 618,560, Sept. 11, 1935 (Cl 6b 11). Details of regulating the running off are given.

Beverage. Felix Werner. Ger. 621,289, Nov 4, 1935 (Cl 6c 3). A foaming alc. beverage is prep'd by adding sugar to a decoction of unmaltd grain, preferably rye, wheat or maize, and fermenting the product.

Clarifying beverages. Chemische Werke Marienfelde A.-G. Ger. 558,369, Oct. 4, 1935 (Cl 6d, 3). See U. S. 2,002,145 (C A 29, 4219).

Beer. Heinrich van de Sandt. Ger. 618,890, Sept. 18, 1935 (Cl 6b 8 02). Wort or beer with a considerable yeast content is given an addn. of liquid contg. vitamins and heated. The vitamin liquid is adulterated with nonheated normal wort or beer. The resulting wort or beer mixt. is fermented with fresh yeast. Examples are given. Cf. C A 29, 52191.

Yeast. Soren Sal. Ger. 620,095, Oct. 31, 1935 (Cl 6a 17 02). Addn. to 607,234 (C A 29, 1936). This corresponds to Brit. 308,324 (C A 24, 201), but includes a sp. example.

17—PHARMACEUTICALS, COSMETICS AND PERFUMES

W O E M E R Y

Improved deodorants. S. P. Jannaway. *Perfumery Essent Oil Record* 26, 375-7 (1935).—A short discussion with formulas of liquid, cream, powder and stick deodorants. Philip D. Adams.

The use and abuse of fixatives. II. A problem of present-day perfumery. Frank Atkins. *Perfumery Essent Oil Record* 26, 378-81 (1935).—A discussion.

Manufacture of cachous. A. G. Arend. *Perfumery Essent Oil Record* 26, 380-8 (1935).—A discussion of the problems and prep'n of mouth- and breath-perfuming materials. Philip D. Adams.

A brief study of cinchonas. Luis Paria. *Rev quim farm (Brazil)* 1, 73 (1935).—Historical. E. S. G. B. Essential oil of *Cinchona maritima* L. G. A. Pevtsov. *J. Gen Chem (U. S. S. R.)* 5, 1185-91 (1935).—The essential oil obtained by steam distn. of the ripe fruit of *Cinchona maritima* L. grown in Crimea is composed of 90% hydrocarbons, of which limonene, β -cymene and

sabinene were identified. A tertiary alc., $C_{15}H_{27}OH$, b. about 205°, was isolated. *Cislimene* found in the French and Italian variety is not present in the Crimean plant. Twenty references. Chas. Blanc.

Nature of the crystalline substance in the essential oil of *Lachnophyllum gossypinum* Bge. V. V. Williams, V. S. Smirnov and V. P. Gol'mov. *J. Gen Chem (U. S. S. R.)* 5, 1195-1204 (1935).—*Lachnophyllum gossypinum* Bge., an annual plant growing wild in Central Asia, gave an essential oil, d₄ 0.8944, n_D 1.526, solidifying to a cryst. mass at -3° and carbonizing with a flash of flame at 175°. It contains 58% of hydrocarbons, among which were identified β -pinene and camphene, and cryst. $C_{15}H_{27}O$ (I). The oil on being cooled to -15° sep'd 30% I, m. 32.6-2.8° (dil. alc.), d₄ 0.989, d₂₀ 0.932, n_D 1.5255, n_D 0, M R 50.82 (calcd.), M R 57.2 (obs.), exaltation 6.65, insol. in H_2O , sol. in alc., Et_2O , CH_2Cl_2 , and 40% CCl_4 . I on exposure to the daylight is decomp'd. with discoloration from yellow to orange. In the air I de

composes with formation of a product irritating to the nose and eyes. Attempts to distil I under atm. pressure and in *vacuo* resulted in a rapid decompn with a flash and carbonization. The most probable structure of I, $\text{PrC} - \text{CC} \cdot \text{CCH} \cdot \text{CHCO}_2\text{Me}$, is based on analysis and identification by degradation. Thus, the action of aq. KOH caused besides the usual sapon the addn of H_2O at the triple bonds with the subsequent decompn of the β -diketone and formation of methyl butyl ketone and butyric acid on the one hand and valeric and acetylacrylic acids on the other hand (cf. Wolff, *Ann.* 264, 253 (1891)). Oxidation with 50% HNO_3 gave butyric acid and considerable oxalic acid. I reduced by catalytic hydrogenation was converted into methyl caprate. With HI it was partially saponified with the formation of MeI. The parachors, detd. and calcd. by the method of Mumford and Phillips (*C. A.* 24, 5258), agree well $P_{\text{calcd.}} = 440$, $P_{\text{obs.}} = 450$. The presence of a compd. with a triple bond in plants was previously observed only in 2 other cases (*Compt. rend.* 134, 842, *Bull. soc. chim.* [3], 27, 484 (1902), *C. A.* 27, 479b). I strongly affects the sympathetic nervous system even in small doses.

Tobacco products. I. Constantin Prikri and Hans Dittmar *Z. Unters. Lebensm.* 70, 297-306 (1935).—Results are given of the nicotine, total reduction of the carbonyl derivatives, the polyphenols and the calcd. polyphenol coeff. found in cigars, cigars and pipe tobacco purchased on the Dresden market. F. L. Dunlap.

Heracleum lehmannianum. I. Vasserman *Am. Perfumer* 31, 65-7 (1935).—This new source of anethole yields at the rate of 80% from the leaves. The plant grows naturally and luxuriantly in Central Asia, and is susceptible of lucrative cultivation. The essential oil is contained in the leaves and petioles, its rate varying from 0.25 to 0.40% of the wt. of freshly cut leaves. In the plant the oil is represented by glucosides, so that the rate of liberation depends on the enzymes causing their degradation into glucose and essential oil. The sources of anethole, anise and fennel, heretofore employed are from an agricultural standpoint inferior to *Heracleum*, in that it is apparently not subject to disease, and furthermore furnishes a good fodder for cattle. The ash of this plant may be utilized for prep. a black soap of excellent quality.

Oil of celery. Ernest S. Guenther *Am. Perfumer* 31, No. 3, 75-8 (1935).—The celery-oil industry in the Rhone valley and adjacent territory from the earliest (Phoenician, Roman and Saracen) down to the present period is described.

Simple volumetric estimation of mustard oil in spiritus sinapis. H. Kaiser and E. Furst *Apoth. Ztg.* 50, 1734-5 (1935).—An app. is shown and described whereby it is possible to det. mustard oil volumetrically in 15-20 min. The app. consists essentially of an inverted 150-cc. pear-shaped vessel having a side tube through which the sample 10 g. and about 150 cc. satd. $(\text{NH}_4)_2\text{SO}_4$ soln. are introduced. The inverted upper end extends to a narrow tube graduated in $\frac{1}{10}$ cc. The lower end connects with a rubber tube carrying a pinchcock, said tube connecting by means of a glass tube with cock with a long rubber tube attached at the other end to a globular 150-cc. buret, contg. further satd. $(\text{NH}_4)_2\text{SO}_4$ soln. After careful agitation of the pear-shaped vessel, whereby the oil is salted out, the globular buret is raised to force the pptd. oil into the graduated tube, the vol. of which may then be noted.

Camomile and peppermint of the 1935 vintage. Hanns Will. *Apoth. Ztg.* 50, 1757-8 (1935); cf. *C. A.* 29, 883².—Oil contents are reported for 30 samples of camomile and 26 samples of peppermint.

Investigation of drugs. Kurt Handke. *Apoth. Ztg.* 50, 1778-9 (1935).—H. is undertaking to show from the results of his analytical experience some of the shortcomings in pharmaceutical control. The present paper covers the official preps. calcium lactum and magnesium peroxidum.

Homeopathic preparations. IX. Essences and tinctures containing arbutin. A. Kuhn and G. Schäfer.

Apoth. Ztg. 50, 1800-3 (1935); cf. *C. A.* 30, 569¹.—As characteristic constituents of the homeopathic essences and tinctures of *Chimaphila umb.*, *Psoralea unifl.* and *rolundif.*, *Epigaea rep.*, *Gaultheria proc.*, *Kalmia latif.*, *Ledum palustre*, *Rhododendron chrys.* and *ferrug.* and *Uva ursi* arbutin, hydroquinone, ercolin, ursone, rhododendrin, monotropiside, ascebin and romedotoxin are briefly characterized. In the case of tinctures arbutin, hydroquinone and ercolin are characteristic ingredients.

A peculiarity in the capillary picture of *Chimaphila umbellata* is described, namely the yellow crystals occurring in the middle zone of the capillary picture are ursone. Erroneous literature data on the fluorescence of the capillary pictures and of arbutin are rectified. These tinctures were evaluated by estn. of their arbutin and hydroquinone contents. The ratio of the split to unchanged glucoside (hydroquinone-arbutin) in tincture and dry plant has been detd. Among the tinctures examd. were those belonging to the *Pyrolaceae* and *Ericaceae*. The constituents and pharmacological action of members of these families are reported. The detection of arbutin, hydroquinone, ercolin, gaultherin, rhododendrin, tannin reactions, ursone and ercolin is described. X. Analysis of coumaric acid preparations. *Pharm. Ztg.* 80, 1253-5 (1935).—In certain homeopathic preps. contg. derivs. of coumaric acid are coumarin, umbelliferone, daphnin, fraxin and scopolin. These substances are briefly characterized chemically. A characteristic test for this group is described. Likewise are described for the pure substances and their tinctures characteristic fluorescence phenomena under filtered ultraviolet light. Capillary pictures of such tinctures are described and their special characters discussed. The detection limits of their fluorescence are further characterized through special chem. tests.

Alkaloids of European Lycopodium species. J. Muszynski. *Arch. Pharm.* 273, 452-7 (1935).—From the results obtained in the examn. of a series of *Lycopodium* species it appears that alkaloids are characteristic constituents thereof. Some of these alkaloids are volatile and some fixed. They are highly toxic and of comine-like action. The fixed bases are sol. in H_2O , extractable with CHCl_3 and yield yellow, amorphous, very bitter salts. The volatile bases are likewise water-sol. and yield hygroscopic salts.

Step photometric measurements of tinctures. P. W. Danckwort. *Arch. Pharm.* 273, 467-75 (1935); cf. *C. A.* 28, 5397¹.—The examn. of tinctures by means of the Pulfrich step photometer appears to promise gratifying results. Many tinctures yield such characteristic curves that recognition becomes possible. The changes in tinctures on standing and in absence of light are not great, so that the typical characteristics of the curves (the measuring ranges and break points) show distinctly after 1 yr. Furthermore, the graded photometric study gives a good insight into the aging process of tinctures.

New and improved methods for the synthesis of pharmacologically important amines X. Catalytic hydrogenation of α -mrostyrenes to β -arylethylamines. Karl Kinder and Eduard Brandt. *Arch. Pharm.* 273, 478-83 (1935).—Mainly a review.

Polymorphism of phenobarbital. A. Kofler and R. Fischer. *Arch. Pharm.* 273, 483-7 (1935).—Phenobarbital crystallizes in 3 modifications belonging apparently to the monoclinic system and characterized by their refractive indices, n_D values, and in part by their crystal form. The stable crystals n_D 1.74, the unstable ones n_D 1.56-7 and 1.66-7, resp. Photographic illustrations of the 3 types are shown.

Leucithin and hydroquinone as antioxidants for vitamin A. Harry N. Holmes, Ruth E. Corbet and Eva R. Hartzler. *Ind. Eng. Chem.* 28, 133-5 (1936).—Hydroquinone and leucithin were studied as antioxidants for vitamin A in halibut-liver and cod-liver oils at both room and higher temps. Each affords protection for the vitamin in varying degree, depending on the concn. of the antioxidant. A combination of the 2 affords a remarkable protection,

much greater indeed than would be expected from additive effects. W O E.

Solid pharmaceutical hydrogen peroxide compounds and their stability. G. Schneider and R. Folger. *Pharm. Zentralbl.* 76, 737-7 (1935).—A comparative study has been made of the stability of H_2O_2 when combined with various substances, notably with urea and Na_2PO_4 . Compounds with anhyd. Na_2PO_4 are almost as stable as are those with urea. W O E.

Salt diet. F. Hoffmann. *Pharm. Ztg.* 80, 1313-14 (1935).—The various special brands of table salt are discussed from a dietary standpoint in connection with S. references. W O E.

Economy in the sterilization of surgical dressings. R. Hahn. *Hygien. Staatsanstalt (Hamburg)*. *Pharm. Ztg.* 80, 1313-14 (1935).—10 references. W O E.

Rehmann and the homeopathic pharmacopoeia. W. Feyer (von Breslau). *Pharm. Ztg.* 80, 1320-1331 (1935).—A series of 32 homeopathic preps. are enumerated comparatively with those taken from Hahnemann's early papers. W O E.

Rotatory dispersion of essential oils. Bernard Angier. *Ann. chim. anal. chim. appl.* 17, 341-7 (1935).—To illustrate the application of the rotatory dispersion for the establishment of the purity of an oil, the results actually obtained in the exam. of geranium oil from Algeria are described. W. T. H.

Chemical examination of the bark of *Terminalia arjuna* Bedd. I. Isolation of arjunin. Radha Raman Agarwal and Subhadrachand Datt. *Proc. Acad. Sci. United Provinces. Agr. Coll., India* 5, 50-4 (1935).—The ext. of the bark of *Terminalia arjuna* was investigated for the active principle responsible for its long use as a powerful tonic and diuretic. A colorless, cryst. compd., arjunin, $C_{18}H_{16}O_6$, was obtained from a benzene ext. of the plant. It is an acid in 10%. It is probably an aglycone of a glucoside present in the plant. The Pb, Ag and Na salts, the dactylol diglycerol and pentaerythritol derivs. were prepd. Its physiol. properties are being studied. C. E. P. J.

Emulsifying agents in the pharmaceutical and cosmetic industries. Fr. Heemann. *Arznei. Chem.* 43, 773-6 (1935).—A discussion with five references. K. K.

An interesting method of adulterating rad. valenaria. G. Oehm and M. Psova Kardova. *Casopis Československých lékařů* 15, 225-8 (1935).—The adulteration of this drug by means of chavory root (*Cichorium intybus*) is described. It was so clever that it escaped the observation of a specialist. The adulteration can be easily ascertained by placing a small amt. of the drug in a vessel filled with water—some pieces for some time float on the surface while others begin sinking at once, being surrounded by clouds of dark-brown powder falling at the same time to the bottom. These yellowish or whitish pieces are the pieces of chavory root which were in a certain way surrounded by dark brown and completely useless powder. The chavory can be proved macroscopically and chemically by means of emulin. V. D. K.

The bactericidal and photochemical properties of irradiated petrolatum and mineral oil. Franklin A. Stevens. *J. Lab. Clin. Med.* 21, 20-30 (1935).—The photoactivity of petrolatum or paraffin oil irradiated with ultraviolet light in the presence of O_2 is due to the evolution of gaseous org. peroxides and aldehydes which diffuse readily through a film of cellulose acetate. Neither the irradiated oils nor the gaseous oxidation products are bactericidal *in vitro*. E. R. Mann.

Iodured oil. A practical method of preparation. Rav. M. Balvart, Everett Seiler and Virgil Outbier. *J. Lab. Clin. Med.* 21, 187-91 (1935).—Prepare ICl_3 by the action of Cl_2 on 55 g. of I crystals at 15° and dissolve in 150 cc. of water, keeping the temp. at 5-15°. Add the product with agitation to 100 cc. of poppy-seed oil. Pour into 100 cc. of $CHCl_3$, shake and discard the aq. layer. Remove the $CHCl_3$ by warming to 80° and filter. The product has d $^{20}_D$ 1.241-28, n^{20}_D 1.22-25°, Cl 6-8%, and should contain no free I or free acid. E. R. Mann.

Tincture of iodine. L. Vigor. *Bull. sci. pharm.* 42, 191-8 (1935).—Tincture of I kept in bottles not sealed hermetically becomes more concd. by evapn. of $EtOH$. Metallic caps with paraffin-covered inside liver prevent such changes. A. E. Meyer.

Juniperus thurifera L. and its essence. Louis Revol. *Bull. sci. pharm.* 42, 577-89 (1935).—A description of the plant and account of its distribution is given. The leaves and fixed ext. comes in guinea pigs and dogs an intense congestion in the intestines and the genito-urinary organs. Essence has been obtained by distn. with steam. It has a sp. gr. slightly above 0.88, is d-rotatory and contains only a small quantity of esterified acid; 70% dissolves below 170°. Inhalation of the vapors kills mice, but the toxicity in guinea pigs, dogs and cats is comparatively low; it did not cause abortions at doses at which salicyl oil would do so. Conclusion: The toxicity of the plant is not caused by the essence alone. The inadvisability of its official use is discussed. A. E. Meyer.

The acetyl index (by acetylation in pyridine) of the essences of the French Pharmacopoeia. R. Delaby and V. Bruguier. *Bull. sci. pharm.* 42, 589-97 (1935).—The index is given as g. $AcOH$ fixed by 100 g. of essence. The pyridine acetylation data, only primary and secondary alcs. It is of value for the following essences: neroli (orange blossom) 5.4, mentha 32.5; rose 38.5, sassa 78.1-79.6. It is necessary to consider the initial acid and a possible $EtOH$ content. The data of esters and of free alcs. permits the calcul. of total alcs.; this avoids the long and often inaccurate detn. by acetylation. A. E. Meyer.

The detection of small quantities of hashish (Cannabis indica) in different drugs by the use of filtered ultraviolet rays of Wood. Joseph Khouri. *Bull. sci. pharm.* 42, 593-612 (1935).—While cannabis gives an intense fluorescence many other drugs show no fluorescence at all. The use of exts. obtained with different solvents supplies a further means of differentiation. A. E. Meyer.

Experiments to isolate the autonomic principle of the liver. Burger Strandell. *Acta Med. Scand., Suppl. LXXI*, 52 (1935).—A preliminary report of the prepn. of a liver ext. of which 0.2 mg. corresponds to 100 g. liver, and which is highly effective against pernicious anemia when an aq. soln. of 2 mg. is injected intragastrically. S. Morfals.

Therapeutic and dietetic properties of "karkade" (*Rhusus sabbardilla* L.), a new colonial pink tea. P. Roreux. *Formules Ind. 3*, No. 1, 13-16 (1935). *Chim. & Industrie* 34, 1150.—The product contains 2 coloring matters, *karkasin* and *purpurin*, it is used, in combination with a natural base, for coloring syrups and liquors. It contains no active principle and can be used as a substitute for tea and coffee for persons who are sensitive to excitants. The therapeutic properties of karkade are due to its citric acid content and to the presence of a large amt. of an emollient and sedative mucilage. Its effects on the organism are: abundant diuresis accompanied by slightly diaphoretic action, activation and neutralization of hepatic secretion, activation of gastric secretion and intestinal contractions which permit of rapid digestion, decrease in hyperviscosity of the blood and in arterial pressure, whence its efficacy in arteriosclerosis; its opioric action has a favorable effect on the functions of the stomach; it possesses a high intestinal antiseptic action and can be used to combat various infectious intestinal diseases; it gives a euphoric impression and acts as a reconstituent in spite of the fact that it possesses weight-reducing properties. A. Papenau-Couture.

The saponins. A. Wall. *Rev. sci. med. nat.* 39, 437-8 (1935), of Teichsche, C. A. 29, 7338.—The chemistry and applications of saponins are described. Mention is made that the saponins of marrows and quills root are most commonly used. Halser E. Sillman.

The preparation and stability of Dakin solution. Svend A. Schou. *Dansk Tids. Farm.* 9, 215-14 (1935) (summary in French).—The prepn. of a soln. of $NaOCl$ contg. 0.5% active Cl (Dakin soln. (B)) sufficiently alk. to be stable and yet nonirritating to the tissues was investigated. Conversion of $Ca(OCl)_2$, triturated in water,

with Na_2CO_3 is inapplicable on account of the uncontrollable amts. of Ca compds. introduced. In using a filtered, concd. soln. of $\text{Ca}(\text{OCl})_2$, it may be assumed that the content of $\text{Ca}(\text{OH})_2$ will be within narrow limits. To det. $\text{Ca}(\text{OH})_2$, add 20 cc. 3% H_2O_2 to 20 cc. soln. and heat until the evolution of gas ceases. Titrate with 0.1 N HCl (methyl red indicator). The amt. of $\text{Ca}(\text{OH})_2$ in freshly prep'd, filtered solns. of $\text{Ca}(\text{OCl})_2$ (19) was almost const. and corresponded to 7.5 cc. 0.1 N HCl per 20 cc. The amt. of NaOH formed by the conversion with Na_2CO_3 can therefore be considered const. and be eliminated with a const. amt. of NaHCO_3 . Very basic solns. contg. excess of Na_2CO_3 are very stable, only 4% of the content of active Cl being lost after 11 months at 25°. A calcn. of the variation in the final reaction of I prep'd by adding a const. amt. of NaHCO_3 to NaOCl solns. contg. 2 to 7 g. Na_2CO_3 per kg. shows that the resulting reaction in all cases will be between pH 9.2 and 10.0 and thus suitable for therapeutic purposes. These solns. were, however, unstable and the more so the lower the original content of Na_2CO_3 . I should therefore be prep'd as follows: Add 30 g. Na_2CO_3 dissolved in 270 g. water to 200 g. filtered, concd. $\text{Ca}(\text{OCl})_2$ soln. contg. 2.4–2.6% active Cl (prep'd from standard $\text{Ca}(\text{OCl})_2$), contg. 25–35% active Cl. Stir and let stand until the ppt. is cryst., filter and wash with sufficient water to make 500 g. filtrate. This strongly basic NaOCl soln. is stable for 1 year and can be kept as stock in a cool place protected from light. When it is dispensed, add 10 g. NaHCO_3 dissolved in 400 g. water. The final prep'n. thus contains 0.5% active Cl, has a suitably low pH and may be considered stable for 2–3 weeks. D. Thuesen

Investigations on methylatropine bromide. The stability of solutions of methylatropine bromide and the determination of methylatropine. I. Reimers *Dansk Tids. Farm.* 9, 215–27 (1935) (summary in English).—In view of the observations of Schou and Bjerregaard (*C. A.* 27, 5145) that aq. solns. of atropine (I), buffered to pH 7.3, hydrolyze strongly when heated, the stability of aq. solns. of methylatropine bromide (II), which are neutral, were investigated under similar conditions. S. and B.'s method for the detn. of I + tropine and tropic acid (III) in solns. of I could not be employed for solns. of II because the strongly basic methylatropine (IV) and methyltropine were not liberated by Na_2CO_3 , even NaOH liberated only about 20% of the theoretical amt. of IV. The method is modified as follows: To 10.00 cc. soln. of II add 10 drops dil. HCl , or, if the soln. contains buffer, sufficient HCl to give a red color with 1 drop methyl red indicator, followed by 10 drops dil. HCl . Shake 3 times with 15 cc. of a 3:1 mixt. of CHCl_3 and iso- PrOH , filter the combined exts., distil off the extn. liquid on a steam bath and dissolve the residue in a small amt. of hot water. Titrate when cold with 0.1 N NaOH (phenolphthalein). One cc. 0.1 N NaOH corresponds to 0.0341 g. decomp'd II. Add 0.5 g. NaHCO_3 to the titrated soln., shake as above with a mixt. of CHCl_3 and iso- PrOH , filter into a separatory funnel and shake the combined exts. with 5.00 cc. 0.1 N HCl . Let stand, drain off the extn. liquid and titrate the excess of HCl with 0.1 N NaOH (methyl red) (I and tropine). Solns. of II undergo very little change on heating because III, which is formed by a slight hydrolysis, increases the acidity of the soln. and prevents further decomp'n. Expts. with very weak solns. showed, however, that the amt. of III which must form before the hydrolysis is checked is the same in all cases; thus in weak solns. a relatively larger percentage of II decomposes. If a small amt. of HCl is added (0.1–1.0 cc. 0.1 N HCl per 100 cc.) the soln. becomes stable and will stand autoclaving for 20 min. at 120° and remain unchanged for half a year or more. If a buffer is added so as to maintain the pH above the value at which the soln. reaches the point of stability (pH about 4), or in strongly acid soln., hydrolysis takes place. Formation of I or tropine could not be detected either in neutral or in acid solns. Solns. of *eumydrin* (IV-nitrate) behaved similarly, the hydrolysis being slightly higher. If an excess of NaOH is added to a soln. of II complete hydrolysis takes place in a few min. Based on this, 2 analytical

methods were developed: (1) For the detn. of II in mixts. with acids or other substances not interfering with the extn., add 2 cc. NaOH soln. to a soln. of 0.1–0.2 g. II, if necessary obtained by concg. a weaker soln. Let stand for 15 min., add 1 drop methyl red indicator and dil. HCl to change of color, followed by 10 drops of dil. HCl . Ext. 3 times with 20 cc. of a 3:1 mixt. of CHCl_3 and iso- PrOH , filter the combined exts. through a small, firmly packed cotton filter and wash with a few cc. of the solvent. (2) Evap. the filtrate on a steam bath and dissolve the residue in 5–10 cc. hot water. When cold add 3 drops phenolphthalein indicator and titrate with 0.1 N NaOH . One cc. 0.1 N NaOH corresponds to 0.03841 g. II. (2) For the examn. of pure II, dissolve 0.2 g. II in 5 cc. water in a flask and add 10 cc. 0.1 N NaOH . Stopper the flask and let stand for one half to one hr. Add 3 drops phenolphthalein indicator and titrate the excess of NaOH with 0.1 N HCl . D. Thuesen

The determination of morphine. V. The value of some methods for the determination of the absolute content of morphine in opium. H. Baggesgaard-Rasmussen and I. Reimers *Dansk Tids. Farm.* 9, 229–43 (1935) (in German), cf. *C. A.* 29, 3459⁴.—In various methods of detg. morphine (I) the material which finally is titrated or weighed, when subjected to a preliminary purification by extn. with benzene, contains one or more by-alkaloids of a phenolic nature. The methods of Mannich (*C. A.* 29, 3462⁴), Eder and Stucki (*C. A.* 27, 2760), Szeghő (cf. *C. A.* 29, 3775⁴) and Eder (*XII Congrès International de Pharm.*, Bruxelles 1935) give values that are too high. When I is shaken out, dissolved and crystd. after addn. of NH_4Cl the loss is larger than for pure solns. of I treated in the same manner. This loss is practically of the same magnitude as the decrease in the amt. of I on benzene purification, carried out as follows. Dissolve I as completely as possible in 5 cc. benzene on the steam bath and evap. to dryness so as to render it cryst. If necessary repeat this operation. Add 10 cc. cold benzene and let the flask stand overnight or at least 2–3 hrs. with frequent shaking. Decant the benzene through a small filter and wash I twice with 5 cc. benzene. Dissolve crys'tals of I on the filter in warm MeOH , transfer to the flask and evap. to complete dryness. A method of detg. the abs. content of I in a lime ext. of opium would consist of (1) shaking out with a 3:1 mixt. of CHCl_3 and iso- PrOH at pH about 9, (2) tetrapon purification of the alkaloid shaken out (cf. *C. A.* 27, 2760), (3) benzene purification of the alkaloids again shaken out, and (4) titration of I. A single shaking out, followed by benzene purification and pptn. cannot be employed because I in some cases is then so impure that the benzene purification fails. D. Thuesen

Cascara adulteration. H. W. Blair *Pharm. J.* 135, 682; *Chemist and Druggist* 123, 737 (1935).—In sampling a consignment about 2% of a deliberate admixt. of large smooth stones and bags contg. chips of *Pseudotsuga douglasii* was brought to light. S. Waldbott

Preservation of chloroform to be used in anesthesia. Adele Lussievici-Dragnesco. *J. pharm. chim.* 21, 533–8 (1935).—Addn. of 1% alc. and keeping the CHCl_3 in the dark in small colored vials will protect it from deterioration for months, even a yr. S. Waldbott

Activity of different salts of cocaine. J. Régner and R. David. *J. pharm. chim.* 22, 16–22 (1935).—A summary of previous work (cf. *C. A.* 28, 4175⁴; 29, 293⁴, 551⁴, 4833⁴). S. Waldbott

Isolation and some properties of an alkaloid from *Crotalaria spectabilis*. Roth, W. M. Neal, L. L. Rusoff and C. P. Ahmann. *J. Am. Chem. Soc.* 57, 2560–1 (1935).—Extn. of the seed, leaves and stems, resp., of *Crotalaria spectabilis* Roth with 5% NH_4OH for 48 hrs. and extn. of this filtrate with HCl , gives 0.4, 0.07 and 0.015% of crude extn., from which was isolated *monocrotaline*, m. 190–73°; it slowly decolorizes KMnO_4 and shows characteristic alkaloidal reactions; it lowers the blood pressure in dogs and decreases the rate and amplitude of terrapin heart *in situ*; the 24-hr. lethal dose for chickens is 65 mg./kg. live wt. C. J. West

Heart glucosides of *Digitalis purpurea* L. and *Digitalis*

lanata Erh. Artur Stoll. *Arch. Chem. Farm.* 2, 129-38 (1935 in German) (1935), cf. *C. A.* 30, 240.—The application of a mild procedure for extg leaves of *Digitalis purpurea* and *D. lanata* led to the prepn of a series of new genuine glucosides, whose mutual relations could be definitely established. The total cryst. prepn obtained from *D. lanata*, called diglanide, has been sepd into 3 components, viz. diglanide A (I), B (II) and C (III). These could be converted into previously known glucosides in 2 ways, i. e. by chem. sapon and subsequent enzymic cleavage of 1 mol of glucose or a reverse sequence of the above treatments. Thus I gave digitoxin, II gitoxin, and III digoxin, all of which differ from the resp. diglanides by a lack of 1 Ac group and a mol of glucose. Processing of *D. purpurea* by the same scheme was seriously hampered by a comparatively larger amt of inactive accompanying substances and the amorphous nature of the genuine glucosides. Nevertheless genuine and pure but amorphous *purpurea* glucosides A (IV) and B (V) could be prep'd differing from I and II by a lack of 1 Ac group, and being identical with desacetyldiglanide A or B, resp. IV is transformed by the *purpurea* leaf substance enzymically into digitoxin, V into gitoxin. For prep'n pure genuine glucoside prep'n *D. lanata* is better suited than *D. purpurea*, since IV and V, being amorphous, are isolated with difficulty and with a poor yield. A detn. of the components of the total prep'n of genuine *purpurea* glucosides does not exist, while with *D. lanata* the total diglanide content as well as the ratio of the resp. components I and II and III is readily det'd., and the prep'n can be obtained in a good yield and by a technically easy method. J. Wiertelak.

Comparative investigations on the adsorptive power of charcoals for medicinal purposes. Aleksey Rausch. *Arch. Chem. Farm.* 2, 182-96 (1935) (German summary).—R. stresses the necessity of a more exact definition of the term *medicinal charcoal* (I) from the medical point of view. The raw material does not seem to play any role in prep'n. I. It is also desirable to decide definitely which chem. substances should be chosen to be adsorbed in the evaluation of I. Requirements for a high adsorption of iodine and HgCl_2 should be barred since in the products of food metabolism substances of such a strong chem. reactivity are absent. On the other hand, too little attention has been paid hitherto to gases, as H_2S , and to decompn. products of albuminous substances. A new peptone method for exam'g. I is proposed. Shake 100 cc. of a 0.15% aq. soln. of Merck's peptone for 0.5 hr. with 0.2 g. of I, filter the suspension, and det. the non-adsorbed peptone colorimetrically (cf. M. Dominikiewicz, *Chem. Polski* 1909, 297). For this purpose add to 50 cc. of the filtrate 5 cc. of a 30% NaOH soln. and 5 cc. of a 1% CuSO_4 soln. and make up to 100 cc. After shaking, filter the mixt. through dry paper, and compare the amethyst-colored soln. with a standard. The method is most practical for work in pharmacies. In addn. adsorption of R-salt is introduced, of which the non-adsorbed portion can be easily det'd. iodometrically. Thirteen different charcoal samples are tested in respect to the adsorption of iodine, HgCl_2 , CaI_2 , H_2S , methylene blue, R-salt and peptone. J. Wiertelak.

Conductometric analysis and its application in pharmacology. Konstanty Hrynakowski and Feliks Modrzejewski. *Wiadomosci Farm.* 62, 427-9, 441-3, 457-60 (1935) (German summary).—The application of conductometric titrations to detn. of weak acids and bases gives generally good results. Extending this applicability to pharmaceutical products, H. and M. det. with an av. error of 0.2-0.5% derivs. of barbituric acid (barbital and phenobarbital) as well as salicylic acid, coumarin, urotropine and papaverine. Substances insol. in water but sol. in EtOH can be titrated in alc. solns. Better results are obtained, however, if the weak acids, after soln. in excess alkali, are titrated back with HCl, or weak bases, correspondingly, after soln. in HCl, with NaOH. The dissociation const. (k) of all substances, mentioned above, is greater than 10^{-10} . The detn. of substances which have k equal to, or smaller than 10^{-10} , is hindered by incipient hydrolysis, e. g., urea

($k = 1.5 \times 10^{-10}$) in aq. soln. does not interact at all with HCl. The same is true of antipyrine. For the same reason errors occur with biacidic alkaloids, as cinchonine ($k_1 = 1.4 \times 10^{-1}$, $k_2 = 1.2 \times 10^{-10}$). The latter gives good results on titration with HCl to a 0.02 M soln., while at a lower concn. too low results are obtained because of hydrolysis. Brucine and strychnine, with k_2 of the order 10^{-11} , have in a 0.01 M soln. the second group to a major part hydrolyzed. In less concd. solns. the hydrolysis is total and these alkaloids can then be det'd. as monoacidic bases. In alc. solns. hydrolysis proceeds farther than in aq. HCl solns. of equal strength already in 0.01 M alc. solns. Strychnine and brucine behave as monoacidic bases. J. Wiertelak.

Essential oils of eucalyptus. Antonio da Costa Cabral. *Anais inst. super. agron., Univ. tech. Lisboa* 6, No. 2, 78-81 (1934).—Samples of leaves of fruiting and non fruiting eucalyptus trees (*E. globulus*) growing in Portugal were taken fortnightly between Dec. and Oct. and the cinole content was det'd. The essential oil obtained has the same cinole content as the Australian and California eucalyptus oils but the yield from these Portuguese trees is much smaller than is found in any other country, being 0.41-0.501%. The oil contains no phellandrene. O. W. Willcox.

Eighteenth-century English medicine (Comrie) 2. Catalysis of hydrogenation. IV. Hydrogen no. a new const. for essential oils (Ginzberg, Evdokimova) 27. Derivs. of carbamylcholine chloride (Ercoli) 10. Detection of heavy water in mineral water (Hansen, et al.) 14. Hydrogenation of tertiary alkyl-phenols to form hydro-aromatic aldes [for use as ingredients for cosmetics and soaps] (U. S. pat. 2,026,668) 10.

Physiologically active preparations. I. G. Farbenund, A.-G. (Carl Ludwig, Willy Ludwig and Fritz Lindner, inventors). Ger. 618,789, Sept. 14, 1935 (Cl. 12p. 17.10). Addn. to 614,861 (C. A. 29, 8238⁹). The method of 614,861 for obtaining active prepns. from hypophysis lobes is modified by subjecting the lobes to autolysis or digestion after extn. with the org. solvent, but before extn. with water.

Antithyroid concentrate. Ferdinand Blum (to Sachsches Serumwerk A.-G.). U. S. 2,024,676, Dec. 17. Material such as blood, liver or spleen is treated (suitably with acetone or alc.) to ppt. protein and after filtering the pptd. proteinous material is repeatedly extd. with water to produce an aq. ext., the filtrate and aq. ext. derived from the ppt. are conc'd. and then are dialyzed and may be evap'd. to dryness. A product thus prep'd. may be used as a therapeutic agent.

Alkaloids. Jean B. A. Lafon. Gr. 787,611, Sept. 26, 1935. Alkaloids are extd. from tea, coffee, tobacco, etc., by means of SO_2 , which is afterward removed by simple expansion. The harmful alkaloids may first be removed from the SO_2 by an adsorbent such as silicotungstic acid.

Separating cinchona alkaloids. C. F. Boehringer & Soehne G. m. b. H. (Heinrich Thron and Wilhelm Dirscherl, inventors). Ger. 621,456, Nov. 7, 1935 (Cl. 8p. 17). Cinchona alkaloids having unsat'd. side chains are sepd. from those having sat'd. side chains by taking advantage of the fact that the alkaloids with unsat'd. side chains combined with Hg salts to form compds. sol. in aq. NH_3 but insol. in ether. These compds. are decomp'd. after the sepn., preferably with H_3PO_4 . Sp. processes are described. The method may be used in analyzing mixts. of the alkaloids.

Nicotine. Constantin de Gendre and Paul Bary. Fr. 787,194, Sept. 18, 1935. Tobacco juice prep'd. from waste tobacco is treated with an alkali then with HCOOH , AcOH or other acid forming with nicotine a salt insol. in petroleum, and the salt is sepd. by decantation.

Solutions of alkoxy phenols suitable for medicinal uses as for injection into body cavities. Walter Kropp (to Winthrop Chemical Co.). U. S. 2,025,869, Dec. 31. A water-sol. 1-phenyl-2,3-dimethyl-5-pyrazolone-4-

aminomethane-sulfonate or -sulfinate is used in prep. aq. solns. of alkoxy phenols such as guaiacol or the like

Vuzine derivative. Vereinigte Chinnfabriken Zimmert & Co. G. m. b. H. Zweigniederlassung Mannheim (Lutz Johannesohn and Heinrich Thron, inventors) Ger. 621,198, Nov. 2, 1935 (Cl. 12p 12) The vuzine salt of camphoric acid is prep. by any of the usual salt-forming processes. Sp. processes are described. The salt has a stronger bactericidal action than the known vuzine salts.

Chloromethylene derivatives. Marcel Sommet and Israel Marsak. Fr. 787,655, Sept. 20, 1935 An aldehyde is caused to react in strong HCl medium with aromatic compds. such as C_6H_5 , $PhMe$, PhI , xylene, anisole, phenetole and butoxybenzene, preferably in the presence of a solvent or diluent. Examples are given of the prep. of *p*-chloromethylanisole, *b*, 100-3°, *p*-chloromethylphenetole, *b*, 105-7°, monochloromethyl deriv. of butoxybenzene, *b*, 135°, monochloromethyl deriv. of methoxybenzene, unstable, α -chloroisobutyl deriv. of methoxybenzene and α -chloroethyl deriv. of *m*-xylene, *b* 98-115°. The products are intermediates for perfumes, etc.

Salts of methylaminomethylheptene. Knoll A.-G. chemische Fabriken (Wilfried Klavohn, inventor) Ger. 618,973, Sept. 19, 1935 (Cl. 12p 8-10) Salts of 6-methylamino-2-methyl-2-heptene, readily sol. in water are prep. by treating salts or salt-like compds. of the above with 4-dimethylamino-1-phenyl-2,3-dimethyl-5-pyrazolone, in optional presence of water. Instead of the salts of methylaminomethylheptene, the base and acid constituents may be treated with the above pyrazole deriv. The substances are used in medicine. 1 examples are given. Cf. C. A. 30, 810⁴

Salts of organic arsenic acids. I. G. Farbenindustrie A.-G. (Karl Streifwolt and Hubert Oesterlin, inventors) Ger. 618,567, Sept. 11, 1935 (Cl. 12p 1-30) Acridine bases are treated with org. arsenic acids which are not exclusively substituted by primary NH_2 groups and which contain complex-bound metals, or these acids are treated with salts of basic substituted acridine compds. Thus, the Na salt of 2-argemontemercaptobenzoxazole-5-arsonic acid is dissolved in water and treated with a warm soln. of 2,3-dimethoxy-6-nitro-9-(γ -diethylamino-8-hydroxypropylamino)acridine-di-HCl to give a salt. Other examples are given. The salts are used in therapy and are sol. with difficulty in water. Cf. C. A. 30, 730⁴

Alkali and alkaline earth salts of sugar phosphoric acid esters. Seigo Funakura U. S. 2,021,030, Dec. 10 Sugars phosphoric acid esters are synthesized by the interaction of sugar dissolved in aq. pyridine contg. about 30% of water with $POCl_3$ dissolved in $CHCl_3$ at -20°, removing excess of pyridine from the reaction mixt. (suitably by vacuum distn.), neutralizing the residual syrupy soln. with the carbonate and hydroxide of a metal such as $CaCO_3$ and $Ca(OH)_2$, removing the remaining pyridine by passing a current of warm air at 35-40° through the soln. and by vacuum distn., removing various impurities by dialysis, removing traces of chloride with Ag carbonate, and finally pptg. the ester salts with $EtOH$. The products thus obtained are suitable for medicinal use.

Solutions of rare earth oxalates. Chemische Fabrik von Heyden A.-G. (Richard Moller, inventor) Ger. 621,309, Nov. 5, 1935 (Cl. 30k 2). Water-insol. or sparingly sol. rare earth oxalates are brought into aq. soln. with the aid of salts of polybasic hydroxy acids, e. g., citric, malic or tartaric acid. The process is preferably effected in an alk. medium, and protective colloids may be added to the solns. The products are of therapeutic value. Sp. processes are described.

Vitamin concentrate from oils such as cod-liver oil. Horatio P. Loomis (to Salmo Chemical Co.) U. S. 2,020,395, Dec. 31. Part of the saponifiable portion of the oil is saponified with an alkali hydroxide and the acid soaps and neutral soaps formed are dissolved in aq. alc.; the unsaponified portion of the oil contg. vitamins is then sep'd by gravity or by centrifuging. Various details and modifications of procedure are described.

Hormones. I. G. Farbenindustrie A.-G. Brit. 435,545, Sept. 19, 1935. Preps. of the hormone of the

suprarenal cortex are obtained free from the toxic action of 1-(3,4-dihydroxyphenyl)-2-methylaminoethanol by treating the cortex or the whole suprarenal capsule, or any preps. from these, with CH_3O or a compd. that splits off CH_3O . Excess CH_3O may be eliminated by adding NH_3 .

Hormone preparations. I. G. Farbenindustrie A.-G. Brit. 435,195, Sept. 17, 1935 Stable solid mixts. of hormones with diluents are prep'd by dissolving the hormone together with an albumin or albumin decompn. product of high mol. wt. in a solvent for both constituents and then adding a precipitant for the 2 substances. Among examples, (1) posterior hypophysis hormone and Na protalbin are dissolved in glacial $AcOH$ and pptd. with a mixt. of Me_2CO and Li_2O , and (2) the sexual hormone of the anterior hypophysis obtained from urine is dissolved in H_2O , mixed with normal serum and pptd. with alc. and Li_2O . Cf. C. A. 29, 5900¹

Follicle hormone preparations. F. Hoffmann-La Roche & Co. A. G. Brit. 431,106, Aug. 30, 1935 Concd. aq. preps. for injection or oral administration are obtained by dissolving the hormone in aq. resorcinol solns. Other phenols, e. g., trisecol, guaiacol, may be added to the resorcinol soln. to increase its capacity to dissolve the hormone.

Suspensions of histological animal cells. I. G. Farbenindustrie A.-G. Fr. 780,057, Aug. 26, 1935 Stable suspensions which do not agglutinate are obtained dispersing the fresh cellular material in the presence of substances which lower the surface tension or prevent coagulation of blood while not appreciably modifying the cells, preferably in conjunction with agents having an antiseptic action. The above substances may be administered to a living animal from which the cellular material for the prep. is to be obtained. Thus, to a cellular suspension is added an aq. soln. of hirudine or *m*-aminobenzoic- or *m*-amino-*p*-methylbenzoic- or 1-naphthylamine-4,6,8-trisulfonic acid, or a mixt. of *sec*-octyl alc. and $LiOH$ and water.

Radioactive compositions of therapeutic value. Gottfried Erhard and Gerhild Schaefer Ger. 650,477, Nov. 16, 1935 (Cl. 30k 2) Ra emanation is absorbed in solid alimentary fats.

Local anesthetic. Sverre Quisling. U. S. 2,025,399, Dec. 24. An aq. or dil. alc. soln. of guanicol is prep'd. with use of Na salicylate or benzoate or both as a solubilizing agent.

Solution suitable for sterilizing aluminum articles. Lamont J. Benson (to Aluminum Co. of America). U. S. 2,021,755, Dec. 17. A soln. comprising a water-sol alkali metal disulfate and available Cl is prep'd, e. g., from Na disulfate and NaOCl.

Deodorant suitable for use as a liquid spray. Max Cline (to International Paper Co.) U. S. 2,024,145, Dec. 17. Zn sulfocarbolate, starch and glycerol are used in an aq. vehicle.

Cosmetic grease paint. Frank Factor (to Max Factor & Co.) U. S. 2,025,913, Dec. 31. A freely flowing liquid compn. contains a nonvolatile oil such as olive and mineral oils in sufficient proportion that after application of the compn. to the skin a flexible film is formed which remains moist and resistant to cracking, together with a pulverulent "texture ingredient" such as Zn and Ti oxides and a suspended pigment and an ingredient for reducing surface tension such as triethanolamine and stearic acid which renders the paint readily removable by the use of soap and water.

Skin creams. The Chrs. H. Phillips Chemical Co. Fr. 787,532, Sept. 24, 1935. The cream contains $Mg(OH)_2$, an oil, an alc. of high mol. wt. contg. at least 16 C atoms, a wax and water. An example contains $Mg(OH)_2$, 2-4, cholesterol 2.7, petroleum 30.3, ceresin wax 1, water 60.4, ethylene glycol 3 and perfume 0.2%.

Dentifrice. Herl L. Crowther. U. S. 2,023,148, Dec. 17. A dry powd. material such as a mixed dentifrice is impregnated with a wax such as ceresin wax for leaving a thin protective coating on the teeth when brushed with the compn.

Dentifrice. Benjamin R. Faunce. U. S. 2,025,655,

Dec 24 A sterilized glyceride of lute freed of pathogenic bacterial matter is mixed with about an equal amt. of glycerol, an excipient such as surup and a cleansing and polishing agent such as pptd. CaCO_3 , etc

18—ACIDS, ALKALIES, SALTS AND OTHER HEAVY CHEMICALS

E M SYMMES

The production of boric acid in the U. S. S. R. L. E. Berlin *J. Chem. Ind. (Moscow)* 12, 821-8(1935).—The app and methods used for decompn of datolite by H_2SO_4 and extn of H_2BO_3 from the residue are discussed

H. M. Leicester
Manufacture of hydrofluoric acid. Pedro Roca. *Quim. e Ind. 12*, 236-8(1935).—Com methods employing CaF_2 and H_2SO_4 are described L. E. Gilson

A rapid method for the determination of available phosphoric acid in freshly prepared superphosphate N. V. Il'in and V. F. Chapuign *J. Chem. Ind. (Moscow)* 12, 819-20(1935).—The standard methods are used, except that for extn of the citrate-sol P_2O_5 the sample is heated 45 min at 70° with the Peterman reagent The method is accurate to 0.2% Unless fresh superphosphate is used, the extn takes much longer H. M. L.

Rapid method of determining nitrogen oxides in tower gases of sulfuric acid production. M. N. Merlis and O. D. Petrova *Zavodskaya Lab* 4, 938-9(1935).—For the detn of NO and NO_2 in the tower gases of H_2SO_4 manuf., NO is oxidized to NO_2 with H_2O satd. with O_2 in the presence of $\alpha\text{-C}_6\text{H}_5\text{NH}_2$ (I) and sulfamic acid (II). The color intensity of the soln of the azo dye formed is compared with that of an aq. mixt. of I and II of the same concns titrated with a standard soln of NaNO_2 . Since only half the combined NO_2 reacts in the diazotization ($2\text{NO}_2 + \text{H}_2\text{O} = \text{HNO}_2 + \text{HNO}_3$), the results of detn. must be multiplied by 2 Fill a 10-bulb Lunge tube with 75 cc H_2O satd. with O_2 and introduce 1 cc. of the I soln (0.1 g. I, 6 cc of 80% AcOH and 94 cc H_2O), 1 cc of 1% II and 10 drops of 80% AcOH . Pass into the tube 500 cc. of the gas sample from an aspirator. Discharge the soln. with the dye into a flask, wash the tube, heat the united soln to $70-80^\circ$, and dil the soln to 300 cc Mix 280 cc. of hot H_2O , 1 cc of the I soln, 1 cc of II soln and 10 drops of AcOH , titrate the soln. at $70-80^\circ$ with NaNO_2 to the same color intensity as the first soln, and calc. Chas. Blanc

Determination of arsenic in flue gases in sulfuric acid production G. B. Zil'berman and K. N. Polikarpova. *Zavodskaya Lab* 4, 760-2(1935).—More reliable results were obtained by the colorimetric method of Sanger and Black (C. A. 2, 975) by using H_2 generated from H_2SO_4 and Al activated by etching with 3% HgCl_2 for 2-3 min. Chas. Blanc

Methods of preparing fluorides A. I. Selezneva. *J. Chem. Ind. (Moscow)* 12, 1041-7(1935).—Methods for converting fluorapatite into cryolite, AlF_3 , and NaF are reviewed H. M. Leicester

The preparation of high-quality chloride of lime. M. E. Pozin *J. Chem. Ind. (Moscow)* 12, 810(1935); cf. C. A. 30, 822².—When Ca(OH)_2 is suspended in CCl_4 and chlorinated for 5 hrs. at 0° , the product contains 42-49% active Cl_2 . If an aq. suspension of yellow HgO is chlorinated, HgCl_2 and HOCl are formed. The soln is filtered and neutralized with lime. It gives a product contg 45% active Cl_2 . Chlorination of a suspension of CaCO_3 in H_2O at 0 to -5° gives CaCl_2 and HOCl . The latter is extd. with CCl_4 and neutralized with finely ground lime The resulting Ca(OCl)_2 contains 51.5% active Cl_2 H. M. Leicester

The preparation of a high percentage calcium cyanamide by the action of ammonia and carbon monoxide on calcium oxide and calcium carbonate. V. F. Postnikov, T. I. Kunin and N. A. Ereemeeva. *J. Chem. Ind. (Moscow)* 12, 795-802(1935).—The optimum conditions for the reaction are to pass a 6-fold excess of NH_3 and 4 times thus amt. of CO over CaO at $750-800^\circ$. Decompn. of the NH_3 is favored by the presence of Fe, which should therefore be avoided, and hindered if the gas stream con-

tains 50% N_2 . Addn of 3% Al_2O_3 and 10% C catalyzes the reaction CaCN_2 contg 26.81% N_2 is obtained thus in 2 hrs The reaction goes more easily if CaCO_3 or natural limestone is used In this case, the optimum temp is $800-50^\circ$, the ratio of NH_3 to CO is 1:3, the catalyst contains 1.5% Al_2O_3 and 17% C, and other conditions are unchanged CaCN_2 contg 28% N_2 is thus obtained A yield of 5% HCN is obtained as a by-product Attempts to convert the CaO in technical CaCN_2 into CaCN_2 by this process were not successful H. M. Leicester

Sulfate formation from the action of chlorine on mixtures of cupric sulfate, cupric oxide, cuprous sulfide and ferric oxide D. M. Chizhikov and G. S. Babikhina *J. Chem. Ind. (Moscow)* 12, 1038-41(1935).—When Cl_2 reacts with a mixt of CuSO_4 and CuO , a small amt. of CuSO_4 is formed. Addn. of Fe_2O_3 to the mixt. greatly increases the amt. of CuSO_4 , especially at higher temps Addn. of CuSO_4 contg. H_2O of crystn decreases the formation of more CuSO_4 at high temp Anhyd. CuSO_4 has little effect. CuSO_4 and Cu_2S react to give S, which also oxidizes CuO , but not as easily as Cu_2S does When a mixt. of CuSO_4 (H_2O), CuO , Cu_2S and Fe_2O_3 , approximating the compn. of Cu pyrites slag, is chlorinated, the amt of CuSO_4 formed rises to 85% of the possible amt.

H. M. Leicester
The production of magnesium and barium fluorides N. S. Nikolaev and S. M. Kamorgorodskii. *J. Chem. Ind. (Moscow)* 12, 1047-50(1935).—Solns of MgCl_2 and MgSO_4 give colloidal ppts with NaF . The resulting MgF_2 is very impure. If these salts are treated with HF , gels are formed However, MgO and MgCO_3 react with HF to give good yields of rapidly filterable MgF_2 . BaCl_2 , $\text{Ba(NO}_3)_2$, and BaS all give good yields of BaF_2 when they are treated with NaF . When BaS is used, one of the reaction products is NaOH , whose alkyl, permits the use of NaF contg much SiO_2 . Details of large-scale applications of these methods are given H. M. L.

Microchemical investigation of the potassium chloride crystals obtained on treatment of sylvinit Ya. E. Vil'nyanskii and Z. S. Bannukh. *Kaif* (U. S. S. R.) 1935, No. 8, 19-21.—Photomicrographs of different intermediate products (vacuum salt, lower salt and dry salt) are reproduced. The manuf. of vacuum salt is recommended as a means to decrease the caking of KCl in storage A. Pestoff

The use of oxygen in soda manufacture A. D. Kron *J. Chem. Ind. (Moscow)* 12, 784-8(1935).—Economic considerations are discussed H. M. Leicester

Obtaining bromine from the sylvinit alkaline mother liquors V. I. Nikolaev and E. M. Petrova. *Kaif* (U. S. S. R.) 1935, No. 8, 18-19.—A table shows the distribution of Br between the liquid and solid phases in the tertiary system $\text{KCl-KBr-H}_2\text{O}$ for Br contents of 0.5-0.3% over a temp. range of 0° to 100° . At 100° the liquid contains 2.4 times more Br than the solid. Max. content of Br in Solkamsk sylvinit liquor was 0.18% A. Pestoff

Some solvents for the extraction of iodine and bromine from dilute solutions. A. G. Balchikov *J. Chem. Ind. (Moscow)* 12, 1062-6(1935); cf. C. A. 29, 2313¹.—Benzene and kerosene are easily brominated, and so cannot be used for Br_2 extn, even if they have been treated with oxidizing agents CCl_4 exts Br_2 and I_2 effectively from H_2O , but less effectively from NaCl solns Addn of up to 30% CaH_2 to the CCl_4 improves the extn. of the halogens from both H_2O and brine, but the sp. gr. of the solvent should be kept well above that of the brine to promote good sepn. of the layers H. M. Leicester

Obtaining hydrogen and hydrogen nitrogen mixtures by the explosive oxidation of methane N. I. Kobozov,

Ya. S. Kazarnovskii and L. I. Kashtanov. *J. Chem. Ind. (Moscow)* 12, 1030-6 (1935).—The explosion of equimol. amts of CH_4 and O_2 gives a yield of 37.8% CO and 49.4% H_2 , independent of pressure from 0.72 to 3.7 atm. The walls of the reaction vessel had no effect, but reduction of the diam. of the vessel hinders the reaction without changing the final products. Addn. of N_2 to the mixt. lowers the yield of CO and H_2 , somewhat, but this effect can be counteracted by the presence of CO_2 . Addn. of H_2O to the mixt. causes incomplete reaction. Calcs. show that the temp. conditions of the reaction probably det. purely thermodynamically the direction of the explosion. H. M. Leicester

The use of waste nitrous gases to produce nitrogen and nitrogen-hydrogen mixtures. I. Ivanovskii, M. Korsh and I. Krushal. *J. Chem. Ind. (Moscow)* 12, 803-9 (1935).—The NO and O_2 which are present in small amts in waste N_2 can be removed by passing the gas at 300-500° with H_2 over a catalyst composed of 2% Cu and 3% Ni deposited on chamotte. This catalyst can also be used to remove small amts of O_2 from electrolytic H_2 . H. M. Leicester

Controlling and operating devices in the sulfur plant at Rönnskär. Per Agren. *Ira* 1935, 83-8.—The instruments and control board for continuously recording and controlling the operations in the Rönnskär plant for the manuf. of S from SO_2 and producer gas are described. E. M. Symmes

Mining of carnallites in the First Potassium mine A. N. Andreichev. *Kali* (U. S. S. R.) 1935, No. 4, 27-36, No. 5, 14-25.—A discussion of the location of the mine and proposed methods of the mining of carnallite. The carnallite contains KCl 19.90, MgCl_2 25.18, NaCl 27.44, H_2O 25.63, CaSO_4 0.956, insol. matter 0.48%. A. Pestoff

The Carnallite-Magnesium Combine. Ya. M. Khelfetz. *Kali* (U. S. S. R.) 1935, No. 7, 8-15.—A description of the manuf. Mg is prepd from carnallite, with KClO_4 as a by-product. A. Pestoff

The preparation of cryolite from a solution of sodium fluoride and aluminum fluoride. V. S. Yatlov and L. M. Korzon. *J. Chem. Ind. (Moscow)* 12, 1030-4 (1935).— Na_2SiF_6 is treated with a slight excess of 15-20% Na_2CO_3 soln. at 90-100°. The SiO_2 ppts. and settles rapidly. It is well washed. The filtrate contains 96-8% of the NaF AlF_3 prepd. from $\text{Al}(\text{OH})_3$ and HF , must be crystd rapidly at low temp., since large crystals react slowly. The AlF_3 suspension is treated at not too high a temp. with NaF soln., and the pptd. cryolite is washed with H_2O at 95° to remove adsorbed sulfate ions. H. M. L.

The cooling of syrilite solutions in vacuo. Ya. E. Vil'yanski and V. Zelyanski. *Kali* (U. S. S. R.) 1935, No. 7, 16-22.—A description of different app. and their operations. A. Pestoff

Salt plant design and construction. Clinton S. Robinson. *Can. Chem. Met.* 19, No. 12, 324-5 (1935).—A brief description of the plant of the Goderich Salt Co. at Goderich, Ont., for the production of very pure, kindred salt by a continuous process. A filter seps the excess brine from the salt slurry, as the slurry is delivered from the evap. pans. The drum employed acts as a continuous filter and drier. The slurry of brine and salt of a predet. d. is received through an ingenious top-feed mechanism. The filter drum is fully encased in a housing having ducts connected to a series of heating units. A const. pressure is maintained on the filter housing by means of a blower. The machine is constructed of cast "Ni-resist" with housing and screen of monel metal. Noncorrosive metals are used throughout. W. H. B.

The production of lampblack from anthracene and naphthalene. P. Zmit. *J. Rubber Ind. (U. S. S. R.)* 12, 851-3 (1935).—A discussion. A. Pestoff

Surface activity of silica gel treated with calcium hydrazide. Aldo Maffei and Arnaldo Battaglia. *Ann. chim. applicata* 25, 309-18 (1935).— SiO_2 gel which has been heated and then cooled, whether slowly or rapidly, adsorbs $\text{Ca}(\text{OH})_2$ from its soln. less readily than does fresh SiO_2 gel. Gel was satd. with $\text{Ca}(\text{OH})_2$ by passing a satd.

$\text{Ca}(\text{OH})_2$ soln. through the gel. $\text{Ca}(\text{OH})_2$ adsorbed was detd. by treating the product with HCl to remove the SiO_2 . Extn. of the mixt. with HCl does not remove all the $\text{Ca}(\text{OH})_2$. The activity and adsorptive powers of SiO_2 gel are increased by treatment with $\text{Ca}(\text{OH})_2$ soln.

A. W. Conteri
The use of siderite as a source for catalysts for the synthesis of ammonia. Ya. A. Fed'man, K. N. Ivanov and A. I. Naumova. *J. Chem. Ind. (Moscow)* 12, 1036-8 (1935).—When Bakal siderite is fused without removing any impurities, most of the Fe_2O_3 becomes Fe_3O_4 , and a good catalyst for NH_3 synthesis is obtained. Addn. of Al_2O_3 or K_2O does not improve it. H. M. Leicester

Conversion of H_2S from coal gas into concd. H_2SO_4 (Hoelzer) 21

Hydrochloric acid. Hermann Fischer. *Ger.* 621,056, Nov. 1, 1935 (Cl. 12: 5). For manuf., storing or cooling concd. HCl , use is made of app. made of or lined with Sb or Bi or their alloys, and the HCl , before it comes into contact with such app., is treated with a reducing agent, particularly H_2S . Corrosion is thus avoided.

Apparatus for phosphoric acid manufacture. Harry A. Curtis (to Tennessee Valley Authority). U. S. 2,026,519, Jan. 7. Various structural and operative details are described of an app. for combined oxidation and hydration of elemental P.

Recovering sulfuric acid from acid tar, etc. Ludwig Harbort and Fritz Keil. *Ger.* 621,123, Nov. 1, 1935 (Cl. 12: 25). Acid tar or like waste acid, e. g., spent H_2SO_4 from the refining of benzene, is halogenated without diln., if necessary at a raised pressure and slightly raised temp. The resinous impurities sep. out, and the clear acid layer is withdrawn and blown with air or other gas to remove halogen and hydrogen halide.

Recovery of sulfuric acid and resins from acid tar produced in purifying benzene hydrocarbons with sulfuric acid. Geo. W. J. Bradley. U. S. 2,026,450, Dec. 31. The acid tar is passed in a thin stream into a body of boiling water equal to 0.5-1.0 the volume of the tar while the water is maintained in a state of ebullition by blowing steam through it, thus producing sepn. into a dil. acid and a resinous layer, and solidification of resin is effected by steaming. App. is described.

Alkali perborates. N. V. Industriele Maatschappij Voorheen Noury & van der Lande. *Brit.* 434,991, Sept. 12, 1935. This corresponds to *Fr.* 776,485 (C. 29, 3472).

Noncaking alkali metal metaphosphate. Geo. W. Smith (to Hall Laboratories, Inc.). U. S. 2,024,543 Dec. 17. A water softener or detergent which sequesters Ca and Mg in a but slightly ionized condition comprises an alkali metal metaphosphate mixed with about 3-20% of an intumescent alkali metal borate, such as borax.

Alkali sulphydrates. I. G. Farbenund A.-G. *Fr.* 786,441, Sept. 3, 1935. Stable, strongly concd., and dry preps. of alkali sulphydrates are obtained by evap. solns. thereof contg. a small amt. of alkali sulfide. Thus, a soln. contg. NaSH 55, Na_2S 3 and $\text{Na}_2\text{S}_2\text{O}_3$ 2.5% can be evapd. to dryness under vacuum without decompn.

Solid alkali silicate mixture suitable for dissolving in water. Franz Albertshäuser (to Philadelphia Quartz Co.). U. S. 2,026,451, Dec. 31. A solid pourable mixt. comprises a cryst. sol alkali silicate such as that of Na and an amorphous alkali silicate in which the ratio of silica to alkali is greater than in the cryst. silicate and which is interspersed with and protected from the atm. by the cryst. silicate.

Thiotetraphosphates. Augustus H. Fiske and Charles S. Bryan (to Rumford Chemical Works). U. S. 2,025,503, Dec. 24. A product having water softening and detergent properties is obtained, e. g., by heating NaPO_3 4 with Na_2S 1 mol. proportion (suitably at about 150°). *Cf.* C. A. 30, 578.

Apparatus for ammonium chloride manufacture. Elam C. Curtis (to Mathieson Alkali Works). U. S. 2,024,680,

Dec 17 App is described with a saturator comprising a closed chamber, a vessel within and opening at its upper end into said chamber, a connection for supplying a liquid reaction medium such as NH_4Cl soln. to the vessel and a connection for discharging the liquid reaction medium from the lower end of the chamber, sep means for introducing 2 gaseous reactants such as NH_3 and HCl into the vessel and for vaporizing liquid NH_3 in heat exchange with the contents of the vessel, and a vent from the upper end of the chamber

Ammonium nitrate Bamag-Megum A-G Fr 786,080, Aug 26, 1935 NH_4NO_3 poor in water and solidifying wholly on cooling is obtained from dil HNO_3 and gaseous NH_3 , by using the heat of neutralization and soln to conc the soln of NH_4NO_3 formed. A soln of HNO_3 of medium concn and NH_3 are introduced into the lower part of a reservoir filled with a molten mass of NH_4NO_3 already formed and b at atm pressure or lower. The untransformed vapors are submitted to a washing by hot molten masses already formed, if desired under reduced pressure App is described

Ammonium sulfate Frederic M Pyzel and Jan D Ruys (to Shell Development Co) U S 2,026,280, Dec 31 Acid sludge, such as that from refining hydrocarbons with H_2SO_4 , is mixed with $(\text{NH}_4)_2\text{SO}_4$ soln and the mixt is neutralized with NH_4OH soln in a reaction system. Liquid products of the reaction are passed into a separator maintained in a quiescent condition, so that oily products of reaction sep from the aq products of reaction, and the aq products of reaction are passed through a tube bundle, whereby further amounts of oily products sep from the aq products. An arrangement of app is described

Ammonium sulfate I G Farbenindustrie A-G. Brit 435,007, Sept 12, 1935 See Fr 781,750 (C. A. 29, 6374)

Ammonium sulfate I G Farbenind A-G Fr. 786,321, Aug 31, 1935 Large crystals are obtained by crystallizing from a neutral or alk. soln contg a small amt. of salts of alkali or alk. earth metals, Mg, Cr, Mn or Zn, or org sulfonic acids. Examples are given of the use of sulfates of Mg, Mn, Zn and Cr and sulfamic acid

Antimony trioxide Thomas Midgley, Jr., Albert L Henne and Robert R McNary (to General Motors Corp) U S 2,024,008, Dec 10 SbCl₃ is treated with HF (suitably in a steam-heated Pb receptacle)

Calcium sulfite Montan- und Industrialwerke vorm Joh D Starek Ger 620,327, Oct 19, 1935 (Cl. 12: 21) See Austrian 142,563 (C. A. 29, 8255)

Horizontal rotary kiln and associated apparatus suitable for calcining calcium and magnesium carbonates, etc Ruland R Shafter and Richard Bernhard (to Traylor Engineering & Mfg Co) U S 2,026,441, Dec 31 Structural, mech and operative details

Basic lead sulfate Fred E Gregory, John I McClaren and Paul R Hamilton (to Eagle-Picher Lead Co) U S 2,026,033, Dec 31 Fumes from an ore hearth are introduced into a setting system, burned Pb sulfide particles are removed from the setting system, ground and introduced into a flash furnace, and the fumes escaping from the flash furnace are passed into the setting system and mixed with the fumes from the ore hearth. App is described

Magnesium sulfate Metallgesellschaft A-G Fr. 787,558, Sept 25, 1935 Solid monohydrated MgSO_4 , and similar salts are obtained in a form having a reduced content of water of crystn, particularly sulfates the soly of which in water increases first as the temp. increases, but afterward decreases, and which have less water of crystn at raised temp. The concd solns are heated by successive stages to a temp which is situated on the descending branch of the soly. curve, but at which no extn of solid salt takes place, and these solns are afterward cooled by auto-evapn, preferably by successive stages to temps which are situated on the rising branch of the soly. curve, but which are still within the limit of the formation of salt with the desired content of water of crystn. The solns circulate in closed circuit through

heaters and evaporators, the salt extd being sepd. between the evaporators and the heaters

Manganese phosphate I G Farbenind A-G (Alois Maier, inventor). Ger 618,787, Sept. 14, 1935 (Cl. 12: 31) See Fr 771,978 (C. A. 29, 7027)

Potassium nitrate Oskar F. Kaselitz U S 2,024,370, Dec 17 A soln. satd at an elevated temp with respect to KNO_3 , and substantially also with respect to K_2SO_4 and K-Mg sulfate is cooled to ppt. KNO_3 , which is sepd, K_2SO_4 and $\text{Mg}(\text{NO}_3)_2$ are incorporated with the mother liquor, this mixt. is heated to evap part of the water from it and is cooled to a limited extent, so that K-Mg sulfate seps and the resulting liquor is reused in cycle with regulation of the percentage of water in the liquor to give it a quantity and concn such as those of the starting soln

Potassium sulfate Imperial Chemical Industries Ltd. Fr. 787,713, Sept. 27, 1935 K_2SO_4 and (or) a double salt $\text{K}_2\text{SO}_4 \cdot \text{CaSO}_4 \cdot \text{H}_2\text{O}$ are made by causing KCl to react with CaSO_4 in aq medium contg. NH_3 and using an excess of KCl. K_2SO_4 is obtained when the concn of KCl and (or) NH_3 is relatively high and the double salt when the concns are relatively low. A limited amt. of NaCl as impurity in the KCl is not harmful. The CaSO_4 may be added in steps, with or without sepn of the solid reaction product after each step

Sodium carbonate decahydrate Geo L Cunningham (to Matheson Alkali Works) U S 2,024,679, Dec 17. NaHCO_3 or Na_2CO_3 is subjected to the action of an eq ammoniacal soln of NaCl at a temp. below about 15° to ppt. $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ while the ratio of CO_2 to free base in the soln is maintained at not exceeding about 0.5. An arrangement of app is described Cl. C. A. 29, 304

Sodium sulfate from calcium sulfate Markus Larsson U S 2,025,756, Dec 31. CaSO_4 is treated with a soln. of Na_2CO_3 in the presence of Na_2SO_4 of about 30% concn and in which an excess of 1-4% Na_2CO_3 is maintained during the reaction, after sepn of the Na_2SO_4 and its crystn, the mother liquor contg. Na_2CO_3 is returned to the initial reaction. An arrangement of app. and various operative details are described.

Zinc oxide American Zinc, Lead & Smelting Co. Brit 435,003, Sept 12, 1935 ZnO of acicular form is obtained by vaporizing Zn in a reducing atm. at approx. 1200° and passing the vapors into an oxidizing zone where the air supply is regulated to promote the growth of the oxide particles, e. g., by slowly mixing the vapors with air to burn them with a lazy flame while maintaining a temp. of substantially 1100° . App is described, in which the Zn is obtained by reduction of Zn ore

Nitric oxide and hydrogen chloride from nitrosyl chloride Oskar F Kaselitz U. S. 2,025,391, Dec. 24 A mixt. of NOCl and H_2 is heated to $150-500^\circ$ (suitably $150-500^\circ$ in the presence of activated C or exposed to light rays).

Sulfur dioxide Metallgesellschaft A-G Brit. 435,116, Sept 16, 1935 See Ger. 606,447 (C. A. 29, 1594)

Fluorine compounds I G Farbenind. A-G Fr 786,123, Aug 27, 1935 F_2 is introduced into org compds using a substantially pure F_2 and carrying out the reaction in a chamber subdivided into small compartments by means of a substantially inert solid filling material, e. g., CaF_2 . Examples are given and app is described

Recovery of lithium values from amblygonite, etc. John H Coleman and Ned E Jaffa (to Warner Chemical Co.) U. S. 2,024,026, Dec. 10. A mineral such as amblygonite or a similar Al phosphate mineral contg. lithia and siliceous gang is digested in a NaOH soln. so as to dissolve Al phosphate and to concentrate the lithia in insol. form in a solid residue, and the residue is subjected to an acid treatment, as with 35% H_2SO_4 , to ext the lithia and leave a final residue of silica and silicates.

Stable water-soluble colloidal molybdenum Perry Vessie U. S. 2,025,403, Dec. 24 An aq suspension of Mo oxides contg. a protective colloid such as gum arabic is treated with sodium formaldehydesulfonate and the product is sepd in a solid state from the resulting soln (suitably by treating with MeOH and ether, cooling and filtering).

Smelting salt. R. Englert & F. Becker Ger 618,788, Sept 14, 1935 (Cl.121 3). Smelting salt, free from gypsum, is prep'd by fusing crude rock salt, adding alkali equiv. to the gypsum to convert this to Na_2SO_4 , and an insol. Ca salt which can be sep'd by settling. The alkali may be alkali phosphate, borate or hydroxide. Examples are given.

Table salt. Chem Werke vorm H & E Althert (Hans Mengele, inventor) Ger 621,230, Nov 4, 1935 (Cl. 53k 1 01). In the manuf. of a table-salt mixt containing cations and anions in about the same proportions as the blood, the sparingly sol salts required for the mixt are formed in the presence of the necessary alkali chlorides under such conditions that they are ppt'd in a finely subdivided state on the chlorides. A product completely sol in water is then obtained. An example is given of the prep'n of a mixt contg K 31.5, Na 320, Ca 12.8, Mg 2.96, Fe 1.7, Cu 0.02, Cl 520.9, P_2O_5 36.6, SO₄ 16.7 and lactic acid 8.3 parts.

Storage of soluble salts such as soda ash. Wm R. McCann (to Atmospheric Nitrogen Corp.) U S 2,024,530, Dec 17. For the storage of a sol salt such as Na_2CO_3 which with water forms a mass of smaller apparent vol. than the solid salt prior to mixing with water, the solid salt is mixed with water in sufficient amt. to form a soln of the salt filling the interstices between the particles of an integral mass of undissolved salt comprising the major proportion of the salt and to give a mass of solid and soln having a smaller apparent volume than the solid salt prior to adding the water, and large quantities of the resulting mixt. are stored in a container in which the integral mass is formed. App is described.

Decomposing beryllium minerals. Deutsche Gold- und Silber-scheideanstalt vorm Roessler Brit 435,092, Sept. 13, 1935. Beryl, etc., is decompd by heating with caustic alkalis in the initial presence of, e. g., 5-25% of H_2O to not exceeding 500°, e. g., 400°. About 16 mols of NaOH per mol of beryl may be used and the alkali may be replaced by substances yielding it under the conditions of operation, e. g., trialkali phosphate. In a modification, the decompn may be conducted in an autoclave, prefer-

ably with stirring, at 150-200°. After extrn. of the product with H_2O or aq. alkali, the residue may be worked up by treatment with conc'd H_2SO_4 . SiO_2 may be removed by evapn., the Al in the filtrate may be ppt'd as alum, and Be may be ppt'd as hydroxide by NH_3 . Alternatively, the Al, Fe and Be may all be ppt'd. as hydroxides and the Be recovered from the ppt. by treatment with $(\text{NH}_4)_2\text{CO}_3$.

Carbon from carbon monoxide. Theodor W. Pfirrmann and Georg Gros Ger 621,599, Nov 9, 1935 (Cl. 22f.14). Addn to 565,053 (C A 27, 1110). The method of Ger. 565,053 is modified by adding a pulverulent catalyst to the CO. When the catalyst is a comp'd of a carbonyl-forming metal, e. g., $\text{Co}(\text{CN})_3$, it may be removed from the product by treating the latter with CO at a temp. and pressure suitable for the production of the carbonyl.

Powdered carbon. Georges Boname Fr 786,380, Sept 2, 1935. In making powd. C by catalytic decompn of a gas rich in CO, a part of the reaction gas is directed as a jet on to the catalyst so as to form a cloud of the catalyst which assures continuity of the reaction. More than one jet may be used at different levels of the reaction chamber and the catalyst may be allowed to fall as grams through the rising current of gas.

Activated carbon. Frank H. Cone and Clive B. Houlder (to Activities Ltd.) U S 2,026,355, Dec 31, Fr 787,769, Sept 28, 1935. Finely divided carbonaceous material such as powd. coal is injected into a zone of incandescent gas in which the material is instantaneously raised to a temp. of about 1400° to decompose the material into carbon and hydrocarbons in a fraction of a sec. and before oxidation of the carbonaceous material can take place. App is described.

Active carbon from peat. Victor Weerts U S 2,025,367, Dec 24. See Fr 776,328 (C A 29, 3474).

Catalysts. Paul Lafitte and Pierre Grandadam. Fr 787,837, Sept. 30, 1935. PtO and PtO_2 (Fr. 785,082, C A 30, 5811) are used as they are or after reduction instead of the usual Pt black as catalysts in the prep'n of NH_3 from N and H and in the hydrogenation of C, CH_4 , oxides of C, water gas and camphor, and in the oxidation of SO_2 to SO_3 and NH_3 to oxides of N.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KLAR

The glass, ceramics and cement industries in Poland in 1934. Constantin de Kownacki. *Chimie & Industrie* 34, 1217-20(1935). A. Papineau-Couture.

Determination of the rate of formation of glass. A. P. Zak. *Mon. Phys. Phys.-Chem. Glass* (Moscow) 30 (1933), *Sprechsaal* 68, 730-7(1935).—The time necessary to complete the formation of glass when melting pure $\text{Na}_2\text{O} + 2\text{SiO}_2$ at various temps was 1300°, 34 min.; 1250°, 42 min.; 1200°, 54 min.; 1150°, 113 min.; 1100°, 248 min.; 1050°, 490 min.; 1000°, 1088 min. Pure raw materials powdered to a grain size of the 100 to 576 screen sieve were used, the charge was 21.7 g. and was melted in a Pt crucible in an elec. furnace. The rate of formation-temp. curve is approx. hyperbolic for Na silicate.

M. V. Kondoidy. The effect of rocks on the process of glass melting and on some physico-chemical properties of glasses. A. P. Zak. *Mon. Phys. Phys.-Chem. Glass* (Moscow) 37 (1933); *Sprechsaal* 68, 737.—Three kinds of glass of the following compn. were studied:

1	SiO_2 69%	R_2O_3 5.0%	RO 11%	R_2O 15%
2	SiO_2 64%	R_2O_3 10.0%	RO 11%	R_2O 15%
3	SiO_2 59%	R_2O_3 15.0%	RO 11%	R_2O 15%

These glasses were melted from pure raw materials and also from rocks. Twenty, 40 and 60% nephelite or volcanic ash were added. The rate of the formation of glass was det'd. at 1300° for all glasses. The time necessary for the completion of the formation of glass was less than half the time required for mfg. glass from pure raw materials. Volcanic ash accelerated the formation of glass also, al-

though not to such an extent as nephelite. Batches were simultaneously heated to 1400° to det. the time necessary to obtain melts free from bubbles, this temp. was kept for 2 hrs. after which the melts were cooled at the same rate and the no. of bubbles was determined by projection on a screen. The refining time was prolonged by rocks: glass contg. 20% nephelite contained 2853 bubbles, the same glass without nephelite contained only 1073. The tendency of the glass to devitrify is not changed when rocks are introduced. Light absorption is lowered much more by nephelite than by volcanic ash. M. V. Kondoidy.

The ultraviolet test as an aid in the glass industry. Julius Grant. *Glass* 12, 520-2(1935).—Bibliography.

Herbert S. Willson. Setting and antissettling properties of clays. F. H. Clews. *Foundry Trade J.* 53, 422-4(1935). D. S.

Some characteristics of fire clay with special reference to manufacturing difficulties. C. A. G. Thomas and J. R. Adderley. *Brit. Clayworker* 44, 275-76(1935). See C. A. 29, 76001. E. C. Petrie.

Discoloration of wall tile by plant organisms. K. Lameke and R. Kühn. *Keram. Rundschau* 43, 567 (1935).—The green coloration observed in cracks in the glaze of dairy wall tile was due to algae. A moist atm. favored their growth. Minerals in the tile served as nutrient material. P. S. Roller.

Dry working of ceramic mixes. A. Primakovskii. *Novosti Tekhniki* No. 15, 15-16(1934). *Referatkovii Silikatliteratur* No. 593(1934). M. V. Kondoidy.

Germany's pottery industry during 1934. R. Land Welch. *Ceram. Age* 26, 242-3, 246(1935). H. S. W.

A study of some auxiliary fluxes in combination with different feldspars in an earthenware body Ralston Russell, Jr., and Arthur S. Watts *Ceram. Age* 26, 219-21 (1935) Herbert S. Wilson

Fluorescence VII The relation of soluble salt content to fluorescence B. Butterworth *Brit. Clayworker* 44, 271-5 (1935), cf. C. A. 27, 5166—The term fluorescence includes damage to plaster by crystals as well as damage to brick. CaSO_4 is sparingly sol and will not cause defects in brick. The Mg content should not be over 0.65% or serious damage will result. E. C. Petrie

Fluidity, lubrication and thixotropy of bentonite suspension Osamu Kumura *J. Chem. Soc. Japan* 56, 1349-52 (1935)—The yield value of Korea bentonite suspension (1.25%) is max. when its NaCl content is 100-200 millimol. The suspension then shows a mm. static coeff. of friction T. Katsurai

Determination of mullite in ceramic refractories V. B. Kraft and T. A. Gurvich *Zerodskaya Lab.* 4, 844-90 (1935)—Satisfactory results were obtained in the detn. of mullite in clay refractories by the method of Raacke and Schade (*C. A.* 25, 5742) Chas. Blanc

Performance of refractories used in basic alloy steel production Gilbert Soler *Brick and Clay Record* 87, 2-6, 298 (1935)—Nonmetallic inclusions in finished steel are traced to unsatisfactory refractories. The interlocking crystal structure of silica brick makes them ideal for roofs and sidewalls of open-hearth furnaces. Although acid chemically, silica brick resists basic slag because of the formation of immiscible liquids with ferrous, Ca, Mn and Mg oxides. Also in *Bull. Am. Ceram. Soc.* 14, 283-8 (1935) E. C. Petrie

Grinding G. Ullmann *Fermentations & Präzision* 43, 193-6 (1935)—A brief historical sketch is given of the development of the art of grinding M. Hartenbaum

Radiant-tube heating offers many advantages to enamellers E. F. Gehrig *Industrial Gas* 14, No. 6, 18-20, *Ceram. Age* 26, 223-4, 247 (1935)—The combination of gas within radiant tubes within the oven permits better control of temp. and atm. than with muffles. Max temp. inside the tube wall does not exceed 1850°F. Also in *Nature* 146, No. 3712, 20-1 (1935) R. W. Ryan

Photometric app. for measuring the hiding power of opal glasses (Brit. pat. 434,126) 26 Rollers for displacing articles at high temps., particularly glass plates or sheets (Brit. pat. 434,315) 1 Concrete [producing bricks or tiles] (U. S. pat. 2,020,257) 20

Glass, etc. Sendlinger Opusche Glaswerk G. m. b. H. (Georg Jaekel, inventor) *Ger.* 618,931, Sept. 13, 1935 (cl. 45 15 04)—To produce satisfactory illumination of living and work rooms by combined day- and artificial light when the former is of insufficient intensity, the daylight is passed through a yellowish brown filter to alter its spectral compn. to cause complementary blending with the artificial light. The filter consists of glass of the compn. SiO_2 71.5, Na_2O 15.0, CaO 11.0, Fe 1.0 and Fe_2O_3 0.2%. Filters of cellulose, dextrin, or solid org. condensation products tinted with suitable dyes may be used.

Fusion of raw materials to make glass Walter O. Ambley (to Hartford-Empire Co.) U. S. res. 19,788, Dec. 17, A res. 19,593,510 (C. A. 27, 1720)

Furnace for fusing glass, etc. Paul Rachelet. *Fr.* 786,123, Aug. 27, 1935

Electric furnace for fusing glass Osa participations industrielles Soc. anon. *Fr.* 786,166, Aug. 28, 1935

Glass furnace with a continuous closed circuit for liquid glass to be delivered to a casting machine Etienne Fechner. U. S. 2,025,581, Dec. 24 Various structural, mech., and operative details

Supplying molten glass to forming machines Thomas S. Embouse (to Hazel-Atlas Glass Co.). U. S. 2,026,267, Dec. 31 Various details of app. and operation

Apparatus for feeding molten glass and forming hollow glassware such as bottles Fritz Eckert (to Hartford

Empire Co.). U. S. 2,026,225, Dec. 31 Various structural, mech., and operative details.

Device for feeding charges of glass to the molds of a forming machine The United Glass Bottle Manufacturers Ltd. and Thomas Courtney Mosehead. *Brit.* 434,639, Sept. 5, 1935

Plungers for glass molds for producing lenses Richard W. Luce (to Eastman Kodak Co.). U. S. 2,024,653, Dec. 17. Various mfg. and structural details.

Glass-shaping machines of the kind in which a number of mold units rotate about one or more stationary columns, the various movements of the molds being effected by cams that are fixed to the columns Europäischer Verband der Flaschenfabriken G. m. b. H. *Brit.* 433,829, Aug. 21, 1935

Sheet glass Luke C. Mambourg (to Libbey-Owens-Ford Glass Co.). U. S. 2,026,186, Dec. 31. An app. and operation are described in which a pair of revolving rolls exert a pressure on the glass only sufficient to form a sheet of the desired thickness

Apparatus for making sheets of glass Pilkington Bros. Ltd. *Fr.* 787,423, Sept. 23, 1935

Heat-treating sheets of glass American Security Co. *Fr.* 786,370, Sept. 2, 1935 Supporting means for the sheets is described

Case-hardening glass sheets David H. Goodwille (to Libbey-Owens-Ford Glass Co.). U. S. 2,026,163, Dec. 31 After the sheets are passed through a furnace to heat them to approx. their softening point, they are passed into an envelope which is cooled from both sides so that the opposite surfaces can be chilled. App. is described

Glass-rolling apparatus for forming glass sheets Alfred L. Harrington (to Pittsburgh Plate Glass Co.) U. S. 2,025,102, Dec. 24 Rolls are driven by a motor the speed of which is regulated, by a thermostatic control device, in accord with temp. changes in the glass.

Apparatus for making glass plates Compagnie réunies des glaces et verres speciaux du nord de la France *Ger.* 618,701, Sept. 16, 1935 (Cl. 23a. 18)

Apparatus for holding glass plates during case-hardening Lloyd V. Black (to Pittsburgh Plate Glass Co.) U. S. 2,025,686, Dec. 24 Structural details

Apparatus for tempering glass plates Soc. Assurex *Fr.* 787,132, Sept. 17, 1935

Tempering glass Assurex le "Roi des Verres de Sécurité" Magnien, Monnier & Coe. *Brit.* 433,748, Aug. 29, 1935 Glass plates are hardened by means of air currents produced by the combined effect of air jets of small dimensions arranged along the sides of adjacent regular polygons and large air-suction openings arranged at the centers of the polygons

Tempering glass Soc. anon. des manufactures des glaces et produits chimiques de St-Gobain, Channy & Cuy. *Brit.* 424,231, Aug. 29, 1935 In app. for tempering sheet glass, the sheet remains stationary while being heated and cooled and the heating and cooling devices are so arranged that the cooling period follows the heating period without any time interval.

Blow-glass containers Gilbert Schaffer and Guy F. Jardine (to Hazel-Atlas Glass Co.) U. S. 2,024,748, Dec. 17. Various details of app. and operation.

Marking glass Theodore B. Drescher (to Bausch & Lomb Optical Co.) U. S. 2,024,277, Dec. 17. A compn. for marking glass surfaces is formed from HF , AmOAc , SeCl_4 and petrolatum.

Gazing glassware Cortland W. Davis (to Mantle Lamp Co. of America). U. S. 2,024,818, Dec. 17. An article to be glazed such as a glass chimney is subjected to a hot medium such as combustion gases at a temp. just short of that at which the article softens and sags, until the temp. of the article is substantially equal to that of the heating medium, and the part of the article to be glazed is then heated to the fusion point. App. is described.

Glass-polishing tool Theodore E. Oborg (to Gall & Lenthke, Inc.) U. S. 2,024,293, Dec. 17. A polishing tool carries a layer of carnauba wax shaped to the same form as the tool, for polishing lenses, etc.

Glass objects Compagnie internationale pour la fab.

uration mécanique du verre (Procédé Libbey-Owens) Soc. anon. Fr. 787,833, Sept. 30, 1935. Parts of the app and articles which come in contact with the molten glass are made in fused quartz instead of chamotte.

Mirrors Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauxy & Cirey Fr. 786,226, Aug. 29, 1935. Glass used for mirrors contains NiO oxide, whereby a warmer color is given to objects reflected in it.

Internal frosting of electric lamp bulbs Gustav Herzberg and Wm. Ambrun (to General Importing Co.) U. S. 2,025,598, Dec. 24. The inner surface of the bulb is intermittently brought into contact with a heated frosting mixt. such as one contg. H_2F and acid salts during an interval of the order of 5 sec., and after such contact heat and moisture are applied to the surface during a similar interval intermittently, followed by treatment with cold water for about the same time.

Colored coating compositions Colloidal Colours, Ltd. Fr. 787,787, Sept. 28, 1935. See Brit. 421,919 (C. A. 29, 5248).

Manufacture of glass corner tiles Gustave P. Mattman (to Cincinnati Advertising Products Co.) U. S. 2,021,775, Dec. 17. App. and various mfg. details are described.

X-ray absorption glass Frederick Gelsharp (to Pittsburgh Plate Glass Co.) U. S. 2,025,999, Dec. 24. Glass is formed from a batch substantially free from alkali and contg. approx. 30-65% of Pb oxide and 4-15% of BaO .

Luminescent glass Jules A. Mauler, Paul de Cagny and Jean Purson Fr. 786,147, Aug. 27, 1935. The luminescent material is formed in the nascent state during the formation of the glass itself. Thus carbonates or other fluxes which enter into the constitution of the glass are used for the formation of the material which then remains in the cryst. state in the glass. The luminescent glass may be combined with a special Pb glass which arrests cathodic radiations or x-rays.

Insulation comprising spaced glass sheets Lloyd V. Black (to Pittsburgh Plate Glass Co.) U. S. 2,025,710, Dec. 31. Between the edges of glass sheets there is placed a spacer of material such as cork or cardboard the pores of which are impregnated with a permanently plastic cement such as a pitch, shellac or pyroxylin compn. which serves to secure the spacer to the glass.

Laminated glass Archibald Renfrew (to Imperial Chemical Industries Ltd.) U. S. 2,024,389, Dec. 17. Sheets of glass are united with an intervening layer of a polymerization product, such as one from methyl acrylate or vinyl acetate, formed into a sheet in a partially polymerized and syrupy condition, freed from unpolymerized material by evapn. at a temp. below the b. p. of the latter and then interposed between the sheets of glass.

Apparatus for making curved sheets of laminated glass Wm. O. Lyle (to Duplate Corp.) U. S. 2,025,115, Dec. 21. Mech. and operative details.

Apparatus for working clay such as that for making large tile, etc. D. Earl Child and James L. Child (to Hancock Brick & Tile Co.) U. S. 2,024,025, Dec. 10. Various details are described of an extruder, a pug mill, a subatm. pressure transfer between them, and associated features of app.

Bricks, tiles, etc. Max Perikiewicz Ger. 621,411, Nov. 7, 1935 (Cl. 806, 12 11). Addn. to 545,237 (C. A. 26, 2685). Molded clay, before it is dried and fired, is treated with a suspension contg. a natural or synthetic resin and a clay or a mixt. of clays, with or without a protective colloid, a flux or a glaze. In this way the color of the final products is not only levelled, as described in Ger. 545,237, but can also be modified as desired by suitable selection of the clay, etc., added to the resin suspension.

Ceramic composition suitable for floor tiles Andrew Malinovsky (to Malinite Corp.) U. S. 2,025,702, Dec. 21. Al_2O_3 0.1-3, MgO 0.1-8, Na_2O 1, and SiO_2 4-14 parts, on a dehydrated molecular basis, form a compn. of good strength and hardness. Oxides of Co, Cr, Cu, Fe, Mn or Pb may be used for coloring.

Ceramic flux for whiteware, wall tile, etc. Joseph H.

1 Weiss (to Feldspathic Research Corp.) U. S. 2,024,407, Dec. 17. Partially kaolinized pegmatite is combined with feldspar, lime and flint in such proportions as to produce a flux having the characteristics of English Cornwall stone and contg. SiO_2 70-74, Al_2O_3 15-17, potash 2.5-4.5, soda 2.5-4.5, lime 1-6 and Fe_2O_3 less than 0.1%.

Ceramic materials Norton Co. Fr. 786,241, Aug. 31, 1935. Granules of refractory material, e. g., Al_2O_3 , SiC , MgO or quartz, and a ceramic binder, e. g., a mixt. of clays, are mixed with water to form a fluid mass which is then beaten up in the presence of air to form bubbles of air therein. The bubbles are stabilized by an aq. ext. of sawdust, sulfonated castor oil, saponin, licorice or bark of saponaria tree. The mass is then dried and baked.

Dielectric ceramic material Porzellanfabrik Kahla. Fr. 787,337, Sept. 21, 1935. Substances such as TiO_2 in different forms (amorphous TiO_2 , titanic acid, brookite, anatase or alk. earth titanate) are added to ceramic compns. in amt. sufficient to give a dielec. constant independent of the temp.

Ceramic ware Wesley B. Flower U. S. 2,026,624, Jan. 7. A supply mixt. of ceramic material contg. excess liquid is agitated and is fed into the cavity of a substantially closed, rotating, liquid permeable mold, which may be formed of plaster of Paris or porous fired clay, and liquid is withdrawn into the liquid-permeable material of the mold. App. is described suitable for the manuf. of saucers, etc.

Blue-coated ceramic articles Frederick J. Iarncomb (to Corning Glass Works) U. S. 2,026,099, Dec. 31. A ceramic article to be blue-coated is exposed to the fumes of a halide of a metal of the W sub-group of the sixth group of the periodic system having an at. wt. between 95 and 185, such as W chloride, to produce on the article a coating of the trioxide of the metal, and is then subjected to reducing conditions (suitably with sulfimating gas) to reduce the trioxide to pentoxide. App. is described.

Silica articles Allgemeine Elektricitäts-Ges. Ger. 621,187, Nov. 2, 1935 (Cl. 32a 37) See Brit. 374,761 (C. A. 27, 3209).

Molded articles containing calcium hydrosilicate Karl I. A. Fikund. Ger. 621,340, Nov. 5, 1935 (Cl. 806, 10 01). In the manuf. of tiles, etc., by molding and hardening mixts. contg. lime and sand, the lime is first mixed with sufficient water to slake it and then treated with steam at a higher pressure than the steam employed in the hardening process. The slaking of a part of the lime during the hardening process is thus prevented, and products of improved mech. properties are obtained. (C. A. 30, 6357).

Molded articles containing calcium hydrosilicate Karl I. A. Fikund. Ger. 621,341, Nov. 5, 1935 (Cl. 806, 10 01). In the manuf. of pipes, plates, etc., by molding and hardening mixts. contg. CaO and a silicious material, an excess of water is used in prep. the mixt., which is then molded by a centrifugal or vibrational process under such conditions that a part of the water is sepi. Products of more uniform properties are thus obtained. Various details are given.

Flame furnaces for ceramic products Soc. des isolants et réfractaires (Fidélité C. Le Coultre, inventor). Fr. 787,819, Sept. 26, 1935.

Refractory bricks C. Otto & Co. C. m. b. H. Ger. 621,283, Nov. 4, 1935 (Cl. 806, 12 04) See Brit. 427,781 (C. A. 29, 6784).

Magnesia refractories Frederic A. Harvey and Raymond F. Burch (to Harbison-Walker Refractories Co.) U. S. 2,026,568, Dec. 31. A minor proportion of a forsterite material is incorporated with magnesia refractory grains so that the grains are bonded by cryst. forsterite at temps. as high as 1600°.

Abrasive Gilbert E. Seil (to E. J. Lavino & Co.) U. S. 2,026,275, Dec. 31. An abrasive comprises heat-treated and cooled chrome ore material contg. chrome and its accompanying gang, in which the chrome particles are recryst. and the gang material is so distributed over the surface of the recryst. particles of chrome as to avoid any local concn. of gang.

Abrasive wheel Frank H. Manchester (to Wingfoot Corp.) U S 2,024,591, Dec 17. An abrasive wheel is formed of rubber with an outside abrasive material bonded to the rubber by a protein-latex compn such as one formed of casein and latex.

Flexible abrasive articles such as sandpapers, etc. Ralph C. Shuey (to Bakelite Corp.) U S 2,025,249, Dec 24. Abrasive grains are used with a binder comprising multiple layers one of which is of the drying-oil varnish type adherent to the base and another of the heat-hardening phenol-aldehyde type insolubilized by heating and forming a superficial protective coating.

Abrading material suitable for grinding disks or wheels. Theodor Pohl and Josef Schneider U S reissue 19,502, Dec 31. A reissue of 1,996,849 (C A 29, 12244).

Enamel Firmutana Metallkeramik G m b H Ger 619,000, Sept 23, 1935 (Cl 48c 1). Enamelled objects of large area are obtained by enameling sections in a muffle furnace, joining the sections by welding, etc., cleaning the joinings or seams with sand, covering them with enamel powder and firing with a portable heater.

Enameling Walter Becker. Ger 618,613, Sept. 12, 1935 (Cl. 48c. 3). Ornaments, etc., are coated with a colorless or colored enamel flux and heated. The heating is continued after the flux begins to melt and flow, till it begins to crack and form an ornamental pattern. Ag may be treated in this manner.

Enameling Alexander Kneidl Ger 618,612, Sept. 12, 1935 (Cl 48c 1). A process for enameling Fe or steel without using a ground enamel consists in coating the metal with a layer comprising a flux and a spinel forming metal monoxide or sesquioxide, or a metal compd, forming these when heated, heating the layer to glowing in an atm poor in O or with exclusion of air, cooling, applying the enamel and reheating. The flux may be B_2O_3 or fluor spar and the oxide may be FeO or Fe_2O_3 .

Enameling and glazing Franz M. Wirtz and Reimbold & Strick G m b H Brit 434,115, Aug 11, 1935. Metal is coated with enamel, glaze, etc., and then passed through, or inserted and removed from, a chamber in which the burning-in temp is maintained by any suitable device. The process may be used for enameling, etc., thin Cu or Al foil. App is described.

20-CEMENT AND OTHER BUILDING MATERIALS

J C WITT

The classification of mixed cements Rudolf Barta Chem Listy 29, 153 5(1935)—After making a survey of the chem and phys characteristics of cements prep'd throughout the world, B. proposes and presents a table of classifications in which the groups are based upon (1) the clinker base as portland, Roman, aluminaceous, (2) the no. of accessory ingredients, (3) the quality of the mixt., (4) the percentage of the constituents, and (5) the method of prep'n. A sample code gives any position in the table, and since the chem analysis of a cement places the cement in a fixed position in the table, the cement can be designated by the code no. which will convey a picture of the characteristics and position of the cement to anyone acquainted with the table. Frank Marech

The heats of hydration of cements O. Kallauer and B. Burgl Chem Listy 24, 238-43(1935)—The heats of hydration and of soln. were measured in a calorimeter for 12 cements manuf'd in Czechoslovakia. The heat of hydration of an aluminous cement was 83, 89, 94 cal per g at the end of 3, 7 and 24 days, resp., at the same time a special cement for hydraulic application yielded 52, 55 and 57 cal per g, resp., the remaining 10 cements yielded heats of hydration between these limits. During the 48 hrs immediately after the cements are mixed with water, the temp of the mixt. rises to a max and returns to room temp. Each temp-time curve is characteristic for a specific brand of cement. The aluminous cement showed a sudden rise to 105° and a sudden fall in temp. from 5 to 15 hrs after being mixed. The smallest rise of 20° occurred in an ordinary portland cement and lasted about 40 hrs. The course of the temp. drop (after the max has been passed) indicates that in special cements and for cements prep'd in tall ovens the evolution of heat during the hardening of the cement is slow, mild and of long duration. Since the results indicate a direct relation between the heats of hydration and the max. temp. it may be possible under adiabatic conditions to est. the heats of hydration from the temp. max on the temp-time curve. F. Marech

Measurement of the heat developed during the hardening of cement. Stig Gieritz-Hedström Ida 1935, 75-6, cf C A 28, 6267—Addnl heat-development detns for pure and mixed cements are given. E. M. Symmes

Behavior of hydrated and set pozzuolana cements at high temperatures Corrado Vittori and Angelo Cereseo Ann chim applicata 25, 392-7(1935)—Test blocks of portland cement and pozzuolana cements were allowed to set 7 months in water, then dried at 2-300°, and finally heated for 1 hr at temps of 600°, 700°, 800°, 900° and 1000°, the samples being at all times in a CO₂ free atm. Samples were then exposed to air. The portland cements

all show cracks, which increase with the increased temp of heating, whereas the pozzuolana cements are free from cracks. These results confirm those of Nagai (C A 26, 2841). This resistance to cracking of pozzuolanas is due to the presence of $2CaO \cdot Al_2O_3 \cdot 7H_2O$ which loses its water of crystn. without undergoing any change in crystal structure. A. W. Conner

The annular deposit in the cement kiln III T. Yokoi J Soc Chem Ind, Japan 38, Suppl binding 192-6(1935), cf C A 29, 8273—The cause of the annular ring formation was exam'd chemically and physically, and a solution of the problem was attempted by the application of the structural arch theory. Expts showed that a raw meal high in SiO_2 and low in CaO is suited for the prevention of the ring formation, and in order to be able to predict a ring-safe zone, the "residual lime-silica modulus" is suggested. When this modulus

$$\left(\frac{\text{Total } CaO \text{ (mols)}}{SiO_2} - CaO \text{ in } CaO \cdot Al_2O_3 \right)$$

was less than 3.19, no trouble was experienced with ring formation. The methods for the removal of the ring which are being used at present are critically discussed and some improvements are suggested. K. K.

Economic balance of waste-heat boilers attached to cement rotary kilns Shun-ichi Uchida J. Soc Chem Ind, Japan 38, Suppl binding 581-3(1935)—The overall heat-transfer coeff H (kg cal/sq m hr degree) based upon the outside surface of the boiler tubes (water tube boiler) and the gas velocity u (m/sec.) were found to be related by $H = 12.4u^{0.44}$, where the value 0.43 covers the resistance to heat flow due to cement dust and boiler scale, and the value 12.4 partly covers the heat transfer by radiation due to powder coal flame. Equations for the pressure drop through tube banks, and the most economical mean velocity and temp. difference at the hot gas exit, are also given. An illustrative example is appended. Karl Kammermeyer

The preparation of concrete and the problems related thereto V. Bahrner Tek Tid Uppl C, Aems 65, 73-9, 86-8(1935)—The factors to be considered in the prep'n of various types of concrete are outlined. The effects of the ratio of cement to water (water-cement no.), the mixing period, uniformity, hardening temp., after-treatment and age on the mech. properties of concrete are discussed. The general formulation of concrete mixts and the resulting consistencies are shown graphically. Diagrams are also given for appropriate sand-stone mixts. D. Thuesen

The compression test of concrete with small test pieces II. Comparison of the compression of small and common

mold concrete using different aggregates. Yoshiaki Kanada *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 555-7 (1935); cf. *C. A.* 29, 313¹—Exptl results are presented. Conclusions: The strength ratio of 15 × 30 cm. and 5 × 10 cm. concrete samples shows no change with age but is changed by the water-cement ratio. The relation between the compression of these samples is given by $C_p = K_p' \times C_c$, where C_p is the compression of the 15 × 30 cm. sample, C_c that of the 5 × 10 cm. sample and K_p' is a const. detd by the water-cement ratio and the aggregates. III Comparison of the compression of concrete and plastic mortar *Ibid* 557-8—The exptl results are presented and show that the effect of the water-cement ratio on the compressive strength of both concrete and plastic mortar increases with the amt. of cement used in the mixes. The max. strength of concrete exists at a certain water-cement ratio, but that of plastic mortar moves toward a slightly higher ratio as the age increases.

Karl Kammermeyer
Physicochemical aspects of asphalt pavements. Energy relations at interface between asphalt and mineral aggregate and their measurements Charles Mack *Ind. Eng. Chem.* 27, 1500-5 (1935)—Surfaces and their energies play an important part in a system asphalt-mineral aggregate. It is shown that hydrophilic solids have energy relations at their interfaces with pure liquids of the same order as at the interface between water and the same liquids. It is also shown that, with few exceptions, the vol. of a powder settled in a liquid is proportional to the interfacial tension of the liquid against water. By applying these facts to a study of 6 asphalts and 3 aggregates, it is found that the interfacial tensions between asphalts and solids vary with the type of asphalt and with the type of aggregate. This knowledge can be used to predict the behavior of asphalt pavements under the action of water.

Marion E. Headington
The drying of solids. XV The drying of wood. S. Kamei, M. Takimoto and Y. Urakami *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 534-44 (1935), cf. *C. A.* 29, 7704¹—Drying expts. were carried out on pine, and cypress wood with the vaporizing surface tangential to the tree rings. Considerable exptl. data are presented for drying velocity, total H₂O evapd., free H₂O content, air velocity and contraction. Cypress wood behaves like soap, e. g., the const. drying period is absent. The less dense pine wood shows all 3 drying stages like clay and paper pulp. Expts. were also carried out on pine wood with vaporization taking place from the radial and cross-section. The drying velocities for all 3 sections in the const. period were almost equal. In the retarded period the velocity was greatest perpendicular to the longitudinal section, medium in the radial and longitudinal direction and lowest in the direction tangential to the rings. The contraction decreased in the order tangential to rings, radial and longitudinal direction. Karl Kammermeyer

Cement industry in Poland in 1934 (Kownacki). 19. Sizing and sepg. fines from crude materials such as cement (U. S. Pat. 2,026,318) 1. Colored coating compns. [for cement] (Fr. pat. 787,787) 19. Heat-exchange app. for cooling hot granular material such as cement clinker (U. S. Pat. 2,024,934) 1.

Cement. I. G. Farbenind A.-G. (Karl Dietz and Karl Frank, inventors). Ger. 618,749, Sept. 14, 1935 (Cl. 22, 1). Acidproof cement or stone is made by mixing water glass to a paste with a substance reacting strongly with the alkali or SiO₂, such as NaF, BF₃, BaO, terephthalyl chloride or benzoic acid anhydride. These substances are powdered and coated with paraffin or wax to delay hardening and ensure even mixing.

High silica hydraulic cement. Edward W. Rice (to Santa Cruz Portland Cement Co.). U. S. 2,026,064, Dec. 31. A mixt. of ground raw cement materials contg. SiO₂ and lime in about a 5 to 1 ratio is calcined at a temp. of about 540° or somewhat higher but below the temp. of incipient fusion, to activate the silica while calcining the

lime, the calcined material is mixed with several times its wt. of portland cement clinker, and the mixt. is ground to portland cement fineness. Cf. *C. A.* 29, 3131¹.

Articles such as those of cement mixtures having a porous cellular structure. Gustav Adolph and Theodor Pohl (to Leichtbaustoff-Ges. m. B. H.) U. S. 2,024,791, Dec. 17. Materials capable of effecting the liberation of O₂, such as H₂O₂ and NaOCl, are added in stoichiometrical proportions to masses such as cement, sand, water and soap mixts. Cf. *C. A.* 29, 4917²

Sintering material such as raw cement mixes. Thorne E. Lloyd (to Dwight & Lloyd Sintering Co.) U. S. 2,024,176, Dec. 17. Finely divided material such as a raw cement mix is prep'd for sintering by mixing with a small proportion of oily material such as a mineral oil and with water (insufficient to render the mixt. fluid) and rolling the mixt. to form it into pellets.

Tunnel kiln suitable for burning cement. Nicolas Kyriacou U. S. 2,024,048, Dec. 10. Structural and mech. details of a furnace having a conveyor of the reciprocatory type a portion of which is surfaced with refractory material for receiving and reflecting heat. Cf. *C. A.* 29, 3503³

Rotary-drum apparatus for treating solids with gases as in cement kiln operation. etc. Mikael Vogel-Jorgensen (to F. L. Smith & Co.) U. S. 2,024,453, Dec. 17.

Various structural, mech. and operative details.

Apparatus for lining pipes with cement mortar. Gerald Haskins and Samuel T. Farnsworth (to Haskins Patent Pipe Linings Ltd.) U. S. 2,026,470, Dec. 31. Various details of an app. of the projectile type.

Mortars or binders containing rubber. I. G. Farbenind A.-G. Fr. 787,236, Sept. 19, 1935. Mortars or binders suitable for mastics, masonry, rough plaster, undercoating for paints and vibration dampers for cars are made by treating aq. emulsions of rubber, vulcanized or not, with powd. cements or binders so as to obtain mortars which contain basic substances sol. in water or capable of being emulsified and, besides, an excess of substances slowly sol. in water and capable of reacting with the alkalies. These substances react with one another so that the basic character of the mortar is neutralized slowly and the excess of substances which react with the alkalies produce afterward the coagulation or hardening of the mortar by sepn. of the acid or in any other manner, the water of the mortar being bound in the form of gel or in any other form in the final solid product. Thus, a cement composed of borax 4, p-toluenesulfonyl chloride 12, quartz powder 50 parts is mixed with an emulsion of rubber and powd. alkali silicate 20 parts, or borax 8, NaSiF₆ 12 and quartz powder 55 parts is mixed with an emulsion of rubber and Na silicate 25 parts.

Glaze. N. V. Nederl. Fabrick van Betonemallic "Tortoliet." Ger. 618,781, Sept. 14, 1935 (Cl. 80b, 23 04). A cold glaze for concrete, walls, etc., consists of cement, soap and a cement-setting accelerator such as ZnCl₂ or CaCl₂.

Concrete. Akt. Ges. Hunziker & Cie. Zürich Baustoff-fabriken Brugg & Olten. Fr. 787,391, Sept. 21, 1935. Concrete of particularly high resistance and chemically insensitive is obtained by adding a material contg. SiO₂, e. g., quartz, to the constituents and afterward hardening under a pressure of steam. Up to 6% of sol. glass may be added to the water used.

Light weight porous concrete. Erik B. Bjorkman. U. S. 2,026,207, Dec. 31. For making preformed concrete of higher compressive strength than 1400 lb. per sq. in. and a lower d. than about 110 lb. per cu. ft., a stream of molten blast-furnace slag is mechanically disintegrated into drops which are solidified and cooled without quenching in water to produce a granulate of hard porous particles capable of developing hydraulic activity on the surface, water is added to the particles, the moist material is consolidated under a pressure in excess of 1500 lb. per sq. in. to form units such as bricks or tiles of the desired shape, the pressure on the units is then immediately released, and the units are cured.

Curing concrete. Dozier Finley and Wm. R. Greig

(to Paraffine Cos) U S 2,021,727, Dec 17. A covering for use on concrete during curing comprises a sheet of water-absorbent material such as felt with a moisture-imperious coating such as bituminous material adhesively secured to one side and a sheet of paper fixed on the coating.

Molding concrete Soc Lap Ger 621,440, Nov. 7, 1935 (Cl 80b 1 16) See Brit 307,639 (C A. 23, 5295)

Grouting with chemically reacting materials Lars R. Jorgensen U S 2,025,919, Dec 31 Loose sand or gravel or the like around piles, tower legs, fills or walls, etc., is solidified by successive addn. of Na silicate soln and of CaCl₂ together with a gel-forming gas such as CO₂. Various details of app. and operation are described.

Cold laid paving material Joseph H. Conzelmann (to Alabama Asphaltic Limestone Co) U S 2,026,614, Jan 7 Crushed rock asphalt is treated with a solvent for bitumen such as naphtha or gasoline in an atm. merely sufficient to soften the hard native asphalt in the rock asphalt and facilitate the fluxing of this native asphalt with the asphalt in the bonding medium, and an aq. asphalt emulsion is added and the materials are agitated to form a homogeneous mixt.

Bituminous paving mixture Charles N. Forrest (to Barber Asphalt Co) U S 2,025,945, Dec 31 Particles of a natural bituminous rock forming an aggregate are mixed with an aq. emulsion of a soft bitumen until the particles are coated with the soft bitumen, and a powder hard bitumen is mixed with the coated aggregate to serve as a binder.

Bituminous macadam Augustus G. Terrey (to Flint-Lote Co) U S 2,026,109, Dec 31 Clean graded stone having less than 5% of powder limestone clinging to and covering its surfaces is mixed with about 5% of an aq. dispersion of bitumen contg. about 50% of bitumen and 10-20% of a liquid such as creosote capable of softening the dispersed bitumen, and the mixing is continued until the stone is completely coated with the dispersed bitumen.

Paving blocks, bricks, etc. Eugen Ganz and Werner Ganz Austrian 143,326, Nov 11, 1935 (Cl. 80d) Cardboard sheets are impregnated with hot linseed oil, dried, treated with an alc. soln. of a PhOH-ClH₂O condensation product, and united by compression.

Artificial marble Joseph H. Andreoli Fr 787,251,

Sept. 19, 1935 Pastes of tinted white or portland cement are mixed with stone powder so as to obtain veined blocks which may be cut and polished.

Porous building material suitable for exposure to acid fumes, etc. Karl Schultz (to Gibb-Lewis Co.) U. S. 2,025,424, Dec. 24. For acid- and alkali-proofing material such as concrete tiles, the material is treated with a soln. of aniline-HCl of about 15% strength, then with a soln. contg. Cu chloride about 15, HIOAc about 5 and KClO₄ about 1%, and then with a soln. contg. about 15% each K₂Cr₂O₇ and H₂SO₄.

Forming shingles of asbestos-cement material. Edward J. Buczkowski (to Kearsbey & Mattison Co.) U. S. 2,023,990, Dec 10 App. and various operative details are described.

Flooring material. Herman W. Richter. U. S. 2,026,594, Jan 7. For laminating sheets of material such as compn. flooring, they are preheated and their surfaces are treated with an asphalt emulsion and they are pressed together without further heating (the preheating being sufficient to evap. substantially all the water of the emulsion so that the sheets are welded together).

Multi layer flooring Geo F. Storm. U. S. 2,026,511, Dec. 31. A subfloor is covered with a layer of permanently ductile adhesive such as asphalt compn. mixed with a large proportion of comminuted resilient matter such as cork and fibrous material and this layer is partially cured by exposure to the atm., a layer is then applied contg. a smaller proportion of comminuted resilient material together with ductile permanently adhesive, and material such as wood flooring may be placed over this layer.

Apparatus for coating and impregnating strips of lumber with a filler composition Irvin I. Dittmar (to Cromar Co.) U. S. 2,026,521, Jan. 7. Various structural and operative details.

Treating wood for use in cabinet making, etc. Margorie G. Snelling U. S. 2,024,257, Dec 17. A smooth surface of wood is treated with a selective swelling reagent (such as an aq. soln. contg. HIOAc 5% and citric acid 5%) to swell the softer fiber groups more than the harder fiber groups, a smooth surface is restored by removing all portions of the swollen fiber groups which extend beyond the original plane surface and filling the surface fibers with an indurating material such as a soln. of shellac which penetrates the softer swollen fiber groups more readily than the harder groups.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

The Franz Fischer method for synthetic gasoline manufacture in Germany E. Pyhäla *Teknillinen Aikakauslehti* 25, 396-7(1935)—Methods have been developed for removing the S from water gas, and catalysts that give yields up to 70% of the theoretical have been discovered. I estimate show that a factory with a yearly capacity of 25,000 tons could work economically, 1/2 of its output being gasoline and the rest by-products. E. E. J.

The present stage of the motor alcohol question Y. Talvitie *Teknillinen Aikakauslehti* 25, 365-74(1935), cf. C A 29, 2334—The compulsory use of an alcohol-gasoline mixt. as a motor fuel would be a considerable expense without achieving the desired purposes.

Transformation of acetylene into motor spirit by catalytic hydrogenation. Comparison of the process with pyrogenic condensation B. Kval *Chimie & Industrie* 34, 773 b(1935)—The most suitable catalyst for the conversion of C₂H₂ into liquid hydrocarbons consists of a mixt. of activated charcoal and Cu₂O. Best results were obtained when, during condensation of the C₂H₂, H₂ was added and combined with the liberated C, this addn. of H₂ both prevents sepn. of C and increases the yield of motor spirit. The tests carried out with addn. of H₂ showed that by this method a good grade of motor spirit is obtained very easily, and that it is not impossible that

a practical industrial process can be developed along these lines.

Practical heat economy K. Schiebl *Chem. Fabrik* 1935, 507-10—A method is given for calcg. with fair accuracy the coal and steam consumptions and efficiencies for plants not equipped with all suitable measuring devices. J. H. Moore.

Anthracite, semi-coke and wood charcoal as fuel for motor-truck gas producers Ch. Berthelot. *Chimie & Industrie* 34, 769-62(1935).—A discussion of the conditions required to render practical the use of gas producers as a source of power for motor trucks. A. Papineau-Couture.

Better products and use of by-products widen outlet of anthracite and bituminous coal H. E. Nold *Mining Met.* 17, 34-6(1936)—Coal dust from dedusting plants is finding ready use for pulverized fuel. A mixt. of semi-bituminous nut and slack and petroleum coke breeze has been used in several New England power plants. Coal contg. less than 1% ash is being prepd. in England by CaCl₂ cleaning. The carbonization of coal in Knowles ovens in Ill. and the production of Disco in Pittsburgh are described briefly. Coal has been gauged in situ.

Classification chart of typical coals of the United States, showing B. t. u. per pound on the moist, mineral matter free basis, plotted against fixed carbon on the dry,

mineral-matter-free basis A. C. Fieldner, W. A. Selvig and W. H. Frederic. *Bur. Mines, Rept. of Investigations* No. 3296, 22 pp. (1935).—The fixed C (dry and free from mineral matter) of 316 typical Am. coals is plotted against their B. t. u. (moist and free from mineral matter). When used in conjunction with the proposed A. S. T. M. specifications for classification of coal by rank, shown tabularly, the chart enables the rapid detn. of rank of typical American coals. Alden H. Emery

Alteration of coal seams in the vicinity of igneous intrusions, and associated problems Henry Briggs *Trans. Inst. Mining Engrs* 90, 114 18(1935). cf. C. A. 29, 7044.—Discussion Alden H. Emery

Study of Roumanian coals by thermal fractionation of the gaseous products of pyrolysis Jean Rudic *Am. Combustibles Liquides* 10, 889-921(1935). cf. C. A. 29, 3493.—The method of Lebeau (C. A. 28, 3215) was applied to 10 Roumanian coals. The yields of volatile products at various temps., microscopic exam. and the action of solvents lead to the conclusion that 6 of the samples are lignites, 3 bituminous coals and 1 is peranthracite. G. Calingaert

Coal from the Saar region W. Gollmer *Gas u. Wasserfach* 78, 917-22(1935).—There appears to be a general belief in Germany that the Saar coals give a poorer coke than Ruhr coals. Coke produced from this coal alone, without grinding, has porous structure, due to the high volatile matter content of this coal, leading to a higher reactivity but a somewhat lower coke strength. The increase in gas and by-product yield together with improvement in coke qualities justifies the grinding and mixing of Saar coal before carbonization. Mixt. with low-temp. coke or other coals gives an excellent coke. R. W. Ryan

The grading and classification of coal. H. Eustace Mitton and D. T. Davies *Trans. Inst. Mining Engrs* 90, 3-8, 45-61(1935). cf. C. A. 29, 7044.—The breakage of coal in mining and handling and crushing for marketing are discussed. Alden H. Emery

Coal's new industry—the production of oil F. S. Summitt. *Gas J.* 212, 711 12(1935).—Hydrogenation is discussed. P. J. Wilson, Jr.

The new preparation plant at the Rising Sun Colliery of the Wallend & Hebburn Coal Co., Ltd. Kenelm C. Appleyard. *Trans. Inst. Mining Engrs* 90, 37-61(1935).—The plant, consisting of the following, is described: dry cleaning, wet washing, de-dusting, flotation of dust, filtration, thermal drying, water clarification, blending and mixing and dry and wet screening. Alden H. Emery

Modernization of coal-preparation plants continues, without striking innovations Henry F. Hebley. *Mining Met.* 17, 36-7(1936). Alden H. Emery

Measurement of the expansion of coal during carbonization. V. J. Altieri. *Am. Gas J.* 143, No. 6, 43(1935). cf. C. A. 29, 7814.—A unidirectional coal-expansion tester is described. Joseph H. Wells

The development of coal hydrogenation by Imperial Chemical Industries, Ltd. Kenneth Gordon. *Gas J.* 212, 722-6; *Colliery Guardian* 151, 985-8; *Petroleum Times* 34, 547-58(1935).—Historical. P. J. Wilson, Jr.

The complete solution of the fundamental matter of a coal in benzene A. Gillet and A. Priot. *Bull. soc. chim. Belg.* 44, 604-12(1935).—At high pressures and temps. complete soln. is attained. R. E. DeRight

Fusain content of coal dust from an Illinois dedusting plant. Gilbert Thiesen. *Am. Inst. Mining Met. Engrs. Tech. Pub. No. 664*, 12 pp. (1936).—Because of its friable nature, fusain is concd. in the fine coal dust. The very fine dust, -200 mesh, produced during the prepn. of coal, is composed mainly of fusain. The coking properties of the fine sizes of Ill. coals may be improved by dedusting. The P content of the coal is reduced at the same time. Alden H. Emery

The pneumatic dedusting of coal S. R. Berrisford and R. H. Allen *Trans. Inst. Mining Engrs.* 90, 139-9, 140-60(1935); cf. C. A. 29, 8285.—Discussion Alden H. Emery

The response of coal-cleaning practice to the demands of modern mining Geo. Raw and F. F. Ridley. *Trans. Inst. Mining Engrs* 90, 9-37, 45-61(1935).—The main factors controlling the type of treatment are (1) range of sizes and ash content of each, (2) free moisture, and (3) the proportions, ash contents and sp. gr. of the constituent portions of coal and impurities. Different methods of wet washing, dry cleaning and float-and-sink sepn. are described. Alden H. Emery

The auto-ignition process in coal W. Bielenberg *Angew. Chem.* 48, 779-81(1935).—A parallelism between certain properties of a coal and its auto-ignition behavior does not exist, although several factors, such as brittleness, pyrite content, catalytic action of mineral constituents, etc., may exert contributing influences. The auto-ignition depends upon the easy oxidation of the coal at ordinary temps. and the occurrence of heat storage depending upon the reaction velocity. The dissipation of the heat of reaction may be very slow as the thermal cond. of coal is very low, i. e., about 0.3 for lignite. The app. of Dennstedt (see C. A. 3, 1453) was used for the detn. of the autooxidation-time curves of coals. The intervals to the ignition point increase greatly with decreasing initial test temp., and the shape of the curve becomes increasingly flatter at the front end. If the initial temp. is sufficiently low, the ignition temp. may not be reached at all, as all of the oxidizable substance may have been used up before the temp. of the coal reaches the ignition point. Auto-ignition tests artificially accelerated by higher temps. are not reliable. Only such spots in coal piles will show auto-ignition, where the heat insulation is excellent and O₂ has access. Autooxidation curves and six references are given. Karl Kammermeyer

Heat conductance of a layer (of coal) P. T. Kolesnikov. *Podzemnaya Gazifikatsiya Uglei* 1935, No. 2, 9-11.—Actual measurements of heat conductance were carried out in various parts of an underground coal block undergoing gasification. The problem was complicated by the presence of cracks in the block through which gases circulated. The heat cond. was found to be 0.12-0.15 cal/s per sq. m per hr. S. L. Madorsky

Steaming in horizontal retorts G. L. Braidwood. *Gas J.* 212, 701-10(1935). *Gas World* 103, 567-75.—The results at Beckton are described. In a 12-hr. carbonizing period with 3-hr. steaming, the steam consumed amounted to 11.2% by weight of the coal carbonized, and the decomposition efficiency was 27.6%. An increase of 7.2 therms per ton of coal of 480 B. t. u. was secured. The extra fuel consumption was between 220 and 620 lb. per ton of coal carbonized. With a 10-hr. carbonizing period and 2-hr. steaming only 16.3% decompos. was secured. The type of charging machine has probably the greatest influence on the conditions favorable to good results. The charges should be uniform and tapered at the gas end. The H₂S content of the steamed gas was increased. The work indicated that the cost per therm of unpurified gas, after deducting the credits for coke and by-products, was increased by 0.3 d. The experiences at other plants, described in the discussion, did not agree with the Beckton results because of differences in the conditions. P. J. Wilson, Jr.

Coal losses due to underground fires at Kuzbass. K. N. Shechepot'ev. *Podzemnaya Gazifikatsiya Uglei* 1935, No. 2, 11-14.—Because of spontaneous combustion in the mines of easily combustible coal, losses amount to 50% of the amt. produced. To avoid these losses underground gasification of the coal is recommended. S. L. Madorsky

Electro hydrogenation of coal under conditions of underground gasification. V. V. Filatov. *Podzemnaya Gazifikatsiya Uglei* 1935, No. 2, 22-8.—A discussion of Bergius method, involving production of H and hydrogenation of coal, under conditions of underground operation. S. L. Madorsky

Heat and gas calculations underlying the project of underground gasification (of coal) V. V. Pomerantsev, N. I. Sazonov and S. N. Sukrin. *Podzemnaya Gazifikatsiya Uglei* 1935, No. 1, 9-15.—A discussion of gas

movements, heat losses and gas compn involved in underground gasification of coal S L Madorsky

Further experiments on underground gasification of Moscow coals P T Kolesnikov *Podzemnaya Gazifikatsiya Uglei* 1935, No 1, 15-20—Moscow coals are low-grade, they contain 30-34 moisture, 25-30 ash and 36-45% combustibles. Expts were carried out on underground gasification of the Kruptovsk deposit, lying about 20 m deep, by blowing air for combustion through borings into a body of coal embracing about 250 tons, and collecting the coal gas from another series of borings S L M.

Results of the third experiment (on underground gasification) of Moscow District coals P T Kolesnikov *Podzemnaya Gazifikatsiya Uglei* 1935, No 4, 29-34—Gasification was carried out on an unbroken block of coal. The gas obtained was nonuniform in compn and had an av heat value of 1000 Cals per cu m S L M.

Experiment on underground gasification of coal in the Lenin-Kuznetzk District (Kuzbas) Petrovichev. *Podzemnaya Gazifikatsiya Uglei* 1935, No 1, 31-5—The compn of the coal is C 79.12, H 5.94, O 12.28, N 2.38, S 0.28 and volatile matter 43.62%. The wt of the block subjected to treatment was approx 1500 tons. After the fire was started underground, air was blown into the coal through drifts. The chem reactions taking place in the gasification are discussed in the light of the compn of the resulting gas S L Madorsky

Method of underground gasification of coal by means of pit holes S I Buyalov *Podzemnaya Gazifikatsiya Uglei* 1935, No 2, 3-9 S L Madorsky

Fundamentals involved in the projecting of underground gasification of coal F M Ivanov *Podzemnaya Gazifikatsiya Uglei* 1935, No 2, 18-20—A discussion S L Madorsky

Economic basis for underground gasification of coal by the Zhuravlev method T V Ovechnikov *Podzemnaya Gazifikatsiya Uglei* 1935, No 2, 20-2—The Zhuravlev method consists in duplicating in underground gasification the ordinary gas-generator method. The air or steam is blown from underneath the coal block, through holes in the block, and the resulting gas is forced to the surface through shafts. In one expt in the Chelyabinsk coal deposit the gas produced by this method had the following compn: CO₂ 9.61, CO 22.05, CH₄ 2.49, C₂H₆ 0.35, H₂ 18.15, H₂S 0.17, N₂ 47.00 and NH₃ 0.18%. Heat value of the gas is 1420 Cals per cu m. The yield of dry gas is 2 cu m per kg of coal S L Madorsky

Economics of underground gasification of coals T V Ovechnikov *Podzemnaya Gazifikatsiya Uglei* 1935, No 4, 34-9 S L Madorsky

Second series of experiments on underground gasification of coal at Kuzbas B P Grindler *Podzemnaya Gazifikatsiya Uglei* 1935, No 4, 3-6—The experience gained in a previous test on underground gasification of coal (C 29, 67.28%), which lasted for 6 months, served as a basis for another test. The difficulties encountered in the first test, particularly in regard to uniformity of the gas produced, were eliminated here. Compn of the gas averaged CO₂ 11.10, CO 12.80, methane and unsatd hydrocarbons 1.80, H₂ 17.25, H₂S 0.30, N₂ 55.55 and H₂O 1.20%. It had a heat value of 1035 Cals per cu m S L Madorsky

Calculation of heat losses in underground gasification of coal P V Melent'ev *Podzemnaya Gazifikatsiya Uglei* 1935, No 4, 7-12 S L Madorsky

Underground gasification of coal by means of double pit holes S I Buyalov *Podzemnaya Gazifikatsiya Uglei* 1935, No 4, 14-21—A discussion S L M.

Results of experiments (on underground gasification of coal) at Krutov shaft P A Manukyan *Podzemnaya Gazifikatsiya Uglei* 1935, No 4, 22-8—A discussion of causes underlying the failure of these expts S L M.

First generator gas under conditions of underground gasification (of coal) P T Kolesnikov. *Podzemnaya Gazifikatsiya Uglei* 1935, No 4, 39-41—Gasification was carried out on low-grade coal contg 34.57 moisture and 28.26% ash. The resulting gas contained 6-13% CO,

5-9% H₂, and approx 0.2% CH₄. It had a heat value of about 1000 Cals S L Madorsky

The development of future possibilities of gas as an industrial fuel Joseph B. White. *Gas J* 212, 642-6, 712-13 (1935), *Gas World* 103, No 2681, *Ind. Gas Suppl* 113-19—Applications of gas in the ferrous and nonferrous metal industries P J Wilson, Jr.

The place of gas in German energy supply. L Winkler. *Gas u. Wasserfach* 78, 815-8, 876-80 (1935)—A discussion of competition of gas with electricity and with solid fuels. A gas of higher heating value than the present 430-450 B. t. u. gas is advocated, as offering a lower unit cost. Low-temp distn is advocated so as to produce larger vols of liquid fuel, and a gas of higher heating value, which may be scrubbed to remove heavy hydrocarbons. Motor-fuel synthesis from manufd gas by the Fischer process is also advocated, and attention called to yield of gas of higher heating value from this process in addn to motor fuel R. W. Ryan

Advances in dry-gas purification A Rettemmiser. *Gas u. Wasserfach* 78, 848-9 (1935)—For regeneration of fouled gas-purifying material, a tower purifier contg the fouled material is isolated from the system and gas contg a regulated amt of O recirculated through the tower and a water-cooled condenser to absorb the heat of reaction and prevent the regeneration temp exceeding 40°. The O content of the recirculated gas is measured and controlled by an O recorder. At first the O content is kept low, but is gradually increased to approx 5%. This process approximates the purifier capacity. This principle was originally suggested in 1907 by Doherty (U. S. pat. 843,624, C. A. 1, 918) but did not find general application because of the absence of a suitable O recorder-controller to ensure safe and automatic control. R. W. Ryan

Gas-dehydration experience in England G. W. Anderson. *Gas u. Wasserfach* 78, 828-33 (1935).—The experience of the Gas Light and Coke Co. of London with gas dehydration by means of CaCl₂ solns, is reviewed. At first, rotary brush washers were used for contacting gas with the soln, but static multfilm washers are now used for large plants and tower scrubbers for smaller plants, resulting in lower costs. Total operating charges, including capital charges, vary from about 0.12¢ per M. cu ft for a plant treating 100,000,000 cu ft of gas per day to 0.3¢ for a plant treating only 1,000,000 cu ft of gas per day. In most cases the dehydration plant is at holder inlet, Beckton being the most important exception. The gas-pressure drop through the dehydration plant was 1 to 3 in. (water). Oil films are used in water-sealed holders so that the dew point of gas stored in these holders increased only about 1° to 1.5° in winter and 2° to 3° in summer, although very much higher increases were noted in those holders provided with wooden framing for supporting the holder crown. A special petroleum distillate was used for filming, and this is said to be better than gas oil. Dehydration causes a loss of 1/4 to 1% of the gas vol, but the Gas Referees allow the actual dew point of the gas as distributed to be taken into account in calcs the heating value of the gas. Only 2 trucks are now required to collect condensate from the 33,000 drips on about 5300 miles of distribution system, as compared with 10 used before dehydration. Only a very slight increase in unaccounted for gas was noted. The no of meter changes has greatly decreased, as have stoppages of services. Recently gum has appeared in both dehydrated and undehydrated gas-distribution systems, and a marked increase in no of stoppages has been noted, but no direct connection between gas dehydration and gum formation could be established R. W. Ryan

Electric current from gas Gustav Josse. *Gas u. Wasserfach* 78, 885-91, 903-6 (1935).—A discussion of the use of gas for generating elec power in decentralized plants. A suggestion is made that gas be generated outside of a city and supplied to a series of plants within the city. When steam plants are considered, the use of gas shows the highest increase in efficiency with the older type of boilers and a much lower increase with modern boilers. Gas offers special advantages for small boilers,

because of its greater flexibility and lower labor costs. For large boiler plants, the gas must be very low in price or used for special purposes, such as peak loads or reserve equipment. Various types of gas burners are discussed and illustrated. The use of gas engines of several types is also discussed. Such engines find applications in areas where cheap coke-oven gas is available. R. W. Ryan

Testing the tightness of high-pressure gas lines. P. Eduard Quintes. *Gas u. Wasserfach* 78, 900-10 (1935).—A compressed gas cylinder is buried at the same depth as the gas line and both the cylinder and the line are brought to some such pressure as 20 atm. A differential manometer between the cylinder and line then permits detection of any large leaks in the line. Small leaks can be evaluated by releasing sufficient gas from the cylinder so as to equalize the manometer reading and measuring this gas volume in a gas buret, this information serves for the calculation of the exact amount of leak. R. W. Ryan

Economic and hygienic aspects of heating with gas. E. Vogel. *Gas u. Wasserfach* 78, 922-9 (1935).—Special advantages in the use of gas for heat are the ease with which it may be regulated and the proper temperature maintained, the ease of using space heaters in each room, the possibility of supplying gas for other household purposes at a lower rate and cleanliness in use, etc. The danger of poisoning by gas is no greater than with solid fuels as suitable safety devices can be used with gas but not with solid fuels. R. W. Ryan

Gas-cleaning and sludge-recovery system. Fred Wille and Albert Mohr, Jr. *Blast Furnace & Steel Plant* 23, 529-32 (1935).—Hot H_2O is more efficient than cold H_2O for washing gas. This increased efficiency is related to the smaller size of the atomized H_2O particle resulting from the combined effect of decreased viscosity and decreased surface tension with increased temperature. A gas-cleaning and sludge-recovery system using hot H_2O and settling cones designed to clean 80,000 cu. ft. of gas per min. is described. The H_2O consumption is less than 22 gal. per 1000 cu. ft. of gas. The waste H_2O has less than 10 grains per gal. of suspended solids. The cleaned gas has less than 0.015 grain of dust and less than 1.0 grain of moisture per cu. ft. F. G. Norris

Gas-works lubrication. A. J. Walker. *Gas J.* 212, 909-11 (1935).

Developments in gas-making process for peak loads. Leon J. Wullen. *Am. Gas J.* 143, No. 5, 23-4, 74 (1935).—Substitute gases are used to augment the supply of coal or natural gas. Joseph H. Wells

Single-stage coke-oven gas exhausters, gas boosters and air blowers. W. Vincent Treeby. *Gas World* 103, 544-8 (1935).—A description, including the operating instructions, of a typical gas-exhauster installation.

P. J. Wilson, Jr.
Thermostatic water quantity regulation with gas water heaters. Walter Brümmerhoff. *Gas u. Wasserfach* 78, 932 (1935).—A description of a thermostatically controlled combination device for shutting off gas in case of water-supply failure and for regulating water flow. This regulator permits conservation of heat in water supplied to a heater, an exact control of the temperature of the water from the heater, elimination of heat waste due to slow initial rate of water heating and automatic starting and stopping of the heating device according to the temperature of the preheated water supplied to the heater. R. W. Ryan

Gum deposits from illuminating gas. B. Th. Tjabbes. *Chem. Weekblad* 32, 521-6 (1935).—A review of the formation of liquid and vapor-phase gums. NO was detected in city gas by the Guyer and Weber method (C. A. 28, 880*); NO was oxidized by $H_2SO_4-KMnO_4$. Good results were obtained on NO removal by dry boxes at the Groningen gas works. The removal was more satisfactory at low temperature (winter) than at high temperature. Fresh bog ore frequently gives off NO to gas (or to CO_2), not to air or to N_2 . Samples of ore from different origins showed this effect to a different extent but addition of 10% active ore to 90% of an inactive species caused a NO yield many times higher than that expected from the active ore alone. The NO yield from 4 parts bog ore + 1 part Lux mass

was for a few days 6 to 8 parts per million cu. ft. of gas. The above NO evolution can possibly be explained from bacterial action; actually the NO evolution decreased materially by addition of 0.2% PhOH to the gas and 1% PhOH stopped it altogether. Use of CH_3O in the gas was somewhat less effective. B. J. C. van der Hoeven

Vapor-phase gum. W. F. Thorne. *Gas J.* 212, 905-6 (1935).—The N in a sample of vapor-phase gum was present as NH_4Cl and as the NH_4 salt of an organic acid. The reaction of the gum with resorcinol and H_2SO_4 indicates the presence of the $\alpha-C_6H_4(C-)_2$ grouping. Conclusion: The gum is similar in formation and constitution to the ordinary coumarone-indene resin. P. J. Wilson, Jr.

Conversion of hydrogen sulfide from coal gas into concentrated sulfuric acid. Hoelzer. *Gas u. Wasserfach* 78, 894-5 (1935).—An exptl. plant, scrubbing about 260,000 cu. ft. of gas daily, has been used for the direct removal of H_2S from gas, by means of NH_4 liquor. The NH_4 sulfide and carbonate formed in this way are decomposed in an eliminator at 96° into CO_2 and H_2S as well as an NH_4 soln., the latter being returned to the scrubber. The acid gases from the eliminator, containing about 14% H_2S , 32% CO_2 , 5% NH_3 and 49% H_2O , are cooled to remove ammonia, washed with H_2SO_4 , and the resulting mixture of about 30% H_2S and 70% CO_2 is sent to the contact H_2SO_4 plant. It is possible to reduce the H_2S content of the gas to about 85 grains per 100 cu. ft., complete removal of H_2S would be unprofitable, and the 70% removal appreciably lightens the load on the dry purifiers. R. W. Ryan

Simple methods of determining olefins and paraffins in coking gas and its ethylene fraction. P. K. Sakmin, *Khimistoi* 7, 487-93 (1935); cf. C. A. 29, 3214, 3262* 6732*.—Full details are given for the analysis of mixtures of CH_4 and C_2H_4 , C_2H_4 and C_3H_8 , CH_4 , C_2H_4 and C_3H_8 , C_2H_4 and C_4H_{10} , C_2H_4 , C_3H_8 and C_4H_{10} , and C_2H_4 , C_3H_8 , C_4H_{10} and C_5H_{12} . The procedures are based on the methods previously described. Chas. Blanc

The synthesis of liquid hydrocarbons from natural gas. III-IV. Theoretical discussion of the pyrolysis of methane and of the formation of acetylene from methane. Kyuhei Kobayashi, Ken-ichi Yamamoto, Heishichi Ishikawa and Sukegata Hinonishi. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 550-5 (1935); cf. C. A. 29, 1959*.—The theoretical discussion is based upon a coordination of the published work. Exptl. work was carried out in the range of 800-1300° and with a CH_4 content of the raw gas of 68.9, 46.3 and 39.8%. The decomposition of CH_4 is accelerated at higher temperatures with an increase of the H_2 and C_2H_2 content in the exhaust gas. A considerable quantity of C_2H_4 is formed between 1100° and 1200°, but it diminishes rapidly at higher temperature. The effect of different heating times between 0.05 and 0.15 sec. is very small. With 39.8% CH_4 , at 1300° and 0.15 sec., the max. amt. of C_2H_4 produced is 17.4% based on the total CH_4 and 26.4% based on the reacted CH_4 , while 7.2% of CH_4 changed to C_2H_4 , giving a total conversion of 37.3% based on the reacted CH_4 . Conclusion: C_2H_4 formation from CH_4 will be more efficient above 1300°. Exptl. data are presented. K. K.

Determination of naphthalene. H. A. J. Pieters and K. Penner. *Chem. Weekblad* 32, 566-8 (1935).—Naphthalene picrate at 20° is not noticeably soluble in picric acid soln. regardless of the concentration of the latter as long as it is above 0.148%, the strength corresponding to the amount of free picric acid in equilibrium with solid naphthalene picrate. The concns. tested ran up to 0.4%; the filtered soln. was titrated with 0.02 N alkali and cresol red-bromothymol blue mixed indicator. The vapor pressure of $C_{10}H_8$ over picrate soln. depends on the temperature and concentration of the picric acid: $P_0 \times N_0 = k = f(t)$. For accurate $C_{10}H_8$ work the soln. should be cooled to 4°. Benzene picrate ppts. only at $C_{10}H_8$ concns. of more than 140 g. per cu. m. air. This benzene concn. is well beyond that present in coke-oven gas. B. J. C. van der Hoeven

Ammonia recovery at Nantes. C. Cooper. *Gas J.* 212, 844-8 (1935).—The vertical chamber oven plant is operated with continuous steaming, the admission of

steam being 4% by wt. of the coal. The gas is cooled in the first stage of the primary condenser to 70°, and the condensate is either used in the NH₃ scrubbers or discarded. The condensate from the remaining condenser compartments is continuously recirculated by spraying into the hot gas from the retorts. The NH₃ scrubbers consist of a Livesey washer and a 12-compartment Multifilm washer, in series, both operated at a temp of 15°. They deliver a liquor contg 80 g per l NH₃, which represents 70 to 75% of the NH₃ in the gas. From 4 to 5 grains of NH₃ per 100 cu ft of gas goes on to the purifiers.

P. J. Wilson, Jr.

Catalytic hydrogenation of phenolic oil of low-temperature tar. III. Effect of catalysts. Shingo Andô *J Soc Chem Ind, Japan* 38, Suppl. binding 567-9(1935), cf *C A* 29, 912. —One hundred g of sample oil and 5 g of catalyst were heated with 4.46% by wt. of H₂ for 1 hr in a 0.6-l shaking autoclave at 470° and with an initial H₂ pressure of 100 atm at 0°. In all expts the liquid-product fractions boiling below 170° were colorless and volatile with gasoline odor. The distillates between 170° and 300° were colorless or yellow. Twenty-one catalysts were tested. The yield of gasoline fraction was highest with a Mo catalyst (MoO₃) followed by SnCl₄, ZnCl₂, NiO and CoCl₂, while some metallic oxides were almost inactive. Phenolic oils contained in the 170-220° fractions were those formed by dealkylation of higher phenols, but no catalyst was observed which accelerated this reaction in a specific manner. The unconverted phenolic oil, sep'd from the products, was found to be desulfurized to a remarkable extent, especially with Mo compds, NiO, Fe₂O₃ and CoS, and this oil is considered suitable for the manu' of synthetic resins, etc. Exptl. results are presented.

Karl Kammermeyer

Hydrogenation of high-temperature tar and distillates. C. M. Cawley *Gas J* 212, 571-2(1935); *Gas World* 103, 531-2. —The amenability of tar to hydrogenation decreases with increasing temp of carbonization. Thus the economics of the hydrogenation of coke oven and horizontal retort tars should be carefully considered before treatment is undertaken.

P. J. Wilson, Jr.

Does hydrogenation pay? F. G. Lupschler *Chem J* 212, 727-9(1935). —The min production costs for the hydrogenation of tar to motor fuel are est'd at 8.07 d per gal (Imperial), an av yield of 85% is assumed. The plant cost exclusive of gas plant and auxiliaries decreases from £3000 to £2500 per ton of tar hydrogenated with increase in the capacity. Under present conditions only the protective methods of the European governments keep hydrogenation alive.

P. J. Wilson, Jr.

Coke oven manager's association. Inaugural address. N. L. Tyler. *Gas World* 103, No. 2679, Coking Sect. 116-18(1935). —T. discusses the disposal of the products from by-product coke ovens.

P. J. Wilson, Jr.

The future of coke-oven development with special reference to coke marketing. G. E. Foxwell and W. L. Boon. *Gas World* 103, No. 2679, Coking Sect. 113-26(1935). —The by-product coking industry is faced with the impossibility of expansion in the blast-furnace industry. The domestic coke market is the obvious outlet.

P. J. Wilson, Jr.

The marketing of coke. Domestic coke boilers for small installations. F. M. H. Taylor. *Gas J* 212, 906-8(1935). —The equipment is described.

P. J. Wilson, Jr.

Determination of volatile matter in coke. A. P. Shakhno and M. D. Zhukovskaya. *Zavodskaya Lab* 4, 874-7(1935). —A comparative study of proposed methods for the detn. of volatile matter in coke with the use of European and American elec and gas furnaces produced unsatisfactory results because of the excessive oxidation of coke. In all cases better results were obtained by heating a sample in an atm of pure N₂. The best results were obtained by heating a sample in a Pt crucible with an alc burner for 15 min by conducting pure N₂ directly into the crucible. By this procedure the oxidation was reduced from 0.79-1.13% to 0.16-0.48%. Chas Blanc

1 Changing to gas fuel improves Columbia tool steels (Foster) 9 Rotary-drum app for filtering and dewatering slimes such as those from coal (U. S. pat. 2,024,338) 1 Exhaust steam condenser (U. S. pat. 2,025,043) 1 Plastic masses [from coal like fuel] (Ger. pat. 618,566) 13 Segg materials such as coal and stone (U. S. pat. 2,026,343) 1

2 Fuel Charles Michel *Fr* 787,222, Sept 19, 1935 2 A radioactive material in soln. or the gaseous state is incorporated in fuels to intensify the phenomenon of ionization of the explosive mixt before and during burning. Stabilizing fuels. Soc d'études & réalisation dite Ereal *Fr* 787,470, Sept 23, 1935 Hydrocarbons contg di- and poly-olefins are purified and (or) stabilized by adding an aromatic compd contg in its mol one or more SO₂H groups so as to transform the di- and poly-olefins into resins and segg the resins. The compds used include benzene-, *p*-toluene- and α - and β -naphthalene-sulfonic acids and they may be used in alc soln. The free or combined S is also removed by the treatment *Fr* 787,471 Aliphatic compds contg SO₂H, e. g., methyl- and ethyl-sulfuric acids are used *Fr* 787,472 App is described for heating the hydrocarbons with the reagent continuously in countercurrent and distg

4 Motor fuel Piero Buti. *Fr* 786,336, Aug 31, 1935 The fuel is composed of a homogeneous mixt. of EtOH (50-70) and a hydrocarbon distillate, the b-p range of which is about 70-100° (22-42 parts). The mixt. is stabilized by benzene up to 8 parts. The EtOH may be replaced partly or completely by MeOH with or without a certain proportion of iso-PrOH or iso-BuOH

5 Motor fuel Aldo Giunta and Paul Letournier *Fr* 787,590, Sept. 25, 1935 The turbidity of fuels contg gasoline and EtOH caused by the fact that the EtOH is never anhyd or does not remain anhyd is produced at a lower temp., e. g., below the temp of use of the fuel by the addn of a 3rd substance which is sol in gasoline, EtOH and water. Examples are piperidine 0.68, cyclohexanol 0.7, complex phenols 0.94, cyclohexanol and PhNH₂ 0.95, pure PhOH 0.95, benzylamine 0.95, iso-PrOH 1.07, benzyl alc 1.48, AcOEt 2.15, paraldehyde 2.3, ethyl ether 2.9, HCOOEt 2.9, acetone 5.8 and C₂H₅ 10.6%. Any of these will lower the turbidity pt of a fuel contg gasoline 100 and alc 6.5 vols from 19 to 9°

6 Refining hydrocarbons for motor fuels. N. V. de Bataafsche Petroleum Maatschappij *Fr* 787,565, Sept. 25, 1935 Motor fuels contg a high proportion of unsatd. or aromatic components are prep'd by bringing crude hydrocarbons into contact in a continuous manner, in the vapor phase and in the absence of H₂SO₄, with a sulfonic acid of a simple hydrocarbon, substituted or not by halogen, in soln or suspension in an inert org. medium liquid at the temp of operation, the vapors of the hydrocarbons being constantly mixed with steam during the refining. The concn of the sulfonic acid (benzenesulfonic acid) in the org. solvent (a lubricating oil) is at most 10 and preferably below 5%, and the refining temp is high enough to avoid intense hydration of the sulfonic acid

8 Fuel briquets Arthur A. Roberts *U S* 2,025,776, Dec 31. A mixt of powd. fuel such as powd. coal and a binder such as cement, bitumen, etc., is formed into briquets which are baked to decompose smoke-producing substances in the superficial portion of the briquets and the evolved vapors are passed through fresh solid carbonaceous fuel and condensed in the latter prior to its use in briquet manu' *U S* 2,025,777 relates to a process in which a combustion-controlling agent such as H₂BO₃ or NaCl is dissolved in water and an emulsion prep'd, from this soln and bitumen, with starch as an emulsifier, is used for wetting a mixt. of powd. fuel such as coal, sawdust, peat or lignite and hydraulic cement for making briquets (details and specified proportions of materials used being given)

Use of Zn alloys for gas pipes (Cazaud, Petot) 9.

agglomeration des combustibles). U. S. 2,026,439, Dec. 31. App. and operative details are described.

Low-temperature carbonization. Alfred J. A. Herang Ger. 621,252, Nov. 6, 1935 (Cl. 100, 29). Finely subdivided fuel is conveyed on a band through a closed chamber in which it is heated sufficiently to yield a passy product. This product is coarsely granulated before it leaves the chamber. The granular product may be briquetted without addition of a binding agent. App. is described.

Electrical apparatus for testing the completeness of combustion of engine fuels, etc. Clarke C. Minter U. S. 2,025,121, Dec. 24. Various structural, elec. and operative details.

Combustion-control system for induced draft furnaces such as those burning coal. Albert G. Blodgett (to Riley Stoker Corp.). U. S. 2,026,159, Dec. 31. Various structural, tech. and operative details of a control system for fuel supply, etc.

Maintaining uniform combustion in engines such as those of automobiles. Wm. Harper, Jr. (to H. B. Motor Corp.). U. S. 2,025,205, Dec. 24. Successive charges of a compressed fuel mixt. are subjected to a plurality of turned interrupted sparks which vary oppositely in intensity with variations in temp. within the combustion space.

Destructive hydrogenation. International Hydrogenation Patents Co. Ltd. Fr. 787,520, Sept. 24, 1935. Carbonaceous materials are treated with hydrogenating gases at a high temp. in the presence of halogen or S compounds, metalloids which are solid in the free state at 18°, or combined NH₃. The compds. are added during or after the preparatory heating of the materials and are protected against decompos. until the moment they are incorporated with the materials by keeping the entry pipe for these compds. cool. Compds. used include CCl₄, CHCl₃, CH₃I, PhBr, PhI, CBr₄, SiCl₄, SeI₂, SeI₄, AsCl₃, (NH₄)₂SO₄, S-Cl₂ and NH₄Cl, and these may be used in conjunction with other catalysts, e.g., compds. of metals of the 6th group.

Hydrogenating coals and lignites. Compagnie des mines de Vaconne, Neoux & Drocourt. Fr. 787,211, Sept. 19, 1935. A complex material which contains the catalyst in a chemically fixed form is prep'd from coal or lignite and an appropriate catalyst (an alkali or alk. earth metal, or alloy or salt thereof), material which may be stocked without alteration and which is hydrogenated under the influence of heat and pressure in an atm. of H₂. Thus, coal or lignite is heated with NaOH, dissolved in water or not, to about 250-330° and kept there for 15 min. and afterward hydrogenated.

Apparatus for separation of materials such as coal, etc., by the action of air currents. Mack E. Haworth (to Jeffrey Mfg. Co.). U. S. 2,026,633, Jan. 7. Various details of app. and operation.

Coal distillation to obtain low-boiling hydrocarbons. Georges F. Mochet-Dupont (to "Physical Chemistry Research Cr."). U. S. 2,025,882, Dec. 31. In coal distn., methyl groups are substituted for phenol groups by heating the coal to a temp. above that at which acetone decomposes and below about 600° in the presence of an alk. salt of an aliphatic acid such as Ca acetate adapted to supply the methyl groups, in the presence of an oxide of a metal of the Fe group serving as a catalyst. Cl. C. A. 29, 582¹.

Horizontal retorts for distilling coal. Fours Fieard Fr. 787,581, Sept. 25, 1935. Means for injecting steam is described.

Apparatus for distilling or calcining coal, schist, peat or wood. Steffe Ltd. Fr. 786,114, Aug. 27, 1935.

Treating furnace flue dust. Ervin G. Bailey and Ralph M. Hardgrove (to Fuller Lehigh Co.). U. S. 2,024,197, Dec. 17. Dust sep'd. from combustion products is returned to the furnace, and the incombustible portion is melted by the heat of the furnace and the molten product is withdrawn. App. is described. U. S. 2,024,188 relates to details of furnace construction.

Lignite briquet plant. Fritjof Dehl Ger. 618,775,

Sept. 17, 1935 (Cl. 103, 9 06). A device for obtaining the lignite dust is described.

Furnace with rotating hearth for carbonizing lignites, etc. Louis Granger. Fr. 786,408, Sept. 3, 1935.

Horizontal chamber furnace for coke and gas. Compagnie générale de construction de fours. Fr. 786,035, Aug. 24, 1935.

Steam generator and compensating superheater. Charles W. Gordon (to Superheater Co.) U. S. 2,026,130, Dec. 31. Various structural details.

Catalytic deoxidation of exhaust gases from Diesel engines. Wilhelm Wenzel (to I. G. Farbenindustrie A.-G.) U. S. 2,025,140, Dec. 24. The gases, while still hot, are brought into contact with a catalyst comprising Cu or organic.

Combustible gas substantially free from nitrogen oxides. Wm. W. Odell U. S. 2,025,071, Dec. 24. A carburized lean gas is obtained by heating a mass of combined refractory solid material such as checker work substantially to incandescence, then causing hydrocarbon material and some steam to react in contact with the heated material to form a rich gas contg. free, active H₂, immediately commingling the rich gas and a lean gas contg. only about 0.1% of a N oxide and bringing the mixt. into contact with another portion of the heated refractory material to effect a substantial reduction of the N oxide. Exhaust engine gases are used and app. is described.

Inert noncondensing gas. Jav E. Teme U. S. 2,025,364, Dec. 24. A mass of charcoal is ignited and partially burned in a primary combustion chamber (of a described app.) until smoke and gases are removed, and the burning charcoal is transferred to a secondary combustion chamber and while still hot, air is forced through the glowing charcoal to form an inert gas free from O and smoke; the inert gas is drawn off, sep'd. from solid impurities, cooled and collected.

Method of fractionating coke-oven gas and like mixtures by liquefaction. Ges. für Linde's Eismaschinen A.-G. Ger. 621,453, Nov. 7, 1935 (Cl. 12, 1 01).

Cleaning gases. Gutehoffmühlwerke Oberhausen A.-G. Ger. 615,957, Sept. 19, 1935 (Cl. 183, 14 03). Soot deposited in solid form from the waste gases of furnaces heated by coal dust by subjecting the hot waste gases to a current of cool air.

Washing gases. N. V. Maschinenfabriek en apparaten fabriek "Meef". Fr. 786,431, Sept. 3, 1935. Light hydrocarbons and C₂H₄ are ex'd. simultaneously by washing coke or lighting gas with strongly cooled (below 0°) washing oil. The hydrocarbons are sep'd. from the oil in the usual manner and the C₂H₄ by strong cooling and crys't.

Purifying producer gas. Raphael Malhot. Fr. 787,632, Sept. 25, 1935. Long removable brushes made of metal wires, preferably in the form of a helix, are placed in the pipes leading from the producer so as to remove solid particles.

Freeing gases from sulfur compounds. Walther Saxner (to Gas Technik G. m. b. H.) U. S. 2,024,836, Dec. 17. A gas such as coke-oven gas is passed through a plurality of layers, arranged in series, of molded bodies of a S-absorbing mass such as may contain Fe(OH)₃ in which the absorbed S is set free by oxidation to regenerate the mass (the first layer traversed by the gas being regenerated more frequently than the second layer). Cl. C. A. 29, 4109¹.

Coal-gas and water-gas generator. Carl Elver. Ger. 621,141, Nov. 2, 1935 (Cl. 24, 2 01).

Generator for making fuel gas from wood or other fuel containing water. Alois Jellik Austrian 143,660, Nov. 25, 1935 (Cl. 246). The generator is particularly designed for the supply of tar-free fuel gas to motors subjected to widely varying loads.

Rotary-tube feed device for gas generator. Wehlerwerk A.-G. Ger. 621,233, Nov. 3, 1935 (Cl. 246, 9).

Treatment of tars. Thermal Industrial & Chemical (T. I. C.) Research Co. Ltd. Fr. 787,511, Sept. 24, 1935. See Brit. 432,998 (C. A. 30, 844¹).

Coke. Octave C. M. Dozy-Hemault. Fr. 787,623,

Sept. 26, 1935 Coke is purified by treating it after leaving the furnace and while still hot with appropriate gaseous reagents, particularly Cl , HCl and HF . Thus, a mixt. of Cl and HCl removes S , Fe and Al , and HF removes SiO_2 as H_2SiF_6 at a lower temp

Coking coal Carl Stoll G m b H Ger 618,903,

Sept. 18, 1935 (Cl 10a 14). A device is described for compressing loose coal in a coke-oven chamber.

Coke oven Louis Wulputte. U. S. 2,025,967, Dec 31 Various structural details

Compound regenerative coke oven Wilhelm Muller Ger 618,969, Sept 19, 1935 (Cl 10a 504)

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W F FARACHER

Official instructions for the distillation test of petroleum products Anon *Ann fals* 28, 555-62 (1935) —Text of the Fr official method is given A. P.-C.

Viscosity of petroleum products Viscosity-temperature characteristics of Pennsylvania lubricating oils R E Hersh, E K Fisher and M R Fenske. *Ind. Eng. Chem* 27, 1441-6 (1935), cf *C A* 27, 834; 29, 1971 —The viscosities of a large no of Penna oils were detd at 100°F and 210°F. in modified Ostwald viscometers Equations are given for the relationship between the kinematic viscosities at 100°F and at 210°F for Penna and for naphthenic oils Viscosity-index tables, expressed in centistokes, are included It is recommended that this method be called kinematic viscosity index Marion E Headington

Viscosity-temperature relationship of Japanese petroleum oils II Takewo Kurosawa *J Soc Chem. Ind., Japan* 38, Suppl bunding 532-4 (1935), cf *C. A.* 29, 8307 —A Redwood viscosity table for Japanese petroleum oils is presented for a viscosity range 30-3000 and temps of 10°, 20°, 30°, 50°, 80°, 100° and 150°. The values were calcd from previously reported viscosity ratios Karl Kammermeyer

Petroleum solvents and naphthas E M Tobv. *Rubber Age (N. Y.)* 38, 85-8, 90 (1935), cf. *C. A.* 29, 4851 —A discussion of the properties and uses of various petroleum solvents. C. C. Davis

The refining of mineral oils by selective solvents Marcel Gheorghiu *Mon pétrole roumain* 36, No 24, 1779-81 (1935) J R Strong

Oil sands as well as lime formations respond to proper acid treatment F B Plummer and R B Newcome, Jr. *Oil and Gas J* 34, No 23, 44-6 (1935); cf *C. A.* 30, 843 J R Strong

Oxidation of white oils Ralph W Dorate *Ind Eng Chem* 28, 26-30 (1936) —D carried out lab expts on the oxidation of white oils to det the chem mechanism involved One procedure consists in measuring the rate of absorption of oxygen at const pressure by a definite wt. of oil and the other in the withdrawal of samples for analysis during the reaction The rate of absorption of oxygen by moderately and highly refined oils is found to be a method of detg the resistance to oxidation E. W. Roth

Thermal polymerization process used by pure oil on olefin bearing gases. M B Cooke, H R. Swanson and C R. Wagner. *Oil and Gas J* 34, No 26, 57, 59, 60, 62 (1935). —The app used and the stocks suitable for polymerization are described The thermal polymerization process is described at length, with the actual operation procedure included J R Strong

Treating crude-oil emulsions in the Seminole area routine operation Harold K. Ihng *Oil and Gas J* 34, No 25, 49, 51, 53 (1935) J R Strong

Production-decline curve of oil well may be extrapolated by loss ratio Salvaun J. Pirson. *Oil and Gas J* 34, No 26, 34-5 (1935) —P. gives a math. justification of the loss rating method for extrapolating oil-well decline curves J. R. Strong

Refining of synthetic acids V. Varlamov, G. Oyat'eva and N. Davudova. *Moskolin Zhivoe Delo* 11, 494-5 (1935); cf *C. A.* 29, 7629 —Oxycids obtained by oxidation of petrolatum jellys were refined by autoclaving 15% soln of acids with 10% excess of KOH in H_2O . (to prevent polymerization) at 180-200° for 1 hr. and at 290-3° for 43 min Similar dehydration with the

formation of unsatd acids was effected by autoclaving 1 C_6F_6 Ca soap in C_6H_6 with stirring, at 250-300° for 1 hr. and 25 min Chas Blanc

New True-Vapor-Phase control unit uses tubular heater instead of original "stoves" Neil Williams *Oil and Gas J* 34, No 25, 38-9 (1935) —Description of a modern True-Vapor-Phase cracking unit. J. R. S

Viscosity and stability of drilling fluid C. W. Woolgar. *J. Inst Petroleum Tech* 21, 825-37 (1935) —The density of a drilling fluid at the bottom of the column proved in tests to be almost independent of the height of the column, and is not as important as the yield-point value This factor governs the stability of the mud, its ability to hold the cuttings and weighting material in suspension, its suitability for pumping and its sealing off and plastering effects It may be measured either by a shearometer or from the viscosity at 600 r. p. m. measured in a Stormer viscometer. E. E. Crandal

Hydrogenation of bituminous schists under ordinary pressure Jean Barlot *Compt rend* 201, 1137-8 (1935), cf. *C. A.* 29, 915 —On distg oil shale in a current of H_2 or $\text{CO} + \text{H}_2$ contg at least 60% H_2 , at ordinary pressure and without previous drying or purification, at 500-600°, the yield of crude oil is increased by 5-10% This oil distils almost entirely (0.5-1.5% pitch) below 350° and contains 25-30% unsatd hydrocarbons With treated, Esthonian kukkerite, schists from Autun, Creveney and Chilly yielded, resp. 23, 13, 6.5 and 5% of crude oil, contg 0.34, 0.18, 1.45 and 0.40% of S Most of the S passed off as H_2S C. A. Silberrad

Coal hydrogenation gasoline plant at Billingham Anon *Engineering* 140, 440-2 (1935). E. H

Copper is economical for sweetening refinery and natural gasolines W. A. Schultze and A. E. Buell *Oil and Gas J* 34, No 22, 42, 44, 46 (1935) —Gasoline can be sweetened by the use of Cu salts The Cu salts oxidize the mercaptans to disulfides and are themselves reduced to the cuprous compounds (1) $4\text{RSH} + 2\text{CuCl}_2 \rightarrow \text{RS-SR} + 2\text{RSCu} + 4\text{HCl}$, (2) $2\text{RSCu} + 2\text{CuCl}_2 \rightarrow \text{RS-SR} + 4\text{CuCl}$ (the CuCl can be reconverted to CuCl_2 by O_2 and HCl), (3) $4\text{CuCl} + 4\text{HCl} + \text{O}_2 \rightarrow 4\text{CuCl}_2 + 2\text{H}_2\text{O}$, combining the above reaction gives (4) $4\text{RSH} + \text{O}_2 \rightarrow 2\text{RS-SR} + 2\text{H}_2\text{O}$ CuCl can be reconverted to CuCl_2 simultaneously with the sweetening operation Some cracked gasolines discolor after Cu salts are used, but can be rendered color-stable if the sweetening operation is followed by a Na-S soln-wash. S and B. claim the following advantages over plumbite (1) saving in chem. costs, (2) no loss in gasoline, (3) no loss in octane no, (4) retention of natural gum inhibitors; and (5) quality of product. J. R. Strong

The "allowable boost ratio" G. D. Boerlage, L. A. Peletier and J. L. Tops. *Aircraft Eng.* 7, 306-8 (1935) —Allowable boost ratio is defined as boost pressure on sample at incipient knock, divided by boost pressure on standard fuel at incipient knock The authors prefer this test method for aviation fuels to the antiknock rating in octane nos M. W. Schwarz

Production of lubricating oils Separation of solvents and water in refining and dewaxing oils Eugene R. Smoley and Wheaton W. Kraft. *Ind. Eng Chem* 27, 1418-22 (1935) —A brief outline is given of solvent refining and dewaxing processes, used in the production of lubricating oils The importance of sepg solvent and water is indicated and the various methods of sepg them are discussed Marion E Headington

Chemical investigation of mineral lubricating oils. The action of chlorine and bromine on a medicinal mineral oil Emile André *Ann Combustibles Liquides* 10, 807-17 (1935)—A Prussian medicinal oil was chlorinated or brominated in CHCl_3 soln., the products contg 8.5% Cl, and 11.0% Br, resp. The halogens were detd by igniting with a large excess of CaO G Calingaert

Selection of lubricants for cold rolling of strip steel. R. W. Moore *Iron Steel Eng* 12, 21-b (Dec., 1935)—A discussion of lubricants used in connection with the rolling of steel strip through finishing mills during the final stages of processing. The primary purposes of a roll oil are (1) to minimize friction between the strip and the work rolls of the mill, (2) to furnish a protective coating on the strip to prevent scratching when the surfaces of the metal are in contact, and (3) to resist atm. or other conditions to which the finished strip may be subjected prior to further processing. Vegetable oils, mineral oils and compounded oils are employed. Mineral oils are being used more and more. Those with viscosities of 100-200 sec at 100°F (37.7°C) are most widely used. Characteristics to be considered in the selection of the roll oil are (1) film strength, (2) thermal properties, (3) ease of application, (4) ease of cleaning, (5) C deposits, (6) clumping characteristics, (7) adhesiveness, (8) ability to spread and (9) economy. Each characteristic is discussed W H Boynton

Use of tin compounds in lubricants. P C Barbosa *Rev. chim ind (Rio de Janeiro)* 1935, 404-5—Metallic Sn and Sn compounds, especially SnO_2 , tin tetraethyl and tin ricinoleate in amts. up to 1% act as retarders of oxidation and sludge formation in lubricating oils. Ca ricinoleate is an aging accelerator O W Wilcox

An attempt to raise the acetone yield from wood. Hilding Bergström and K. N. Cedergaard *Ind* 1935, 76-8.—In dry distn. of wood, a layer of marble in pieces placed over the wood chips in the retort did not improve the acetone yield, the marble became coated with C.

Determination of resinous matter in pyrogenous powder. V. P. Zemlyanitsin *Zavodskaya Lab* 4, 877-8 (1935)—To det. resinous matter in pyrogenous powder in the production of AcOH , dissolve a 5-g. sample in 50 cc. of hot water, add 50 cc. of concd HCl and 1.5 g. of powdered activated C, and boil the mixt. for a few min. Filter through a weighed Gooch crucible, wash the ppt. with hot water free from AcOH and Ca salts, dry in a steam-heated drying oven to a const. wt., weigh, ignite and weigh again. The difference between the wt. of ppt. and the combined wt. of ash and C gives the wt. of resinous matter. The corrections for the ash content of activated C and its loss in wt. on boiling with H_2O and HCl must be introduced. The latter is obtained by drying the C at 100° and boiling with H_2O and HCl as described above, followed by drying and weighing. The detn. can also be made by using a tared filter paper, which, together with the ppt., is dried to a const. wt., ignited and weighed. Chas. Blanc

Petroleum geology of Gondwana rocks of Southern Brazil (Oppenheim). 8. Gas-woks lubrication (Walker) 21. App. for measuring the heat cond. of oils. (Lederer) 1. Use of wood tar from gas generators for the prepn. of plastic compds. (Losev, et al.) 13. Disposal of oil-field brines in the Ritz-Canton oil field, McPherson County, Kansas (Wilhelm, Schmidt) 14. Hydrogenation of tertiary alkyl phenols to form hydroaromatic alks [use as lubricants for textile fibers] (U. S. pat. 2,026,668) 10. Oxygenated org. compds. from hydrocarbons (U. S. pat. 2,024,954) 10. Exhaust steam condenser and oil separator (U. S. pat. 2,025,043) 1. NH_4 sulfate [produced from sludge from refining hydrocarbons] (U. S. pat. 2,026,250) 18. App. for proportioning the flow of liquids as in refining petroleum oils (U. S. pat. 2,024,478-9-80) 1. Aminoanthraquinone compds. [for petroleum fractions] (Brit. pat. 434,906) 25. App. for distg. or calcining schist, peat or wood (Fr. pat. 780,114) 21. App. for lifting oil from wells (U. S. pat. 2,026,226) 1.

1 App. for sampling or visual examn. of oils (U. S. pat. 2,026,267) 1.

Petrolatum refining. Harry T. Bennett, Harris H. Hopkins and Jerry R. Marshall (to Mid-Continent Petroleum Corp.) U. S. 2,026,492, Dec. 31. U. Nitrate and anhyd. AlCl_3 are added to the petrolatum to be treated, followed by agitation while heated and sepn. of resulting sludge.

2 **Breaking petroleum emulsions.** Claudius H. M. Roberts (to Tretolite Co.) U. S. 2,023,976, Dec. 10. Neutral phthalic olefin is used as a demulsifying agent.

Breaking petroleum emulsions. Melvin De Groot, Bernhard Keiser and Arthur F. Wirtel (to Tretolite Co.) U. S. 2,025,804, Dec. 31. A demulsifying agent is used comprising a poly keto fatty acid compd. such as may be derived by pressure oxidation of castor oil, suitably with linseed oil, MeOH and solvent naphtha. U. S. 2,025,805 relates to similar use of a keto fatty acid material, such as may be derived from castor oil, suitably with C_6H_6 and LiOH .

Breaking petroleum emulsions. Charles N. Stehr (to Tretolite Co.) U. S. 2,026,195, Dec. 31. A demulsifying agent is used consisting of an anhyd. mixt., oil-sol. at least in high concns., comprising blown oil compds., such as those from castor oil 15-50, one or more acid salts of a sulfo fat acid such as an acid Na salt from sulfonated castor oil 2-15, an unsaponified S-free fat acid derived from sulfation of material such as castor oil followed by hydrolytic decompn. with splitting of sulfuric acid 20-60, and an aliphatic monohydric alc. such as iso-Pr alc. 2-25%.

Breaking petroleum emulsions of the water-in-oil type. Charles N. Stehr (to Tretolite Co.) U. S. 2,023,979, Dec. 10. A demulsifying agent is used which is produced by the super-oxidation of blown castor oil by the action of air at 200° and with continuation of the oxidation until the product is "semi-liquid" in consistency when freshly prepd., the oxidation being stopped just short of the point of kerosene-invol. U. S. 2,023,980 relates to the use of a demulsifying agent derived by the conventional oxidation (as by the action of air while heated) of a mixt. of castor oil and at least one semi-drying oil such as rapeseed oil in which the castor oil constitutes 40-80% of the mixt. U. S. 2,023,981 relates to the similar use of an oxidation product similarly derived from a mixt. of castor oil and sardine oil. U. S. 2,023,982 relates to like use of a demulsifying agent comprising blown castor oil or the like and dehydrated ricinoleic acid products such as may be formed by heating ricinoleic acid to slightly above 100°. Triethanolamine may be used as an acid neutralizing agent. Cf. C. A. 29, 7634 and following abstr.

Breaking petroleum emulsions of the water-in-oil type. Melvin De Groot and Bernhard Keiser (to Tretolite Co.) U. S. 2,023,993, Dec. 10. Demulsification is effected by use of dehydration products of ricinoleic acid of specified character such as may be produced by heating ricinoleic acid to above 100° and which are neutralized with a substituted basic amine such as triethanolamine and did. with a pine wood intermediate oil. U. S. 2,023,994 (Melvin De Groot and Arthur F. Wirtel (to Tretolite Co.)) A mixed demulsifying agent is used comprising dehydration products of ricinoleic acid such as specified in U. S. 2,023,993 in admixt. with blown fatty material such as blown castor oil and alkylated naphthalenesulfonic acid compds. in specified proportions. U. S. 2,023,995 (Melvin De Groot and Bernhard Keiser (to Tretolite Co.)) relates to the use of a demulsifying agent comprising an ester derived from a noncyclic nonfatty dibasic carboxy acid of the type $(\text{CH}_2)_n(\text{COOH})_2$, in which n is at least 5 and not more than 8, or castor oil or the like and an hydroxylated fatty acid compd. such as sebacic acid. U. S. 2,023,996 relates to similar use of a demulsifying agent comprising an hydroxyhendecenoic acid material of the formula type XTCOOZ , in which X is at least one O atom or at least one hydroxyl radical, or an acid residue, T is a hendecenoic acid residue and Z is an acidic H equivalent.

lent U S 2,023,997 relates to like use of an hydroxy-octadeca-9,11-dienonic acid material of the formula type XTCOOZ, in which X is at least one O atom or at least one hydroxyl radical or acid residue, T is an octadeca-9,11-dienonic acid residue and Z is an acidic H equivalent. U S 2,026,217, Dec. 31. Melvin De Groote and Bernhard Keiser (to Tretolite Co.) A demulsifying agent is used contg a hydroxylated, nonsulfo fatty acid compd of the type (R'TOH)COOZ, in which R' is a fatty acid hydrocarbon residue derived from a fatty acid or its glyceride, T is an aromatic residue attached directly to R', OH is a hydroxyl attached directly to T, COO is the carboxyl residue and Z is a "hydrogen-ion equivalent," such as the triethanolamine salt of phenol stearic acid. U S 2,026,218 relates to the use of a demulsifying agent comprising a sulfo compd derived by sulfonation of an unsatd oxy fatty material, such as a salt or ester of sulfobutenecenoic acid. U S 2,026,219 relates to the use of a demulsifying agent comprising a sulfite addn product derived by reaction between a water-sol sulfite such as NaHSO₃ and an unsatd reactive fatty material such as linseed oil.

Oxidized product of hydroxylated fat acids suitable for demulsifying water-in-oil petroleum emulsions. Melvin De Groote and Bernhard Keiser (to Tretolite Co.) U S 2,025,803, Dec. 31. Water insol hydroxylated fat acids obtained by the hydrolytic decompn of linseed oil type fat acid sulfates are blown with air or O until substantial oxidation takes place (suitably for several hrs at a temp of about 150°).

Producing steam for use in petroleum oil refining. Edward H. Clendenn (to Standard Oil Development Co.) U S 2,025,724, Dec. 31. Various features of app and operation are described.

Use of sulfur dioxide for extraction of petroleum oils. John T. Rutherford (to Standard Oil Co. of Calif.) U S 2,024,476, Dec. 17. Concd exts of unsatd. and aromatic constituents are obtained by extg a petroleum oil, such as a topped crude oil pressure naphtha, with SO₂, the extd. oil is sepd. from the SO₂ and the ext. being admixed with a petroleum oil which has been denuded of the greater part of its unsatd. and aromatic compds., and the mixed oils are subjected to a second extn. with SO₂.

Ammonium sulfate and denaturant from acid sludges produced in petroleum refining. John T. Rutherford (to Standard Oil Co. of Calif.) U S 2,025,401, Dec. 24. A sludge from petroleum oil refining is hydrolyzed with about 4 times its quantity of a mother liquor contg (NH₄)₂SO₄ and H₂SO₄ to sep. the material into an acid oil suitable for use as a denaturant after neutralization and distn. and the aq. phase resulting from the hydrolysis, after sepg. the acid oils, is treated with NH₃ for the production and pptn. of (NH₄)₂SO₄ and the mother liquor remaining after sepn. of the (NH₄)₂SO₄ is returned to the first step of the process. An arrangement of app is described.

Pour-point-reducing material from petroleum residue. Harry Levin (to Texas Co.) U S 2,024,106, Dec. 10. A cracking still residue is cracked and extd. with a solvent comprising a mineral-oil fraction of higher-boiling range than petroleum naphtha, such as a lubricating oil, to dissolve the desired constituents, the soln. thus formed is sepd. and ddd. with petroleum naphtha to ppt. the desired constituents in solid form, and the ppt. is removed. The product imparts pour-point-depressing and color-imparting properties to mineral lubricating oils.

Cracking hydrocarbon oils. Carbon F. Dubbs (to Universal Oil Products Co.) U S 2,025,500, Dec. 24. Oil is heated to a cracking temp. under pressure in a heating zone and thence discharged into a vapor-sepg. zone maintained under superatm. pressure, whence vapors and unvaporized oil are separately removed; the vapors are dephlegmated in contact with charging oil and reflux condensate, and the removed unvaporized oil from the sepg. zone is combined with a sufficient quantity of the mixt. of charging oil and reflux condensate substantially to check the cracking reaction in the unvaporized oil to

prevent C formation, and the admixed oils are introduced into a flashing zone maintained under a lower pressure than the sepg. zone and vapors from which are dephlegmated to condense heavier fractions which are fed to the heating zone. App. is described. Application for this patent was filed Jan. 17, 1927. U S 2,025,501 (issued on an application filed Aug. 15, 1929) relates to a somewhat similar process in which incondensable gases sepd. from dephlegmated vapors are heated by indirect heat exchange with vapors prior to their dephlegmation and are passed into heat-exchange relation with a reflux condensate to reboil it, the reflux condensate is combined with such condensate as may be formed by the heat exchange between the gases and vapors. App. and various other operative details are described. Cf. C. A. 30, 848².

Cracking hydrocarbon oils. Edward W. Isom (to Sinclair Refining Co.) U S 2,026,231, Dec. 31. Fresh oil such as fuel oil or gas oil is passed in a single pass through a heating zone such as a heated pipe coil or the like and thence into an enlarged vapor-sepg. zone, after being heated to a cracking temp. under pressure. The vapor-sepg. zone is maintained at a temp. and pressure sufficient to permit partial vaporization only and vapors are taken off and subjected to a 1st and 2nd refluxing, fresh oil is introduced into direct contact with the vapors in the 2nd refluxing and resulting reflux and admixed fresh oil are passed in a single pass through a sepg. heating zone and thence into the vapor-sepg. zone. Fresh oil being supplied to the 1st-mentioned heating zone is passed in indirect heat-exchange relation with the vapors in the 1st refluxing operation, and the oil in the 2nd heating zone is subjected to a vapor-phase cracking under a pressure lower than that maintained in the 1st-mentioned heating zone. App. is described.

Cracking hydrocarbon oils. Douglas P. Bailey (to Texas Co.) U S 2,026,505, Dec. 31. A condensate oil is heated to a high cracking temp. while passing through a heating coil and is thence passed into an enlarged cracking zone and vapor separator into which oil of a lower temp. is also introduced so as to subject the cooler oil to cracking; sepd. liquid is withdrawn from the enlarged zone at a rate sufficient to prevent accumulation, and sepd. vapors are passed to a secondary cracking zone for further cracking and from which liquid is also withdrawn to avoid accumulation and conducted to the enlarged cracking zone, vapors being passed to a fractionation zone for sepn. of a final light distillate and a reflux condensate which is passed to the heating coil. App. is described.

Cracking and coking hydrocarbon oils. Luis de Florez (to Texas Co.) U S 2,024,996, Dec. 17. A process for converting oil into a light distillate, heavy fuel oil and coke comprises heating the oil to a cracking temp. while passing it through a heating coil, introducing a portion of the stream of cracked products from the coil into a coking chamber, directly admixing a residual oil from a source extraneous to the system with the portion of the stream being introduced into the coking chamber, passing vapors from the coking chamber at a cracking temp. into a dephlegmating zone, introducing a stream of fresh charging stock into the dephlegmating zone for subjection to a cracking temp. by heat exchange with the vapors, introducing a further portion of the hot cracked products from the heating coil directly into the dephlegmating zone, withdrawing liquid from the dephlegmating zone as a heavy fuel-oil product, fractionating vapors from the dephlegmating zone to produce a condensate heavier than gasoline and passing condensate back to the heating coil, and condensing final light vapors from the fractionating zone. App. and various operative details are described.

Separating olefins from gaseous mixtures such as those from oil cracking. Harry T. Bennett (to Mid Continent Petroleum Corp.) U S 2,026,265, Dec. 31. Dichloroethyl ether is used as a selective solvent for the olefins.

Apparatus for cracking hydrocarbon oils in the vapor phase. I. Morris Levine (to Texas Pacific Coal & Oil Co.) U S 2,024,828, Dec. 17. Various details are described of an app. in which a chamber for the oil vapors

to be cracked is heated by gases passing around the chamber and through tubes extending through it.

Furnace and heating-tube system suitable for heating oils for cracking or distillation John C Black U S 2,026,120, Dec 31. Structural details.

Return-bend fitting suitable for oil-cracking and refining apparatus John F Getzen (to Fred C Fantz) U S 2,024,572, Dec 17. Structural details.

Return-bend fitting for high-pressure oil-cracking apparatus Herbert C Stockham (to Fred C Fantz) U S 2,021,399, Dec 17. Structural details.

Return-bend fitting for oil-refining apparatus Fred C Fantz U S 2,024,347, Dec 17. Various structural details.

Return-bend fitting for oil-still apparatus, etc. Samuel H Edwards (to Standard Oil Co of Calif) U S 2,026,674, Jan 7. Structural details.

Refining hydrocarbon oils N V de Bataafsche Petroleum Maatschappij Fr 780,175, Aug 28, 1935. Nonparaffinic hydrocarbons are removed from oils by an extn with a mixt of 2 furalsdehyde (60) and $C_{12}H_{14}$ (40%).

Refining hydrocarbon distillates Richard F Davis (to Universal Oil Products Co) U S 2,024,681, Dec 17. A distillate such as a cracked gasoline contg unsatd hydrocarbons and S compds is treated with SO_2 in the presence of $AlCl_3$ (suitably in the vapor phase). App is described.

Hydrocarbon oil conversion Jean D Seguy (to Universal Oil Products Co) U S 2,025,532, Dec 24. Oil is subjected to conversion conditions of heat and superatm pressure in a heating coil and reaction chamber and then discharged into a reduced pressure chamber where vapors sep from non-vaporizable residue, the vapors are subjected to fractionation followed by condensation and collection of resulting distillate and uncondensed products, and the latter, following their sep from the distillate, are subjected to liquefaction to effect the removal of their higher-boiling constituents, and the recovered liquid is subjected to further conversion at a higher temp than that employed in the first-mentioned heating coil and the heated liquid is introduced into the reduced pressure chamber. App is described. Cf C A 29, 3507.

Fractionating hydrocarbon oils. N. V. de Bataafsche Petroleum Maatschappij. Fr 780,038, Aug. 24, 1935. An oil is introduced wholly or partly in the liquid or vapor state into one or more fractionating columns, preferably almost midway between the top and bottom, and one or more fractions are withdrawn as vapor between the bottom and the point of admission and submitted in a sep zone to a partial condensation, while the heavier constituents formed during the condensation are returned to the 1st column, preferably at the same place from which the vapor is withdrawn from the column or near this place.

Heating coils such as those used for hydrocarbon oil treatment Percival C. Keith, Jr (to Gasoline Products Co.) U. S. 2,025,667, Dec. 24. For increasing the heat-reflective capacity of selected parts of a tubular heating coil exposed to radiant heat, the selected parts are painted with a paint contg. a white pigment such as lithopone or CaO capable of being subjected to normal furnace conditions without material discoloration and a vaporizable vehicle such as water contg. Na silicate and the coil is heated to vaporize the paint vehicle and fix the pigment on the coil surface as a relatively thin adherent layer. App is described.

Refining mineral oils. Bernhard R. Carney and Ralph H. Crosby (to Shell Development Co.) U. S. 2,026,213, Dec. 31. See Can. 350,629 (C. A. 29, 62609).

Distilling acid-treated mineral oils Brian Mead (to Standard Oil Development Co.) U. S. 2,025,766, Dec. 31. A sufficient quantity of an oil-sol. soap such as Na naphthenate is added to the oil practically completely to take up any acid-reacting substance evolved from any residue of the treating acid during the distn. of the oil and the distn. is effected in the presence of this added soap. An arrangement of app. is described.

Separating naphthenic and paraffinic constituents of mineral oils James M. Whiteley, Jr (to Standard Oil De-

velopment Co.). U. S. 2,025,965, Dec. 31. The oil is extd with phenol in the presence of an added liquid (such as liquefied C_4H_{10} and C_6H_6) having greater solvent power for paraffinic constituents than for naphthenic constituents.

Increasing the oil production of oil wells Wm V. Viets and Allen D. Garrison (to Texas Co.). U. S. 2,024,119, Dec 10. For increasing the proportion of oil and decreasing the proportion of water produced from an oil well, there is deposited in a water-wet sand adjacent the well a chemical ppt. such as a Ca salt of sulfonic sludge acid which acts to render the sand less permeable to water without substantially retarding the flow of oil to the well.

Treating oil or gas wells to increase production Leonard C Chamberlain (to Dow Chemical Co) U. S. 2,024,718, Dec 17. There is introduced into the well a water-sol agent such as EtOH capable of substantially lowering the surface tension of water and an acid such as HCl capable of forming water-sol salts with the earth formation.

Treating mineral absorbent material such as that used in oil refining Geo R Lewers (to Nichols Engineering and Research Corp) U S 2,024,589, Dec 17. Various structural and operative details of a multiple hearth furnace are described.

Purifying oils, waxes and synthetic resins Standard Oil Development Co. Brit 431,072, Sept. 6, 1935.

Heavy hydrocarbon oil, e. g., lubricating oils, resins, e. g., those obtained by polymerizing unsatd hydrocarbons or by condensing unsatd hydrocarbons with aromatic hydrocarbons, etc., are treated with light hydrocarbon solvents at within 80° F of the crit temp of the solvent, whereby the oil, resin, etc., is sep into 2 layers which are removed and oil, resin, etc., recovered therefrom. App. is described. In 434,714, Sept. 6, 1935, divided on 434,672, the oil, resin, etc., is treated with a light hydrocarbon solvent and sep. into layers contg. heavy and light fractions and the heavy fraction is further treated with the solvent at a lower temp. App. is described. In modifications of the process, the extn is effected in (1) sep stages of decreasing temp, in which the heavier fraction proceeds from 1 stage to the next and the lighter fraction is drawn off at each stage, or (2) sep. stages of increasing temp, the lighter fraction proceeding from 1 stage to the next in 1 direction and the heavier fraction in the opposite direction.

Flange oil. Harry T. Bennett (to Mid-Continent Petroleum Corp.). U. S. 2,026,491, Dec. 31. A flange oil having a Furol viscosity between 200 and 375 comprises 50-25% of an adhesive residuum from a fractional distn of petroleum and having a Furol viscosity between 10,000 and 35,000 at a temp. of 50° and 50-75% of an adhesive residuum resulting from a cracking operation and having a Furol viscosity between 10 and 125 at 50°.

Antiknock fuels. International Hydrogenation Patents Co. Ltd. Fr. 780,145, Aug. 27, 1935. Middle oils from any source are treated by H under pressure and in the presence of catalysts having an intense hydrogenating action and submitting, without the addn. of H₂, the fractions obtained (after removal of fractions b below 100° or below 150°) to a heating under conditions of temp, pressure and duration that a product is obtained poorer in H but without appreciable change of the mol. wt. of the whole of the final products. In an example a temp. of 420° and pressure of 200 atm. is used in the 1st step, and 500-520° and 80-100° in the 2nd.

Antiknock fuel. The Pure Oil Co. Fr. 780,207, Aug. 29, 1935. Gases contg. olefins in a relatively dil. state are brought into contact with a solvent which easily dissolves the olefinic hydrocarbons but not the H and CH_4 . The dissolved gases are sep. from the solvent, compressed and heated to polymerization temp., allowing a large part of the olefins to be converted to liquid fuel which is sep. from gaseous constituents.

Antiknock fuel. N. V. Nieuwe Oetropi Maatschappij. Fr. 787,664, Sept. 25, 1935. Crude oil is fractionated to give a light fraction from direct distn., a fraction of naphtha and a heavier fraction than the naphtha fraction.

The 1st fraction is passed to a sep. condenser. The 2nd fraction is vaporized, superheated and mixed with a gas serving as heat carrier in a reaction zone. The conversion products are brought into contact with a washing fluid to ext. the tar and C and part of their heat. The 3rd fraction is brought into contact with the reaction products in the washing operation. App. is illustrated.

Cracked motor fuel. Wm M. Stratford (to Texas Co.). U. S. 2,024,117, Dec. 10. Cracked petroleum naphtha is extd. with a mixt. of furfural and water proportioned to remove about 10% by volume of the original naphtha as an ext. contg. gum-forming constituents and undesirable S compds. without substantial impairment of the antiknock properties of the naphtha.

Stabilizing cracked motor fuel. Frederick B. Downing and Herbert W. Walker (to E. I. du Pont de Nemours & Co.). U. S. 2,025,192, Dec. 24. About 0.001-1.0% of a dihydroxynaphthalene is added to inhibit gum formation. Cf. C. A. 30, 279.

Refining cracked gasoline. John C. Black (to Gasoline Products Co.). U. S. 2,025,409, Dec. 24. The material is subjected, in vapor phase, to partial condensation to produce a 1st condensate requiring chem. treatment and a 2nd vapor which requires no chem. treatment and which represents at least 20% of the mixt. being treated, the 2nd vapor is sep'd. into liquid products substantially free of normally gaseous hydrocarbons and into a gas, the first condensate is chemically treated while in substantially the same conditions as when sep'd. and the treated condensate is blended with the liquid products sep'd. from the 2nd vapor. An arrangement of app. is described.

Refining a sulfur-containing cracked gasoline distillate. Jack F. H. Taylor and Harold I. Lounsbury (to Shell Development Co.). U. S. 2,025,255, Dec. 24. The distillate is divided into a series of fractions of successively higher b. p., one of the limits of one of the b. p. ranges being so selected as substantially to correspond with a b. p. range limit of one of the sulfurous fractions in which S-bearing substances are conc'd. as the result of cracking and so as to include the sulfurous fraction in the oil fraction of corresponding b. p. range. An arrangement of app. is described.

Filter suitable for gasoline. Jean Zwicky (to Zwicky Ltd.). U. S. 2,024,753, Dec. 17. Structural, mech. and operative details.

Storage tank suitable for holding gasoline, etc. James O. Jackson. U. S. 2,026,279, Dec. 31. Structural features.

Oil or gasoline storage tank with a floating roof. Harry L. Babcock (to Graver Tank & Mfg. Co.). U. S. 2,024,327, Dec. 17. Various structural details.

Dewaxing hydrocarbon oils. Bernhard Y. McCarty and Wm. E. Skelton (to Texas Co.). U. S. 2,024,107, Dec. 10. A wax-bearing oil such as a lubricating-oil fraction is mixed with a selective solvent composed of o-dichlorobenzene and an aliphatic ketone, such as acetone or methyl ethyl ketone, having wax antisolvent properties such as those of acetone in such proportions that at temps. of about -22° the mixt. has substantially complete solvent action on the oil but substantially no solvent action on the wax; the mixt. is chilled to ppt. the wax, the wax is sep'd. and the solvent is removed from the dewaxed oil. Cf. C. A. 29, 3149.

Removing wax from oil. Robert E. Wilson (to Standard Oil Co. of Ind.). U. S. 2,026,336, Dec. 31. Waxy oil dissd. with a normally gaseous diluent such as liquefied propane is cooled in a closed chll. chamber by condensing vapors above the mixt. in the chamber so that the pressure in the chll. is lowered and the vaporization of the diluent is increased, and the cold-condensed diluent is returned to the body of dissd. oil wax mixt. Wax slurry is passed to a filter. App. and various operative details are described.

Separating waxes from oils. Standard Oil Development Co. Fr. 787,163, Sept. 18, 1935. The oil is dissd. by a solvent of sp. gr. less than that of the wax to be eliminated, a "sepn. additive compd." is added of the type produced by the passage of an a. c. of high frequency through an org. compd. having a relatively long straight

chain. The dissd. mixt. is cooled to effect solidification of the wax and the solid wax is sep'd.

Apparatus and method for dewaxing oils by use of propane, butane, etc. Donald E. Payne (to Standard Oil Co. of Ind.). U. S. 2,026,651, Jan. 7. Various structural and operative details are described.

Petroleum lubricating oils. John D. Fields. U. S. 2,024,968, Dec. 17. For conditioning low-gravity petroleum oils for removal of S from them, the oil is heated in a closed container with cellulosic vegetable material such as wood, cane refuse or hemp to a temp. sufficient to effect decompn. of the vegetable material, under a pressure (suitably about 100-140 lb. per sq. in.) not exceeding 140 lb. per sq. in. for a sufficient time to cause breaking of the bond linking the S to H and C in the oil so that the S can be readily removed from the resulting distillate and residual oil, at least in substantial part, by washing with water.

Lubricating oils. Hermann Zorn, Gerhardt Hofmann and Walter Rousinsky (to I. G. Farbenind. A.-G.). U. S. 2,025,490, Dec. 24. A vegetable fatty material such as soybean oil or olive oil is either heated to 300-500° in the presence of a catalyst having a splitting action such as oxides of Cu and Al or is treated with H at 200-300° under a pressure of 50-300 atm. in the presence of a catalyst having a reducing action such as Cu chromite and the resulting product, after dehydration, is treated with a condensing agent such as AlCl₃ at a temp. of about 120° to produce a lubricating oil.

Lubricating oils. Standard Oil Development Co. Fr. 787,381, Sept. 21, 1935. Oils are purified by treating them with an undissd. mixt. of liquid solvents composed of pure PhOH and crude phenol (or other member of the class comprising crude phenol and cresol) at a temp. below that at which the mixt. becomes completely miscible with the oil, sep'd. the layer of oil from the layer of mixt., and removing the dissolved solvent from the layer of oil.

Lubricating oils. The Standard Oil Co. of Ohio. Fr. 787,717, Sept. 27, 1935. Paraffin is removed from oils by treating them with SO₂, alone or with the addn. of a volatile org. solvent while cooling the mixt. to about -15°.

Refining oils such as mineral lubricating oils. Lawrence M. Henderson (to Atlantic Refining Co.). U. S. 2,024,221, Dec. 17. A mixed aliphatic-aromatic amine such as phenylmethylamine is used as a selective solvent for sepn. of fractions resp. richer in paraffinic and naphthenic compds. than the material treated.

Filter for lubricating oils. Manufacture de machines auxiliaires pour l'électricité & l'industrie. Fr. 787,686, Sept. 26, 1935.

Apparatus for production of high-grade lubricating oils by heating oil with hydrogen-containing gas under pressure, etc. Wm. L. Gomory (to Standard Oil Development Co.). U. S. 2,025,354, Dec. 24. Numerous structural and operative details.

Apparatus (with a light-sensitive cell) for testing lubricating oils, etc. Mead Cornell and Charles C. Curtis (to Charles C. Broadwater). U. S. 2,024,720, Dec. 17. Various structural, light-regulating and operative details.

Lubricant. Standard Oil Development Co. Fr. 787,577, Sept. 25, 1935. A lubricant comprises a lubricating oil and a linear polymer of C₂H₄, not contg. O, e. g., 0.2-10% of hydrogenated polyvinylacetate or alkylated polychloroprene.

Lubricant. I. G. Farbenind. A.-G. Fr. 787,801, Sept. 30, 1935. A lubricant comprises a major portion of a lubricating oil and a minor portion (0.25%) of a residue which is solid at ordinary temp. and which is obtained by distn. under vacuum of a deasphalted hydrocarbon product contg. cyclic constituents. Thus, an addn. product is obtained by removing asphalt from the product of destructive hydrogenation of coal and distg. under vacuum, a red-brown resin being obtained as residue.

Lubricants from fatty oils. Primo Perucca. Ger. 621,443, Nov. 7, 1935 (Cl. 23c 1). See Fr. 747,016 (C. A. 27, 4919).

Penetrating lubricant suitable for use with leaf springs.

Roy D. King (to Socony-Vacuum Oil Co.). U. S. 2,025,517, Dec. 24. Pine fatty acids and defoliated graphite are used with a preponderating proportion of a nonviscous petroleum distillate.

Lubricating grease. Gus Kaufman (to Texas Co.) U. S. 2,024,990, Dec. 17. A normally solid lubricant suitable for use with ball or roller bearings comprises neat's-foot oil, an alkali metal soap of neat's-foot oil and 30-50% of mineral lubricating oil, in homogeneous and substantially dehydrated mixt.

Removing foreign matter from used journal-box waste oil. Wm. T. Bissell and Thomas W. Potter (to Journal Box Servicing Corp.). U. S. 2,023,988, Dec. 10. Na silicate about 600 lb and a 20% aq soln of Na aluminate about 5 gal are added to about 1000 gal of dirty oil (the combined proportion of the silicate and aluminate being 3.5-8% of the oil) and the mixt is agitated and heated to above 100° and a ppt is allowed to form and is sep'd.

Apparatus for reclaiming oil such as that from internal-combustion engines by heating and filtration. Paul Williams (to Skinner Purifiers, Inc.). U. S. 2,023,986, Dec. 10. Various structural and operative details.

Apparatus for filtering and reclaiming contaminated oils. Frank M. Clark (to General Elec. Co.). U. S. 2,025,570, Dec. 24. Various structural and operative details.

Products resembling petrolatum. I. G. Farben und A.-G. Fr. 786,472, Sept. 3, 1935. Such products are obtained by mixing waxy polynuclear chlorinated hydrocarbons, oily and resinous polynuclear chlorinated hydrocarbons, small amts of oils such as paraffin or mineral oils and (or) small amts. of waxes such as ozocerite or artificial waxes. An example contains waxy chlorinated $C_{12}H_{18}$ (50% Cl content) 49, chlorinated Ph_2 (59% Cl content) 59, ozocerite 0.5 and paraffin oil 0.5 parts.

Apparatus for cooling and granulating asphalt. Standard Oil Development Co. Fr 787,734, Sept. 28, 1935. Asphalt and a liquid hydrocarbon b. below 0° (propane)

are mixed and passed into a vessel of large dimensions so that the asphalt is solidified to small particles and the hydrocarbon is gasified.

Rapidly setting asphalt. Charles M. Daskin (to Standard Oil Development Co.). U. S. 2,025,709, Dec. 31. A rapidly setting liquid asphalt of approx. 200 viscosity Furol at a temp of 60° comprises a soln. of 70-83% of asphalt of 80/100 penetration (N. Y. penetrometer) at a temp of 25° derived from the cracking of petroleum oil under at least 350 lb. per sq. in. pressure with 30-17% of distillate obtained from cracking petroleum oil.

Asphalt from oil residues. Herman T. Swerissen (to Shell Development Co.). U. S. 2,026,073, Dec. 31. A mineral oil residue contg naphthenic soaps is treated with just enough inorg acid such as an acid sludge to reduce its naphthenic soap content as desired by decompn. of the soap, and the substantially neutral residue, contg. products of decompn of the soaps, is subjected to an oxidizing treatment.

Asphaltic product from cracked oil residuum. Felton S. Dengler, Earl W. Gardner and Dudley H. Felder (to Texas Co.) U. S. 2,024,046, Dec. 10. Cracked residuum relatively high in unstable CCl_4 -insol compds is heated and blown with air to remove low-boiling constituents to increase its hardness and raise its m. p. and mixed with an air-blown substantially uncracked asphaltic residue adapted to stabilize the unstable CCl_4 -insol compds. in the cracked residuum and to inhibit their formation and segregation.

Treating asphalt to prolong its "adhesive life." Geo. R. Hoover (to American Rolling Mill Co.) U. S. 2,026,039, Dec. 31. Asphalt, while liquid and at an elevated temp, is blown with air to which NH_3 is added.

Mixing and masticating apparatus suitable for use with asphalt mixtures. Burns A. Stewart (to Patent and Licensing Corp.) U. S. 2,025,077, Dec. 24. Mech. features.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Molecular weight of cellulose. J. Marchlewska-Roczniki Chem 15, 331-7 (1935).—The mol. wts. of different samples of cellulose treated with acetone were detd. by the van Campen dynamic osmotic pressure method (van Campen, C. A. 25, 5331) (R. Obogi and L. Brodka, C. A. 29, 1696). The values range from 27,000 to 37,000. J. I. Matejczyk.

Solka, the purified cellulose—its development, characteristics and application to industry. C. S. Kaufman. Proc. Am. Assoc. Textile Chem. Colorists 1935, 338-60, Am. Dyestuff Repr. 24, 734-6 (1935).—Solka is a fiber ranging from 93 to 98% pure α -cellulose. Applications in various lines are mentioned. W. H. Boynton.

The synthesis of butylcellulose. S. Ushakov and V. Konkova. Kunststoffe 25, 169-73 (1935), cf. C. A. 29, 3151.—In disagreement with Nowakowski (cf. C. A. 26, 6122) U. and K. have found it possible to butylate alkali cellulose with BuCl. Most of U. and K.'s expts proceeded as follows. Linters were mercerized by treating them for 24 hrs with NaOH solns. of 50, 40 or 20% concn, and then allowed to ripen for 24 hrs. Excess caustic was removed by pressing. The alkali cellulose so obtained was ground in a mortar and butylated by reacting with 5, 7, 10 and 20 mols. BuCl and 5, 7, 10 and 10 mols NaOH, resp. per C₆ cellulose unit. Butylation was carried out at temps. ranging from 110° to 125°. A Ag-lined autoclave was used and the duration of heating varied from 8 to 30 hrs. In a few expts the alkali cellulose was subjected to repeated (stepwise) butylation. In any case, the product was purified by successively washing with hot water, grinding up with water and pouring on a filter, steam distg off as much BuOH as possible and vacuum drying at 60-70°. Soln. in CH_2 and, to a lesser extent, soln. in an 80% CH_2 -20% alc. mixt., as well as yield of cellulose ether increased very rapidly as the

duration of heating was lengthened up to 12 hrs. and more slowly thereafter. The temp. of heating in these expts was 123-5°, 10 mols. of BuOH and NaOH being used per C₆ unit. Similar results were obtained on increasing the amt. of BuCl up to 10 mols. while holding the butylation temp. at 123-5° for 12 hrs. It may be said that in general a butylation temp. of 123-5° gives somewhat better results than 110°. A mercerizing caustic contg. 50% to 40% NaOH was preferred as otherwise pressing the alkali cellulose caused excessively large caustic losses. Stepwise butylation at 123-5° yielded the most highly butylated product with a benzene soly of 93.9%. Films prep'd from 8% benzene solns. possessed excellent resistivity to water, strong H_2SO_4 and 20% caustic. The relatively poor mech. strength of such films is apparently ascribable to the Bu radical itself (cf. Frank and Caro, C. A. 24, 4270). J. W. Perry.

A method for treating celluloid wastes. S. Rozenblyum. Plasticheskie Massy 1935, No 3, 29.—Waste celluloid is softened with addn of soap and talc and pressed into blocks which can be sliced and used again.

Synthetic textile fibers. H. Roche. Silk J. 12, No 139, 40 (1935).—A review is given of processes for fibers other than viscose and cellulose acetate fibers. H. E. S.

Standard types of defiberizers. A. A. Khelebnikov, Ya. G. Rozental and P. E. Pimenov. Leningrad. Oblast. nol. Secet Nauch. Inzhenerno-Tekhn. Obshchestva Trelyuzno-Bumazhnol Prom (Problems of Pulp-Paper Production) No 4, 42-55 (1935).—Screw defiberizer is considered the most satisfactory of the continuous-action type of defiberizers. A four-press hydraulic defiberizer is considered more economical than a screw defiberizer. Chas. Blanc.

Method of analysis and composition of pumiceous defibering stones. M. I. Koffman. Bumazhnaya Prom

14, No. 9, 28-35 (1935).—The compn of several grades of Norwegian debarking stones was detd by a method of mech decompn and microscopic analysis. The working top layer is composed of ground corundum-pumice 60-1, Portland cement 16-29, Na₂SO₄ 10.6-14.5 and org matter 0.2-0.4%. The loss in wt on ignition is about 8%. The core contains feldspathic sand 55, sawdust 4-5, Portland cement 18-25 and Na₂SO₄ 8-14%. The loss in wt is about 7%. Chas. Blanc.

Results attained in sulfite digesters by combined acid and gas circulation. O. Kreusler. *Svensk Papperstidn* 38, 630-61 (1935).—A historical resumé. W. S.

Formulas for calculation of wood-pulp production. P. I. Borovoy. *Leningrad Oblasnii Sovet Nauch. Iskuzhenno-Tekhn. Otshektrno-Tekhn. Prom. Problemy of Pulp-Paper Production* No. 4, 55-63 (1935).—A math treatment of various phases of wood-pulp production. Chas. Blanc.

Viscose pulp and viscose pulp woods. VII. Chemical compositions of Japanese and Manchurian birches. Masuzo Shikata and Hideo Onishi. *J. Agr. Chem. Soc. Japan* 11, 879-8 (1935).—The wood of *Betula ermanii* Champ var. *communis* Kodz. produced in Karafuto contained H₂O 8.12, alc-ether ext. 5.43, cold-H₂O ext. 0.65, hot-H₂O ext. 2.14, 1% NaOH ext. 29.77, mannann 0, galactan 0.74, pentosan 25.14, hemicellulose 25.68, total cellulose 53.25 (α-cellulose 70.52, β-cellulose 11.45 and γ-cellulose 17.50), crude protein 0.72, ash 0.24 and Lignin 21.50%. The wood of *Betula japonica* Sieb. produced in Karafuto and Manchukuo contained, resp., H₂O 8.42, 9.16, alc-ether ext. 5.18, 6.02, cold-H₂O ext. 0.89, 1.16, hot-H₂O ext. 5.38, 10.31, 1% NaOH ext. 24.29, 28.14, mannann 0, galactan 0.51, 0.43, pentosan 21.01, 24.13, hemicellulose 21.52, 24.56, total cellulose 53.99, 54.38 (α-cellulose 70.19 and 67.53, percentage of total cellulose), crude protein 0.63, 0.49, ash 0.12, 0.53, and lignin 21.17, 21.28%. VIII. Chemical composition and cooking test of Manchurian fir, *Abies nephrolepis* Maxim. Masuzo Shikata and Kenkichi Tadokoro. *Ind.* 925-39.—*Abies nephrolepis* Maxim. contained H₂O 10.99, alc-benzene ext. 4.10, 1% NaOH-sol matter 12.78, hot-H₂O-sol matter 3.17, cold H₂O-sol matter 1.12, total cellulose 49.57, α-cellulose 27.08, hgm 26.77, pentosan 12.92, mannann 5.54, galactan 0.79, hemicellulose 19.25, methoxyl 5.20, N 0.86 and ash 0.29%. It resembled in chem compn karafuto fir, *Abies sachalinensis* Fr. Schum. The Manchurian fir was cooked with 1% Ca and Mg bisulfite soln at 145° for 8 hrs under 75 lb/sq in., a comparatively good viscose pulp was obtained. Y. Kihara.

Effect of sodium hydroxide, sulfite, sulfite and carbonate on straw pulping. K. A. Dolgor. *Bumachnyye Prom.* 14, No. 10, 21-35 (1935); cf. *Tekhn. Nauch.-Isledovatel. Inst. Bumachnoi Prom. Materialy* 1931, No. 1.—Rye straw (13.5% moisture content) was pulped 3 hrs at 140°, 155° and 170° with equiv. amts. of NaOH, Na₂S, Na₂SO₃, Na₂CO₃, Na₂S + NaOH, NaOH + Na₂SO₃, Na₂SO₃ + Na₂S, Na₂SO₃ + Na₂S + NaOH at a diln. of 8 parts of liquor to 1 part of straw. Conclusions: At 155° Na₂SO₃ gave 54.07%, Na₂S 48.48% and NaOH 42.89% of unbleached pulp. At 140° the yields are considerably larger, because of the increased contents of lignin (by 1.78%), cellulose (1.54%) and pentosans in the monosulfite pulp, and cellulose (1.58%), pentosans and hgm in the NaOH pulp. The best liberation of fiber and highest degree of wetness are effected with Na₂S, followed by NaOH and then by Na₂SO₃. The degree of delignification decreases in the following order: Na₂S + NaOH, NaOH, Na₂SO₃ + Na₂S + NaOH, Na₂SO₃ + Na₂S, Na₂SO₃ + NaOH and Na₂SO₃. The decoloration of the stocks (dark brown) is greatest with NaOH and Na₂S, and lowest (gray) with Na₂SO₃ + NaOH and Na₂SO₃ + Na₂S + NaOH. The latter products can be used without bleaching in the manuf. of some grades of white paper. NaOH and Na₂S act on straw lignin with the formation of salt-like products, which on acidulation sep. org. substances in the amt. nearly equiv. to that of Lignin dissolved in the pulping process. With Na₂SO₃ Na lignosulfonate is formed. The action of

NaOH, Na₂S, Na₂CO₃ and Na₂SO₃ on S.O₂ in straw decreases in the order given. A large part of pentosans (about 50% in soln.) is decomposed, probably into the corresponding acids. With NaOH this decomposition leads to formation of reprecipitation products incapable of giving furfural with HCl. At 140° Na₂CO₃ causes considerable delignification and demerization of straw with solvation of 10% of available pentosans. The effect of Na₂CO₃ in pulping with NaOH and NaOH + Na₂S is probably insignificant, but is very strong in pulping with Na₂SO₃ and Na₂SO₃ + NaOH. The difficulties in bleaching NaOH and sulfate stocks increase with the higher temp. of pulping (from 140° to 155°). This may be explained by the formation of humic substances and products of pentosan reprecipitation becoming partly fixed on the pulp fibers. Pulping with Na₂SO₃ at higher temps. results in better bleachable stock. More easily bleachable stock of greater whiteness is obtained at 140° and 155° with Na₂SO₃ + NaOH, followed by Na₂SO₃ + Na₂S + NaOH. The action of mixed alkalis is more favorable than that of any single reagent (NaOH + Na₂S acts better than NaOH, and Na₂SO₃ + NaOH acts better than Na₂SO₃), because of the more effective and milder seps. of incrustations. In the process of pulping with reagent's contg. S, the S compds. are oxidized (perhaps with the aid of certain catalysts) probably at the cost of decomposition of certain org. substances. Chas. Blanc.

The use of liquid sulfur dioxide in making cooking liquor. Feltz Bergström. *Finnisk Papper och Timber J.* 1935, 922-4.—The equipment for the transportation and use of liquid SO₂, such as steel tank cars, storage tanks and valves, is described. By using liquid SO₂ the compn. of the cooking liquor can be regulated according to the requirements. E. E. Jukkola.

Standardization of beaters. A. M. Berlin, K. P. Belavin and P. I. Borovoy. *Leningrad. Oblasnii Sovet Nauch. Iskuzhenno-Tekhn. Otshektrno-Tekhn. Bumachnoi Prom. (Problems of Pulp-Paper Production)* No. 4, 3-25 (1935).—Standardization of beaters for reworking of paper and newsprint wastes. *Ibid.* 26-35.—A comparative discussion of the construction and performance of various types of beaters with illustrations and math. treatment. Chas. Blanc.

Production of fine paper from eiled and tarred rag waste. G. S. Tumpkin. *Bumachnyye Prom.* 14, No. 10, 50-5 (1935), cf. Sokolov, *Tekhn. Nauch.-Isledovatel. Inst. Bumachnoi Prom. Materialy* 1931, No. 1, 36.—Canvas and 6-inch waste was cooked with 8-10% CaO and 2-3% NaOH at 3-4 atm. for 6-10 hrs., depending on the degree of contamination with oil and tar, and then bleached with 12% Ca(ClO)₂. The stock after reworking was used in mixt. with 25% of bleached and 25% of unbleached sulfite pulp in the production of a good grade of cigar paper. Chas. Blanc.

Production of vulcanized fiberboard. D. F. Lebedev. *Leningrad. Oblasnii Sovet Nauch. Iskuzhenno-Tekhn. Otshektrno-Tekhn. Bumachnoi Prom. (Problems of Pulp-Paper Production)* No. 4, 64-102 (1935).—A comprehensive discussion of all phases of production of vulcanized fiberboard and recovery of waste products. Chas. Blanc.

Soln. of nitrocellulose (Tocman). 2. Hydrolysis of cellulose and its oligosaccharides (Frendenberg, Bloquist) 10. App. for drying continuous webs of paper (U.S. pat. 2,024,827) 25. Powd. substances [nitrocellulose and benzylcellulose] (Fr. pat. 757,323) 1.

Cellulose from lignocellulose materials. Walter H. Greenbridge and Eric V. Mellors (to Celanese Corp. of America). U. S. 2,024,689, Dec. 17. Material such as wood, straw or grass is etrid. at an elevated temp. with a solvent mixt. contg. a substantial proportion of water and at least 2 org. liquids such as acetone and EtOH which are chemically inert toward Lignin and which have substantially different dielectric constants due to the presence in the mols. of groups of different type. Cl. C. A. 30, 82²¹.

Alkali cellulose; viscose. I. G. Farberindustrie A.-G.

Brit. 434,540, Sept. 4, 1935. See Fr. 784,935 (C. A. 30, 6119).

Regenerated cellulose products Henry Drevfus U. S. 2,025,940, Dec. 31. Regenerated cellulose materials, such as filaments, etc., are treated with sulfonic acids, such as sulfacetic acid or the like of at least 60% concn in the absence of inorganic acids, to give improved strength or elasticity or modified luster.

Regenerated cellulose sheets, films, etc. Daniel W. Loese (to Johnson-Loese Corp.) U. S. 2,025,000, Dec. 17. Urea phosphate is used as a treproofing addn and sheets or films of regenerated cotton cellulose contg. sufficient of the natural incrustations to waterproof the material are provided with a transparent, flexible, non-tacky coating such as a pyroxylin compn.

Inhibiting distortion of regenerated cellulose films Clarence E. Coleman (to DuPont Cellophane Co.) U. S. 2,025,376, Dec. 24. A roll of the film is aged in an atm. having a relative humidity of 30 to 40 for a time (which may be about 40 hrs. or longer) sufficient to relieve at least a large part of the internal strains present in the film.

Cellulose derivatives Walter F. Hoffman (to Cellosis, Inc.) U. S. 2,025,283, Dec. 24. Cellulose fibers such as aspen wood pulp together with a volatile liquid such as water and a foaming agent such as soapin are formed into a foam which is dried to form a fibrous distended porous fibrous mass and the latter is treated with a reactive fluid such as a nitrating or acetylating agent.

Cellulose derivative compositions Geo. D. Graves (to E. I. du Pont de Nemours & Co.) U. S. 2,025,048, Dec. 24. A cellulose deriv. such as cellulose nitrate or acetate or ethylcellulose is plasticized with a carboxylic acid ester of a lauryl ether of a polyhydric alc. such as lauryl myristyl acetate or stearate. Numerous examples are given.

Films from cellulose derivatives I. G. Farbenmd A. G. (Max Hagedorn, Wilhelm Schmidt and Paul Möller, inventors) Ger. 621,189, Nov. 2, 1935 (Cl. 3, 12 01). Thin films prepd. from cellulose derivs., e. g., films of a thickness below 200 μ , are improved in their mech. properties by treatm. with an inert nonaq. solvent until the softening agent originally present has been entirely or nearly entirely removed. Exptl. results are given.

Use of cyclic ethers in plasticizing cellulose derivatives Henry Drevfus. U. S. 2,025,044, Dec. 24. A cellulose deriv. such as cellulose acetate is used with a cyclic ether obtainable by condensing an alc. contg. at least 4 hydroxy groups such as erythritol alone or with an alc. contg. at least two hydroxy groups such as ethylene glycol. Various examples are given.

Cellulose ester compositions. The Distillers Co. Ltd., Harold A. Anden, Hains P. Strandger and Philip Eagleshead. Brit. 434,970, Sept. 12, 1935. Comps. contg. cellulose triacetate (I) as the chief constituent contain also a substantial amt. of a lactide or an anhydride of an org. acid having a b. p. of at least 200° at normal pressure, halogen derivs. of such lactides or anhydrides not being included. In examples, the comps. consist of: (I) 100 mixed with lactide from fermentation butyric and isobutyric chlorides (II) 25, triacetate 12 and ethylacetamide 5 parts; or with maleic anhydride 18, a mixt. of equal parts of II and ethylene chlorohydrin 25 and ρ -toluenesulfonamide 6 parts; or with succinic anhydride 20, II 10 and cell. on red dye 0.3 parts.

Cellulose organic and esters Richard Müller, Martin Schenk, Wilhelm Weitz and Fritz Müller (to C. F. Roehm & Soehne G. m. b. H.). U. S. 2,024,881, Dec. 17. A cellulose material such as pretreated cotton linters is treated with an acylating agent such as Ac_2O in the presence of a lower aliphatic sulfonic acid, such as chloro- (or *n*-) propanesulfonic acid which contains more than one org. and radical and which serves as a catalyst for promoting esterification of the cellulose. Several examples with details are given.

Stabilizing organic esters of cellulose. Camille Drevfus and Clifford I. Haver (to Celanese Corp. of America). U. S. 2,025,900, Dec. 31. An ester such as a cellulose

acetate, formate, propionate or butyrate which has been prepd. in the presence of a S-bearing acid catalyst, such as H_2SO_4 , is sepd. from the primary soln. in which it is formed, dissolved in a solvent such as glacial HOAc and a sol. Ba salt such as Ba acetate is added.

Refining organic acid esters of cellulose. Dennis E. Northrop and Robert C. Burton (to Eastman Kodak Co.). U. S. 2,024,246, Dec. 17. For refining an ester such as a cellulose acetate, it is dissolved in an aq. acetone, the soln. is filtered and the ester is substantially completely pptd. by gradually adding the filtered soln. to an agitated aq. acetone in which the ester is substantially insol. and which is maintained at approx. const. concn. during the pptn. App. is described.

Extraction of cellulose esters Cyril J. Stand and Edward C. Yackel (to Eastman Kodak Co.). U. S. 2,024,660, Dec. 17. For fractionally extg. a cellulose ester contg. an acyl group such as cellulose acetate of low viscosity from mixed cellulose acetates, a mixt. of acetone and water or HOAc and water is used.

Cellulose diglycolic acid ester, etc. Carl J. Malm and Charles R. Fordree (to Eastman Kodak Co.). U. S. 2,024,238, Dec. 17. By reaction upon a cellulose material such as regenerated cellulose, or on a cellulose acetate, with diglycolic anhydride, in the presence of a tertiary org. base such as pyridine, an ester is obtained such as cellulose diglycolate or cellulose acetate-diglycolate, suitable for various uses.

Cellulose of acetate compositions Geo. Schneider (to Celanese Corp. of America). U. S. 2,023,957, Dec. 31. A compn. resistant to discoloration when heated comprises cellulose acetate with the addn. of about 0.01-0.3% of a naphthene acid salt such as the Ca salt.

Plated sheets of cellulose acetate or the like Joseph H. Brown (to Celluloid Corp.) U. S. 2,025,568, Dec. 24. Substantially permanently plated sheets contg. an org. cellulose deriv. such as cellulose acetate and which also may contain a plasticizer such as dibutyl phthalate are formed so as to be extensible without loss of their plated form.

Cellulose triacetate compositions The Distillers Co. Ltd., Harold A. Anden and Hains P. Strandger. Brit. 433,311, Sept. 19, 1935. Cellulose triacetate is mixed with cyclohexanone, Me cyclohexanone, cyclohexanvl acetate, Me cyclohexanvl acetate, benzyl acetate or Et Ac glycolate in such quantity that the mass, when afterward heated to 150-190°, becomes viscous and capable of being molded or rolled.

Mixed esters of cellulose Thomas F. Murray, Jr., and Cyril J. Stand (to Eastman Kodak Co.). U. S. 2,024,658, Dec. 17. In making a mixed ester contg. acetyl and higher aliphatic acid radicals such as those of propionic, butyric or crotonic acid, in cases where the mixed ester does not form by the initial esterification both contain grain or hays, a small proportion of Ac_2O is added to the dope to eliminate the grain or hays.

Cellulose acetate isobutyrate. Carl J. Malm and Charles L. Fletcher (to Eastman Kodak Co.). U. S. 2,024,651, Dec. 17. In prep. cellulose acetate isobutyrate in fibrous form, cellulose such as cotton linters is treated with an esterification bath which is rendered non-solvent of the cellulose acetate isobutyrate formed by the presence of about 60-80% isobutyryl based on the total acyl content, the remainder of the acyl content being acetyl.

Partially de-esterifying acetone-soluble cellulose acetate-propionate and acetate-butyrate. Carl J. Malm and Charles L. Fletcher (to Eastman Kodak Co.). U. S. 2,023,583, Jan. 7. A material the acyl content of which comprises at least 15% propionyl or butyryl is treated with a hydrolyzing agent such as aq. HOAc soln. contg. H_2SO_4 , and the hydrolysis is terminated before the total acyl content of the acetate has been reduced to less than 57% to obtain a product which is suitable for various uses.

Treatment of cellulose esters and ethers. Gero Lindan and Georg Frank. Ger. 621,047, Nov. 1, 1935 (Cl. 33, 12 01). Cellulose ethers and esters are caused to swell or are brought into soln. or dispersion by treat-

ment at atm temp with aq solns of salts of aromatic hydroxycarboxylic acids, e g, salicylic acid. Org solvents may be added to the aq salt solns.

Treating cellulose material such as that for making viscose. Emil Scheller (to E I duPont de Nemours & Co.) U S 2,026,068, Dec 31. The material is treated with active Cl to the extent of "about a half to three-fourths bleach," then washed with an alkali boil in the absence of O at a relatively high temp, and bleaching is completed with alkali peroxide solns, and the material is then washed, soured with a dil acid soln and finally washed with water which is slightly alk. in the last stage of the washing.

Pressure indicating device suitable for use with viscose flowing through pipes. Ralph E Valentine (to Dupont Cellophane Co.) U S 2,024,752, Dec 17. Various structural and operative details.

Recovery of waste viscose. Comptoir des textiles artificiels (Soc anon.) Fr 780,270, Aug 30, 1935. Waste viscose strongly swollen with water is submitted to a treatment with AcOH to replace the water by AcOH and then converted to triacetate by Ac₂O. The replacement of water by AcOH may take place in a battery of diffusers.

Artificial sponges from viscose. Walter Johannes (to Winthrop Chemical Co.) U S 2,026,177, Dec 31. Viscose contg a pore-forming material is pressed into a tubular mold, coagulated in the mold by heat externally applied, the coagulated mass is removed from the mold, the pore-forming material is then removed and the coagulated mass is cut into pieces perpendicularly to its longitudinal axis. App is described. Cf. C. A. 29, 6758¹.

Viscose rayon. James W Humphrey (to Viscose Co.). U S 2,025,868, Dec 31. For increasing the tensile properties of viscose rayon, there is added to the viscose soln, prior to spinning, a substituted hydroxybenzene in which a H atom of the benzene ring has been substituted by an alkyl group, such as *m*- or *p*-cresol in an amt of 1-2% the wt of the viscose soln (most of the added material being lost upon spinning).

Increasing the tensile strength of viscose rayon. James W Humphrey and John W Pedlow (to Viscose Co.) U S 2,024,041, Dec 10. There is added to the viscose soln used an aromatic deriv. of an aliphatic alc in which the aromatic group replaces a H atom of the alc, other than that of the OH group, such as anisyl alc, phenyl-ethyl alc or benzyl alc, most of which does not remain in the extruded filament but is lost during the spinning operation, but which serves to facilitate the production of a product of increased tensile strength.

Rayon. Alsa Soc anon. Fr 787,585, Sept 25, 1935. In making rayon having tubular filaments from viscose, the thread has a short path (25 cm.) through the coagulating bath and a long path through the air before being wound. Fr 787,586. The lower the unitary titer of threads made of tubular filaments the higher is the concn of H₂SO₄ and Na₂SO₄ in the coagulating bath used. Cf. C. A. 29, 3513².

Rayon, etc. I G Farbenindustrie A-G. Brit 434,547, Sept 4, 1935. See Fr. 752,152 (C. A. 29, 1636⁴).

Apparatus for rayon manufacture. Earle J R Beatty U S 2,024,962, Dec. 17. An app is described having a spinneret in a coagulating bath and a device with entrance and discharge openings of different size with which the filaments come into contact and through which they pass, the discharge opening being smaller and of a size less than the combined diam. of the rayon filaments after their extrusion from the spinneret.

Apparatus for making rayon. I G Farbenindustrie A-G. Brit. 434,881, Sept 9, 1935. The thread that leaves the spinning bath under the draft of a galeite is allowed to fall freely onto a plate having a rotary and an addnl. reciprocating movement, or movement with a reciprocating component, so as to form annular crosswise layers, and the ratio of the period of the rotary movement to that of the addnl. movement is adjusted so that at most only 1 addnl. movement occurs at every half revolution, while the period of natural oscillation of the freely hanging

thread is adjusted to equality or substantial equality with the period of the addnl. movement or a harmonic thereof.

Apparatus for spinning rayon. Edward Wurtz. Ger 618,960, Sept. 19, 1935 (Cl. 29a 6 01).

Filaments, films, etc., of cellulose, organic derivatives such as cellulose acetate. Wm I. Taylor (to Celanese Corp. of America) U S 2,025,902, Dec. 31. For increasing the tenacity of the material, it is subjected to swelling by treatment with glycerol or diethylene glycol at temps. of 120-170° or 75-90°, resp., and to stretching of 65-80% of the length of the material in the presence of the treating substance.

Artificial threads, films, etc., from cellulose acetate. Wm A Dickie and Percy F C Sowter (to Celanese Corp. of America) U S 2,025,730, Dec. 31. A soln of cellulose acetate is extruded through a suitable orifice into a coagulating bath contg a relatively high proportion of a solvent or plastifying material and the product is stretched while in a plastic state with only a portion, at most, of the stretching force acting on the material immediately on extrusion. App is described.

Artificial filaments, yarns, films. British Celanese Ltd and Percy F C. Sowter. Brit. 434,953, Sept. 9, 1935. A soln of an org. deriv. of cellulose in a volatile solvent is extruded into a liquid coagulating medium that contains a softening agent for the cellulose deriv. that has a b p above 100° and is maintained near or above the b p. of the volatile solvent. Suitable softening agents are those of Brit 340,325 (25, 4708). In an example, an MeCO soln of cellulose acetate is spun into an aq 30% soln of glycol monoacetate at 55°.

Cellulose sulfonic acid. Geo W. Rigby (to E. I. du Pont de Nemours & Co.) U S 2,025,073, Dec 24. Cellulose such as cotton linters is treated with pyrosulfuric acid in the presence of a tertiary amine such as pyridine.

Artificial staple fibers. Fred Ferrand. Brit. 435,384, Sept. 19, 1935. In a method of fibers where a coagulable soln fed to an extrusion nozzle is subdivided at regular intervals in such manner that the soln is extruded from the nozzle as sepd. or staple fibers, the subdivision is effected in or at the perforated cap of the nozzle. App is described.

Utilizing values of waste sulfite liquor. Peter A Paulson U S 2,025,891, Dec. 31. Waste sulfite liquor is evapd and the steam thus generated is brought into indirect heat exchange with the cooking liquor of a digester, heat for the evapn. being generated by burning the concd residue of the liquor. App is described.

Paper pulp. André Bergès. Fr 787,386, Sept. 21, 1935. The pulp is purified by causing it to enter a fixed circular vessel at a high speed and tangentially, cone-shaped separators being mounted in the vessel.

Wire faced roll for paper making apparatus. Einar I Flateboe U S 2,025,445, Dec 24. Structural details.

Drier for paper manufacture. Franz Hassmann. Ger 618,664, Sept. 13, 1935 (Cl. 55d. 14 30).

Felts or aprons for drying paper. James K Diamond (to Clipper Belt Lacer Co.) U S 2,025,275, Dec 24. Structural details.

Apparatus for drying continuous running webs of paper. Wm. Whiting (to Whiting Paper Co.). U S 2,024,079, Dec 10. Various structural, mech and operative details.

Bacterial product suitable for use in making sheets or as a filler in paper. Joseph R Sanborn (to International Paper Co.) U S 2,026,253, Dec 31. Growths formed from cultures of slime forming microorganisms such as *Oidium lactis* and *Monilia candida* are digested with a ZnCl₂ soln to form a viscous mass, and the mass is re-generated with water into a desired form such as a substantially transparent sheet.

Coating paper to render it greaseproof. Joseph H Swan, 3d (to Gardner-Richardson Co.) U S 2,025,788, Dec 31. A coating is prep'd by adding an aq CH₂O soln to an aq alk. casein soln, to form a mixed soln contg about 10% as much CH₂O as casein on a dry wt basis, and then adding the CH₂O casein soln to rubber latex emulsion with agitation to avoid coagulation of the latex.

Composition suitable for coating paper. Webster E. B. 1 Baker (to Stein, Hall & Co.). U. S. 2,024,123, Dec. 10. For making a paper coating of substantially insol surfacing material, a starch-contg material is treated (as with HOAc) to produce weak esterification and dextrinization of the starch constituent, a volatile alk substance such as NH_3 is added, and the material is mixed with a dry sol Na silicate, dissolved in water, mixed with china clay, the coating is applied to paper and is heated to volatilize the alk substance and cause generation of hydrated silicic acid by hydrolysis upon concn of the soln.

Draining press for continuous or individual sheets of fibrous material such as paper. Antoine Valentin U. S. 2,024,616, Dec. 17. Structural, mech and operative details.

Apparatus for treating paper webs with sizing liquids, etc. Harold R. Rafton (to Raffold Process Corp.) U. S. 2,024,248, Dec. 17. Various structural, mech and operative details.

Sized paper. Akt-Ges für chem Ind (Rannsdorff), Felix Noss and Wilhelm Goldlust Austrian 143,323, Nov. 11, 1935 (Cl. 55c). Animal glue hardened by treatment with CH_2O is dispersed in paper stuff and then pnd on the fibers, e. g., by addn of alum or $\text{Al}_2(\text{SO}_4)_3$. The treatment of the glue with CH_2O should be effected in a medium of H ion concn below pH 5, and may be carried out in the presence of the paper stuff

or as a sep. operation. Various methods of procedure are indicated.

Cigaret paper. Schoeller & Hoesch G. m. b. H. Fr. 786,460, Sept. 3, 1935. A consistent white ash is obtained by impregnating the paper with an aq. soln. of the products of hydrolysis (only slightly or not sweet) of polymerized carbohydrides, the hydrolysis being carried far enough to produce not only mono- but also di-, tri- and tetra saccharides sol in water, and also of a small amt of salt. Fr. 786,461. The combustion of cigarettes is improved by impregnating the paper with a soln of Na stearate, to which beeswax or other wax may be added in the form of an emulsion. Fr. 786,462. The aroma of cigarette is improved by adding beeswax in aq. emulsion or a soln of honey or both to the paper.

Multi layer paper or cardboard or the like. Ernst Fues (to Anthony W. Deller). U. S. 2,024,635, Dec. 17. A wet paper web has applied to it a hydrated cellulosic slippery mass having a fibrous structure such as one of wood fibers and filler and the treated web is finished to form an integral product.

Multi ply reinforced paper suitable for box corner stay strips, etc. Edward C. Smith (to American Reinforced Paper Co.) U. S. 2,026,194, Dec. 31. Various details of paper sheets united by adhesive and enclosing reinforcing unspun filaments.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

Coal dust and rock dust as constituents of air (Stipaniz) 13.

Smokeless powder. Willard de C. Crater (to Hercules Powder Co.) U. S. 2,024,128, Dec. 10. A double-base smokeless powder contains nitrated flaked starch retaining substantially its original flaked form, together with nitrocellulose, etc.

Propellant nitrocellulose explosive. Geo. C. Hale and Donald R. Cameron. U. S. 2,026,531, Jan. 7. Nitrocellulose is used with TNT 10-15 and triacetin 2-10%.

Purifying normally solid organic explosive compounds. Wm. A. Smith (to E. I. du Pont de Nemours & Co.) U. S. 2,024,396, Dec. 17. Purification of compds such as tetryl, trinitrobenzene, trinitrotoluene, tetranitroamline and pentaerythritol tetranitrate is effected by crystrg from a neutral org. solvent such as ethylene glycol having a b. p. above 100°, which is miscible with water and nonreactive

with the compd and the vapors of which are relatively noninflammable.

Wrapping plastic explosive material such as blasting explosives. Albertus H. Haupt (to Imperial Chemical Industries Ltd.) U. S. 2,026,532, Jan. 7. App and various operative details are described.

Priming mixture for explosives. Alfred Weale (to Imperial Chemical Industries Ltd.) U. S. 2,024,406, Dec. 17. See Can. 348,291 (C. A. 29, 3518).

Blasting-cap charges. Edmund T. Lednum (to E. I. du Pont de Nemours & Co.) U. S. 2,024,588, Dec. 17. See Can. 348,291 (C. A. 29, 3518).

Blasting cartridge. Charles B. Officer (to Safety Mining Co.) U. S. 2,024,247, Dec. 17. Structural details.

Match-igniting compositions. Sven Harald Ledum. Ger. 621,050, Nov. 1, 1935 (Cl. 78b 2). This corresponds to Brit. 355,901 (C. A. 27, 1177), but describes sp. compns.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Precision in the analysis of dyes. M. G. Martin. Rec. gen. met. color. 39, 423-8 (1935).—The use of math formulas as an aid is given.

Method for the identification of vat dyes. G. Buzziferraris. Boll. assoc. ital. chim. tessile 11, No. 1, 1-6 (1935); *Chimie & industrie* 34, 1182.—The method, based on the analogy of color and sound, consists in observing changes in tone. Of the various reagents which can modify chiefly the tone of vat dyes, 2 are particularly simple to use, viz., hyposulfite in alk. soln and Co^{2+} Be^{2+} H_2SO_4 . On applying a drop of the hyposulfite soln to the sample, the tone will be either (1) increased, or (2) decreased or unchanged; the same observation is made with H_2SO_4 . Dyes are thus divided into 4 groups, and the identification of the particular dye is sought by comparison with known dyes of the same group which give the same variation in tone. The comparison is facilitated by use of 3 auxiliary reagents: 41° Be^{2+} , HNO_3 , SnCl_4 , and Na hyposulfite in acid soln. A. P.-C.

Degradation of colors under the influence of light as a

function of concentration. J. Pinte. *Chambre Commerce Roubaix Lab. recherches ind.* 1935, No. 25, 10-13; *Chimie & industrie* 34, 923, cl. C. A. 28, 5989.—In the case of dyestuffs applied to fibers there is a concn. at which they exhibit max. sensitiveness to the action of light, and which is known as the "mean crit. tone." Its value is approx. 55% for yellows, 45% for oranges, 40% for reds and 35% for violets, blues and greens. The fastness of a color improves the further it is from the mean crit. tone, whether it tends toward 0 (abs. black) or toward 100 (white). If the dyestuff is very pure, its mol. structure offers a point at which absorption is max.; exposure to sunlight, therefore, as an abs. general rule, has for effect suppression of the dominant. If the dyestuff is impure, destruction of the color occurs more slowly. Beyond the mean crit. value, the fact that the color curve tends to a deeper and deeper gray accounts for the increased fastness to light. At decreasing concns. there is a smaller no. of dyestuffs mol., and hence sunlight has less effect. By means of a systematic study of

dye stuffs at different concns by means of a "fade meter," curves may be established which show, with a satisfactory degree of approximation, the degradation of the mean tones, when the crit pt and the max concn. (which generally is 3 times smaller) are known. It follows, on the other hand, that the light fastness of dyes must not be compared at different concns., all comparative tests should be made at the previously detd mean crit. tone.

A Papineau-Couture

Fading of dyestuffs I. Photochemical decomposition of malachite green and crystal violet. Kenji Iwamoto *Bull Chem Soc Japan* 10, 420-5 (1935).—Malachite green oxalate (2 g) exposed to direct sunlight for 2 months under Vita glass gives 0.51 g of *p*-dimethylaminobenzophenone, m 90.5-01°. Similar treatment of crystal violet oxalate (2 g) gives 1.18 g of *Michler's ketone*, m 173-4°. When sealed in Vita glass tubes these dyes give the corresponding leuco compounds. W. J. P.

Wool dyeing—dyeing methods and formulas employed with various colors C. H. Young *Am. Dyestuff Repr* 24, 739-40 (1935). W. H. Boynton

Silk filaments' shape and size cause two tone dyeing. F. A. Mennerich *Am Dyestuff Repr* 24, 723-4; *Am Silk Rayon J* 54, 17, 19, *Textile Bull* 49, No 15, 12, 30 (1935).—See C. A. 29, 40461. W. H. Boynton

Suppression of alkaline boiling in the bleaching and dyeing of vegetable fabrics Raymond Vidal *Revue ind. color* 39, xiv-xvii (1935).—Use of NaOCl plus a fatty acid gives a stronger and more elastic fabric. It suffices to have a simple passage of the fabric through a cold bath of 0.5% detergent acid for 1 to 2 mm., to hydrophilize the fabric, and thus suppress the 8 to 12 hours' operation of alk. boiling. Halsey E. Silliman

Staybrite steel in the dyeing industry F. Godber *Textile Mfr* 61, 512 (1935).—The qualities of Staybrite steel compared with other materials for plant construction and use are cited. In respect to this type of steel, whereas stainless steel has about 13% Cr and 0.3% C, stainless iron, 13% Cr and 0.1% C, Staybrite is a group of special steels, which besides having a high Cr content, have a high Ni content and also other metals. It differs from stainless steel in that it does not harden from quenching, it needs no heat treatment and avoids the complications of disintegration at both heavily manipulated joints and welded joints. Halsey E. Silliman

Flax yarn qualities and types VII. S. A. G. Caldwell *Textile Mfr* 61, 459 (1935), cf C. A. 30, 8637.—The mech. properties of flax yarns are shown by stress-strain diagrams. Halsey E. Silliman

Isolation of long silk filaments. Thomas Lonsdale *Silk J.* 12, No 139, 39 (1935).—A method is described of obtaining cocoon threads and single ultimate filaments of silk in long lengths. Halsey E. Silliman

The isolation of cystine from wool hydrolyzates Gerrit Toennes and Mary A. Bennett *J. Biol. Chem.* 112, 39-50 (1935).—A suitable hydrolyzing agent for the prepn of cystine from wool is 50% H₂SO₄. The humin fraction can be removed from the hydrolyzate by salting out with Na₂SO₄ and the cystine is rapidly pptd by cupric ion without oxidative or reductive changes. The best yield obtained was equiv to 44% of the total S content of the wool. Because of racemization the stage at which the amt. of L-cystine available for isolation is at its max. does not coincide with the completion of hydrolysis and a neg. buret test or a cyanide-nitroprusside test corresponding to the total S content is no proof of completeness of hydrolysis as far as liberation of cystine is concerned. No relation was found between the optical rotation of the hydrolyzate and the state of cystine under different conditions. Forty-two references. A. P. Lothrop

Measurement of electrolyte content of textiles A. A. New *Textile Mfr* 61, 477-7, 508 (1935); cf *Ibid.* 58, 69 (1932).—The method has been developed more fully and successfully applied as a routine test for more than 2 years to all types of textiles used as insulation material. Details of the method, diagram of the app. used, and curves to det. the proper time of extn for the sp. cond. and pH data are given. Five g. of textile material is extd in 100

1 milliliters of H₂O for 1 hr., and a portion of the ext. is placed in a cond. cell and the resistance detd. The math methods of calcg the results are also given. The sp. cond. of the aq. exts. of the following materials, in microhmhos at 25°, was found to be unwashed gray cotton yarn or sheeting 800-1000, dyed cotton 50-200, wool, dyed and undyed 100-200, natural silk 50-200, acetate rayon 30-100, jute 100-300 and washed gray cotton yarn or sheeting 50-100. Halsey E. Silliman

A new apparatus for the evaluation of waterproofed textiles Bundesmann *Melliand Textilber* 16, 128-31, 211-13, 331-2, 663-4, 739-40, 792-4 (1935).—The app. works on the following principle: the test pieces of the waterproofed fabrics are subjected to a continuous spray of rain from above, while being wiped at the same time by rubber wipers from below. The amt. of moisture taken up by the test piece is detd., as is the amt. going through the test piece. The testing equipment consists of 3 parts, a water tank to produce rain, 4 containers, over which the test pieces are stretched, mounted on a revolving cross arm and the driving mechanism. The cylindrical water tank is placed 150 cm. over the test pieces. The cross section of the tank is 1200 sq. cm., it has on its bottom plate 300 holes, each 0.4 mm. in diam. The size and the velocity of the drops can be regulated by the height of the water column in the tank. For the standard test a height of 7.5 cm. is recommended; this gives a spray corresponding to a very severe shower. The test pieces, about 15 X 15 cm., previously conditioned at 65% relative humidity and 17° for at least 12 hrs. are weighed and then stretched over the 4 cup-like containers, 9.8 cm. in diam and 7.6 cm. high. The fabric is kept taut over the cup by stainless steel bands. The surface of the test piece subjected to the rain is 75 sq. cm. There is a faucet at the bottom of each cup. The cups are on a cross arm which revolves around a vertical shaft, 5 r. p. m. The circle described by the cup has an area of 1100 sq. cm. so that the test pieces are within the area of the spray. In each cup 4 rubber blades are pressed against the underside of the test pieces. These are so arranged that the test pieces are rubbed 10 times during each revolution. The driving mechanism consisting of a motor and speed reducer are in a waterproof housing. The entire assembly is mounted on rails, so that the fabrics can be placed over the cups outside of the rain, the motor started and then the assembly pushed under the rain. The test may be carried out for 5-30 min. At the end of the test the test pieces are removed from the cups, the surface water is shaken off 4 times, and then the fabrics are weighed. It is shown by a great no. of test results that this app. and method give reproducible figures for the detn. of the water resistance of impregnated wool, silk and leather. Photographs of the app. and various test pieces are given. J. A. Szilard

Textile finishing from a chemical engineering standpoint J. E. Howarth *Textile Mfr* 61, 513 (1935).—Examples are given of the principles in the design and choice of equipment for various processes. Halsey E. Silliman

Tinsel fabrics S. Bergneon *Textile Mfr* 61, 510 (1935).—The special qualities and limitations of lame fabrics which call for adaptations in scouring, dyeing, finishing and packing are described. Halsey E. Silliman

An electrical measurement of moisture content of fabrics J. L. Spencer-Smith *Textile Mfr* 61, 494 (1935).—In methods of this type, based on the change of dielec. const. of the material, the material is placed in the field of a condenser and the increase of capacitance then is due to the difference of the material in a dry state and when the moisture is included. Halsey E. Silliman

Characteristic defects of hosiery from mercerization J. Pinte and A. Delhalle *Revue ind. color* 39, 472-89 (1935).—A series of tests are described, illustrated by diagrammatic curves. Halsey E. Silliman

The influence of metals in bleaching A. H. Pettinger *Textile Mfr* 61, 472 (1935).—In peroxide bleaching, it is essential to avoid Fe, Cu and Cr salts. Sn and Ti have no deleterious effects. Monel metal vessels can be used. Halsey E. Silliman

Test to determine durability and resistance to water of certain umbrella fabrics. Viola Sykes and Katharine Cranor. *Am. Dyestuff Repr.* 24, 725-6 (1935).—Various umbrella fabrics were tested as to durability and resistance to water. All the fabrics tested contained Al, but the degree of surface waterproofing was not determined by the amount of ash contained in a fabric. None of the treated fabrics possessed the strength of the original fabric but cotton offered the greatest resistance to folding endurance and edge breaking. Closeness of weave, thickness of fabric, diam. of yarn and twists per in. influence water resistance. Twenty-four references.

Wool-scouring problems. A. T. King. *Textile Mfr.* 61, 483-4, 486 (1935).—A crit. exam. is given, confined to worsted yarns and only clear wools, of the requirements in scouring, in efficiency and in economy and from a phys. and chem. view of the fiber and subsequent processing of the material. The preservation of fiber strength is taken as the main factor of efficiency. H. E. S.

Reclaiming chlorinated dry-cleaning solvents by adsorption. Lawrence E. Stout and Arthur B. Tullman. *Ind. Eng. Chem.* 28, 225 (1936).—The authors in expts. carried out in the lab. and in a com. dry-cleaning plant with an azeotropic mixt. consisting of 70 mole percent CCl_4 and 30 mole percent $\text{C}_2\text{H}_5\text{Cl}$ as dry-cleaning solvents substituted adsorption by means of commercially obtainable adsorbing agents such as activated C, silica gel and activated magnesia for the customary distn. process to reclaim contaminated dry-cleaning fluids. The results indicate that activated C, silica gel and activated magnesia are excellent economical adsorbing agents, each having specific properties, in a combination of adsorption and filtration of contaminated chlorinated dry-cleaning solvents. E. W. Roth.

Rubberizing of balloon fabrics (Panem) 30. Prepn. of water for the textile industry (Ornstent) 14. Hydrogenation of tertiary alkyl-phenols to form hydroaromatic alcs. [use as lubricants for textile fibers and as dye intermediates] (U. S. pat. 2,026,668) 10. Rotary-drum app. for filtering and dewatering slimes such as those from wool (U. S. pat. 2,024,358) 1. Pressure filter and pump for filtering solvent liquid such as that used in "dry cleaning" (U. S. pat. 2,024,463) 1. Dyeing skins, etc. (Ger. pat. 618,902) 29. Azo-, amino- and acylamino-N-nitroamines (Brit. pat. 434,917) 10. Anthraquinone compds. and dyes (Fr. pat. 786,103) 10. 1,3-Dibromo-2-aminoanthraquinone-6- or -7-sulfonic acid (U. S. pat. 2,025,169) 10.

Dyes. I. G. Farbenind. A.-G. (Paul Wolff and Friedrich Heim, inventors). Ger. 621,476, Nov. 7, 1935 (Cl. 22c 7/02). One mol. of *p*-sulfobenzaldehyde or of a *p*-halobenzaldehyde is condensed with 2 mols. of an α -substituted indole, and the leuco compd. so obtained is successively sulfonated and oxidized. The sulfonation step may be omitted if a sulfonic acid of an α -substituted indole is used. The halogen atom or the SO_3H group linked to the benzaldehyde residue is then exchanged by fusing the product with a *p*-alkoxyaryl amine. Blue acid dyes for wool are obtained. Sp. processes are described.

Metalized dyes. I. G. Farbenind. A.-G. Fr. 787,428, Sept. 23, 1935. Dyes of formula X(Y)NRN:NRZ , where R is the radical of a diazotization component, R' is a coupling component of azo dyes which may contain azo groups, X and Y are H, alkyl, aralkyl, aryl or acyl, Z is OH or NH_2 and N(Y)X and Z are ortho to the azo bond, are converted to complex metal compds. in known manner. Thus 1-methyl-3-aminobenzene-4-azo-1-(4'-sulfophenyl)-3-methyl-5-pyrazolone is treated with Cr formate giving a product which dyes wool fast brownish yellow shades from an acid bath. Several examples are given.

Pigmentary dyes. I. G. Farbenind. A.-G. Fr. 787,453, Sept. 23, 1935. Dyes which are fast to oil, alc. and solvents are prep'd. by coupling diazotized amines of the formula $\text{ROSCCH}_2\text{C}(\text{NH}_2)\text{CXCH}_2\text{CY}$, where R is

1 alkyl, aralkyl or aryl and these may contain nonsolubilizing substituents, X and Y are H, alkyl, alkoxy, aralkyl, aryl, aralkoxy, aryl or halogen, and these may contain nonsolubilizing substituents, and Y can only be the same as X when X is H or alkyl, with an anilide of 2,3-hydroxynaphthoic acid having at least 2 alkyl groups as substituents in the C_6H_4 ring. Thus, 3-amino-4-methyl-diphenyl sulfone \rightarrow 2-hydroxynaphthalene-3-carbonyl-amino-2',5'-dimethylbenzene forms an orange-red ppt. which may be used as a paste or powder. Other examples are given.

Azo dyes. Miles A. Dahlen (to E. I. du Pont de Nemours & Co.) U. S. 2,025,094, Dec. 24. Dyes which have good fastness to washing, light and Cl are formed from components such as diazotized 4-nitro-2-aminonitroisole and 3,4,5-trimethoxyaniline of β -hydroxynaphthoic acid or the like.

Azo dyes. Arthur H. Knight (to Imperial Chemical Industries Ltd.) U. S. 2,025,211, Dec. 24. Azo dyes which are suitable for dyeing cellulose acetate are formed with 1- β -hydroxyethylamino-5-naphthol as end component which may be coupled with various aromatic diazo compds. Several examples are given.

Azo dyes. Ernst Fischer (to General Aniline Works) U. S. 2,025,582, Dec. 24. Red dyes insol in water and which may be used for the prepn. of lakes fast to oils and light, and which are suitable for coloring natural or synthetic rubber are obtained by coupling diazotized 3-amino-4-methylbenzene-1-sulfonamide or the diazo deriv. of the corresponding methylamide, ethylamide, butylamide or cyclohexylamide or the like with 2',3'-hydroxynaphthyl derivs. such as the 1- or 2-aminonaphthalene derivs. an aminomethoxybenzene deriv. or the like (numerous examples being given).

Azo dyes. Max A. Kunz, Gerd Kochendoerfer, Kuno Maurach and Walter Lumbacher (to General Aniline Works) U. S. 2,025,991, Dec. 31. Dyes generally producing violet to blue to black shades and suitable for combination with Cr on wool are produced by coupling one mol. proportion of a diazo compd. with one mol. proportion of a monohydroxypyridinonaphthalene or by coupling one mol. proportion of a tetrazo compd. with two mol. proportions of a monohydroxypyridinonaphthalene, where either the diazo (or tetrazo) compds. or the monohydroxypyridinonaphthalenes used or both components contain at least one sulfonic acid group and the components are selected so that the resulting dyes are capable of forming complex metal compds. Several examples with details are given.

Azo dyes. I. G. Farbenind. A.-G. (Gerhard Schrader, inventor). Ger. 618,809, Sept. 10, 1935 (Cl. 22a. 1). Dyes insol. in water are obtained by coupling *o*-hydroxynaphthothiazole carboxylic acid arylides with diazotized arylamines in the substance or on the fiber, neither constituent contg. soly.-inducing groups. Thus, cotton is soaked in 1-(2'-methyl-7'-hydroxy-1',5',1'-naphthothiazole-6'-carbonylamino)-2-methylbenzene dissolved in alkali. The cotton is then treated with a soln. of diazotized 1,4-diethoxy-2-benzoylamino-5-aminobenzene. A fast blue effect results. Other examples are given.

Azo dyes. I. G. Farbenind. A.-G. Fr. 786,042, Aug. 24, 1935. Dyes are prep'd. by coupling diazotized 5-nitro-3-amino-1-x-benzene-3-sulfonic acids, (in which x is a nonacid substituent and the SO_3H group is esterified or contains an NH_2 group, substituted or not) with 2-amino-naphthalenesulfonic acid or one of its substitution products, in acid medium. Thus, 5-nitro-2-amino-1-methoxybenzene-3-sulfonethylaniline \rightarrow 2-amino-8-hydroxynaphthalene-6-sulfonic acid dyes wool in clear blue shades insensitive to artificial light. Several examples are given.

Azo dyes. I. G. Farbenind. A.-G. Fr. 786,086, Aug. 26, 1935. Dyes contg. metal are prep'd. by treating 8-hydroxyquinoline with agents furnishing metal and combining the metal compds. obtained with diazo compds. free from groups capable of forming complex metal compds., the constituents being chosen so that the dyes contain at least one acid group. Thus, the compd. obtained from 8-hydroxyquinoline and Cr formate is

combined with diazotized metanilic acid. The dye gives a fast brown-yellow on leather and orange shades on wool.

Azo dyes. I. G. Farbenind. A.-G. Fr. 786,193, Aug. 28, 1935. Dyes are prepared by coupling diazotized 3-nitro-4-chloro-2-aminophenol with 1-naphthol-3,8, or 4,8-disulfonic acid, and, if necessary, the dyes are treated with chroming agents. Bordeaux-red shades are obtained on wool before chroming and deep blue after chroming.

Azo dyes. Imperial Chemical Industries Ltd. Fr. 787,714, Sept. 27, 1935. Dyes sol. in water for acetate silk, wool, silk, silk charged with Sn, nitrocellulose lacquers, etc. colors and rapid drying remakes and oils are prepared by condensing a diazotized β -nitroaniline of the C_6H_5 series with a N -sulfatoethyl (or propyl)- N -3-alkoxyethyl deriv. of an amine of the C_6H_5 series having a coupling position free, the resulting dyes contain no solubilizing groups other than the sulfato group. The dyes may also be prepared by coupling with the corresponding N -hydroxyethyl (or propyl) compd. (I) and afterward treating with concd. H_2SO_4 . The compds. I are obtained by condensing a N -3-alkoxyethylamine with an ethylene or propylene chlorohydrin or with an alkylene oxide or by condensing a N -hydroxyethyl (or propyl)aniline with a 3-chloroethylalkyl ether or a toluene- p -sulfonic-3-alkoxyethyl ester. Examples are given of the prepn. of N -3-hydroxyethyl- N -3-ethoxyethyl- m -toluidine, b. 183°, N -3-hydroxyethyl- N -3-methoxyethylamine, b. 181-3°, N -3-hydroxyethyl- N -3-methoxyethyl- m -amino- p -cresol methyl ether, b. 192-4°, also their sulfonic esters and of dyes prepared from these esters and diazotized p -nitroaniline, α -chloro- p -nitroaniline, 2,4-dinitroaniline and 6-chloro-2,4-dinitroaniline.

Azo dyes. See pour l'ind. chim. a. Bile. Fr. 786,106, Aug. 27, 1935. Various diazo compds. are coupled with phenols and their derivs. capable of coupling in the 2 or 6-position and which are substituted in the 3- and 4-positions by an atom of halogen, alkyl, O-alkyl or NH-acetyl groups, with the exception of products in which the 3- and 4-positions are occupied by 2 alkyl groups or by an alkyl group and an atom of halogen. Thus, sulfanilic acid \rightarrow 3,4-dichlorophenol dyes wool orange-yellow and 1-amino-naphthalene-4-sulfonic acid \rightarrow 3,4-dichlorophenol a red-brown.

Azo dyes. See pour l'ind. chim. a. Bile. Fr. 787,692, Sept. 26, 1935. Dyes are prepared by coupling diazotized aromatic amines containing a nitro or acetyl group in the para and an SO₂R group (R is alkyl or aralkyl, substituted or not) in the ortho position with respect to the diazotizable group, with amines of the C_6H_5 and C_6H_4 series and their substitution products capable of coupling. The NO₂ group, if present, may be reduced, acetylated, alkylated or diazotized and coupled with appropriate components. Thus, 2-amino-5-nitrophenyl ethyl sulfone \rightarrow ethoxyethylamine dyes acetate silk in pure violet-red shades. Several examples are given.

Azo dyes. See pour l'ind. chim. a. Bile. Ger. 618,749, Sept. 14, 1935 (Cl. 22a 2). Dyes containing one or more metals and free from COOH groups are obtained by treating azo dyes free from COOH groups and groups containing SO₃, such as HSO₃, HSO₃, SO₂NH₂, etc., and in which the coupling C atom is ring-bound, with hydrides of metals in the presence of alkalis. Thus, the dye from diazotized 2-amino-1-naphthol and 2-naphthol is heated with Cr(OH)₃ in the presence of KOH to give a product imparting a blue-violet color to Japanese lacquer, suitable for coloring Al foil. Other examples and a table of dye components, metals and colors produced are given.

Azo dyes. See pour l'ind. chim. a. Bile. Ger. 621,304, Nov. 6, 1935 (Cl. 22a 1). Diazotized 4-nitro-2-chloroaniline is coupled with an α -alkylsulfonic acid of a primary amine of the benzene series containing at the most one additional substituent, which must not be SO₃H and must not be in m -position to the NH₂ group. The alkyl-sulfonic group is split off in known manner after the coupling. Orange or red dyes applicable to cellulose esters and ethers are obtained. Examples are given.

Azo dyes, dyeing. I. G. Farbenind. A.-G. (Max Balthes, Kurt Bricsewitz and Arthur Zitscher, inventors). Ger. 621,078, Nov. 1, 1935 (Cl. 22a 1). See U. S. 1,992,461 (C. A. 29, 27357).

Chromatable azo dyes. Georges Kopp and Pierre Petitcolas (to Compagnie nationale de matieres colorantes et manufactures de produits chimiques du Nord reunes etablissemens Kuhlmann). U. S. 2,024,864, Dec. 17, 1935. Dyes of various shades capable of being after-chromed are obtained by diazotizing an initial material such as 1-alkoxy-2-amino-6-nitrobenzene substituted in the 4-position by a nitro, sulfonamide or sulfonic acid group and coupling with a naphthol, phenol, naphthylamine, aminonaphthol, pyrazolone or β -diketone. Various examples are given.

Metal compounds of azo dyes. I. G. Farbenind. A.-G. (Hans Krmkalla and Walter Kuhne, inventors). Ger. 621,473, Nov. 7, 1935 (Cl. 22a 2). Salts of haloacetylated lower aliphatic acids with metals such as Cr or Cu are used as the source of metal. These salts react more quickly than those ordinarily used. Examples are given.

Metaliferous azo dyes. I. G. Farbenind. A.-G. (Guido von Rosenberg, inventor). Ger. 621,079, Nov. 1, 1935 (Cl. 22a 1). The diazo dyes are obtainable by coupling 1 mol. of tetrazotized 3,3'-dimethoxy-4,4'-diaminodiphenyl with 2 mols. of a naphthol are heated with a heavy-metal salt of a carboxylic acid of high mol. wt., e. g., with a Cr, Cu, Fe, Ni, Co or Pb stearate, oleate, laurate, naphthenate or sebacate. The reaction may be effected in the presence or absence of an org. solvent, e. g., xylene or trichlorobenzene. Pigment dyes, generally violet or blue, are obtained. Sn processes are described.

Azo dyes containing metal. I. G. Farbenindustrie A.-G. Brit. 435,040, Sept. 13, 1935. Addn. to 434,777 (C. A. 28, 4919). The dyes are made by treating α -hydroxyquinoline (I) or its derivs. with an agent supplying heavy metal and combining the product with a diazo compd. free from groups that form complex metal compds., the components being so chosen that the resulting dyes contain at least 1 acid group. In examples, (1) the Cr compd. obtained by boiling a HCl soln. of I with Cr formate, fluoride, acetate or sulfate is coupled with diazotized metanilic acid in alk. soln., the compd. from I and (AcO)₂Fe may be similarly coupled, the products are suitable for dyeing leather, and (2) the Cr compd. obtained by boiling a neutral soln. of I-5-sulfonic acid with Cr formate is coupled with diazotized p -nitroaniline in AcOH soln., the product dyes wool.

Copper-containing azo dye. Imperial Chemical Industries Ltd. and Mordecai Mendoza. Brit. 435,315, Sept. 19, 1935, Fr. 789,445, Sept. 3, 1935. The dye is made by coupling 2 mol. proportions of diazotized 6-chloro-2-aminophenol-4-sulfonic acid with 1 mol. proportion of the urea of Jacod in aq. alk. med. soln., e. g., Na CO₃, and treating the resulting dye with Cu or an agent yielding Cu, e. g., CuSO₄. It dyes cotton blue-shaded shades fast to light.

Monoazo dyes. Henry Jordan and Miles A. Dahlen (to E. I. du Pont de Nemours & Co.). U. S. 2,024,358, Dec. 17, 1935. Dyes of various colors (various red shades in most of the examples given) which are suitable for development on the fiber and which can be discharged to a pure white, suitable for dyeing cellulose esters such as cellulose acetate, are formed by diazotizing p -aminodimethylbenzamide or other amine of the general formula R¹NR²NR³NH₂ in which R¹ and R² represent H or alkyl groups when X represents CO and R³ represents an alkyl group and R¹ represents H or an alkyl group when X represents SO₂, and R³ represents a phenylene radical, and by coupling with m -toluidine, cresidine or other amine of the benzene or naphthalene series having a free β -position to the amino group. Numerous examples are given.

Trisazo dyes. I. G. Farbenind. A.-G. (Hermann Klingenstein, Eugen Gletenberg and Oscar Goos, inventors). Ger. 621,186, Nov. 2, 1935 (Cl. 22a 10). See Fr. 765,752 (C. A. 28, 70349).

Mordant azo dyes. Durand & Huguennin A.-G. Brit. 434,918, Sept. 11, 1935. Addn. to 432,287 (C. A. 29, 33619). Dyes are made by coupling H acid in an acid

medium with a diazotized aminoazo compd. of type $R_1N:NR_2NH_2$, then in an alk. medium either with a diazo compd. of the same type or with a diazo compd. of an amine R_1NH_2 , where R_1 is a C_{6H_5} nucleus which may contain substituents, particularly SO_3H , NO_2 , $COOH$ or halogen, R_2 is a sulfonated C_{6H_4} nucleus and R_3 is a C_{6H_5} nucleus that contains OH and $COOH$ in *o*-position and may contain further substituents, e. g., Cl , CH_3 , halogen. They yield fast blue-green to green shades in chrome printing on cotton. In examples, 3-nitroaniline-4-sulfonic acid — salicylic acid (reduced) — (alk.) HCl — (alk.) *o*-, *m*- or *p*-sulfamic acid, 4-chloroaniline-3-sulfonic acid, aniline-2,4-disulfonic acid or 3-amino-4-sulfolobenzenazo-azobenzene acid.

Vat dyes Wilhelm Eckert and Otto Braunsdorf (to General Aniline Works). U. S. 2,026,026, Dec. 31. Dyes, examples of which dye cotton from a hyposulfite vat gray to brown shades, are obtained by heating, to about 140–250°, an arylamino substituted 1,4,5,8-naphthylenedi(aryl)imidazole with an acid-condensing agent such as $AlCl_3$ either alone or mixed with a flux such as $NaCl$. Several examples with details are given.

Vat dye paste for textile printing Herbert A. Lubs and John E. Cole (to E. I. du Pont de Nemours & Co.) U. S. 2,024,973, Dec. 17. An unsubstituted alkali metal anthraquinone-sulfonate is used as an assistant. U. S. 2,024,974 relates to the similar use of an alkali metal anthraquinone-sulfonate and gives numerous examples and U. S. 2,024,975 relates to the addition of anthraquinone-2-sulfonic acid or an NH_2 or alkali metal salt of this acid to various printing pastes, and also gives numerous examples.

Separating vat dyes I. G. Farbenindustrie A.-G. Brit. 434,815, Sept. 9, 1935. Addn. to 341,357 (C. A. 25, 5040) and 369,604 (C. A. 27, 2308). Sepn. of mixts of isomeric 1,4,5,8-naphthylenediarylimidazoles, obtainable according to Brit. 257,244 (C. A. 20, 1527), 265,232 (C. A. 22, 322) and 265,904 (C. A. 22, 503) into their constituents is effected by first heating with an alkali metal compd. of strong alk. action, except caustic alkali, e. g., sodamide, $NaOLi$, in presence of a H_2O -miscible solvent or diluent, e. g., alc., then sep. the compds. obtained by means of their different solubilities and recovering the vat dyes from these sep. compds.

Anthraquinone vat dyes Max Utringer and Max Bommer (to Soc. pour l'ind. chim. A. Bille). U. S. 2,026,150, Dec. 31. See Brit. 414,620 (C. A. 29, 6122).

Vat dyes of the anthraquinone series. Paul Nawia-ky and Berthold Stein (to General Aniline Works). U. S. 2,025,546, Dec. 24. Dyes giving green shades of good fastness on cotton are obtained by heating compds. such as 1,2'-dianthraquinonyl sulfide or a chloro deriv. with $ZnCl_2$ (suitable at about 300° and in the presence of a catalyst such as Cu chloride). The crude dyes may be purified by treatment with alk. solns. of dextrose or by recryst. or by dissolving in H_2SO_4 and subsequent fractional pptn.

Dyes formed by heating α -cyanoarylamides with metal compounds. Joseph F. Thorpe, Reginald P. Linstead and John Thomas (to Imperial Chemical Industries Ltd.) U. S. 2,025,791, Dec. 31. By heating an α -cyanoarylamide such as α -cyanobenzamide to 200–300° in the presence of an oxide, sulfide or carbonate of a multivalent metal such as those of Fe or Mg , or with the free metal, dyes are obtained which appear to be dehydration and condensation products of intermediately formed compds. such as 1-hydroxy-3-undecylole.

Anthraquinone dyes. Chemische Fabrik vorm. Sandor Ger. 621,369, Nov. 6, 1935 (Cl. 223, 3 02). Water-sol. blue, violet or brown wool dyes are prepd. (1) by introducing a SO_3H group or groups by standard processes into the known N,N' -dianthraquinonyldiiminodiazol compds. obtainable by oxidizing arylaminoanthraquinones or (2) by oxidizing a sulfonated arylaminoanthraquinone, unsubstituted in the aryl residue in *p*-position to the NH_2 group. Method (1) may be effected with oleum at about 45°; method (2) may be effected with H_2SO_4 and MnO_2 at atm. temp. Examples are given.

Anthraquinone dyes. Chemische Fabrik vorm. Sandor. Fr. 787,400, Sept. 21, 1935. Bright dyes are

prepd. by condensing aromatic bases of which the 2 positions ortho to the NH_2 group are substituted, and which may also contain other substituents, with anthraquinone derivs. having one or more groups replaceable by an arylamino group, and treating the products obtained by the usual methods for anthraquinone dyes. Thus, they may be sulfonated or treated with aldehydes in acid or neutral medium or converted to anthrapyridines, anthrapyrimidones or anthrapyrindones. In an example *C*-carbethoxy-2-methyl-4-bromoanthrapyrindone is heated with 1-amino-2,4,6-trimethylbenzene in the presence of $AcOK$ and Cu and the product is sulfonated giving a product which dyes wool bright yellowish red shades. Several examples are given.

Benzanthrone dyes Soc. pour l'ind. chim. A. Bille. Fr. 787,448, Sept. 23, 1935. Dyes are prepd. by treating the *B*-1-bromo-2-methylbenzanthrone prepd. by the process of Fr. 787,175 (C. A. 30, 10707) with alk. condensing agents, if desired after causing the atom of Br to react with appropriate compds. of S , Se or 1-aminoanthraquinone.

Chromiferous dyes Soc. pour l'ind. chim. A. Bille. Brit. 434,835, Sept. 10, 1935. See U. S. 1,990,257 (C. A. 29, 19069).

Tricarbocyanine dyes, intermediates. Leslie G. S. Brooker (to Kodak Ltd.) Brit. 435,232, Sept. 18, 1935.

Pyridinium quaternary salts are prepd. by causing pyridine (1) to react with a 2-iodopyridine alkyl halide or with a 2-iodoquinoline alkyl halide. Dyes are prepd. by condensation of these salts with quaternary cycloammonium salts having a reactive alkyl group, the pyridinium ring appears to undergo fusion, 2-aminopyridine or 2-aminoquinoline alkyl halides being left as by-products. Alternatively, dyes are prepd. by condensing a quaternary cycloammonium salt having a reactive alkyl group with pyridine in the presence of 2-iodopyridine alkyl halide or 2-iodoquinoline alkyl halide. Among examples, 1-methylbenzothiazole ethyl *p*-toluenesulfonate, 2-iodoquinoline ethiodide and *f* are heated together to form the dye 2,2'-diethylthiobenzocarbocyanine iodide.

Sulfur dyes, intermediates. Soc. pour l'ind. chim. A. Bille. Brit. 435,342, Sept. 19, 1935. An N -aryl deriv. of a hydrocarbon that contains at least 3 condensed rings or of a carbazole contg. the nucleus of such a hydrocarbon, or a hydroxy deriv. of such an N -aryl deriv., is treated with S or an agent yielding S to produce sulfurized dyes. Among examples, (1) *p*-hydroxyanthracene is condensed with *p*-aminophenol to give 2-(4'-hydroxyphenyl)aminoanthracene which is heated with S in cyclohexanol, and (2) quinoxalinecarboxamide is condensed with the carbazole derived from 1-phenylaminoanthracene and, after reduction, the leuco compd. is sulfurized. Examples of dyeing cotton with the product of (1) in the usual Na_2S bath and with the product of (2) in a hyposulfite vat are given.

Pigments of the indanthrene series. Frank W. Johnson (to E. I. du Pont de Nemours & Co.). U. S. 2,026,657, Jan. 7. Highly dispersed dyes easily reducible to the leuco form and which are suitable for dyeing cloth by the "pigment pad-jig reduction" process are produced by treating a H_2SO_4 soln. of a compd. of the indanthrene series such as *N*-dihydro-1,2,2',1'-anthraquinonazine with Cl_2 and then with a sol. cycloaliphatic compd. such as cyclohexanol under such temp. conditions that the H_2SO_4 is substantially inert. Several examples with details of procedure are given.

Dye printing pastes Hermann Berthold (to General Aniline Works). U. S. 2,024,502, Dec. 17. A mercapto-benzothiazole or a mercapto-benzimidazole is used as a stabilizer. Several examples are given.

Printing pastes I. G. Farbenind. A.-G. Fr. 788,012, Aug. 24, 1935. Printings of used, azo dyes are obtained on fiber by using an azo dye prep. contg. the usual thickening agents and a compd. capable of liberating acids during steaming and developing the dyes by steaming. Suitable compds. liberating acid include K fluoro-sulfonate, Na bromoacetate, K salt of the mono- Mc ester of oxalic acid and Na acetoxyethanesulfonate.

Printing pastes, printing fabrics. E. I. du Pont de Nemours & Co. Brit. 434,736, Sept. 9, 1935. The pastes comprise as principal component a yellow or orange vat dye having only moderate printing qualities and as subsidiary color component a yellow or orange 1,8-bis-(acylamino) anthraquinone exhibiting a greater vat solubility than the principal dye. Alternatively, the principal and subsidiary components may each be a mix of suitable vat dyes as specified. Among examples, (1) a soln. of crude 1,8-dibenzamidoanthraquinone (1 part) in 95% H_2SO_4 at 5° is poured into ice water, filtered and washed free from acid, the filter cake is suspended in H_2O , warmed to 80–85° with addn of a dil. alk. hypochlorite soln., so maintained for 2–4 hrs., again filtered and washed free from alkali, then made into an aq. paste with addn of "Leucanol" or other wetting agent, milled and mixed with a similarly prep'd paste of 1,8-dibenzamidoanthraquinone (2 parts), and (2) cotton fabric is printed with an aq. paste contg. wheat starch, British gum, gum tragacanth, K_2CO_3 , Na formaldehydesulfonate, glycerol and the dye paste obtained in (1) and the printed fabric is dried, steamed for 2–8 min. at 101–102°, oxidized in dil. Na Cr_2O_7 soln. or in cold running H_2O , soaped, rinsed and dried.

Arylides of 4-hydroxybiphenyl-3-carboxylic acid. Oskar Haller and Hermann Morechel (to General Aniline Works). U. S. 2,025,587, Dec. 24. See Ger. 618,213 (C. A. 30, 4, 309).

Dioxazine compounds. Georg Kalscheur and Werner Zerweck (to General Aniline Works). U. S. 2,024,525, Dec. 17. By the reaction of 2 mol. proportions of a nitro- α -naphthol with the benzene or naphthalene series on 1 mol. proportion of a halogenated quinone of the benzene or naphthalene series, products are obtained such as dichloro-di- or tetra nitro-triphenoldioxazine which dye cotton from an acid bath brown-orange shades.

Aminoanthraquinone compounds. I. G. Farbenindustrie A.-G. Brit. 434,906, Sept. 11, 1935. 1,4-Diaminoanthraquinones in which the 1- and 4-groups may be substituted by alkyl, aralkyl, cycloalkyl or aryl or heterocyclic groups are obtained by condensing leuco-1,4-diamino-, 1,4,5-triamino- or 1,4,5,8-tetraaminoanthraquinones in the absence of reducing agents with at least 2 mol. proportions of a primary amine free from salt-forming groups, or with at least 1 mol. proportion of each of more than 1 different such amines. The condensation takes place at atm. pressure, if desired in the presence of a diluent and if in the presence of air gives the substituted amino derivatives and if not gives the leuco compounds, which may be oxidized with air, O , $FeCl_3$ or H_2O_2 and in presence of Cu. The products are suitable for dyeing cellulose esters, artificial combs, lacquers, waxes, oils and petroleum fractions. According to examples, leuco-1,4-diaminoanthraquinone is condensed with $BzNH_2$, cyclohexylamine, $PhNH_2$, ethanoloamine and benzylamine.

Quaternary ammonium compounds. Gytung. I. G. Farbenindustrie A.-G. Brit. 435,388, Sept. 20, 1935. Polyethylenepolyamine mixtures contg. substantial proportions of compounds of the formulas $H_2N(C_2H_4NH)_nC_2H_4NH_2$ and $(C_2H_4NH)_n$, in which n is greater than 2, are converted into quaternary NH_4^+ compounds by treatment with alkylating or aralkylating agents. In an example, a mix is freed by distn. from the fraction boiling up to 220° under 10 mm. pressure and the residue is treated with Me_2SO in an aq. medium kept alk. with Na_2CO_3 . Alkylation may be effected in 2 stages, tertiary amines being formed in the 1st stage by treating the starting material with an alc. and HCl , and quaternary NH_4^+ compounds being formed in the 2nd stage by further alkylation. The products are useful for after-treating cellulose materials dyed with substantive dyes, to improve the fastness of the dyes. Cf. C. A. 29, 4375.

Arylamides (dye intermediates). Herbert A. Lubs, Emmet F. Hinch and Miles A. Dahlen (to E. I. du Pont de Nemours & Co.). U. S. 2,025,116, Dec. 24. An alkylmercaptopyrimidine such as a toluene soln. of β -methylmercaptopyrimidine is caused to react with a hydroxyaryl carbonyl chloride, or a hydroxyaryl carboxylic acid such

as 2,3-hydroxynaphthoic acid in the presence of a dehydrating agent such as PCl_5 , to produce arylamides suitable for use in the manufacture of ice colors and insol. azo pigments. Various examples with details of procedure are given. U. S. 2,025,117 relates to azo dyes of various colors produced by coupling a diazotized arylamine with an alkylmercaptopyrimidine of 2,3-hydroxynaphthoic acid. Numerous examples are given.

Intermediates for polymethine dyes. Imperial Chemical Industries Ltd. Ger. 621,494, Nov. 7, 1935 (Cl. 22, 3). See Brit. 344,470 (C. A. 26, 315).

Dyed cellulose esters. Soc. pour l'ind. chim. à Bâle Ger. 620,246, Nov. 11, 1933 (Cl. 8m, 2.02). Cellulose is impregnated with a dye which contains an acid group and has only a low or no affinity for cellulose. The latter is then acylated, whereby a cellulose ester dyed fast to washing is obtained. Patterns may be produced by applying the dye and (or) the acylating agent to parts only of the material. The dye must be one which is not converted into a nondyeing compound under the acylation conditions. Examples are given in which cellulose is acetylated after it has been impregnated or printed with the following dyes: Kiron red G, Alzarna fast green and Kiron red 6B.

Dyeing. Daniel Bertho and Richard André Ger. 621,038, Oct. 31, 1935 (Cl. 8m, 12). In producing azo dyes on vegetable fibers or silk with the aid of 2,3-hydroxynaphthoic arylides, the dyed materials are rinsed in the cold, boiled in a circulated soap soln., and then subjected to a stamping or ponding treatment in a hot soap soln. which is gradually displaced by water. The materials may be packed in sacks for the stamping treatment or treated in a loose form, and the soap soln. used may contain fullers' earth or like mineral or a fat solvent, e.g., CCl_4 or $CHCl_3$. The treatment removes unfixed dye from the materials, and yields dyings fast to wet rubbing.

Dyeing. Soc. pour l'ind. chim. à Bâle Ger. 621,359, Nov. 6, 1935 (Cl. 8m, 2.01). The known products obtained by treating alkaliized cellulose, dyed or undyed, with heterocyclic compounds, contg. one or more groups $-NCH_2-$, where X is halogen, have been found to be innumerable to mid-gold dyes provided that the application of the dye is effected at below 30° under otherwise usual conditions. Details are given of the utilization of this property in the production of white or colored effect threads in mixed fabrics.

Dyeing. I. G. Farbenind. A.-G. (Hans Kämmerer and Hermann Winkler, inventors). Ger. 621,451, Nov. 7, 1935 (Cl. 8m, 7). For dyeing animal fibers, use is made of the azo dyes obtainable by coupling 1-(3'-sulfonyl)-3-methyl-5-pyrazolone with the diazo compounds from 2-aminophenols substituted in the 4-position by halogen or NO_2 , and in the 6-position by halogen, NO_2 or CH_3 . Dyeing is effected by the single-bath process in the presence of a heavy-metal compound, e.g., K_2CrO_4 .

Dyeing. Soc. pour l'ind. chim. à Bâle Ger. 621,452, Nov. 7, 1935 (Cl. 8m, 12). In producing azo dyes on the fiber, the material is first impregnated in the usual way with an arylide of an α -hydroxy carboxylic acid which couples in α -position to the OH group. It is then treated with a soln. of a diazotized amine of the formula $ROCH_2CONHR'NH_2$, where R is a phenyl residue which may be substituted, e.g., by Me or Cl , and R' is a β -phenylene radical substituted by two alkyl groups in β -position to one another. The acidity of the diazo soln. must be between pH 5 and 6.5. Blue or violet dyes are produced. Sp. processes are described.

Dyeing regenerated cellulose rayon. Imperial Chemical Industries Ltd. Ger. 618,329, Sept. 6, 1935 (Cl. 8m, 1.05). See Brit. 420,993 (C. A. 29, 8357).

Dyeing elastic cloth. Dogman, S. A. Fr. 787,224, Sept. 19, 1935. App. is described for stretching the cloth during dyeing.

Dyeing textiles. Deutsche Hydrierwerke A.-G. Brit. 434,911, Sept. 11, 1935. See Fr. 782,872 (C. A. 29, 7040).

Discharging dyes on wool with sulfonates. Robert Haller (to Soc. pour l'ind. chim. à Bâle). U. S. 2,024,038, Dec. 10. See Fr. 780,588 (C. A. 29, 6077).

Printing cotton. Radmer & Co A-G (C. Bener, inventor). Ger 621,109, Nov. 1, 1935 (Cl 8n. 5 01). Crude, bleached or mercerized cotton fabric is printed with a paste contg. an oxidizing agent and an ester salt of a leuco compd. of a vat dye, and the dye is then developed in the cold with H_2SO_4 of parchmentizing strength, e. g., 50°Bé. The coloring of the fabric is thus combined with the known processes for producing opalescent, linen-like or transparent finishes with the aid of H_2SO_4 . Modified effects may be produced by using gum arabic as a thickening agent in the printing paste, whereby the printed parts are protected from the action of the acid, but the development of the dye is not prevented. As a further modification, the fabric may be mercerized after the H_2SO_4 treatment. Sp. processes are described.

Stripping dyed materials, sulfonium and phosphonium compounds. I G Farbenindustrie A-G. Brit 434,810, Sept. 3, 1935. Dyes are stripped from textiles, leather, paper, etc., by the use of H_2O -sol org. compds. derived from quaternary S or quaternary P and contg. at least 1 aliphatic residue of at least 6 C atoms, but no sulfonic groups, e. g., methylthiethylsulfonium hydride (I) and its Me sulfonic acid salt, diethyloctadecylsulfonium chloride (II), trimethyldodecylphosphonium bromide (III), dimethylethylsulfonium chloride (IV) and diethyldodecylphosphonium sulfate (V). I is made by causing methyl ethyl thioether to react with cetyl iodide and converting the product into the hydride, II by causing diethyl thioether to react with octadecyl chloride, dipropyldodecylsulfonium bromide by treating dipropyl thioether with dodecyl bromide, III by causing trimethylphosphine to react with dodecyl bromide, IV by treating dimethylethylphosphine with cetyl chloride, V by causing diethylethylphosphine to react with oleyl halide and converting the product into the hydride from which the corresponding sulfate is formed.

Apparatus for bleaching and dyeing textiles. Gustave Cotel. Fr. 787,841, Sept. 30, 1935.

Apparatus (with a rotating applicator disk) for applying liquids such as dye solutions, etc., to yarns or filaments. Wm. Whitehead (to Celanese Corp. of America). U. S. 2,025,079, Dec. 24. Structural and operative details.

Device for testing materials for the fastness of their colors to light. N. V. Philips' Gloeilampenfabriek. Brit. 435,097, Sept. 13, 1935.

Obtaining vegetable fibers. Leo Nordmann. Ger 621,115, Nov. 1, 1935 (Cl 29b 2). In the recovery of fibers suitable for spinning from bast-fiber material, e. g., flax straw, the air-dried or dried material is treated with O_2 or ozonized air under such conditions that the material and (or) the gas is continuously or periodically agitated. Preferably, the temp. of the gas is reduced periodically to about 2°. The fibers and the incrusting materials are then sep'd by known mech. methods.

Obtaining fiber from plant materials such as flax, jute, china grass, etc. Joseph A. Manahan. U. S. 2,026,584, Jan. 7. For liberating plant fiber from connective tissue, the raw material is treated with water contg. an emulsifying agent such as a tallow soap and is subsequently treated with an aq. soln. of a mild alk. salt such as Na_2PO_4 and is then rinsed and treated with a softening agent such as a dil. soap and $CaCl_2$ soln. prior to spinning.

Bleaching fibers. B. Laporte Ltd and Isaac E. Weber. Brit. 434,809, Sept. 5, 1935. Vegetable textile fibers are bleached in a bath consisting of a peroxide to which a metaphosphate or HPO_4 has been added. Na silicate, Na_2CO_3 , $NaOH$, etc., may be added to give the bath any desired alkali.

Treating textile fibers. Soc. Nobel Française. Fr. 787,907, Sept. 20, 1935. Textiles are given the elasticity of silk or wool by treating them with a soln. composed of the mixt. of a condensation product of urea and CH_3O with a condensation product of another compd. and CH_3O . The other compd. is preferably thiourea or dicyanodiamide.

Oiling textile fibers. I. G. Farbenind. A-G. (Joseph Nüsslein and Heinrich Ulrich, inventors). Ger. 621,396, Nov. 7, 1935 (Cl. 29b. 5). As lubricants for fibers, use is made of the condensation products of primary, secondary

or tertiary amines, contg. one or more OH groups, with carboxylic, sulfonic or sulfo-carboxylic acids of high mol. wt. Typical products are obtainable by condensing $OH_2C-H_2NH_2$, $(HOCH_2)_2N$ or $(HOCH_2)_3N$ with oleic acid. The products may be used as aq. emulsions.

Preserving fibers. Kammgarnspinneri Stöhr & Co A-G and Ehrhart Franz. Fr. 787,342, Sept. 20, 1935. Animal and vegetable fibers and rayon are preserved against the attack of parasites by means of inorg. compds. such as derivs. of P, Se, Sr, Ba and Zn, or org. substances such as derivs. of chloro phenols, thioureas, rhodanides, thiuronium salts and chloroanilides and organo-metallic compounds such as triphenylphosphine, triphenylstibine, their halides, oxides and salts of the corresponding acids. The products are applied when the receptivity of the material is high, e. g., during or after washing, bleaching, dyeing, sizing or oiling, according to the soly. of the treating agent in water, oil, etc.

Soaking natural silk fibers to soften them. Philip Kaplan. U. S. 2,025,980, Dec. 31. The fibers are soaked in a bath contg. high titer fats which have been sulfonated to the extent of 5% or more combined SO_2 .

Treating yarns. Joseph Brandwood. Brit. 435,395, Sept. 16, 1935. Doubled textile yarns impregnated with rubber or analogous dispersions are made by impregnating the individual yarns under differential pressure, clearing them from excess dispersion by means of a gas under pressure and doubling while still moist. App. for impregnation is described.

Producing fullness in yarns such as those of wool. Geo. M. Pearsall. U. S. 2,025,175, Dec. 24. A roving is twisted to a higher degree than the normal roving twist, spun, subjected to the action of a boiling liquid, dried, twisted in the reverse direction to remove part of the twist imparted by the spinning, redrafted to displace the fibers longitudinally, and spun.

Lubricating natural and artificial threads and filaments. Aleidis G. Bouthuys (to American Enka Corp.). U. S. 2,025,434, Dec. 24. Various materials are treated with a stable, homogeneous "soln." consisting of a mineral oil, an emulsifying agent such as a mineral oil sulfonate in an amt. insufficient to inhibit the lubricating properties of the oil, addnl. emulsifying and lubricating agents including alkali metallic and org. base soaps such as K oleate and the triethanolamine soap of oleic acid and a substantially anhyd. hygroscopic solvent for the soaps, so that the solvent serves to absorb from the materials treated any moisture which would normally form an emulsion with the oils. U. S. 2,025,435 relates to similar compns. contg. oil, a mineral oil sulfonate, soaps and a solvent such as the monoethyl ether or monobutyl ether of diethylene glycol.

After-treatment of rayon filaments. Vereinigte Glanzstoff-Fabriken A-G (Hugo Elling, inventor). Ger. 621,395, Nov. 6, 1935 (Cl. 29a. 6 08). Freshly spun rayon filaments are given their first washing while they are wound on porous reels or on perforated reels having a porous coating. The filaments are then dried and re-wound, with twisting, onto similar reels, on which the after-treatment is completed. More uniform products are thus obtained.

Rendering silk and rayon articles mat. Fritz Schuster. Fr. 787,767, Sept. 28, 1935. The treating liquid is projected by aspersion onto the articles, particularly stockings, while these are mounted and stretched on a form.

Finishing agents for textiles. Farb- und Gerbstoffwerke Carl Flesch, Jr. Fr. 787,815, Sept. 30, 1935. Agents resistant to water contain in addn. to glue or other albuminoid materials, substances which cause sepn. of the glue, etc., in an insol. form and that only after a certain time or by the application of heat. Thus, to a soln. of paraffin, glue and $Al(OAc)_3$, is added $SnCl_4$ and the mixt. is regulated to 16°Bé. The soln. is applied to cotton velour which is afterward heated to 120°. In another example $CaCl_2$ is added to an emulsion of glue and spermaceti.

Apparatus for fulling and other processing of textiles. Kraft Göbel and Georg Friede. Ger. 618,640, Sept. 12, 1935 (Cl. 8a. 9 70). Addn. to 554,773 (C. A. 28, 12021).

Moore fabrics Albert Mellor and Ralph J. Mann (to Celanese Corp. of America). U. S. 2,024,177, Dec. 17. Various details of manufacture and use of a pressure surface for use in the production of more effect fabrics are described.

Transparent fabric from muslin, etc. Geo. Heberlein, Jr. (to Heberlein Patent Corp.). U. S. 2,026,129, Dec. 31. Cloth such as a cotton fabric is treated with a swelling agent such as H_2SO_4 to render it transparent and is passed through successive jaws of a calender having at least 2 jaws, to render it noncurling. The material may also be mercerized.

Impregnating textile fabrics with metal compounds such as those for weighing and mordanting. Sidney G. Osborne (to Hooker Electrochemical Co.). U. S. 2,025,072, Dec. 24. A fabric such as silk or cotton is immersed in a solution of a metallic salt such as one of Pb, Sn or Sb in a nonaqueous solvent such as an organic solvent which is inert to the fabric, and the salt is hydrolyzed (suitably by water vapor and NH_3) to convert it into a water-insoluble compound of the metal.

Treating cellulose esters. I. G. Farbenindustrie A.-G. Brit. 435,129, Sept. 16, 1935. In treating materials made of or containing cellulose esters with an alkali liquor, saponification of the esters is avoided by incorporating in the liquor a small proportion of aminoacetic acid, or a salt thereof. Among examples, a mixed fabric of cotton and acetate rayon is handled for 1 hr. in a boiling liquor containing Chicago blue 6B, Na_2CO_3 , Na_2SO_4 , and Na aminoacetate to dye the cotton only.

Treating fabrics such as "tobacco cloth" to improve its resistance to sun and rain. Geo. H. Rhodes. U. S. 2,026,190, Dec. 31. A web of fabric is continuously

brought into contact with an acidulated solution of Pb acetate for a sufficient time to effect penetration and is then treated with a solution of $Na_2Cr_2O_7$ to form Pb chromate on the fibers of the fabric. Apparatus is described.

Rotproof material. I. G. Farbenindustrie A.-G. (Fritz Siefert and Hans Kammerer, inventors). Ger. 618,783, Sept. 18, 1935 (Cl. 8 & 1). Cellulose material for sacks, fishing nets, sails, tents, etc., is made rotproof by treatment with mono- or poly-azo dyes containing at least 2 NO_2 groups in the molecule; the material is also fast to light and water. Thus, fishing nets are impregnated with 2,3-dihydroxynaphthyl-4-amino-2',4'-dinitrodiphenylamine and treated with diazotized 2-nitro-4-chloroaniline to render them rotproof. Other examples are given.

Apparatus for sizing warp threads. Otto Stoeger. U. S. 2,024,890, Dec. 17. An apparatus with a pump for supplying size from a container is provided with devices for indicating the viscosity of the size and its temperature, and for indicating the temperature of a hot-air chamber of the apparatus during the drying process.

Apparatus for drying continuous webs of cloth, paper or the like. Alphons O. Huxthal (to Proctor & Schwartz). U. S. 2,024,927, Dec. 17. Various structural, mechanical and operative details of a loop dryer.

Fat acid amides. Gustave Maubec. Fr. 787,641, Sept. 26, 1935. Amides such as stearamide are made by bubbling anhydrous NH_3 through the fat acid previously melted and heated to 100–150°. The amides may be used for coating, softening or finishing textile fibers and leather.

Dry-cleaning fabrics. Warren T. Reddish (to Emery Industries, Inc.). U. S. 2,024,981, Dec. 17. An absorbent compound such as one comprising true mahogany Na sulfonate 50, oleic acid 25 and naphtha 25% is mixed with a dry-cleaning solvent such as naphtha.

26—PAINTS, VARNISHES AND NATURAL RESINS

A. H. SABIN AND CARLTON H. ROSE

Production and use of high grade Zn oxide (Breyer). 13. Constituents of natural phenolic resins (Haworth, et al.). 10. Plastic compounds, lacquers, etc. (Brit. pat. 435,058). 13. Colloidal compounds [used in making varnishes] (Fr. pat. 787,267). 13. Aminoanthraquinone compounds [for lacquers] (Brit. pat. 434,906). 25. Azo dyes [for lacquers, varnishes and oils] (Fr. pat. 787,714). 25.

Roll and bar mill for grinding paints, etc. Asbjorn Sonsthagen. U. S. 2,024,073, Dec. 10. Various structural, mechanical and operative details.

Photometric apparatus for measuring the hiding power of paints, opal glasses and photographic emulsions. Raymond F. Hanstock, Louis A. Jordan and The Research Association of British Paint, Colour and Varnish Manufacturers. Brit. 434,136, Aug. 27, 1935.

Pigments. Geo. I. A. Stutz and Harlan A. Depew (to New Jersey Zinc Co.). U. S. 2,024,611, Dec. 17. In drying a wet pigment, the wet mass is heated under superatmospheric pressure until a sufficient amount of the associated liquid is vaporized to leave the pigment readily disintegrable, and the vapor is permitted gradually to escape while the material is under pressure.

Pigments from vat dyes. Maurice H. Fleischer and James Oglvie (to National Aniline & Chemical Co.). U. S. 2,026,623, Jan. 7. For producing a pigment, a vat dye such as flavanthrone or indanthrone is dissolved in H_2SO_4 and the material is dropped in water of substantially the boiling temperature.

Driers for use in paints and varnishes. Wilhelm Krumpholtz (to Beck, Koller & Co.). U. S. 2,025,870, Dec. 31. For producing a finely divided light-colored drier, a metal hydroxide such as that of Co, Pb, Mn, Ca or Zn is precipitated at a temperature not above room temperature under nonoxidizing con-

ditions, the precipitate is dispersed in an oil such as linseed oil and the dispersed precipitate, without drying, is treated with a resinic, naphthenic or soap-forming acid or with a glyceride of such an acid at a temperature below 200° (suitably with rosin in "mineral spirits").

Varnishes. Dubois & Kaufmann G. m. b. H. Ger. 621,440, Nov. 7, 1935 (Cl. 22 & 2). Brown fattier prepolymer in known manner from nondrying oils, e. g., tannic oil, is dissolved in a drying oil, e. g., linseed oil. Driers and pigments, e. g., PbO_2 , may be added. Rapidly drying compounds are obtained.

Varnishes and plastic compositions. I. G. Farbenindustrie A.-G. Fr. 787,690, Sept. 26, 1935. Varnishes and plastics are made by mixing linseed oil, wood oil, chlorinated rubber, natural or artificial resins or cellulose derivatives with viscous or solid chlorinated aromatic compounds containing at least 1 cyclic methylene group, e. g., chlorinated compounds of tetra- and decahydronaphthalene, acenaphthene, fluorene, benzanthrene, indene, etc. The mixture is preferably effected in the presence of solvents. Pigments, fillers, etc., may be added.

Bronzing lacquer. Denis J. Burke (to Commercial Solvents Corp.). U. S. 2,026,493, Dec. 31. A bronzing lacquer contains, as a gel preervative, an ester or salt of malic acid such as ethyl or Na malate.

Coating compositions. N. V. tot Voortzetting der Zaken van Pieter Schoen & Zoon. Brit. 434,870, Sept. 10, 1935. A binding agent for paints or lacquers is manufactured by mixing 1 or more raw or polymerized drying oils with an oil-modified polyhydric acid-phthalic anhydride resin and chlorinated rubber. Paints are prepared by mixing the binding agent, or its 3 constituents in any order, with the pigment. A siccativ and a thinning-out agent may be added to the finished paints or lacquers.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

The investigation of saturated acids of completely hydrogenated oils by the method of fractional distillation I. Hardened cottonseed oil. Sei-ichi Ueno and Masayoshi Iwai. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 602-3 (1935).—Hardened cottonseed oil (I no. 107.3, sapon no. 189.5), was saponified, purified with Et₂O and the mixed fatty acids were saponified. The mixed acids (neutralization no. 191.5, I no. 0.86, m. 63.5-4.3°, titer 60.6°) were esterified with MeOH contg. 2.5% HCl and the Me esters were fractionally distd. at 2 mm pressure into 14 fractions. The results of the distn. were checked by the fractional crystn. of the free fatty acids in alc. The quant. compn. was calcd. by use of the mean mol. wt. of the Me esters computed from the neutralization nos. and the theoretical mol. wt. of the pure esters. The compn. was found to be minute amt. of myristic acid, and about 17% palmitic, 76% stearic and 7% arachidic acids. Exptl. results are given.

Catalysis of hydrogenation III. Hydrogen number, a constant for fatty oils. A. S. Ginzberg and N. Yrasshevskii. *J. Gen. Chem. (U. S. S. R.)* 5, 1168-70 (1935). *C. C. A.* 30, 368¹.—The H nos. of 32 kinds of fatty oils, fats and waxes were detd. by the method of hydrogenation previously described. IV. Hydrogen number, a new constant for essential oils. A. S. Ginzberg and E. Evdokimova. *Ibid.* 1252-4.—The H nos. of 34 essential oils were detd.

Use of the Wood light in analysis. Examination of Argentine olive oils under the Wood light and comparison with peanut, cottonseed, rape and sunflower oils of domestic origin. B. Berisso. *Rev. col. farm. nac. (Rosario)* 2, 59; *Anales farm. bioquim.*, Suppl. 6, 89-90 (1935).—The adulteration of olive oil with 3% of any of the above oils can be detected by examn. of the fluorescence produced by irradiation with light of 365 mμ wave length.

Apple- and pear-seed oil. J. Fritzker and Robert Jungkutz. *Z. Untersuch. Lebensmittel* 70, 255-8 (1935).—Data are presented on the constants of these 2 oils. The comps. of the seeds are also tabulated, as well as some tests made on the total fat acids.

Adulteration of arachis oil with coconut oil. Henryk Ruebenbauer. *Przemysł Chem.* 19, 9-10 (1935).—Arachis oil contg. 10% of coconut oil can be distinguished from the pure product by its higher d, sapon, Reichert-Messl and Polenske values, and by its lower n and i no.

The fruits of *Ochra pulchra* as a source of vegetable oil. E. P. Phillips. *Farming S. Africa* 10, 337 (1935).—The fruits and seeds contain a greenish brown oil having an odor resembling that of valeric acid. The oil is suitable for soap making. The residual meal contains no alkaloids.

The occurrence of some new alcohols and hydrocarbons in sperm oil. (Preliminary report) Sei-ichi Ueno. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 608-11 (1935).—The oil used was a blubber (skin) oil of the sperm whale (*Physeter macrocephalus* L.). It was saponified, the unsaponifiable matter extrd. with Et₂O, and fractionally distd. at 15 mm pressure. The distillate boiling below 150° had an Ac no. 168.0 and I no. (Wijts) 54.3. Refractionation, mol. wt. detns. and chilling tests on fractions, acetylation of fractions and fractionation of Ac derivs., as well as soly. detns. on the Ac fractions in MeOH were carried out and alcs. contg. 8, 10, 12 and 14 C atoms were found. Some hydrocarbons were sep'd. from the Na alcoholates by distn. at reduced pressure. They formed a colorless volatile liquid and had a fragrant odor.

Eel oil. Toyoki Ono. *J. Agr. Chem. Soc. Japan* 11, 773-80 (1935).—The properties of the eel oil in the spring were: sp. gr. 0.9330, acid value 2.11, sapon. value 197.01 and I value 146.22; in the summer they were, resp.,

0.9334, 6.20, 193.09 and 158.89. The higher I value of the oil of the eel in the summer may be due to the fact that the eel consumes a large amt. of food in the summer. The Carr-Price reaction of vitamin A could not be observed in the oils of the various part of the eel. A small amt. of vitamin A was found only in the liver oil. The said fat acids consisted of palmitic acid and a small amt. of myristic acid and stearic acid. The Me esters of unsatd. acids were distd. fractionally and sep'd. as bromide. Tetradecylene, eleic, somarinic, stearidonic and iwahine acid were proved.

Copra of Mozambique. Joao de Carvalho de Vasconcellos. *Anais inst. super. agron., Univ. tech. Lisboa* 6, No. 2, 63-73 (1934).—Analyses of 7 samples of well-dried (H₂O less than 6%) Mozambique copra show oil contents of 66.06-68.85%, ash 1.74-3.18, crude protein 5.69-7.34, cellulose 8.02-10.03 and N-free ext. 8.73-12.40%. There is no correlation between the percentage of oil and percentage of N-free ext.

O. W. Wilcox. Orientation of molecules of beeswax. Paul Woog and N. Yannaquus. *Compt. rend.* 201, 1400-2 (1935).—Examined by x-rays the mols. of beeswax, when first built into the cell wall show very little orientation, this increases with time at a rate increasing rapidly with temp. Thus wax showing practically no orientation showed it distinctly after 23 days at 30°, and even more so after 3 days at 40°. Beeswax from hot countries is much more oriented than that from cold.

C. A. Silberrad. The use of palm oil in making hard soap. C. Bergell. *Seifenfabr.-Ztg.* 62, 688-9, 720 (1935).

Volumetric determination of unsaponified fat in soap. N. Spasskii. *Maslobitno Zivrovo Delo* 11, 352-3 (1935).—The Spitz-Hönig method of detn. of unsapd. fat in soap is time-consuming and gives high values. The following procedure is rapid and accurate to 0.01% for 0.2% contents of unsapd. fat in soap: Dissolve 10-20 g. of soap in 100-50 cc. of 60% alc. contg. 0.5% Na₂CO₃. Ext. the unsapd. and unsaponifiable matter with petr. ether as usual. Wash the ext. with 60% alc. contg. 0.5% Na₂CO₃ and distil off the solvent. Dissolve the residue in 5 cc. of alc.-C₂H₅ (1:1) and titrate the soln. with 1/10 N KOH in alc.-C₂H₅ (1:1) to a faint pink. Introduce 5-10 cc. of the same KOH soln., reflux the soln. on a water bath for 15-20 min. and titrate back with alc. 1/10 N HCl.

Chas. Blanc. The determination of free alkali in soap. II. W. Poethke. *Fettchem. Umschau* 42, 180-2, 197-201 (1935); *C. C. A.* 26, 4493.—The soly. of Na or K soaps in PrOH-glycol mixts. suggested the use of such mixts. as solvents for acidimetric titrations of soaps. Preliminary work detd. the indicator error (amt. of standard alkali soln. required to produce a red color to phenolphthalein) of a series of PrOH-glycol, PrOH-H₂O, glycol-H₂O and PrOH-glycol-H₂O mixts. The indicator error increased continuously with the glycol content of the glycol-H₂O and glycol-PrOH mixts., while it passed through a max. at 95% PrOH in the PrOH-H₂O mixts. Addns. of small amts. of water had a minor effect on the indicator error of PrOH-glycol mixts. Addn. of NaOAc or K palmitate to various of the solvent mixts. always markedly decreased the indicator error. By applying the proper corrections, it was possible accurately and easily to titrate known amts. of KOH in artificially prep'd. mixts. of KOH and K palmitate or K stearate. Total carbonate and caustic alkly. in soap can be detd. by dissolving the soap sample in alc., adding an excess standard acid, boiling to expel CO₂ and cooling before titrating with standard alkali. Other expts. established the error involved in attempting to titrate the NaOH in soaps contg. Na₂CO₃ with a mixt. of 80 cc. PrOH and 15 cc. glycol as a solvent. With the help of the corrections thereby detd., it was possible accurately to est. the free caustic in soap contg. small amts. of Na₂CO₃. Perhaps analogous methods for detg. the KOH in K soaps contg. K₂CO₃ could be worked out. Expts. for prep. Na

oleate and Na palmitate in cryst. form are described.

J W Perry
Detergent action of soaps of elaidinized fatty acids and the cis trans isomerism of unsaturated fat acids. S. H. Bertram and E. C. S. Kipperman. *Chem. Weekblad* 32, 624-7 (1935).—Drop nos. were detd. by means of a stalagmometer, of soaps of K soaps of 9 unsatd. acids and Na oleate, with 15 different org. solvents. The drop nos. are proportional to the emulsive powers of the soaps. All K soaps of elaidinized acids have higher drop nos. than the corresponding oleic acids, and the ratios of the drop nos. of the elaidic acids to those of the corresponding oleic acids is roughly const. Drop nos. of C_{18} oleic acids do not differ much from those of stearic acid, but the drop nos. of the corresponding elaidic acids are considerably higher for the hydrocarbon solvents, therefore the oleic acids have to be considered as the *trans*- and the elaidic acids as the *cis*-isomers. The influence of a longer fat acid chain, of a hydroxyl group, and the position of the double bond in the soap mol. are demonstrated and discussed. The "2,3-oleic acid" of the literature is shown to be 2,3-elaidic acid. Drop-no. tests and comparative washing tests show that soaps from oils in the ordinary condition have smaller detergent powers than elaidinized soaps.

O W Wilcox

App. for measuring the heat cond. of oils (Lederer) 1. Butter, fats and fatty oils (Langton) 12. Exhaust steam condenser and oil separator (U. S. pat. 2,025,043) 1. App. for proportioning the flow of liquids as in refining vegetable oils (U. S. pat. 2,024,478-9-80) 1. App. for sampling or visual examn. of oils (U. S. pat. 2,026,267) 1. Ammonoanthraquinone compds. [for waxes and oils] (Brit. pat. 434,906) 25.

Fats, etc. Swift and Co. Ger. 618,836, Sept. 17, 1935 (Cl. 53a 1 01). Fats, oils or their mixts., especially lard, is rendered stable by adding 1-5% of crude cottonseed oil.

Denaturing fats or oils to render them inedible. John E. Muth (to Standard Oil Co. of Calif.) U. S. 2,025,954, Dec. 31. A benzyl deriv. of a saccharide or of glycerol or a glycol is added to a fat or oil.

Neutralizing oils. The Sharples Specialty Co. Fr. 787-555, Sept. 25, 1935. App. is described for continuously mixing fatty oils and an alkali at high speed in carefully proportioned quantities and for sepp. the soap and neutral oil at suitable temp.

Oxidation products of castor oil. Melvin De Groote and Bernhard Keiser (to Tretolite Co.). U. S. 2,025,806, Dec. 31. Castor oil is oxidized with air at a temp. of

1 about 120-150° and under a gage pressure of 25-125 lb., with 10-20% of octadeca-9,11-dienoic acid glyceride as an autooxidizer-catalyst. U. S. 2,025,807 relates to a similar oxidation of castor oil with air of normal moisture content, with use of heneleoic acid glyceride as an autooxidizer-catalyst. U. S. 2,025,808 involves the similar use of α -pinene as catalyst. U. S. 2,025,809 involves a like use of dipentene as catalyst.

Polymernizing glyceride oils. Wilhelm Krumhaar (to Beck, Koller & Co.). U. S. 2,024,103, Dec. 10. For bodying, an oil such as linseed, soybean or coconut oil, is heated with a colloidal dispersed heavy metal such as Co, Mn or Fe until a viscous product is obtained.

Apparatus for treating fish to recover oil from them and to prepare them for canning. John M. Devers (to Food Machinery Corp.). U. S. 2,026,022, Dec. 31. Various structural, mech. and operative details.

3. Soap. Herbert Krause. Austrian 143,654, Nov. 25, 1935 (Cl. 23b). In the manuf. of soap from fat compns. contg. liquid fatty oils or fat acids having an I no. of 70 or more, the tendency of the product to deteriorate during storage is restrained by adding to the soap small proportions of glycerol (or other alc.) and a water-sol phosphate, preferably Na_2PO_4 . These addns. are made at any stage in the manuf. of the soap following the removal of excess alkali and salt.

4. Soap preparations. I. G. Farbenind. A.-G. Fr. 787-785, Sept. 28, 1935. Water-sol. salts of aliphatic carboxylic acids having at least 10 C atoms and in which at least 1 atom of N, O or S is situated between the aliphatic radical and the $COOH$, are used alone or with other substances such as soaps, inorg. salts, albuminous materials, vegetable gums, starch, fats, waxes, glycerol, tar or nicotine, instead of soaps and have a high stability to the action of lime. Examples of these compds. are alkali salts of lauryl-propylaminoacetic acid, oleylsarcosine, sarcoside of palm oil fat acid, reaction product of dodecylamine and maleic anhydride, reaction product of α -stearyl- β -diethylene-diamine with $CH_3ClCOOH$, heptadecylaminoacetic acid, dodecylmercaptosuccinic acid, dodecylaminobenzoic acid, stearylbenzylaminopropionic acid, and dodecylphenylaminoacetic acid.

5. Continuous soap-crutching apparatus. Robert V. Burt (to Procter & Gamble Co.). U. S. 2,024,425, Dec. 17. Structural, mech. and operative details.

6. Washing agents. Chemische Fabrik Joli A. Benckiser G. m. b. H. Fr. 786,332, Aug. 31, 1935. Alkali salts of metaphosphoric acid or mixts. of these salts with alkali pyrophosphates or other alkalies, such as Na_2CO_3 , are added to soaps in amt. such that the H-ion concn. of the product is not above $pH = 8.5$.

28—SUGAR, STARCH AND GUMS

J K DALE

Refining quality of raw sugar. Effect of manufacturing conditions. R. W. Harman. *Intern. Sugar J.* 37, 471-3 (1935).—Although the fundamental cause of poor-quality sugar originates in the cane, the mfg. conditions are also often responsible. Poor clarification and poor sugar boiling often yield very low-quality raw sugars from good-quality cane. H. has devised a set of lab. methods to test the refining quality of these raw sugars. Since these tests duplicate refining conditions very closely their use has proved very effective in grading incoming raw sugars.

D. P. Langlois

The present state of purifying sugar juices. K. Smolenski. *Gaz. Cukrownicza* 77, 35-53, 69-87 (1935).—A review with numerous references.

J. Wiertelak

Modern beet-juice clarification. O. Spengler. *Intern. Sugar J.* 37, 476-7 (1935).—See C. A. 29, 64584.

D. P. Langlois

Determination of mixtures of sucrose, invert sugar and glucose sirup by Kruisheer's method. Wacław Reicher. *Gaz. Cukrownicza* 77, 5-18 (1935).—Kruisheer's method of analyzing sucrose, invert sugar and glucose sirup in mixts.

with each other (C. A. 23, 3520, 24, 3064) has been applied to confectionery. The results are quite satisfactory.

J. Wiertelak

8. Methods of determining invert sugar. Jerzy Zaleski. *Gaz. Cukrownicza* 77, 109-29 (1935).—The different methods of detg. invert sugar, as recommended by the VIIIth International Comm. Meeting for standardization of analytical methods in sugar research, held at Amsterdam in 1932, are described.

J. Wiertelak

Different methods of defecation. II. K. Smolenski. *Gaz. Cukrownicza* 75, 157-70, 185-207 (1934) (French summary); cf. C. A. 28, 22114.—An important factor in the reproducibility of defecation expts. performed on a factory scale is the alk. after first satn. which should be approx. 0.08. Previous results were confirmed, showing that a higher dose of CaO results in quicker filtering and better quality of the juices, e. g., if 1.5% CaO (on the juice basis) is used, 10-15% more nonsugars are removed from the juice, than with 1% CaO. S. considers that nascent $CaCO_3$ is the main cause of this improvement. Slow defecation, lasting 5 min., gives higher filtering rates and better

juices than quick defecation, lasting 0.5 min. Similarly quick defecation, at 80°, gives a better filtering rate than cold defecation at 40°, but only slightly better juices. Defecation performed according to Troye's method of mixing the diffusion juice before defecation with an equal vol. of first satn. juice gives considerably shorter filtering periods, but a lower quality of juice, than if a preliminary defecation is applied. J. Wiertelak

Use of the electrical sodium lamp in saccharimetry. E. Landt. *Intern. Sugar J.* 37, 474-6, *Centr. Zuckerind.* 43, 650-1 (1935) — The advantages of a simple polarimeter illuminated by means of a new elec. Na lamp of high intensity over the white light, quartz wedge compensation saccharimeter, which is almost universally used in the sugar industry today, are discussed. Such equipment has been used in England for many years. Two years ago such a polarimeter was supplied to a firm on the continent. Its performance has been highly satisfactory. D. P. Langlois

Ost and Wilkening's method of determining lignin applied to sugar beets. Anna Nowotwórna and Janina Włodowska. *Gas Cukrownicza* 76, 270-2 (1935) — Ost and Wilkening's method of detg. lignin in wood is modified for sugar beets. In the first step the total fiber of the beets is isolated according to Henneberg and Stohman and the lignin is then detd. in the usual way, except that previous to hydrolysis with 72% H₂SO₄ the total fiber is extd. consecutively in a Soxhlet app. with Et₂O, 96% EtOH, C₂H₅, and Et₂O. Four different samples of beets showed the following lignin content: (a) 0.368, 0.385%; (b) 0.467, 0.471%; (c) 0.341, 0.340%; (d) 0.416, 0.424%. J. Wiertelak

Microscopy of starches and their modifications. Otto A. Sjöström. *Ind. Eng. Chem.* 28, 63-74 (1936) — A series of photomicrographs shows the appearance of the more important starches and their modifications, also the thin-boiling starches and dextrans, in their gelatinized and disintegrated forms. These pictures support the recent theory of "growth structure." W. H. Boynton

X-ray studies of nitrated starches. I. Maria Kolaczowska and Tadeusz Urbański. *Roczniki Chem.* 15, 339-42 (1935) — The authors obtained x-ray spectrograms of nitrated potato and sol. starch by the Debye-Scherrer method. Both show a marked resemblance and give the

same principal interference rings. Natural starch is more cryst. before the introduction of --ONO₂ groups, while the structure of sol. starch changes regularly during nitration. J. F. Matejczyk

Treatment of molasses for the production of foods, fertilizers, etc. (Gaspar y Arnal) 12. Significance of K in the system of fertilizing sugar-beet rotations (Lut) 15. Sugar cane (Taggart, et al.) 15. Clarifying and removing coloring matter from aq. liquids [sugar solns.] (U. S. pat. 2,025,715) 1

Sugar. Allgauer Alpenmilch A.-G. Brit. 435,034, Sept. 9, 1935. See Fr. 769,800 (C. A. 29, 519).

Apparatus for concentrating sugar sap. Hermanus A. Jansse. Ger. 618,075, Sept. 17, 1935 (Cl. 89d) 1.

Crystallizers for sugar, etc. Walter J. Blanchard. Brit. 434,740, Sept. 9, 1935. A crystallizer comprises a soln. container within which rotates a drum having hollow radial arms arranged so that their paths overlap. Cooling water or steam may be admitted to the worm-driven drum.

Starch from corn. Robert E. Greenfield and Harold R. Baker (to A. E. Staley Mfg. Co.) U. S. 2,023,999, Dec. 10, 1935. Corn is steeped, cracked, dewatered by starch flotation, ground, washed to remove fibrous constituents and to form a starch-gluten water suspension, tabled to sep. starch from gluten, and the gluten is dewatered; the starch milk from the flotation is dewatered and the water is employed to steep addnl. corn, the dewatered starch is washed with fresh water, germs from the flotation are washed with the starch wash water, the germ wash water is returned to the flotation, the starch-gluten suspension is dewatered, the dewatered starch-gluten mixt. is washed with fresh water, the fibrous constituents are washed with the starch-gluten wash water; a portion of the fibrous constituents wash water is returned to the flotation; water from the gluten is added to the dewatered materials to form a water suspension which can be tabled, tabled starch is taken up in water, the tabled starch is filtered, the filtered starch is washed with fresh water, a portion of the water from the filtered starch is employed for taking up addnl. tabled starch, and an addnl. portion of the water from the filtered starch is returned to the process. An arrangement of app. is described.

29—LEATHER AND GLUE

ALLEN ROGERS

Wattle barks. IV. Tannin content of a variety of *Acacia mollissima* Willd. F. A. Coombs, W. McGlynn and M. B. Welch. *J. Proc. Roy. Soc. N. S. Wales* 68, 246-8 (1934); cf. C. A. 27, 439. — Analytical data are given for 17 samples of bark from a newly recognized and described variety that differs from the main species only in its slightly lower ratio of tannin to nontannin.

H. B. Merrill
The vinegar eelworm in tan liquor. B. G. Peters. *J. Helminthology* 13, 159-62 (1935). — Eelworms (*Turbatrix aceti*) thrived in fermenting tan liquor of pH 5.0. There is no evidence of the active secretion of proteolytic enzymes by this worm and there is no reason to suppose that the worm causes damage to hides and skins during the tanning process. K. D. Jacob

Fat liquoring of animal skin. Edwin R. Theis. *J. Tech. Assoc. Fur Ind.* 6, 88-90 (1935). H. B. Merrill

Practical salting experiments in 1934. W. Grassmann and W. Hausam. *Ledertech. Rundschau* 27, 49-53, 57-62, 67-70 (1935); cf. C. A. 29, 2777. — Packs of calfskins in 3-7 cities were cured with NaCl contg. NaF or naphthalene, 2385 and 1376 skins, resp., including blanks. Small lots of skins (15-50) were cured with addn. of Zn salts and Preventol. Skins cured with NaCl contg. 1% NaF were slightly less stained than comparable skins without NaF, but the finished leather was not enough better to make the use of NaF advisable. Crude naphthalene was advantageous but the pure material was much

better; the addn. of naphthalene to curing salt at the beginning of warm weather is advisable. Preventol in brine followed by salting with 15% ordinary salt entirely prevented staining of the skins but the finished leather was only moderately better than that from the blanks. Preventol-treated salt was not effective. ZnO (1.25%) with salt was very effective and was better than Zn peroxide. Dry salted skins were much better than brined skins.

I. D. Clarke
Effect of perspiration on leather. P. White and F. G. Caughley. *New Zealand J. Sci. Tech.* 17, 412-17 (1935). — To show the effect of perspiration from the foot on the compn. of leather, socks made from vegetable-tanned lamb skin were worn for periods up to 30 days and analyzed. pH values of H₂O exts. of the leather increased from about 4.1 to 5.4, there was a marked increase in sol. N, a slight decrease in H₂O-sol. matter, and a marked darkening. The last 2 changes are attributed to oxidation promoted by the lowered acidity. H. B. Merrill

Fat acid amides for [coating, softening or finishing leather] (Fr. pat. 787,641) 25. Azo dyes contg. metal [for dyeing leather] (Brit. pat. 435,060) 25

Leather. Sebastiano Boccardo & Co. S. A. Austrian 143,631, Nov. 25, 1935 (Cl. 28b). White leather is obtained by lightly tanning hides with CH₂O soln. and com-

pleting the tanning with an acidified soln of water glass. The hides are washed between these treatments. If a soft product is desired, an alkali, e. g., soda, is added during the treatment with CH_2O in an amt. sufficient to establish a pH value of 7-9.8.

Chrome tanning. Arthur Weinschenk. Ger. 618,921, Sept 18, 1935 (CI 28a 3). A complex Cr tanning compn is obtained by treating Cu or Zn borates with Cr salts and drying. Hydroxides, carbonates or basic carbonates of Cu or Zn may be dissolved in water, treated with H_2BO_3 and Cr salts, and the product evapd to dryness. In an example, CuSO_4 , H_2BO_3 and Na_2CO_3 are dissolved in water and treated with $\text{Cr}_2(\text{SO}_4)_3$ soln. and the product dried or evapd to the required strength.

Treating soft leather to render it more rigid. Arthur J. Beford. U. S. 2,026,453, Dec 31. The leather is impregnated with a hot soln of paraffin, colophony, Burgundy pitch and neat's-foot oil and compressed while heated.

Coating leather. Imperial Chemical Industries Ltd. Fr. 786,233, Aug 29, 1935. A finishing compn for leather is made by incorporating an aq emulsion of an aliphatic alc of long chain contg 10 C atoms or more, e. g., cetyl alc or one obtained by reducing lauric acid, with an alk. soln of gum lac.

Dyeing skins, etc. I. G. Farbermnd A.-G. (Erich Lehmann, inventor). Ger. 618,902, Sept 18, 1935 (CI 3m 10 02). Addn to 617,987 (C. A. 30, 878a). The

method of 617,987 for dyeing skins, hair and feathers is modified by replacing the salts of 1,5-dihydroxynaphthalene and ammodiphenylamine by salts generally of 1,8-dihydroxynaphthalene and aromatic or heterocyclic amines, their derivs. or substitution products. Thus, the salt of 1,5-dihydroxynaphthalene and 7-aminoquinoline is dissolved in water and given a small addn. of H_2O_2 . On soaking in the soln white dog skin mordanted with Cr salt, a product with deep wine-red hair and bright red leather is produced. Other examples are given.

Gelatin from pigskins, etc. Chester H. Epstein and Nathan R. Gotthoffer (to Grayslake Gelatin Co.). U. S. 2,024,683, Dec. 17. The gelatin-yielding raw material is acidulated with citric or tartaric acid (suitably conjointly with an inorg. acid) and is then hydrolyzed.

Adhesive. Sergei Ushakov and Aron Endlin. Ger. 621,139, Nov. 2, 1935 (CI 22a 2). As an adhesive for securing veneers under heat and pressure, use is made of finely powd vegetable-tanned leather waste, which has preferably been pretreated with warm water. Small proportions of softening, preserving or waterproofing agents may be added to the leather. Sp. processes and compns. are described.

Dried glue. Roy C. Newton and Frank L. De Beukelaer (to Industrial Patents Corp.). U. S. 2,024,131, Dec. 10. Glue particles with a surface of jagged glue granules are obtained by dropping glue liquor upon granulated dried glue (various details of procedure being described).

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

The role of pH in the latex industry. Maurice Dérivé. *Caoutchouc & gutta percha* 32, 17363-5, 17365-7 (1935), cf. C. A. 28, 1889^a.—Measurements of the pH values of fresh and stabilized latex, and the coagulation of both kinds of latex are discussed. C. C. Davis

Patent literature in the field of latex and rubber in 1933-1934. St. Reiner and O. Duditz. *Caoutchouc & gutta percha* 32, 17339-40, 17371-3 (1935); cf. C. A. 30, 897^a.—Forty-six French and English patents are described. C. C. Davis

Progress in x-ray research on rubber. Geo L. Clark. *Rubber Age* (N. Y.) 38, 79-80 (1935).—A review, with preliminary announcement of the discovery of a long spacing in gel rubber, which is absent in sol rubber. C. C. Davis

Contributors to rubber compounding progress. D. C. McRoberts. *India Rubber World* 93, No. 4, 45-7 (1935), cf. C. A. 29, 8396^a.—An illustrated description of the Philadelphia Rubber Works Co. at Akron, O., with special reference to the lab. facilities. C. C. Davis

Purification of natural rubbers. III. A formula for the calculation of nonvolatile, water soluble substances in coagulated rubber and the application of the formula. Syozo Satake. *J. Soc. Rubber Ind. Japan* 8, 602-10 (1935), cf. C. A. 29, 5300^a.—Nonvolatile, water-sol substances (A) in coagulated rubber can be calcd by knowing the concn of nonvolatile, water-sol substance in the serum of coagulated latex and its degree of satn (com. raw rubber = 100) of water (B) thus: $A = (a/b) B$, where a is the nonvolatile, water-sol solid in the serum of coagulated latex and b is the volatile substances. Expts on the syneresis taking place when coagulated latex was passed through rolls indicated that the degree of satn of water became approx 20%. Application of this formula to the removal of nonvolatile, water-sol substances of coagulated rubber prepd from dln of latex agreed well. Three samples of rubber (pale crepe, smoked sheet and LS rubber) of known content of water-sol substances were tested with this formula and agreed well. K. Kitsuwa

The acetone extraction of raw rubber. VII. The time of acetone extraction of raw rubber and the saponification values of the acetone extract and of the residue. Hidemaro Endô. *J. Soc. Chem. Ind., Japan* 38, Suppl

binding 514-17 (1935), cf. C. A. 30, 323^a.—Free fat acids and saponifiable matter were extd. almost completely by acetone in 1-2 hrs. The sapon. no. of the ext. (A) decreased rapidly and reached a min. after 12 hrs of discontinuous extn. and after 16 hrs of continuous extn. This decrease is attributed to a gradual increase of extd. non-acidic compds and unsaponifiable matter with increasing time of extn. and the neutralization of acids by other compds. After the min. point, A increased, probably as a result of a gradual increase of extd. esters, formation of acids by oxidation and decomps. of esters. The change in the sapon. no. of the acetone ext. with increasing time does not result from a change in the type of compds. gradually extd., but from a change of the ext. in acetone soln. during extn. This is in agreement with the facts found for the acid no. Exptl. data are reported. Karl Kammermeyer

The oil resistance of rubber. II. Molecular polarization and dipole moment of purified natural rubber. Shû Kanbara. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 506-10 (1935); cf. C. A. 29, 7121^a.—Natural rubber was purified by Fummeier's method and dissolved in C_6H_6 and Et_2O . The dielec. const., n_D^{20} and d_4^{20} values and the concn of the solns were measured, and from these data the mol. polarization and the dipole moment (I) were calcd. on the assumption that rubber is dissolved in a mol. state of (C_6H_6)₁. For total and gel rubber, the I values were 2.45 and 2.91×10^{-18} e. s. u., resp., in C_6H_6 . These values are of the same order as those for masticated crude rubber obtained by Ostwald. The impurities in rubber are probably interlocked mechanically with the rubber mol., and not combined chemically. Sol rubber in Et_2O and C_6H_6 gave I values of 0.72 and 2.79×10^{-18} , resp. The values of total and gel rubber may be high because of autooxidation, and the true values for the rubber hydrocarbon may be considerably smaller than the reported ones. Circuit diagrams of the app. used for detg. the dielec. const. and the exptl. data are included. K. K.

Fundamental rules for the technical application of chlorinated rubber. Guido Schultze. *Farben-Ztg.* 40, 1165-7 (1935).—A discussion of the correct formulation of chlorinated rubber protective coating compns., contg. unsaponifiable plasticizers, pigments, etc., and methods which give the best practical results. J. W. Perry

Hydrazines as rubber softeners I Williams and C. C. Smith *Ind. Eng. Chem.* 27, 1317-21 (1935).—About 1% of PhNH₂ (I) plasticizes rubber, reduces the viscosity of its solns., and peptizes gel rubber in CCl₄. Softening is faster at 75° than at 25°, but reaches the same final stage, which depends on the concn of I. Rubber softened to the same extent by either I or by milling gives the same tensile strength, which is much greater than when mineral oil or stearic acid is used as a softener. C black, clay, etc., retard the action of I. Viscosity reduction is less in gasoline than in CCl₄, and is lessened by addn of EtOH. The softest product (like molasses) had a mol wt of 4500 (Staudinger's method) and a tensile strength of 115 kg per sq cm. Other asym hydrazines, salts of I, and its addn products with PhOH, CS₂, heavy metal salts, etc., are also softeners. The action of I is probably not phys., since I cannot be recovered from the softened rubber. Since the softening appears to depend on the presence of O, it is suggested that O reacts with double bonds, thus either reducing the real mol wt by breaking C chains or the apparent mol wt by destroying centers of attraction between mols. I accelerates this process by combining with the oxidation products. Reducing agents (HI), however, are not softeners. The literature of viscosity reduction and rubber softening is reviewed.

Arnold M. Collins.

The properties of rubber coagulum and rubber films formed from it A van Rossem and Raden Soepardi Prawirodipoero *Gummi-Ztg* 48, 622-53 (1934).—A preliminary report. The remarkable properties of so-called Emka sheet, prep'd by the Emka process by compression of the coagulum, suggested an investigation of the coagulum itself. Sheets were prep'd in 2 ways: (1) by coagulation of latex cream with Na₂SiF₆, in which case coagulation was slow enough so that the next could be placed on a smooth glass surface and a coagulum of uniform thickness be obtained, and (2) by the method of Traube, in which the latex was poured on a layer of gelatin, and a coherent sheet thus obtained. Acid products diffused out of the gelatin, lowered the pH value and led to coagulation. Addn. of HCO₂H to the gelatin accelerated the coagulation. The properties of the coagulated sheet obtained thus were studied: (1) *Water absorption on stretching under water*.—When a sheet was stretched under water, it absorbed up to 100% of its own vol of water, and the proportion absorbed was independent of the original water content and of the elongation. (2) *Syneresis*.—Compression of the coagulum released very little water, whereas kneading released a large proportion of water by syneresis. The washing process on the plantations may be regarded as a kneading process with irrigation by water, the only function of which is a pronounced cooling effect. (3) *Residual elongation*.—Measurements were made of the elongation remaining after sheets were stretched in a moist atm., and also when kept stretched until dry. In the latter case, the residual elongation was very high, and diminished only slightly on warming to 70°. Emka sheet also showed no shrinkage at 70°. (4) *Emka sheet showed, for raw rubber, an extraordinarily high tensile strength and modulus*. When wet sheeted coagulum was stretched to 300% and was dried under this tension, the tensile strength increased greatly in the direction of stretching, whereas it remained practically unchanged at right angles to this direction. Here there are certain analogies to calendered sheets having a calender effect, with the difference that calendered sheets shrink considerably at 70°, whereas stretched wet sheeted coagulum does not shrink. Accordingly there is a sort of reinforcement involved, the cause of which is still uncertain. Probably the phenomena are related in some way to an orientation of the long-fiber mols., which if true will be confirmed by x-ray studies in progress. Though other films from wet coagula, e. g., viscose and cellulose acetate films, show different properties in different directions, the phenomena are not the same as with rubber, for in the first case gel formation from a sol is involved, whereas in the latter case a gel is formed from a suspension of particles in an aqueum.

C. C. Davis

Effect of oxygen absorbers in rubber. A. A. Somerville *Ind. Eng. Chem.* 28, 11-17 (1936).—A new chem. method for retarding the tendency of vulcanized rubber to crack when subjected to repeated dynamic strains, such as so-called flexing, is described. This new method is based on the theory that such cracking is an aftermath of oxidation by free O dissolved in the rubber and absorbed by the powders (cf. Neal and Northam, C. A. 26, 873), and involves the addn of org. substances which absorb O in the presence of a base. The more strongly a substance in alk. medium absorbs free O, the more it retards cracking from flexing, and substances of the activity of the photographic developer class have a notable effect. As simple examples, the results obtained with pyrogallol + ethanolamine and pyrogallol + hydroquinone + ethanolamine are described. The mechanism of this reaction is obscure and it is complicated by the fact that the O absorbers develop their max. effect in the presence of a catalytic antioxidant. The exp't results are of direct practical significance, since with O absorbers, higher proportions of C black can be used with no greater tendency to crack by flexing than with lower proportions of C black in the absence of such agents. The use of O absorbers also enables the use of lower proportions of S. C. C. Davis

A new gutta from South Africa. Anon. *Bull. Imp. Inst.* 33, 303-6 (1935).—The *Gutta* exts of bark and of twigs and leaves of *Gymnosporia acuminata* Syzgs. (= *Celastrus acuminatus* Linn.) from Swaziland have the appearance and properties of gutta-percha or balata, and are quite distinct from rubber. The yield of 3.5% of gutta-like material from the twigs and leaves compares very favorably with that stated to be obtained in the East from the leaves of gutta-percha trees (*Palaquium* spp.). It is recorded that on the Govt. estates in Java a yield of 2.7% is obtained. On this basis, the yield of 10% obtained from the bark is very satisfactory. A. P. C.

A program of research with a view to improving carbon blacks for rubber. Cuvenc *Rev. gén. caoutchouc* 12, No. 116, 8-10 (1935). C. C. Davis

Further observations on variations of smoked sheet rubber. John Young and L. H. Rich. *Trans. Inst. Rubber Ind.* 11, 343-53 (1935); cf. C. A. 28, 462a. The light and dark grades (I and II, resp.) of smoked sheet already described (*loc. cit.*) were tested further for their aging properties and for the relative resistances to abrasion in road service of tires made from them. I and II gave, resp., in % ash, 0.136, 0.080; acetone ext., 2.54, 3.99; aq. ext., 1.59, 1.01. Photomicrographs (illustrated) showed that I gave the poorer dispersion of C black, both in a rubber-C black master batch and in a tire-tread mixt., whereas there was no difference between I and II after vulcanization. The dispersion in II was as good as that in I in less than 0.5 the time of milling. I, washed and dried I, masticated I and II were vulcanized according to a tire-tread formula, and the tensile strengths and moduli (at 300%) at 0°, 25° and 100° were det'd. The differences in phys. properties of the 4 samples at a given temp. were small, but the differences with change in temp. were great. This shows the importance of testing at a const. temp. Aging tests by the Geer oven and O-bomb methods showed small differences in the tensile strengths and in the resistances to abrasion (Williams app.), while in road wear tests the best wear was shown by the tire made from washed I, and in flexing tests (Rubber Service Laboratories Co. machine) I and II were almost the same, and better than masticated I and washed I. C. C. Davis

Reinforcement and stearic acid. Harry Barron *India Rubber J.* 90, 638-40 (1935).—An investigation was made of the effect of stearic acid (SA) on the mech. energy of vulcanizates composed of the base mixt.: rubber (10), S 3, diphenylguanidine 1.5, ZnO 5, C black 35, to which had been added 0, 0.5, 1, 1.5, 2, 2.5, 3 and 5 parts of SA, and which had been vulcanized at 141° to their optimum tensile properties. Another similar vulcanizate was prep'd from the same rubber previously ext'd. free of SA by acetone. The rubber contained approx. 1.5% SA. Graphs show the works of extension, works of retraction and hysteresis losses as functions of the elongations, and the

tensile strengths, elongations at rupture and energies as functions of the proportion of SA. For a given elongation, the work of extension (resilient energy) (WE) increased from 0 to 1.5% SA (normal content), remained practically constant to approx 4% (2.5% addn) and then diminished progressively. For a given elongation, the work of retraction (WR) increased from 0 slowly to a maximum 4% SA, above which it diminished very slowly. For a given elongation the hysteresis loss increased greatly to a max at 1.5% SA (normal content), then diminished slowly. The tensile strength increased from 0 to 1.5% SA (normal content), remained the same to 3.5% (2% addn) and then slowly diminished with increasing SA. The elongation at break increased progressively with increase in SA. Since SA has only a small effect on the total reinforcement but reduces considerably the reinforcement from internal friction and increases the WK value (true reinforcement as defined by B and Cotton, C 26, 3908), it probably has a 2-fold part. As a softener, it acts as a lubricant and reduces the work expended in overcoming internal friction. It is also sol in rubber and reduces the interfacial tension, and according to the Gibbs adsorption theory there must be a concn of SA at the interface. There are unnumerable interfaces in a rubber-filler mixt, since not all air disappears from the surface of the filler particles in the rubber, and SA blooms to these internal interfaces. Here it decreases the interfacial tension between rubber and filler, and increases the wetting of the filler by the rubber, i.e., increases the true reinforcement. There are several known phenomena in support of this view, including particularly the acceleration of the rate of vulcanization by SA and the blooming of SA on a freshly cut surface of vulcanized rubber. C C Davis

Rubbenizing of balloon fabrics J Panem. *Rev gen caoutchouc* 12, No 116, 18(1935)—Present-day developments are discussed. C C Davis

The use of rubber in automobile construction Colin Macbeth *Aautschuk* 11, 197-204(1935)—Descriptive, with numerous diagrams. C C Davis

An impact cutting test for tire tread stocks J H Dillon *Ind Eng. Chem., Anal Ed.* 8, 68-71(1936)—The relations between the ease of cutting of vulcanized rubber of the tire-tread type and its tear resistance, resistance to cracking and hardness are discussed and an impact-cutting device, based on theoretical principles, is described and illustrated. C C Davis

The story of synthetic rubber J A Nieuwland *Proc. Indiana Acad Sci* 44, 17-21(1934)—A review covering for the earlier years all important investigations, but for the last few years only work on the polymerization of chloroprene. C C Davis

Chloroprene synthetic rubber (Soprprene) A L Klebanik, L G Teyurikh and I. M. Dolgopost'skiy *Bull acad. Sci. U R S S* 1935, No 2, 189-226; *J. Research Assoc Brit Rubber Mfrs* 4, 505-6(1935)—In the continuous polymerization of C_3H_4 in a weakly acid soln of $CuCl \cdot NH_4Cl$ as catalyst, the product contains 75-80% of HC CCH CH_2 (I) and 20-25% of the trimer (II) and higher polymers. The yield, calcd on the C_3H_4 , is almost 100%, and a single passage of the gas converts about 40% of the C_3H_4 . The optimum condition of the catalyst, the mechanism of the reactions and the main factors which affect this polymerization are discussed, and a method of sepn and absorption of the gas by solvents is described. A discontinuous method of synthesizing chloroprene (III), and methods for its continuous prepn from pure I and from mixts of I with C_2H_4 are also described. The polymerization of III to the α -polymer (IV) is then discussed, with particular reference to the conditions which hinder the formation of higher, balata-like polymers. A study was made of the ozonization and oxidation of polymers of III, the first method being applied to IV, to the μ -polymer and to the α -polymer. The chief product is succinic acid. The compn of II is discussed and the phys and chem. properties of the previously unknown acetylenic polymer, $H_2C \cdot CHCH \cdot CHCH \cdot CH$, the formation of which accompanies that of the divinyl, are described. Data are also given on the action of alk. $NaOH$ on 2,4-

dichloro-2-butene (V), in which reaction 2-chloro-2-butene ethyl ether is formed. Similar methods are described for the synthesis of chlorobutanol and of dichlorobutenyl ether from chlorobutanol and V are described. In this reaction 2-chlorobutene-4-ol xanthate is also formed. A series of new syntheses from I is described, including a new synthesis of α, β -dichlorobutadiene. The structure of the product and the method of polymerization are discussed, as well as the fixation of aliphatic org. acids by I in the presence of $HgSO_4$ or a mixt. of HgO and BF_3 , with formation of esters of 2-hydroxy-1,3-butadiene. The method of synthesis and the structures of the formates and acetates of 2-hydroxy-1,3-butadiene, and of the condensation product with maleic anhydride, and of their hydration products, are described. The combinations of EtOH and MeOH with I in the presence of alk. alc. are described. In these reactions 1-methoxy-3,4-butadiene and 2-ethoxy-1,3-butadiene are formed. The fixation of MeOH by I in the presence of HgO or BF_3 , EtOH, and the hydrogenation of I to butadiene are described. Finally the formation of styrene by the polymerization of I is discussed. C C Davis

The use of substitute [factice] in rubber manufacture. I. H. Hurlston *Trans Inst Rubber Ind* 11, 295-301 (1935)—A review and discussion, with new expl. data. Tests of rubber mixts contg various org. accelerators, and with and without 2% white factice (I), showed that the latter has a pronounced tendency to retard scorching with mercaptobenzothiazole (II), Zn diethylthiocarbonate and Zn isopropylxanthate, less tendency with II diphenyl guanidine, and practically no effect with piperidine piperidylthiocarbonate, tetramethylthiuram disulfide (III) and tetraethylthiuram disulfide. At a temp corresponding to 5 lb per sq in steam pressure, increasing percentages of I increased progressively the rate of vulcanization, whereas at a temp corresponding to 25 lb per sq in steam pressure, the rate of vulcanization was retarded progressively with increase in I, and the tensile strength lowered progressively. The acceleration may be due to free alkali or S compds, while the retardation may be caused by decompn products of I (cf Baker, Bodger and Cotton, C 26, 335). Tests show that most factices (white and dark) increase the tendency of rubber-III 7nO mixts. to scorch. Measured by the Griffiths extrusion plastometer (C 20, 2094), I has very little effect on the plasticity of milled rubber, whereas a factice of the Vulcatac type (cf Auer, C 23, 4370) has considerable effect. Tests show that brown factice (IV) can be used up to 5% in C black mixts used for belt and hose covers without affecting adversely tensile strengths, elongations and tear-resistances, whereas the resistance to abrasion diminishes with increase in IV. C C Davis

Balata resin I Crystalline components of Sumatra sheet balata resin Yoshio Tanaka, Tsutomu Kuwata and Toshio Suzuki *J. Soc Chem Ind, Japan* 38, Suppl. binding 504-5(1935)—From balata produced in Guiana were isolated cryst β -amyrin acetate m 230-1°, an ester of isopuleol, m 195-6°, and balatal, m 100-1°, sapon no 121.0, benzoyl ester, m 121-15°, percentages of C 81.62, 82.13 (calcd from $C_{27}H_{44}O_2$: 81.98), percentages of H 11.32, 11.45 (11.19) and mol wt from sapon no 463.6 (calcd 468) Karl Kammermeyer

Synthesis of the derivs. from 2,4-dichloro-2-butene—use of by products from the synthesis of chloroprene (Klebanik, Chevchnalova) 10 Application of furaluril and its derivs to the manu of plastics [accelerators for rubber vulcanization] (Bruins) 13 Production of lamp-black from anthracene and naphthalene (Zmii) 18 Synthesis of α, β -dichlorobutadiene and its polymerization (Klebanik, del) 10 Hydrogenation of tertiary alkyl phenols to form hydroaromatic alcs [use as softening agents in rubber compns] (U. S. pat. 2,026,668) 10 Pwd. substances [chlorinated rubber] (Fr. pat. 787,363) 1 Azo dyes [for coloring rubber] (U. S. pat. 2,025,582) 25 Mortars or binders contg rubber (Fr. pat. 787,236) 20 Aliphatic S compds [vulcanizing rubber] (Fr. pat. 787,310) 10 Plastic rubber deriv for molding (U. S.

pat. 2,024,987) 13. Activated C (U. S. pat. 2,026,355) 18.

Rubber latex. Metallgesellschaft A-G. Fr. 786,458, Sept. 3, 1935. The deep coloration of latex is prevented or suppressed and its stability improved by the addn of stabilizers of alk. reaction, e. g., NH_3 or KOH in amt sufficient for stabilization, as well as small amts of compds of Zn, e. g., ZnO, alkali zincate, complex compds. of Zn and NH_3 or salts of Zn such as carbonate, chloride or acetate, while avoiding the addn of any substance permitting vulcanization of the rubber.

Preserving latex. I G Farbenind. A-G. Fr. 787,466, Sept. 23, 1935. Amines contg at least 1 aliphatic radical of more than 8 C atoms or the corresponding quaternary NH_4^+ bases or their salts or mixts, e. g., dodecylamine-HCl or diethylbenzyl-dodecylammonium chloride are incorporated with latex to prevent coagulation or corruption.

Determining the rubber content of latex, etc. John S. Ward and Samuel D. Gehman (to Wingfoot Corp.). U. S. 2,024,617, Dec. 17. An incandescent filament is observed through a green filter by looking through an extinction cell contg a rubber dispersion, and the extinction cell is moved in a light-proof housing across the field of vision from the extinction point on one side of the point of max. brightness to the extinction point on the other side, and the amt. of movement is indicated by a described device. Various features of app. are described.

Rubber compounding. Albert A. Somerville. U. S. 2,026,442, Dec. 31. In the manuf. of products such as tire casings, elec. insulation, etc., a rubber compn is vulcanized which contains a catalytic antioxidant (such as diphenylamine) effective to inhibit oxidation of the rubber by the O of the atm. to which it may be exposed, an org. O absorber (such as pyrogallol) effective to eliminate O initially present in the compn and an org. base (such as an ethanolamine) which is nonvolatile at the vulcanizing temp., is miscible with rubber and is effective to activate the O absorber. Numerous examples are given.

Halogenating rubber. Nicolas Floresco and Max Pfunder. Fr. 787,217, Sept. 19, 1935. Rubber or natural gums are masticated and submitted at the same time to the action of ultraviolet rays, then treated with a solvent such as CCl_4 and submitted to the action of halogen, such as Cl_2 , the latter operation taking place in the presence of ultraviolet rays or very intense light, preferably short radiations.

Chlorinated rubber. Eugen Molloy (to Chemische Fabrik Buckau). U. S. 2,025,017, Dec. 17. See Fr. 768,157 (C. A. 29, 6409).

Chlorinated rubber. Bosnische Elektrizitäts-A-G. (Noc. L. Müller and Oskar Siglhuber, inventors). Austrian 143,522, Nov. 11, 1935 (Cl. 39a). An aq. suspension of mechanically disintegrated rubber is chlorinated, preferably at below 40° , until a product contg 30-40% of Cl is obtained. This product is further disintegrated in water or an org. solvent, and then rechlorinated until its Cl content is about 70%. The final product is sol. in org. solvents.

Chlorinated rubber. Rubber Producers Research Association. Fr. 786,102, Aug. 27, 1935. See Brit. 424,561 (C. A. 29, 5693).

Chlorinated rubber. International Latex Processes Ltd. and John McGavack. Fr. 787,333, Sept. 20, 1935. Latex is stabilized to prevent premature coagulation of the rubber at the moment of chlorination and Cl_2 is then introduced at least until isolated particles of chlorinated rubber ppt. The latex may be stabilized by vulcanization or by oxygenating or by adding glucosides, Na alkyl-naphthalene sulfonates or the product obtained by sulfonating phenols and hydrocarbons in the presence of unsatd. aliphatic acids, etc. Cf. C. A. 30, 649.

Chlorinated rubber. Deutsche Gold- und Silber-Schneidanstalt vorm. Roesler. Fr. 787,354, Sept. 21, 1935. Solns. of chlorinated rubber in solvents such as CCl_4 and CHCl_3 are treated with small amts of alkali salts of org. acids such as HCN, propionic, stearic and oleic

acids which are themselves sol. in the solvent used and their alkali salts are sol. to a certain degree. The chlorinated rubber when freed from solvent and dried is found to have a high degree of stability.

Preserving rubber. Winfield Scott (to Rubber Service Laboratories Co.). U. S. 2,024,477, Dec. 17. Rubber is treated with a S. deriv. of a diaryl amine (such as that of *p*-ethoxyphenyl-*p*-naphthylamine) a phenyl radical of which contains a nuclear alkoxy substituent only.

Preserving rubber. Louis H. Howland (to United States Rubber Co.). U. S. 2,026,380, Dec. 31. About 1% or less of a product of reaction of an alkali metal such as Na upon a ketone-aromatic amine condensation product such as that from acetone and diphenylamine is added to a rubber compn.

Preserving rubber. Albert M. Clifford (to Wingfoot Corp.). U. S. 2,026,517, Jan. 7. The reaction product of an amino deriv. of a diphenylene oxide and an aliphatic aldehyde such as CH_3CHO , crotonaldehyde, acrolein or aldol is added to rubber compns. (suitably in a proportion of about 1-5%) Cf. C. A. 30, 649.

Coloring rubber. Imperial Chemical Industries Ltd. Fr. 786,392, Sept. 2, 1935. A finely divided coloring substance such as Indigo LL, Caledon blue R, Durindone blue 4 BC or Monolith red R, and a supplying agent comprising a compd. having a long alkyl chain, *n* below 100° and preferably about 50° , e. g., stearic acid, cetyl alc. or the condensation product of sulfonated $\text{C}_{12}\text{H}_{25}$ with CH_3O , are intimately mixed with rubber latex and a dispersing agent is added. The mixt. is dried and made into sheets or other forms.

Coloring rubber, etc. I G Farbenind. A-G. Fr. 786,389, Sept. 2, 1935. Dyes obtained by coupling diazo-benzene compds. contg the group $-\text{CON}(\text{R})\text{R}'$, not in the position ortho to the azo group, with 2,3-dihydroxy-naphthoic amides which contain the group $-\text{CONR}^2\text{R}^3$ in the 3 position and which may also contain a halogen or oxyalkyl ($\text{R}, \text{R}', \text{R}^2, \text{R}^3$ represent H, alkyl, aryl, aralkyl or a hydro-aromatic radical, or they may form heterocyclic nuclear systems but R (or R^2) must not be H when R^3 (or R^2) is H and R (or R^2) an aryl group). Thus, 1-amino-2-methylbenzene-5-(carbonylaminobenzene) \rightarrow 2,3-dihydroxy-naphthoic ethylamide colors rubber a bluish red. Several examples are given.

Mixture of size and rubber. Georg Goll and Ernst Helft. Fr. 618,657, Sept. 13, 1935 (Cl. 39b. 5). Size or glue is mixed with high mol. fatty acids and the product mixed with rubber. In the examples, size is mixed with stearyl or dodecyl alc.

Rubber coatings. Johann Tengler. Ger. 618,592, Sept. 11, 1935 (Cl. 22k. 3). Unsatd. substances such as fish oil, tall oil, wood pitch, etc., are vulcanized and the product is dissolved in an org. solvent with rubber or old rubber. The soln. is revulcanized, mixed with a diluent, and used as a paint for coating articles with a rubber-like layer. The org. solvent used is preferably an oily, fatty or resinic acid.

Rubber articles. Edmond Basset. Fr. 786,084, Aug. 26, 1935. A colloidal dehydrating agent capable of absorbing a large amt. of water, e. g., "bentonite," "wulkenite" or "ardmonte" is applied to a form which is repeatedly dipped into rubber latex and exposed to air between each dipping until the latex is partly dehydrated. The process is continued until sufficient thickness of rubber is obtained.

Apparatus for cutting and weighing lengths of material from a continuous strip of material such as rubber for tire manufacture. Charles C. Cadden (to B. F. Goodrich Co.). U. S. 2,025,801, Dec. 31. App. and various operative details are described.

Apparatus for making inner-tire tubes. Wm. W. Potter. U. S. 2,024,304, Dec. 17. Structural, mech. and operative details.

Forming hollow articles such as tire tubes. Frank A. Daly (to Wm. W. Potter). U. S. 2,024,149, Dec. 17. App. and various operative details are described.

Elastic yarn comprising rubber and suitable for knitting. Buntwell B. Foster (to United States Rubber Co.). U. S.

2,024,155, Dec 17 Structural details U. S. 2,024,156 also relates to details of manufacture of an elastic yarn.

Hydronubber yarn Thomas H. Byrton (to North American Rayon Corp.). U. S. 2,025,025, Dec. 24. A spinning soln for the manufacture of soft-luster products contains viscose or cuprammonium cellulose and a small proportion of a hydronubber.

Printing plates comprising rubber compositions of different degrees of hardness in different layers Stanley A. Danser (to Vivian M. Stacy-Bush). U. S. 2,026,021, Dec 31 Various structural details.

Splicing rubber articles such as unvulcanized rubber tubes Jorgen I. Haase (to Wingfoot Corp.) U. S. 2,024,577-8, Dec 17 Various details of app. and operation are described.

Apparatus for retreading tires Howard L. Shaw, U. S. 2,024,888, Dec 17 Structural details.

Attaching rubber soles to shoe bottoms Alexander D. Macdonald (to Boston Blacking & Chemical Co.) U. S. 2,024,233, Dec 17 The attaching surface of the rubber sole is treated with an aq. dispersion cont. rubber and an org. rubber solvent such as toluene and $\text{C}_2\text{H}_5\text{Cl}$, and a rubber adhesive is applied to the overlaid portion of the shoe bottom, the comps. are permitted to dry, the deposited rubber material is activated by a rubber solvent such as C_6H_6 , contg. rubber and the materials are united under pressure. U. S. 2,024,235 relates to a generally similar process of attaching leather soles to shoe bottoms after treating them with a soln. of a low-viscosity rubber in an org. solvent. U. S. 2,024,237 relates to cementing channel flaps on a shoe sole by a method generally similar to that of U. S. 2,024,235. Phenyl- β -naphthylamine is used as an antioxidant.

Rubber-lined metal barrels Claude S. Beldin (to Pennsylvania Salt Mfg. Co.) U. S. 2,025,932, Dec 31. Various mfg. details.

Rubber-like polymerization products E. I. du Pont de Nemours & Co. Fr 787,151, Sept 18, 1935. 2-Buta-1,3-diene, substituted by halogen, is completely or partly polymerized by air or O₂, heat, light, pressure or catalysts. The butadiene is made into an emulsion before polymerization and the rapidity or degree of polymerization is retarded or lessened by an anticatalyst or a solvent. The catalyst may be H_2O_2 or peroxides of Pb, Na or benzoyl.

Rubber-vulcanization accelerators Clayton O. North (to Rubber Service Laboratories Co.). U. S. 2,024,470, Dec 17. An accelerator is formed by the reaction of CS_2 on a preformed aldehyde deriv. of a Schiff's base such as that formed by the reaction of 1.5-3.0 mols. of an aliphatic aldehyde, such as butyraldehyde with 1 mol. of an aromatic primary amine such as aniline.

Rubber vulcanization accelerator Lorin B. Sebrell (to Wingfoot Corp.) U. S. 2,024,605, Dec 17 Vulcanization of rubber is effected in the presence of a mercaptothiazole such as mercaptobenzothiazole in combination with a compd. such as NH_3 , an amine having a primary amine group such as ethyl or propyl amine or other aliphatic amine, or an alkyl aryl amine such as ethyl aniline, etc. U. S. 2,024,506 relates to mercaptan derivs. which are obtained by reaction of a mercaptothiazole with NH_3 or an amine, suitable for use as accelerators.

Rubber vulcanization accelerator Waldo L. Semon (to B. F. Goodrich Co.). U. S. 2,025,276, Dec 31. A tetraaryl substituted thuram sulfide such as a diphenyl-di- β -naphthyl thuram sulfide is used as a vulcanization accelerator.

Vulcanization accelerators The Rubber Service Laboratories Co. Brit. 434,506, Sept. 2, 1935. An isocyclic said org. base, e.g., decabicyclo-o- and - β -naphthylamine, bornylamine, di- γ -naphthylamine, carylamine, cyclohexylamine, dicyclohexylamine, cyclohexylmethylamine, methylbornylamine is caused to react with a mercaptoarythiazole or di- or poly-sulfide thereof, or with thuram di- or

poly-sulfide, or with arylthiocarboxylic acid disulfides, e.g., mercaptobenzothiazole, mercaptotolylthiazole, dibenzothiazyl di- and poly-sulfides, tetramethylthuram di- and poly-sulfides, tetraethylthuram disulfide, dithiobenzac acid disulfide, dithioisobutylic acid disulfide.

Vulcanization accelerators The Rubber Service Laboratories Co. Ger. 618,025, Sept. 21, 1935 (Cl. 398.8). An accelerator for rubber vulcanization is obtained by treating a ketoneamine with a mercaptoarythiazole. Diphenylguanidine may be added to the accelerator. In an example, the accelerator is produced by treating dacetone amine with mercaptobenzothiazole. Several other examples are given. Cf. preceding abstract.

Vulcanization accelerators E. I. du Pont de Nemours & Co. Brit. 434,506, Sept. 5, 1935. A 2 mercaptoarythiazole is caused to react with a halogenated ketone of formula $\text{RCH}_2\text{XCOR}'$, where X is a halogen atom and R and R' are alkyl groups. In examples 2 mercaptobenzothiazole is condensed with 2-chlorobutanone-3, 3-chloropentanone-2 and 2-chloropentanone-3 and details showing the accelerating properties of the compds. in a rubber mix are also given.

Dithiazyl disulfides Albert M. Clifford (to Wingfoot Corp.) U. S. 2,024,567, Dec. 17. For prep. a dithiazyl disulfide such as dibenzothiazyl disulfide, a thiazyl mercaptan such as 1-mercaptobenzothiazole is oxidized with H_2O_2 in the presence of an inorg. acid such as H_2SO_4 . Various examples are given.

Dithiazyl disulfides Albert J. Gracia (to Wingfoot Corp.) U. S. 2,024,575, Dec. 17. Dibenzothiazyl disulfide is prep'd by heating an aq. soln. of mercaptobenzothiazole and mixing with it an aq. soln. of H_2O_2 and an amt. of H_2SO_4 sufficient to neutralize the alk. soln., filtering, washing and drying the ppt. formed. Similarly, other related compds. may be obtained.

Hydraulic presses for vulcanizing, veneering, etc. Josef van Liempt. Brit. 435,012, Sept. 12, 1935.

Apparatus for vulcanizing belting Fernand Van Camp (to Soc. anon. des établissements J. Laroche-Lechat) U. S. 2,024,811, Dec. 17. Structural and mech. details.

Apparatus for vulcanizing tire casings John G. Ebenhaek. U. S. 2,024,279, Dec. 17. Various structural, mech. and operative details.

Apparatus of the "full circle" type for vulcanizing tires, etc. Leslie T. Vogt. U. S. 2,024,554, Dec. 17. Structural and mech. details.

Retreading vulcanizer for tires Charles E. Miller. U. S. 2,024,941, Dec. 17. Structural, mech. and operative details.

Manufacture and vulcanization of tire casings Laurits A. Laursen (one-fourth to Pearl F. Laursen) U. S. 2,025,993, Dec. 31. App. and various operative details are described.

Vulcanizing tire casings Laurits A. Laursen U. S. 2,025,992, Dec. 31 App. and various operative details are described.

Vulcanizing rubber Continental Gummi-Werke A.-G. Ger. 618,658, Sept. 13, 1935 (Cl. 398.7). Rubber objects are coated with rubber latex or a rubber-latex mixt. and vulcanized in the mold.

Rubber vulcanization. Th. Goldschmidt A.-G. (Hans Schneider, inventor). Ger. 618,756, Sept. 14, 1935 (Cl. 398.8). The vulcanization of natural or synthetic rubber, etc., is accelerated by an addn. of PbO and alk. earth sulfide to the vulcanization mixt. Examples are given.

Vulcanizing product Cela Holding S. A. Fr 786,267, Aug. 20, 1935. A vulcanizing agent for latex, particularly that used for impregnating textiles, contains the element (Zn and S) necessary for the vulcanization in the form of a colloidal dispersion. Thus, $\text{Zn}(\text{OH})_2$ or a salt of Zn with a weak acid is dissolved in NH_3 soln., mixed with a soln. of an org. substance such as albumin, casein, gelatin, agar-agar or blood serum and a NH_4 polysulfide is added.

CHEMICAL ABSTRACTS

Vol. 30

MARCH 10, 1936

No. 5

I—APPARATUS, PLANT EQUIPMENT AND UNIT OPERATIONS

W. L. BADGER

Chemical plant construction of the present and future Hurlbut S. Jacoby *Chem. & Met. Eng.* 42, 674-7 (1935), cf. C. A. 29, 1477.¹ C. H.

Electro-ultrafiltration apparatus E. J. Czarnetzky *Science* 82, 625-6 (1935).—The app. was developed for sepg. Hg salts from Hg-protein solns and consists of a collodion-covered aluminum thimble contg. a Pt electrode, and a wide glass tube contg. another Pt electrode and with the opening of a short, wide side-arm covered with Cellophane. The glass tube is open, the thimble is closed with a rubber stopper connected to a vacuum line. Both are dipped into the soln and when the current is applied the gradient in potential discharges the protein from the collodion surface of the thimble and prevents clogging, which is the essential feature of the app. *Ch. C. A.* 21, 1074. J. H. Moore

Semimicro Cottrell boiling-point apparatus Mary L. Willard and Delena E. Crabtree *Ind. Eng. Chem., Anal. Ed.* 8, 79-80 (1936).—The app. is one-tenth the size of that referred to in C. A. 29, 381, and results accurate to 0.1° are obtained on as little as 5-cc. samples. J. H. Moore

An electrically heated melting point apparatus Edwin Doward and Michael J. Russo *Ind. Eng. Chem., Anal. Ed.* 8, 74-5 (1936).—The app. consists of a round battery jar contg. a resistance wire-wound test tube. The latter contains a smaller test tube in which the m-p capillary and thermometer are suspended. It is suitable for the detn. of m-p's up to about 310° with a reproducibility of within 0.5°. Allen S. Smith

An automatic recording balance D. S. Binnington and W. F. Geddes *Ind. Eng. Chem., Anal. Ed.* 8, 76-9 (1936).—The app. was designed for use in drying macerous products, and losses up to 17 g. on a 100-g. load are shown to ± 0.01 g. It is electrically operated and the chart will cover periods up to 6 days. Construction details are shown. J. H. Moore

A new type of calorimeter for the measurement of continuous heat effects W. Swietoslawski *Roczniki Chem.* 15, 342-9 (in French 349-50) (1935).—A flow calorimeter suitable for the detn. of such continuous heat processes as the hardening of cement is described. In principle the calorimeter consists of a labyrinth of concentric tubes through which water or other calorimetric liquid circulates from the outside to the middle, to avoid loss of heat. The system evolving heat is placed in the central portion and the temps. of the liquid at the entrance and exit are measured. The effect is calcd. from the temp. difference and the amt. of liquid flowing. M. W.

Development of an electric light calorimeter Th. W. Schmidt, *Z. Instrumentenk.* 55, 339-48, 357-67 (1935).—A math. discussion of the errors as compared with calorimeters using a gas lamp. The new calorimeter has 0.4% error but is not so satisfactory for plant use. Thirty-eight references. Ann. Nicholson Hurd

An inexpensive ball mill. Laurence L. Quill, *Ind. Eng. Chem., Anal. Ed.* 8, 27 (1936); cf. *Furnst. C. A.* 29, 1727. L. L. Quill

A precision pycnometer for liquids. S. T. Yuster and L. H. Reyerson *Ind. Eng. Chem., Anal. Ed.* 8, 61-2 (1936).—The pycnometer described is believed to eliminate difficulty of thermostating both liquid and container, evapn. losses at ground-glass joints, loss of liquid during filling and the difficulty of detg. the d. at some definite

temp. Sizes from 0.1 to 25 cc. were used. It was possible to check wts. to 0.1 mg. Allen S. Smith

A differential refractometer D. Rau and W. E. Roseveare *Ind. Eng. Chem., Anal. Ed.* 8, 72-3 (1936).—The app. described was designed to be a rapid and reliable instrument for detg. concns. of solns too dil. to permit the use of the Pulfrich or immersion refractometers. It is similar in principle to the Ketteler and Haber-Löwe instruments but is more practical because of a new method of observing and measuring the deflection and of detg. the zero reading. It has been used to det. the concns. of aq. solns with n_D from 0.0004 to 0.002 greater than pure water with an accuracy of 0.1%. Allen S. Smith

Drum dryers Charles R. Harte, Jr. *Ind. Eng. Chem.* 28, 7-10 (1936).—A review describing types, uses and economic factors. F. W. Tillitson

The use of a new valve for the flow of gases through a slit V. Kunzl and J. B. Slavik *Ann. Physik* 24, 409-20 (1935).—The new valve consists of a glass tube with an external diam. 1.95 cm., internal diam. 1.75 cm., which has spontaneously split longitudinally to a length of 2.3 cm. The slit varies (0.58-2.3) 10^{-4} cm. under different pressures. The flow of air through this valve has been measured under differences of pressure of 200-700 mm. Hg. The values $(p_1 - p_2)$ of $G = V_1/(p_1 - p_2)$ agree with the theoretical ones derived from Poiseuille's formula. Poiseuille's formula obtains if the smallest dimension of the slit is at least 10 times the mean free path of the mols. passing through it. Data and curves are given. I. R. Scherz

New extraction apparatus Zoltán Silyom-Barna. *Magyar Chem. Folyóirat* 41, 94 (1935).—An Erlenmeyer flask is provided with a cooler ground into the stopper and a small extn. bottle suspended from the end of the cooler into the Erlenmeyer flask by means of a Pt wire. This bottle contains also a suction pipe to accelerate circulation of the extn. agent. Structural details and dimensions are given. S. S. de Finály

Phosphorus pipet for oxygen determination Zoltán Silyom-Barna. *Magyar Chem. Folyóirat* 41, 94-6 (1935).—Rods of P are kept under water within the lower part of the pipet and can be pushed up from outside by means of a glass rod. Structural details are given. S. S. de Finály

New applications of the expansion pyrometer. P. Chevenard. *Génie civil* 107, 424-7 (1935).—Construction improvements have made this type of pyrometer sufficiently robust for factory use, either as a control app. or as an automatic heat regulator. Drawings and photographs explain the construction and working principles of the pyrometers and their use in grain-growth studies. Ann. Nicholson Hurd

Maintenance of partial radiation pyrometers by standardization in practice J. Marwedel *Glastech. Ber.* 13, 416-20 (1935).—The use of a tungsten lamp is discussed in which the filament is a notched band. J. F. Hyde

Increasing sensitivity of bimetal thermometers J. Blair Dowden. *Product Eng.* 6, 388-9 (1935).—A multiple helix form of bimetal thermometer is described with photographs and the underlying principles are discussed. A single strip is wound in the form of concentric helices. The several coils are additive in rotational deflection, but the axial displacement is mutually counterbalanced between the coils. A thermal element no larger than the

bulb of a thermometer is accurate to fractions of a degree

Ann Nicholson *Hrd*
Publications in the field of gas analysis in 1934 *H*
Löffler Z. osterr. Ver. Gas- u. Wasserfach 75, 210-18 (1935) *E. H.*

Note on a routine gas analysis apparatus *H* K Sen, Kanai Roy and Pankaj Roy *J. Indian Chem. Soc.* 12, 654-58 (1935).—The app. contains one novel feature, a vacuum-creating device for removing residual gases from the combustion chamber. Samples of 0.5-3 cc can be analyzed. Drawing of app. and data are given.

A simple air-analysis apparatus *Tsun Chee Shen Chinese J. Physiol.* 9, 363-5 (1935).—A simple app. for student or clinical use. *L. A. Maynard*

Prevention of foaming in crude fiber determinations *H* W. Gerritz *Ind. Eng. Chem., Anal. Ed.* 8, 75 (1936).—A fine jet of air is blown against the surface of the liquid through a tube extending down through the condenser. *J. H. Moore*

An absorption apparatus for the microdetermination of certain volatile substances *III*. The microdetermination of chloride with application to blood, urine and tissues *Edward J. Conway Biochem. J.* 29, 2221-35 (1935); cf. *C. A.* 27, 3537.—A microdetn. of chloride is given; the absorption app. described by C., whereby the chloride is oxidized to Cl₂ with KMnO₄ at 20-30° and absorbed in 1 ml of 20% KI soln, is used. The liberated I₂ is titrated with Na₂S₂O₃ with a Conway buret (*C. A.* 28, 3941) or when the chloride content is between 7 and 35%, colorimetrically. For amts. between 7 and 0.7%, 0.5 ml of 0.2% starch is added to the KI soln and the color is detd. colorimetrically. The coeffs. of variation for the 3 procedures are 0.5, 4-5 and 6-7%, resp. The "grey soln." of Thiel and a colorimeter provided with spectral filters were used instead of standards. The method is independent of the presence of iodide but bromide must be removed or detd. by a method to be described later. Protein up to 1 mg. in the soln. analyzed does not interfere. The blood chloride in 1 ml. of tungstate filtrate (0.1 ml. blood) can be detd. with a 0.5% variation; the urine chloride in 0.1 ml. or 1 ml. of dild. urine with a 0.7% variation and the tissue chloride in 0.2-g. samples (99% recovery of chloride added to ground ox. muscle). Protein in urine up to 1% does not interfere. *E. W. S.*

A sensitive check valve *E. L. Green Ind. Eng. Chem., Anal. Ed.* 8, 40 (1936).—A glass float seating within a ground joint in a gas delivery tube effectually seals the tube when a reverse pressure causes water to rise in the tube. *Allen S. Smith*

The development of the air-driven spinning top as transparent ultracentrifuge *James W. McBain and Carroll M. O'Sullivan J. Am. Chem. Soc.* 57, 2631-41 (1935).—The air-driven top-type centrifuge has been described at length. Speeds of 3000 r. p. m. have been obtained. Sedimentations of certain heavy mol. materials were made having mol. wt. as low as 208,000. Photographing is done by transmitted light. The present stage of development of the instrument is given. *R. H. L.*

A rapid portable stirrer for the manufacture of glues and adhesives *Wollenberg Deut. Wollen-Gewerbe* 67, 600-1 (1935).—Two of the stirrers shown and described are hand-driven; 2 others are electrically operated. The small stirrers are suitable for lab. purposes while the larger ones can be employed in large-scale operations. *Leopold Scheffan*

Calculation of condenser coolers *I. G. Zak Neft 3, No. 22, 15-18 (1932).—Math.* *A. A. Roehling*

Lessons on rectification *A. M. Tregubov Neftanor. Akhryulst 28, No. 7, 38-41 (1935).—A mathematical analysis of the performance of bubble towers is presented.* *A. A. Roehling*

An apparatus for sugar and other titrations *Edward S. West Ind. Eng. Chem., Anal. Ed.* 8, 62 (1936).—The app. consists of a buret fitted with a syphon automatic leveling device and a hypodermic needle tip, and a stirring rod actuated by a vacuum windshield motor. *Allen S. Smith*

Decantation of crystalline suspensions *I*. General theory *II*. *III*. *G. Bozza Atti accad. Lincei* 21, 697-700, 752-5, 809-13 (1935).—Math. *A. W. C.*

Automatic method for neutralization and registration of *pH* *V. S. Ledneva, B. I. Petrov and M. A. Proskurnin Zashchita Lab.* 4, 1007-13 (1935).—An app. for potentiometric regulation and recording of *pH* and neutralization of various liquids with the use of a W electrode is illustrated and described. *Chas. Blanc*

Air conditioning frees rotogravure plant from weather hazards *II*. *E. Jacobsen Heating, Piping, Air Conditioning* 7, 423-4 (1935).—The most desirable dry-bulb temps. are: etching department 72°F., photogallery 74°F., retouching department 75°F., sensitizing of carbon printing 72°F., dark rooms 74°F. and drying room 75°F. A relative humidity of 50% is best for all departments. *M. W. Schwarz*

Piping and pumping process materials *Leo P. Hynes and Charles D. Campbell, Jr. Heating, Piping, Air Conditioning* 8, 3-6 (1936). *M. W. Schwarz*

Welding in the chem. engineering industry (Ingels, Andrews) *9*. Fabrication of monel metal in chem. equipment (Nakamura) *9*. Detn. of fixed points of low temp. with a H thermometer (Anyama, Kanda) *2*. Dry-cleaning (Brit. pat. 435,575) *25*. App. for removing moisture from the air (Brit. pat. 434,666) *13*.

Apparatus for obtaining pure distilled water for estimation of *pH* values *Solomon F. Acree Ger.* 619,616, Oct. 4, 1935 (Cl. 858) *4*.

Apparatus for electrometric volumetric analysis *I*. *G. Farbenind. A.-G. (Udo Ehrhardt, inventor). Ger.* 622,048, Nov. 18, 1935 (Cl. 421) *3* (4). This corresponds to Brit. 364,939 (*C. A.* 27, 1787).

Catalytic apparatus *Soc. française de catalyse générale. Fr.* 787,896, Sept. 30, 1935. The space in which the gaseous reaction mixt. circulates is divided into a no. of narrow rectilinear conduits, e.g., the gas passes through a no. of long tubes and returns along the spaces between these tubes and outer surrounding tubes, the catalyst being in these spaces.

Apparatus for making chlorine solutions from liquid chlorine and water *Georg OrNSTEN. Ger.* 622,148, Nov. 21, 1935 (Cl. 12) *4*.

Precipitating *Arne J. Myhren and Byron Marquis (to The New Jersey Zinc Co.). Brit.* 435,257, Sept. 18, 1935. The production of ppt. by reaction between a gas and a soln. is effected by causing the soln. repeatedly to entrain large vols. of the gas. The process may be carried out by passing the gas and soln. or slurry obtained by reaction through a series of tanks, withdrawing slurry from each tank and returning thereto a part thereof intimately mixed with a considerably larger vol. of gas withdrawn from the tank while conveying the remainder of the slurry to the next succeeding tank intimately admixed with gas and withdrawing from the last tank an amt. of slurry substantially equiv. to the amt. of soln. introduced into the 1st tank. App. is described.

Closures for double-walled vacuum flasks *Hugo Scheider A.-G. Brit.* 435,832, Sept. 30, 1935.

Vacuum mixing apparatus suitable for use with volatile substances *Everts G. Loomis U. S.* 2,027,185, Jan. 7

Rotary classifiers, applicable to ball-and-rim mills *Ralph M. Hardgrove (to Babcock & Wilcox Ltd.). Brit.* 434,923, Sept. 11, 1935.

Jacketed kettles or tanks with agitating and scraping devices for various heating and cooling operations *G. H. Hay (to Lee Metal Products Co.). U. S.* 2,027,756, Jan. 14. Various structural, mech. and operative details.

Box for holding carboys *Allan W. James U. S.* 2,019,890, Nov. 5. Structural features.

Rotary filter *Wm. Rausch (to Municipal Sanitary Service Corp.). U. S.* 2,027,652, Jan. 14. For removing scale from the drum of a rotary filter, a liquid spray is thrown on the surface of the drum in a direction opposite to the direction of movement of the surface and scale ma-

terial is removed in a continuous sheet by a rearward and outward brushing action on the surface in advance of the spraying action. App. is described.

Air filter. Lee Hand. U S 2,027,906, Jan 14 Structural details

Filter for air and gases Hundt & Weber G m. b H Fr 789,702, Oct 15, 1935

Filter belt for roller presses Adolph W Lissauer (to Louisville Drying Machinery Co.) U S 2,027,542, Jan 14 Structural details

Filtering material Società italiana Pirelli Ir 788,603, Oct 14, 1935 A filtering mass for aerosols comprises a fibrous material and inert powders, the fibrous material being in the form of porous felt The felt is immersed in a soln of the inert powder, dried and submitted to a mech treatment to break up the crusts and granulations of the powder Cf C A 30,009

Apparatus for filtering and thickening slimes or sludges from mining and other industrial processes Henry T Durant and Eric O Stubbings (to Blomfield Engineering Co, Ltd.) U S 2,027,681, Jan 14 Various structural and operative details

Apparatus for coagulating and filtering liquids Robert B. Morse Fr 789,548, Oct 11, 1935

Apparatus (with a centrifugal separator and filter) for separating solid matter entrained in air or other gases Ludwig F. Holty. U S 2,026,834, Jan 7 Various structural, mech and operative details

Rotary screen separator Geo H Fraser U S 2,027,375, Jan. 14. Structural and mech details

Gravity-separation apparatus Horace J Greaves Brit. 435,050, Sept 13, 1935 The outflow of H₂O from a settling tank or pump sump to the circulating system of a coal washing plant or to waste is automatically controlled so that wastage does not occur on stoppage or failure in the washing app. or other part of the circulating system

Separating heaped materials by the action of gas streams Henry M. Chance. U S 2,022,585, Nov 20 App and various operative details are described

Apparatus for straining gasoline or other liquids or gases. John Wardle (to Lolo Strainers Ltd.) U S 2,022,016-17, Nov. 20 Various structural and operative details

Sifting-apparatus. Frank Pascall. Brit. 435,344, Sept. 19, 1935

Plansifters comprising a plurality of superposed sieve frames. John Speight and Henry Simon Ltd. Brit. 435,328, Sept. 19, 1935.

Centrifugal apparatus for separating dust from gases. François Jacques Berry Fr. 787,897, Sept. 30, 1935.

Apparatus for removing dust from gases Pierre Frémont. Fr. 788,115, Oct. 4, 1935 The gases are caused to impinge on the surface of walls down which water flows.

Apparatus for washing gases. Wm Learmonth, Gordon Nonhebel, John L. Pearson and Imperial Chemical Industries Ltd. Brit. 434,590, Sept. 5, 1935 Divided on 424,414 (C. A. 29, 49787). A gas-scrubber comprising a main body of packing consisting of transverse tiers of thin laths with vertical flow of gas and liquid has relatively deep plates arranged vertically side by side at the gas inlet in the path of the scrubbing liquid, the plates being spaced at a greater distance apart than the thin laths and having enlarged tops so that the plates receive a greater proportion of scrubbing liquor per unit area than the laths.

Apparatus for washing gases Axel Larsen Brit. 435,047, Sept. 13, 1935. Dust-laden gases are led through loose bodies, e. g., balls, rings, spirals or short pieces of Fe, resting on the inner wall of a stationary drum less than half filled therewith; fixed transverse positions prevent the gases passing through the free space in the container without coming into contact with the bodies, which are agitated by stirrers mounted on an axle above the level of the bodies and are kept moist by liquid added at the top and withdrawn by pipes.

Apparatus for washing gases Wm. H. Yardley. Brit. 435,550, Sept. 19, 1935. In app in which liquid falls

over several rows of helical blades disposed vertically in a casing, the blades in each row touch one another and the blades of 1 row are staggered with respect to and spaced apart from those in adjacent rows to form tortuous passages for the horizontal passage of the gas

Treating air with liquids Max Berlowitz Brit. 434,671, Sept 6, 1935. For moistening, cleansing, heating or cooling air, a motor-driven centrifugal pump dips into liquid and raises it over its top edge to deliver it over a perforated container packed with filling bodies through which air is forced by a fan co-axial with the motor

Gas analysis apparatus Matyan P Matuszak (to Fisher Scientific Co.) U S 2,026,842, Jan 7 Various structural and operative details

Automatic periodically operating gas-analysis apparatus H Mahak A-G (Richard Prantzs, inventor). Ger 622,137, Nov 21, 1935 (Cl 421 4 04)

Apparatus for dispensing gas such as oxygen from a liquefied gas supply Geo J Boshkoff (to Linde Air Products Co.) U S 2,028,110, Jan 14 Various details of app and operation

Apparatus for transferring liquefied gases William F Messenger (to Dominion Oxygen Co Ltd.) Can 353,938, Nov 5, 1935

Purifying liquids The Dorr Co Inc Fr 788,042, Oct 2, 1935 App is described for passing a current of the liquid through a flocculation or coagulation zone and bringing the liquid to a calm zone where the flakes are pptd. A slowing down of the flakes by gravitation in an ascending current is produced to obtain a zone concd with flakes and this zone is submitted to a supplementary agitation transverse to the direction of the current.

Centrifugal machine for separating liquids. Aktiebolaget Separator Brit 435,241, Sept 17, 1935

Drives for centrifugal machines The British Thomson-Houston Co Ltd Brit. 435,982, Oct. 2, 1935 The elec. motor of the short-circuited rotor type for driving the machine is slowed up during the filling operation by the automatic insertion of a single-phase stator resistance.

Centrifugal apparatus for disintegrating and dewatering wet raw materials. Alexander Dexter and Martin Ziegler. Ger 622,228, Nov. 22, 1935 (Cl 10c 7)

Centrifugal apparatus for removing oil from thick neutralization pulp Aktiebolaget Separator. Fr. 788,500, Oct 12, 1935.

Progressive evaporators. The Thermal Syndicate Ltd. and Burrows Moore Brit. 435,134, Sept. 16, 1935. Towers for the concn of liquids by evapn or absorption contain a no of transverse members, each having 1 or more openings provided with orifices or notches.

Multiple evaporator for sirup, etc Hermann Claassen. Ger. 619,822, Oct. 7, 1935 (Cl 12a. 5)

Evaporating foaming liquors such as black liquor from cellulose manufacture. Erik Oman and Sven H. Ledin (to Industriemiska Aktiebolaget). U S 2,027,115, Jan. 7. In passing a current of gas under pressure through a layer of the liquid, the gas is divided into streams substantially uniformly distributed with respect to the layer of liquid and which have an individual width of preferably at least 1.5 mm. and not more than 12 mm. and pitches at least 2 5 times the width of each stream. App. is described

Drying apparatus Bernard M. Carter (to General Chemical Co.). Can. 353,947, Nov 5, 1935 Operative and structural details are given.

Tube drier Zeitzer Eisengesserei und Maschinenbau-A-G Ger. 619,730, Oct. 10, 1935 (Cl 82a. 23.01).

Conveyor-band apparatus for drying ammonium sulfate Elektra A-G für Elektrotechnik. Ger. 621,530, Nov. 8, 1935 (Cl 12t 2). Addn to 618,363 (C. A. 30, 74)

Kiln for drying granular and like substances, e. g., oats George S Hamilton. Brit. 435,077, Sept 13, 1935.

Muffle furnaces Henry W. Spencer and Leonard S Davis. Brit. 430,180, Oct. 7, 1935. In a furnace having its side walls and roof formed of refractory blocks suspended, resp., from angle beams and overhead girders,

the muffle itself is constituted by tiles keyed into and supported by the blocks

Rotary tubular furnace I G Farbenind. A-G Fr. 788,306, Oct 8, 1935 The furnace is surrounded by heat-insulating means which can be regulated by opening or closing apertures

Regenerators Soc anon d'Ougrée-Marhay Brit 435,162, Sept 16, 1935 An integral honeycomb element for Cowper type regenerators comprises at least 3 layers of superposed and intersecting bars

Valve system for regenerative furnaces Otto Reiner Ger 623,174, Nov 21, 1935 (Cl 24c 7 03)

Closure device for a furnace observation opening The British Thomson-Houston Co Ltd Brit 435,292, Sept 18, 1935

Apparatus for furnace-combustion control Shirley S Weeks U S 2,027,942, Jan 14 Various mech. and operative details

Annealing furnace Hans Cramer. Ger. 619,022, Oct 11, 1935 (Cl 18c 10 01) Details are given

Apparatus for charging annealing furnaces Homer Buck and Harvey W Ball (to Morgan Engineering Co.) U S 2,028,045, Jan 14 Mech features

Apparatus for charging furnaces with articles in annealing boxes Harvey W Ball (to Morgan Engineering Co.) U S 2,028,038, Jan 14 Various structural, mech and operative details

Water heater for utilizing heat of waste gases Peter W Kaiser U S 2,020,686, Nov 12 Various structural and operative details

Heat-exchange system suitable for use with chemical solutions Kurt V Nesselmann and Edmund Altenkirch (to Siemens-Schuckertwerke A-G) U S 2,027,610, Jan 14 Various details of app and operation are described

Tube and fin heat exchange apparatus Anthony F Hoessel U S 2,019,967, Nov 5 Structural details

Tubular heat-exchange apparatus for use in sterilizing liquids Geo J van Zijderveld, Jr, Geo J van Zijderveld, Sr, Johannes van't Hoff and Leonardus de Jonge (trading as Syndicate Jozydhoff) Brit 433,760, Aug 20, 1935

Gilled tubes for heat-exchangers Auguste Tummers Brit 435,895, Oct 1, 1935

Crucibles Alfred Kropf and Stahlwerke Roehling-Buderus A-G Ger 622,275, Nov 23, 1935 (Cl 31a. 3 70) Addn to 469,433 (C A 23, 1732) The method of prep crucibles of Ta carbide, described in Ger 469,433, is modified by adding to the mutual mixt a metal in between 1100° and 3000°, e g, Cu, Fe, Ni, Cr, Ti, W or Mo The mech properties and the elec cond of the crucibles are thus improved Crucibles of Zr carbide or of mixed Ta and Zr carbides may be made in the same way

Heating and cooking vessels Wm H Hatfield and Joseph F. Bridge Brit 436,229, Oct 7, 1935 The undersurface of an austenitic stainless steel vessel is coated with a metal of high thermal cond, e g, Cu, Al, applied by spraying

Ball mills divided by longitudinal partitions into chambers open toward the periphery of the tube Mikael Vogel-Jørgensen Brit 435,046, Sept 13, 1935

Impact pulverizers Edmund E Bental Brit 435,925, Oct 1, 1935

Gyrator crushers Humboldt-Deutzmotoren A-G Brit 435,959, Oct 2, 1935

Crushers with gyrator heads Harvey H. Rumpel. Brit 435,237, Sept 17, 1935

Rolling and crushing mills Venesta Ltd and Angus Love Brit 435,367, Sept. 19, 1935

Hygrometric and thermostatic apparatus suitable for recording humidity Albert E Clawson (to Taylor Instrument Cos.) U S 2,027,959, Jan 14 Various structural and operative details

Conditioning and dehumidifying air, as by the use of calcium chloride Charles R Downs (to Weiss and Downs, Inc) U S 2,026,935-6, Jan 7. Various details of app and operation

Use of calcium chloride for air conditioning and dehumidifying Charles R Downs (to Weiss and Downs, Inc) U S 2,027,993, Jan 7 Lumps of CaCl₂ are used in which finely divided activated carbon is distributed and held for deodorizing the air treated U S 2,027,094 relates to a process in which air is treated successively with a soln of CaCl₂ and with solid CaCl₂ and describes app

Air-conditioning apparatus Pierre R. M Willoughby Brit 435,372, Sept 19, 1935 The air enters a conduit through sieves coated with resin to retain the dust, passes through a water spray, is cooled and finally passes through an ozonizer and is discharged by a fan

Air conditioning system suitable for railway passenger cars Milton E Hanson (to B. F. Sturtevant Co) U S 2,027,097, Jan 7. Various structural and operative details

Air-conditioning and -cooling system (suitable for railway cars) Charles R Neeson (to Baldwin Southwark Corp) U S 2,027,058, Jan 7. App. and various operative details are described.

Air-moistening and -conditioning apparatus John O Guffey U S 2,026,974, Jan 7. Structural, mech and operative details

Apparatus and operative details for cooling and aerating comminuted solids such as ammoniated phosphate fertilizer Augustus J Sackett. U S 2,028,413, Jan. 21 Various structural and operative details

Bin with agitating apparatus and supplied with air under pressure for homogenizing pulverulent materials such as cement raw meal Niels Nielsen (to F L Smidth & Co) U S 2,027,697, Jan 14 Various structural and operative details

Apparatus for drying sheet material such as cloth Frank B. Morrill (to James Hunter Machine Co) U S 2,027,317, Jan 7. Various structural, mech and operative details

Apparatus for testing liquids such as lubricants by a rotor and closely fitted casing Jean G Dintilhac (to "L'Huile des Records du Monde S A F.") U S 2,027,903, Jan 14 The liquid is fed into an adjustable space between a frusto-conical rotor and a surrounding casing with closely spaced walls of like shape and an atm of N may be used in the app. Various details of structure and operation are described

Press (with a rotary drum and endless caterpillar chams) for dehydrating colloidal materials such as peat Mathieu van Roggen and Leo Robin U S 2,027,657, Jan. 14 Various structural, mech and operative details

Means for controlling the level of conducting liquid or flowing material in a container Evershed & Vignoles Ltd and John C Needham. Brit. 435,426, Sept 20, 1935

Apparatus and method for making foam Komet Kompagnie für Optik, Mechanik und Electro-Technik G m b H Brit. 435,979, Oct 2, 1935 In prep. air foam, the foaming liquid and air are drawn into and forced through a mixing chamber by a steam injector Cf C A 29, 2984⁴

Apparatus for converting solid carbon dioxide into liquid and gas Eugene L Ragonnet (to Pure Carbonic Co of America) U S 2,026,799, Jan 7. Structural details

An ancient Chinese alchemical classic. Ko Hung on the gold medicine and on the yellow and the white. The fourth and sixteenth chapters of Pao-p'u-tzu. Translated from the Chinese by Lu-Ch'ing Wu, with an introduction, etc. by Tenney L. Davis. *Proc. Am. Acad. Arts Sci.* 70, 221-84 (1935). I. H.

High-school science a foundation for science courses in college. Ralph L. Horton. *Science Education* 19, 163-9 (1935). W. H. Boynton.

German chemical books and journals in their cultural significance at home and abroad. P. Walden. *Chem.-Ztg.* 59, 873-5 (1935). E. H.

Chemical elements and the unity of matter. H. F. A. Paneth. *Scientia* 58, 272-9 (1935). cf. C. A. 30, 337¹. L. E. Gilson.

Recent methods of determination of molecular weight. Karl Rast. *Chem.-Ztg.* 59, 853-7 (1935).—A review. E. H.

The ionization balance in the Arctic. Joachim Scholz. *Gerland's Beitr. Geophysik* 44, 306-20 (1935). J. F. S.

Deuterium as a research tool in the physical and biological sciences. Herrick L. Johnston. *Ohio J. Sci.* 35, 363-87 (1935).—A summary of the properties of D and some sp. problems to which the use of D has been applied. E. J. Rosenbaum.

Thermocouples from 2° to 90° absolute. J. Fliston. *Ahlberg and Walter O. Lundberg. J. Am. Chem. Soc.* 57, 2722-3 (1935).—Math. considerations lead to the equation

$E = A + BT + CT^2 + DT^3$, where E is the thermocouple voltage in microvolts, T is the abs. temp. and A , B , C and D are consts. Comparisons of thermocouples show, to first approximation, that the differences in voltages of 2 different thermocouples are proportional to their av. voltage, the data suggest that only 4 isolated comparisons of voltage and temp. are necessary for the calibration of thermocouples for use below 90°K. C. J. West.

Resistance thermometry below 10°K. J. D. Babbitt and K. Mendelssohn. *Phil. Mag.* 20, 1025-40 (1935).—One sample of phosphor-bronze wire out of many tried has a temp. coeff. of resistance in the temp. range 2-7°K. which makes it suitable for a thermometer for that range. Heating and quenching this wire destroys the temp. dependence of the resistance. Other wires of the same compn. do not show the desired effect. The superconducting component of the phosphor-bronze might be the α -phase of the Sn-P alloy, which becomes superconducting at 8°K. A Pb-Ag alloy with 5% Pb has a temp.-dependent resistance between 3° and 7°K. E. J. R.

Determination of fixed points of low temperature with a hydrogen thermometer. Shin'ichi Aoyama and Eizo Kanda. *Bull. Chem. Soc. Japan* 10, 472-81 (1935).—An

all-glass H₂-thermometer of const. vol. with an accuracy of $\pm 0.03^\circ$ at 0° and $\pm 0.025^\circ$ at -200° is described and discussed. The b. p. of N₂ is $-195.83 \pm 0.03^\circ$, that of O₂ $-183.02 \pm 0.03^\circ$, and the sublimation p. of CO₂ $-78.52 \pm 0.009^\circ$. Some Cu-constantan thermocouples were also calibrated in a special cryostat that could be kept const. within $\pm 0.02^\circ$ even at -200° .

John E. Milbrey. Filtration of some mineral powders suspended in water or aqueous solutions. Paulette Berthier. *Compt. rend.* 201, 1368-70 (1935).—Various powders, C, Fe₂O₃, etc., were suspended in solns. of varying concn, c , of the Na salt of an organic acid, e , oleate, citrate, of surface tension, τ . The amts., A , passing through when filtered under identical conditions were detd. With Na oleate (τ decreasing) A increases with c , with citrate (τ independent of concn) A shows a max., but no definite connection between τ and A was found. It is suggested that increase in filterability is due to fixation of anions by the particles and their consequent acquisition of a neg. electrification, which reduces their adsorbability by cellulose (cf. Spring, C. A. 4, 1011). C. A. Silberrad.

The odor of hydrocyanic acid. Julius Meyer. *Gasmasker* 7, 112 (1935).—The odor of HCN varies widely with the concn, duration of action on the olfactory nerve and other conditions. Liquid HCN or strong aq. solns. have a penetrating, pungent odor and cause a harsh, scratching sensation in the throat. In very dil. condition it has been described as aromatic, but is more "dull" in effect. HCN paralyzes the nerves of smell and of taste to an unusual degree so that in a few seconds it can no longer be distinguished by these senses. About 5-10% of persons cannot smell it at all in low concns. The odor is quite different from that of bitter almonds or its oil with which it is frequently incorrectly associated in descriptions.

A. L. Kibler. The atomic weight of neon (after experiments by R. Jungblut-Ficht and M. Hoeppefer). A. v. Antropoff. *Ber.* 68B, 2389-91 (1935).—Pure Ne was sep'd. from a mixt. of 82% Ne and 18% He by repeated absorption by ignited coconut shells of mixed grain size in long tubes kept at the temp. of liquid air and subsequent pumping off at the same temp. The at. wt. was found by d. measurements to be 20.183, it confirms the value obtained by Baxter and Starkweather (C. A. 22, 1504). J. E. A.

Relative atomic weights of oxygen in water and air. Malcolm Dole. *J. Am. Chem. Soc.* 57, 2731 (1935).—The difference in d. of H₂O prep'd. from atm. O₂ and from O₂ prep'd. by electrolysis of H₂O indicates that the at. wt. of O₂ in the air is 16.00008 if the at. wt. of O₂ in Lake Michigan H₂O is 16.00000. The work is being repeated.

C. J. West. Abnormal density of water from the depths of lake Balcal. I. Mendelev. *Compt. rend. acad. sci. U.R.S.S.* [N. S.], 3, 105-8 (1935).—A complete immersion chain aerometer was used to det. differences in d. of water from various sources, and that of water from lake Balcal from the surface to the depths. The d. of the lake water at the surface was identical in the 7th decimal place with that of other water. The d. of distd. samples increased toward the depths to a value of 56 units of the 7th decimal place at 1650 m. The d. of a series of undistd. samples also indicate a collection of heavy isotopes in the depths after allowing for mineral content. It is thought that mols. contg. heavy O and to a lesser degree, heavy H are conc'd. in the depths by gravity. The investigation is being continued. C. E. P. Jeffreys.

The periodic system of energy coefficients. A. E. Fersman. *Compt. rend. acad. sci. U.R.S.S.* [N. S.], 3, 173-6 (1935) (in English), cf. C. A. 29, 5787¹, 7719¹.—The Ek values of elements are considered in relation to the positions of elements in the periodic table. Analysis of the results gives the following conclusions: (1) the energy contributed by unit valences increases with w (charge); (2) all the values of Vek of intermediate ions of a given valence are almost equal; (3) the values of Vek of ions of the noble-gas type are smaller than the corresponding values of Vek of ions of the Pd type; (4) the anions of noble-gas type are smaller than the corresponding cations.

Curves of hardness, at. cohesion, crystal energy, m. p., b p and sp gr, are similar to the ϵ_k curves A. B. F. D.

A statistical perturbation theory. I. Perturbation calculation in the Thomas Fermi theory without exchange Paul Gombás *Z. Physik* 97, 633-54(1935)—A statistical perturbation theory on the lines of the Thomas-Fermi approximation is developed for a neutral atom. The first- and second-order perturbation energies are compared with the corresponding wave-mech. expressions, and agree satisfactorily. The method can be extended to ions. It is applied to the calcn of the induced dipole moment in an external field B Swirles

The solution of Dirac's equation for a centrally symmetrical field of force Fritz Sauter *Z. Physik* 97, 777-84(1935)—A new method of solution of Dirac's equation for a potential, $\Phi = \Phi(r)$, is given and its identity with previous forms of soln established B Swirles

Optical activity IV Racemization of the optically active oxalates Christopher Hollis Johnson. *Trans Faraday Soc* 31, 1612-21(1935), cf. C. A. 27, 3415—Properties of metallo-trioxalates are discussed with reference to optical activity and racemization. The ionization theory of racemization was shown to be unreliable. The newly discovered racemization of chromi- and cobalt-oxalates in the cryst state supports the intramol rearrangement theory. It is suggested that H_2O mols play an important part in detg the properties of these oxalates. A connection between optical isomerism and magnetic susceptibility is discussed. Some coordination compds of Al are described. All attempts to resolve $[Al(C_2O_4)_3]^{3-}$ and $[Fe(C_2O_4)_3]^{3-}$ failed V Racemization of the strychnine salts of dextro and levo chromoxalate in the crystalline state C. H. Johnson and A. Mead *Ibid.* 1621-32—The d salt $K_2[Cr(C_2O_4)_3] \cdot 12H_2O$ does not racemize even after heating for 2 days at 120° . Partial racemization of the strychnine salt occurs at room temp, and the extent of racemization depends upon the temp though apparently it is never complete even after heating for a long period at 130° . The tri-strychnine d- and l-salts of chromoxalate were studied at a variety of temps. There is evidence that the loss of rotatory power occurs chiefly after dehydration and not contemporaneously. It was shown that racemization does not result from, nor is it accompanied by, decompn of the mol. ion. Tentative explanation regarding the mechanism is proposed. Both enantiomorphs were obtained for the first time in a state of almost abs optical purity. VI Racemization of potassium chromoxalate in aqueous solution—accelerating influence of ions N. W. D. Beese and C. H. Johnson. *Ibid.* 1632-42—The failure of $C_2O_4^{2-}$ to depress the rate of racemization of $K_2[Cr(C_2O_4)_3]$ in aq soln indicates that racemization is either a measure of ionization or it is not a factor at all. The latter is considered most probable. Racemization is markedly accelerated by pos ions, an effect that increases with valence. The Ag ion and Ti ion exhibit greater activity than alkali ions, but are weak in comparison with bivalent ions. Judging from the effect of mercurous ion Hg^{2+} is a doubly charged unit. Unionized $HgCl_2$ is inert. No evidence for the existence of Ti^{++} , Cr^{+++} or Al^{+++} in soln was obtained, but the two latter behave as $[Al(OH)]^{++}$ and $[Cr(OH)]^{++}$.

The catalytic effects of $CaCl_2$, $MnCl_2$, and $CuCl_2$ were studied over a wide range of concn. It is hoped to apply this catalytic effect to a study of complex ions in soln, with a view of detg the degree of disson. C. E. P. Jeffreys

Degree of depolarization in the molecular scattering of light Harald Volkmann. *Ann Physik* 24, 457-84(1935)—The degree of depolarization of polarized, parallel sunlight scattered by CH_4 , H_2 , CO_2 and N_2O was measured at pressures up to 45 atm. The values found are: CH_4 , 0, H_2 0.009, CO_2 0.0724 and N_2O 0.102. Sources of error are discussed E. J. Rosenbaum

Magnetic birefringence in solutions of paramagnetic salts of rare earths S. W. Chinchalkar. *Phil. Mag.* 20, 856-8(1935)—A regularity in the birefringences of the rare earth ions is found. If the rare earths in the order of at. no. are divided into 2 groups on the basis of Hund's

theory, the birefringences of these groups vary in the same way from a neg. value to a pos one E. J. Rosenbaum

Physical methods in chemistry. III. The dielectric constant, its measurement and application. P. Cohen Hennequiez and L. J. N. van der Hulst. *Chem. Weekblad* 32, 493-8(1935); cf. C. A. 29, 3203⁷—A review and description of methods and app. for accurate detn. of dielec const; a liquid filled condenser of 0.5 cc. content is described. Applications of ϵ detn. to process control are described IV. Dipole measurement and its application in chemistry *Ibid.* 636-45—An elaborate review of dipole work and its application (C. A. 29, 972⁷). The discussion includes additivity of moments in mols, electron affinity, double-bond moments, neg and pos groups, structural study on the basis of dipole moment, pyramid structure, C, N, O and S moments in their compds, ring systems, intramol effects, σ -, m- and p-derivs, etc. There are 30 tables of μ values for different types of mols and at. groups with conclusions as to structure.

B. J. C. van der Hoeven

Electric resistivity and magnetic susceptibility of sugar carbon after various thermal treatments Paul Corniez *Compt rend.* 201, 1489-7(1935); cf. C. A. 30, 920¹—The resistivities and susceptibilities of the 6 samples of sugar C previously described show, resp, a steady decline and a steady increase as the temp to which they were heated was greater, approximating but not attaining, those for graphite (cf. C. A. 28, 5959⁹). C. A. S

The negative cohesion pressure V. Jacyna, S. Derev'yankin, A. Obnorski and T. Parfent'ew. *Z. Physik* 97, 774-6(1935)—The investigations of P. Weiss (C. A. 29, 4985⁷) and P. W. Bridgman (C. A. 29, 4982⁷) have shown that for sufficiently high temps neg values of α occur in the van der Waals equation for all gases. This supports J.'s theory (Z. Physik 30, 372(1924)). B Swirles

The scattering of molecular rays in gases R. G. J. Fraser, H. S. W. Massey and C. B. O. Mohr. *Z. Physik* 97, 740-4(1935)—The geometry of the method of crossed mol. beams is discussed for the case of a primary beam of rectangular cross section and the cross section for collision of Na-Hg and K-Hg is newly evaluated. It is shown that the corrected values give reasonable expressions for the van der Waals potentials. B Swirles

Remarks on the work of M. Trautz and W. Müller. Definition and correction of the gas-diffusion constants Jarl Kuusinen. *Ann Physik* 24, 445-6(1935)—T and M.'s equation (cf. C. A. 29, 4228⁷) is similar to the one K. proposed, which was attacked. E. R. Schierz

Definition of (gas-) diffusion constants. Jarl Kuusinen. *Ann Physik* 24, 447-56(1935)—K. derives as the most useful and general definition of the diffusion const for tridimensional diffusion in a mixt. of several components the following expression. $v_i \Delta \gamma_i = \sum_j \frac{v_i \gamma_j}{\gamma_i} \frac{c_i - c_j}{\gamma_i - \gamma_j}$ where γ_i, γ_j = abs. concn.; v_i, v_j = partial molar vol (Lewis); c_i, c_j are space vector for component s and j , resp. $\Delta \gamma$ = concn. gradient. E. R. Schierz

New method of measuring the viscosity of gases André Fortier. *Compt rend* 201, 1330-2(1935)—The gas issues from a reservoir in which it is under approx const. pressure, P , through a capillary tube of length l and radius r , which causes it to arrive in a chamber, C , under pressure $P - \pi$, whence it passes by a small tube, cross section S , into a second chamber where the pressure is less than $0.52(P - \pi)$. The equation $\pi = K(1 - K/2P)$ then holds, where $K = \frac{8\mu l^2}{15} \frac{1}{(1 + \gamma)} \frac{1}{(1 + \gamma)}$ $|\frac{1}{2} \gamma R / (1 + \gamma)|^{1/2} / (1 + \pi^0 / r^2 (r + l))$ and μ is coeff. of viscosity, T and 0 are the abs. temps of the gas in the capillary and C resp., ϵ is the thickness of slip, and γ and R have their usual meanings P may be atm. pressure and π of the order of 10 cm H_2SO_4 . C. A. Silbertad

Equation for approximating heat capacities of gases calculated from spectroscopic data I. N. Godnev. *J. Am. Chem. Soc.* 58, 180-1(1936)—An equation is proposed for the approx. representation of the heat capacities of gases calc'd. from spectroscopic data, $C_p = C_{p0} + \sum \frac{E_i}{T} (9/T + aT + bT^2)$, the applicability of which was exam'd for CO .

N_2 and S in the range 100–5000°K. In these cases the approximation can be accomplished very well with the coeff. b equal to zero for the temp. interval 100–5000°K.

C. J. West

Flame speeds during the inflammation of moist carbon monoxide-oxygen mixtures. W. Payman and R. V. Wheeler. *Nature* 136, 1028(1935).—The increase in speed of mixts. richer in water vapor found by Flock and Roeder (C. A. 29, 7810) is explained by the simultaneous reaction $CO + H_2O \rightarrow H_2 + CO_2$.

R. E. DeRight

Color temperatures of the Hefner and acetylene flames A. R. Pearson and B. Pleasance. *Proc. Phys. Soc. (London)* 47, 1032–41(1935).—The color of the cylindrical acetylene flame depends upon the gas pressure, the rate of consumption and the height of the flame. The color temp. of the Jones flame is 2520°, and that of the Hefner flame is 1919°.

S. Bradford Stone

The new treatment of critical phenomena. A. J. Jauch. *Z. Physik* 97, 669–70(1935).—The attribution of the existence of a crit. region (as opposed to point) to the presence of impurities, by Natanson and others, is reconcilable with J.'s new theory.

B. Swirles

The viscosity and the constitution of organic liquids. S. G. Papkov. *Z. Physik Chem.* A174, 445–5(1935), cf. C. A. 29, 7758. —By addition of the at. increment, the viscosity of org. liquids can be calcd. from the formula

$\eta = M/d \cdot \sqrt{v_m}$. The validity of this function is proved by calcd. the value of η for 26 liquids. The degree of assoc. of strongly assoc. liquids was calcd. and compared with exptl. values from the literature.

R. H. Baechler

Surface tension by the ring method—applicability of the Du Nouy apparatus. Rudolph Macy. *J. Chem. Education* 12, 573–6(1935). —It is possible by the ring method to obtain surface-tension data uniform with those given as "correct" in "International Critical Tables" (I. C. T.). Two methods are available: (1) to apply correction factors or (2) to employ a calibration curve in which detns. made by the ring method are plotted against correct I. C. T. values. The latter gives almost as good results as the exact method of Harkins.

Philip D. Adams

Theory of surface tension of liquid metals. D. V. Gogate and Duleh Sinha Kothari. *Phil. Mag.* 20, 1136–44(1935).—Math. Agreement with observed values is obtained.

E. J. Rosenbaum

Surface tension near the critical point. Alfred W. Porter. *Phil. Mag.* 20, 1163–6(1935).—Uncertainty exists as to the behavior of liquids in capillary tubes near the crit. temp. because while the rise decreases, the surface becomes flattened as the crit. temp. is approached. The change in form of the surface is calcd.

E. J. Rosenbaum

Boiling points of normal paraffin series. Edwin R. Cox. *Ind. Eng. Chem.* 27, 1423–5(1935).—The b ps of the normal paraffin series are given by $\log_{10} T_b(K^\circ) = 1.07575 + 0.94125 \log_{10} m - 0.101 \log_{10} m$, where T_b is the normal b p. in temp. abs. and m is the approx. mol. wt. If CH_4 and C_2H_6 , which are not homologous with the rest of the series in regard to b ps., are excluded the agreement is perfect from propane to octane, except in C_8H_{18} .

O. W. Wilcox

Isotopic shift of water by distillation. J. Horuchi and G. Okamoto. *Bull. Chem. Soc. Japan* 10, 503–5(1935). —Samples (20 g.) of heavy water contg. 2.60% D_2 were distd. at const. low temps. so that 10 mg. distd. oil in 40–60 min. The D_2 content of this first distillate was detd. by a microspectrometer. The shift was greater the lower the temp. of distn. Thus the percentage D_2 in the distillate at 20.42° was 2.49, at 0.05°, 2.42 and at –6.42°, 2.38. The results are discussed thermodynamically and a few calcs. made.

John E. Milberry

Structure of anisotropic liquids. R. D. Shulvas-Sorokina and M. V. Posnova. *Physik. Z. Sowjetunion* 8, 319–23(1935).—The dielec. const. (DK) of p -azobenzene (P) in several phases was studied by the capacity bridge method as a function of frequency in the range 35–1000 Hertz. While the capacity of the condenser plus liquid (P) falls off with decreasing frequency, the DK of (P) is independent of frequency and dielec. losses are absent.

For the isotropic liquid at 139°, the DK is 5.2; for the anisotropic liquid at 126°, 5.4; for the same phase undercooled to 115–103° the DK is of the same order; for the solid at 20°, 3.24. The sp. resistance of the liquid is shown as a function of temp. in the range 140–100°.

C. D. West

Electric conductance in semiconductors. Wilfried Meyer. *Physik. Z.* 36, 749–55(1935).—The rule that the log of the cond. σ is proportional to $-B$ in the cond.-temp. formula $\sigma = a e^{B/T}$ holds only to a first approximation. Measurements on TiO_2 contg. varying amts. of excess O_2 show a relation between cond. and a . The no. of conducting electrons was measured and a graphic relation between cond. and electron concn. is presented.

C. E. P. Jeffreys

Formation of counter tensions in solid ionic conductors. Adolf Smekal. *Physik. Z.* 36, 742–9(1935).—Newer investigations of solid ionic conductors help explain the nature of dielec. anomalies of special conducting ionic crystals. The Maxwell-Wagner theory of dielectrically homogeneous solid substances and the Jaffé theory are in accord with the exptl. facts.

C. E. P. Jeffreys

Conductance of electricity in melts of alkali salts with a stoichiometric excess of metal. E. Mollwo. *Physik. Z.* 36, 740–2(1935).—Alkali salt melts dissolve up to 1 vol. % of alkali metal in the form of neutral atoms. No electronic cond. was observed in the melts. With equal no. of excess atoms absorbed the total cond. was at least $1/2$ less than in the solid crystal at the m. p.

C. E. P. Jeffreys

Electric conductivity of cuprous oxide in equilibrium with its neighbor phases. F. Waibel. *Physik. Z.* 36, 760–4(1935).— Cu_2O was brought into equil. with Cu over a temp. range of 100–1000°. The elec. cond. of the sample was measured after rapid cooling. A max. for cold cond. occurs at 400–500° analogous to the Cu_2O - Cu equil. The formation of unidirectional plates for Cu_2O rectifiers is explained. The amt. of dissolved O_2 was detd. by weighing and gas-volumetrically.

C. E. P. Jeffreys

The electric resistance of tantalum wires saturated with hydrogen. A. Sieverts and H. Brünig. *Physik. Z.* 36, 760–4(1935).—cf. C. A. 30, 923. —The H absorption and elec. resistance of Ta wire were measured at temps. of 600°, 500° and 400° and pressure, P , up to 1 at. At 600° and 500° but not at 400° the amt. of dissolved H is exactly proportional to \sqrt{P} . The increase in resistance at 600° and 500° is proportional to the amt. of dissolved H and therefore to P . At 400° it is almost proportional. Only a few measurements were possible at 400° because the wire ruptured with an increase in absorbed H_2 . The same regularities held for the system $Pd-H_2$ at low H_2 content as for the system $Ta-H_2$. In both cases the validity held only as long as H_2 could be absorbed without the formation of a new phase.

R. H. Baechler

The solubility of deuterium and hydrogen in solid palladium. A. Sieverts and G. Zapf. *Physik. Z.* 36, 759–64(1935).—The solubilities of H_2 and D_2 in solid Pd were detd. Former measurements of $Pd-H_2$ were substantiated fairly well. The ratio of the solubilities L_D/L_H is 0.67 at 300°, increases to 0.91 at 1000° and at higher temps. approaches 1. The soly. of both isotopes in Pd at const. temp. is proportional to the 4th root of the gas pressure.

R. H. Baechler

Thermoelectric potential, Peltier heat and photoelectric potential in the element copper-copper oxide-copper. G. Monch. *Physik. Z.* 36, 755–7(1935).

C. E. P. Jeffreys

Thermal formation of color centers and their life period. R. Hilsch. *Physik. Z.* 36, 735–7(1935).—The degree of dissoc. of U -centers and the life period of F -centers in KBr were measured. Such measurements may lead to a quant. understanding of the properties of semiconductors.

C. E. P. Jeffreys

Plasticity of crystals. IV. Further foundation for the dynamic plasticity law. E. Orowan. *Z. Physik* 97, 573–95(1935); cf. *Z. Physik* 89, 634(1934).—The plastic limit is not noticeably affected by the recovery of the crystal during the expt. Hence its dependence on temp.

and flow velocity cannot be interpreted as a recovery effect in a statistical theory. In particular, its velocity dependence is directly connected with a dynamic plasticity law. Confirmation is derived from curves of flow of Zn crystals.

B. Swales

Etching studies of concave bodies. II. Studies of hollow hemispheres and other concave forms of fluorite. Hans Himmel and Willi Kleber. *Neues Jahrb. Mineral. Geol., Beilage-Bd. 70A*, 49-64 (1935), cf. *C. A.* 29, 5714.

J. F. Schauer

Surface optical properties of calcite. René de Malle-mann and François Suhrer. *Compt. rend.* 201, 1344-6 (1935).—From observations on the result of reflecting rectilinearly polarized monochromatic light from a polished surface of calcite cut in definite directions it is inferred that the polishing produces an isotropic layer on such surface the precise nature of which depends on the method of polishing. There seems some reason to think that a similar surface to at least some extent exists on a natural (cleavage) surface.

C. A. S. J. S. J. S. J.

Calculation of the magnitude and pressure dependence of ion-disarrangement energies and mobilities in crystals. W. Jost. *Physik Z.* 36, 757-60 (1935).—By considering polarization effects, an approx. calcn. of disarrangement energies of ions in crystals is possible. The approximation depends upon whether the theory of Schottky (*C. A.* 30, 346) or that of Frenkel is followed.

C. E. P. Jeffreys

Some new features in habit modification shown by potassium perchlorate crystals. H. E. Buckley. *Z. Krist.* 91, 375-491 (1935) (in English).—Effects of various dyes on the crystal habit of $KClO_4$ are given and possible explanations discussed. The results are similar to those on $KMnO_4$ (*C. A.* 25, 5811).

L. S. Ramsdell

A Röntgenographic study of the process of producing spongy iron from hematite by reduction with gases. W. P. Kasper. *Z. physik. Chem.* A174, 370-83 (1935).—The products of reduction of hematite by H were studied by the Debye-Scherrer method. The findings on compn. of the products agreed with those obtained by chem. analysis. Mech. mixts. of the products were the rule, solid solns. being lacking. The length of the edge of the α -Fe fine crystal was found to be of the order of magnitude given in the literature. Higher temp. produced longer edges. At 700° the change of Fe_2O_3 to Fe_3O_4 is faster than the formation of the next phase. In the next step FeO is formed which quickly changes to Fe. When the reduction is 82.5% complete α -Fe and a small residue of Fe_3O_4 are present, the latter rapidly changing to Fe. At 450° the reaction is much slower and FeO is lacking. Because of the sensitivity of the Debye method one can assert the lack of FeO in cases where it is indicated by other methods.

R. H. Baechler

Examination of electrodeposited nickel coatings by x-ray diffraction. W. A. Wood. *Phil. Mag.* 20, 964-71 (1935), cf. *C. A.* 29, 7924. —Coatings formed under a variety of conditions were examined. Bright coatings formed with small c.d.s. are associated with a highly oriented structure, while dull coatings have the crystallites oriented at random. The harder deposits have broader spectrum lines than do the softer ones. Lattice distortion alone cannot account for the broadening, which is also due to the small size of the crystallites. This size is of the order 10^{-3} cm. in the soft deposits while in the hard ones it is approx. 10^{-4} cm.

E. J. Rosenbaum

Simplified technique for lattice-parameter measurements. J. T. Norton. *Metals & Alloys* 6, 342-4 (1935).—Measurements are described which can be made in a routine way without sacrifice of the accuracy necessary for good work.

Downs Schaeff

Methods of determining structure. Alfred Hettich. *Z. Krist.* 90, 473-92 (1935); cf. *C. A.* 29, 2943. —The following are discussed: (1) assignment of indices to Weissenberg photographs, (2) use of x-ray goniometer for adjustment of specimens of unknown orientation, especially needles and plates, (3) the fact that in rotating-crystal methods, planes nearly parallel with rotation axis pass through the reflecting position more rapidly than

those at greater angles, a correction factor for this is derived; (4) the "Eigendiagram," a new method of treating atomic groups in Fourier analysis; (5) optical methods of representing the results of Fourier analysis in structure details.

L. S. Ramsdell

Layer lattices and the base-exchange clays. C. E. Marshall. *Z. Krist.* 91, 433-49 (1935) (in English).—Complete chem. analyses of montmorillonite and beidellite accord with the structure proposed by Hofmann, Endell and Wilm (*C. A.* 28, 2237) with 2 SiO_2 layers and 1 Al_2O_3 layer. Montmorillonite, beidellite and some of the nontronites are members of a single series. In montmorillonite the chief lattice replacement is Mg for Al, in the beidellites that of Al for Si predominates; in many nontronites each of these is overshadowed by the substitution of Fe for Al. Other nontronites correspond more nearly to the kaolinite type. Two other replacements are probable, Ti³⁺ for Al, and P-Al for 2 Si. Analyses of fractions of several clays have been interpreted and agree well with the results of mineralogical analysis. Cf. *C. A.* 29, 4701.

L. S. Ramsdell

Lattice constants of beryllium. E. A. Owen and Llewellyn Pickup. *Phil. Mag.* 20, 1155-8 (1935).—The values for an annealed sample of high purity are: $a = 2.2810$ and $c = 1.5682$.

E. J. Rosenbaum

X-ray investigation of the thermal expansion of cadmium. G. P. Kosolapov and A. K. Trapeznikov. *Z. Krist.* 91, 410-23 (1935).—The lattice constants a and c for Cd were measured in the range of 26° to 189°. Perpendicular to the hexagonal axis the linear coeff. of expansion varies from 1.7 to 2.2×10^{-5} , and parallel to the axis is 4.8×10^{-5} .

L. S. Ramsdell

MgZn and MgZn₂. L. W. McKeen. *Z. Krist.* 91, 501-3 (1935).—It is pointed out that if the coordinates given by Tarschusch (*C. A.* 28, 2238) for MgZn and MgZn₂ are correct, the compds. must have lower symmetry than T. proposed. It is concluded that more expl. work is needed.

L. S. Ramsdell

The crystal lattices of heteropoly acids and their salts. I. The lattice of silicotungstic acid, borotungstic acid and ammonium borotungstate. O. Kraus. *Z. Krist.* 91, 402-9 (1935).—Rotation photographs show that the following compds. are tetragonal, space group D_{2d}^{11} , with 2 mols. in the unit cells, and with these dimensions: silicotungstic acid, $H_4SiW_{12}O_{40} \cdot 31H_2O$, $a = 12.93$ Å, $c = 18.52$ Å; borotungstic acid, $H_4BW_{12}O_{40} \cdot 31H_2O$, $a = 12.83$ Å, $c = 18.35$ Å; ammonium borotungstate, $(NH_4)_2BW_{12}O_{40} \cdot 26H_2O$, $a = 12.80$ Å, $c = 18.40$ Å. There is apparent isomorphism between the borotungstic acid and its ammonium salt. The probable amt. of water in borotungstic acid is discussed. Methods of prep. these compds. are given.

L. S. Ramsdell

Crystal structure of sodium uranyl acetate. I. Fankuchen. *Z. Krist.* 91, 473-9 (1935) (in English); cf. *C. A.* 29, 4546. — $NaUO_2(C_2H_3O_2)_4$ is cubic, space group $T_h^1 - P_1^1$. The unit-cell size is 10.670 ± 0.001 Å, with 4 mols. On the basis of packing considerations and symmetry, the acetate groups are located approximately and are assumed to be planar and sym. Parameters are as follows: (1) atoms in special positions, U, 0.425, 0.002; O, 0.55 and 0.31, 0.02; Na, 0.81, 0.03; (2) atoms in general positions, O, 0.26, 0.46, 0.84; O₁, 0.32, 0.45, 0.62; C, 0.33, 0.45, 0.74. Me group 0.44, 0.35, 0.77. These values, obtained by the rotation method, differ somewhat from the powder-photograph results of De Jong (*C. A.* 24, 3149).

L. S. Ramsdell

Isomorphism of the double fluoroberyllates with the Tutton salts. P. L. Mukherjee. *Z. Krist.* 91, 504 (1935) (in English).—Rotation photographs of $(NH_4)_2Ni(BeF_4)_2 \cdot 6H_2O$ indicate a cell contg. 2 mols., with the dimensions $a = 9.04$, $b = 12.31$, $c = 6.04$ Å, and $\beta = 106^\circ 40'$. The space group is C_{2h} with glide component $a/2$. $(NH_4)_2Ni(SO_4)_2 \cdot 6H_2O$, a typical Tutton salt, also belongs to C_{2h} with the dimensions $a = 8.88$, $b = 12.22$, $c = 6.10$ Å, and $\beta = 107^\circ 4'$, indicating structural isomorphism with the former compd.

L. S. Ramsdell

Crystal structures of hydrated compounds. II. Structure type $M(ClO_4)_2 \cdot 6H_2O$. C. D. West. *Z. Krist.* 91,

480-93(1935)(in English)—Hydrated perchlorates and fluoroborates of some univalent and bivalent metals are described. The 12 isomorphous hydrates of Mg, Mn, Fe, Co, Ni and Zn have structures derived from hexagonal $\text{LiClO}_4 \cdot 3\text{H}_2\text{O}$ (C. A. 28, 57337) by removing half of the Li atoms from octahedral positions and replacing the remainder with Mg. The crystals are twinned so that the water-perchlorate lattice is continuous by virtue of its high symmetry, while the metal lattice, with lower symmetry, is discontinuous at the twinning boundary. n_o and n_e and cell dimensions a and c , resp., are as follows (Li) 1.483, 1.448, 15.42 Å. (doubled), 5.42 Å. (Mg) 1.482, 1.458, 15.52 Å, 5.20 Å. (Mn) 1.492, 1.475, 15.70 Å, 5.30 Å. (Fe) 1.493, 1.478, 15.58 Å, 5.24 Å. (Co) 1.510, 1.490, 15.52 Å, 5.20 Å. (Ni) 1.518, 1.498, 15.46 Å, 5.17 Å. (Zn) 1.508, 1.487, 15.52 Å, 5.20 Å. (Cd) 1.489, 1.480, 15.92 Å (doubled), 5.30 Å. (Hg) 1.511, 1.509, trigonal, (Cu) monoclinic, $\alpha = 1.495$, $\beta = 1.505$, $\gamma = 1.522$.

L. S. Ramsdell

Crystal structure and composition of sodium dihydroxyphosphate. J. Bentma *Proc. Acad. Sci. Amsterdam* 33, 1015-20(1935)—Na dihydroxyphosphate crystallizes in the tetragonal bipyramidal class. The elementary cell contains a mass $[\text{Na}_2\text{H}_2\text{Si}_2\text{O}_7 \cdot 5\text{H}_2\text{O}]$ with $c_0 = 8.00$ Å. and $c_0 = 7.86$ Å. The cations and anions form a NaCl-like grating with each Sb surrounded by 6 O atoms in an almost octahedral configuration. The structure is in accord with Pauling's view that the substance has the compn NaSb(OH)₂.

C. E. P. Jeffreys

Crystal structure of cerium tungstate J. Bentma *Proc. Acad. Sci. Amsterdam* 33, 1011-15(1935)— $\text{Ce}_2(\text{WO}_4)_3$ is tetragonal bipyramidal and possesses a scheelite-like structure, with $c_0 = 5.33$ Å. and $c_0 = 11.62$ Å. with a mass of $\text{Ce}_2(\text{WO}_4)_3$ within its elementary cell. Only $1/2$ of the positions of Pb atoms in PbWO_4 which forms an uninterrupted mixing series with it are occupied by Ce atoms. The remaining places are void. The mixed crystals and $\text{Ce}_2(\text{WO}_4)_3$ crystals are stable, however.

C. E. P. Jeffreys

The crystal form and chemical composition of lamprophyllite. B. Gossner and K. Drexler. *Z. Krist.* 91, 494-500(1935).—A crystal of lamprophyllite from Kola, with $d = 3.35$, is orthorhombic, V_h , with the dimensions $a = 19.05$ Å, $b = 7.05$ Å, $c = 5.35$ Å. The basic formula is $\text{TiSrNa}_2(\text{SiO}_3)_2$. Ca and Ba may be present up to 25%. Further, SiO can be replaced by (AlF + FeF) and Sr by Mn.

L. S. Ramsdell

An x-ray examination of methylene blue W. H. Taylor. *Z. Krist.* 91, 450-65(1935)(in English), cf. C. A. 29, 7737.—The methylene blue sulfur chloride, bromide and iodide, and selenium bromide, were examined optically and by x-rays. The first 2 and the latter are isomorphous, forming monoclinic crystals, with symmetry of space group $C_{2h} = P_2/c$, and have the following dimensions sulfur chloride, $a = 9.5$, $b = 31.3$, $c = 6.9$ Å., $\beta = 97^\circ$, bromide, $a = 9.7$, $b = 31.5$, $c = 6.9$ Å., $\beta = 97^\circ$, selenium bromide, $a = 9.65$, $b = 31.5$, $c = 7.0$ Å., $\beta = 97^\circ$. Measured d_s are 1.29, 1.41 and 1.57, resp. These values, and cell vols., indicate that the chloride has 4 mols., and the 2 bromides 5 mols. of H_2O . The iodide has 2 forms, one triclinic, with $a = 16.9$, $b = 15.8$, $c = 6.9$ Å., $\alpha = 98^\circ$, $\beta = 95^\circ$ and $\gamma = 89^\circ$; and the other triclinic, pseudomonoclinic, with $a = 14.8$, $b = 15.7$, $c = 7.6$ Å., $\alpha = \gamma = 90^\circ$, $\beta = 98^\circ$. The former, while not isomorphous with the chloride and bromides, has a related structure. The space group of the latter form was not detd. The 2 iodides have 3 and 1 mol. H_2O , resp. The large scattering power of the I atoms makes possible a detn. of the structure. It is suggested that the C-N-S atoms form lath-shaped mols. which are stacked one above the other, and packed end to end, but adjacent stacks are sep'd. by layers of I atoms and H_2O mols.

L. S. Ramsdell

Theory of adsorption. H. Bradley. *Trans. Faraday Soc.* 31, 1652-5(1935).—The formula formerly proposed by B., $\alpha = ap^{\beta}/(1 + \beta p^{\beta})$, where α = gas vol. adsorbed in cc., p = pressure in cm. Hg, T = abs. temp., and α , β are consts., was applied to a wide variety of published data with success. For the adsorption of air and

CO on coconut charcoal, $\alpha = 1$. In all cases of adsorption of H_2O $\alpha = 2$. In the case of adsorption in CaH_2 , $\alpha = 3$. The value of α may be of important significance in view of Fowler's formula (cf. C. A. 29, 49901), wherein $1/\alpha$ is derived as the index of pressure under certain conditions. C. E. P. Jeffreys

Specific heat and binding conditions of adsorbed argon on charcoal. Hans M. Cassel. *J. Am. Chem. Soc.* 57, 2724(1935).—Measurements of sp. heat suggest that the majority of A atoms are adsorbed in the hollow edges or steps of the very cleavable material rather than on the smooth surfaces of the netplanes. C. J. West

Adsorption and oxidation of succinic acid by charcoals. B. Tamamushi and H. Umezawa. *Z. Elektrochem.* 41, 761-4(1935).—The adsorption of succinic acid (I) and fumaric acid (II) on Merck's animal charcoal and Kahlbaum's blood charcoal was detd. The adsorption of I by animal charcoal was less than by blood charcoal, but on the former catalytic oxidation was much greater. If it is more highly adsorbed by blood charcoal, and thus inhibits the oxidation of I. The adsorption and catalytic activity of a special hemin-sugar charcoal was about the same as the animal material. In neutral soln. I is oxidized partially to II as in acid soln. and partially to CO_2 . The catalytic activity of the charcoal is diminished but not destroyed entirely when it is heated in N_2 and the reaction effected in a stream of N_2 , this shows that O_2 carried by the charcoal takes part in the oxidation. C. E. P. J.

Sorption and diffusion of ammonia in analcam. Arne Tiselius. *Z. physik. Chem.* A174, 401-23(1935).—As a continuation of previous work (cf. C. A. 28, 2534*, 5736*) a study was made of the sorption and diffusion of NH_3 in the zeolite analcam which seemed well suited because of its relatively simple structure. Various isotherms were taken, direct diffusion was measured on individual crystals by an optical method as well as measurements of absorption velocity on powders. R. H. Baechler

Emulsions. E. G. Thomssen. *Am. Perfumer* 31, 59-60, 96-8(1935).—Emulsions in general, emulsifying agents and app. are discussed with special reference to toilet articles. The use of triethanolamine in the manuf. of cosmetics like liquid, cold, vanishing and lanolin creams is considered. Among the app. illustrated are a push-pull mixer, paste-type mill, colloid mill and viscolizer.

W. O. E.

Collapse of unimolecular films of palmitic acid upon acid solutions. Robert J. Myers. *J. Am. Chem. Soc.* 57, 2734-5(1935).—In the study of the compression of unimol. films of palmitic acid on HCl or phosphate buffer solns. in a Langmuir film-pressure trough, the films collapsed at a pressure apparently connected with the H-ion concn. When the collapse pressures were plotted against p_H of the substrate a sigmoid curve resulted, the mid-point of which was about $p_H 3$, as compared to $p_H 5$, the mid-point of neutralization curves of fatty acids; this appears to be evidence of increased activity of palmitic acid when oriented on a H_2O surface. The collapse pressure was sp. for H ions alone, although increased spread at low pressures was noticed when Ca or Mg ions were present in the HCl soln.

C. J. West

Action of metallic copper on a film of cupric sulfide. Henri Devaux. *Compt. rend.* 201, 1305-7(1935).—If a small fragment of Cu is placed on the film of CuS formed by passing H_2S over aq. CuSO_4 , the film near the Cu changes to steel blue in color and becomes more lustrous; the area so changed grows to a width of about 10 cm. in a few hrs. The Cu must touch the CuS , which must rest on the cupric soln. The change does not extend to any portion of the film not continuous with the part in contact with the Cu. The max. distance between the CuS mols. which will permit the change to pass on is 0.6-1 Å. Cu may be replaced by any metal that ppts Cu from the soln, e. g., Fe or Zn, but not by one that does not ppt. Cu, e. g., Au or Pt.

C. A. Suberrad

Comparison of the electrokinetic potentials at fused and unfused glass surfaces. Betty Monaghan and H. L. White. *J. Phys. Chem.* 39, 935-9(1935).—An app. and method are described for the prepn. of microscopic glass

spheres Pyrex spheres and unfused Pyrex particles have the same electrophoretic velocity. The velocity of fused or unfused Pyrex particles is much less in dil. solns than the electroosmotic velocity at a fused Pyrex surface, the latter being measured by 2 independent methods.

A. E. Beitch
Factors influencing electrophoretic mobilities and apparent critical potentials. H. L. White and Betty Monaghan. *J. Phys. Chem.* 39, 925-34 (1935).—The electrophoretic mobility of small glass particles in dil. electrolytes is less than the electroosmotic mobility at a glass surface. The two mobilities are identical in 0.01 M solns. Polarization of the double layer causes retardation of the particles in dil. solns because the mobilities of particles in crit. concns. of multivalent salts are abnormally low rather than because the crit. potentials with inorg. multivalent salts are abnormally high. The crit. mobility in inorg. multivalent salt solns is a true measure, while the true zeta potential in the crit. concns. of multivalent salts is higher than that indicated by the mobility and may be the same as that with inorg. univalent salts. A. E. Beitch

Colloid chemistry in 1935. Wm. Clayton. *Chem. Age* 33, 594-6 (1935).

Donnan effect in ultrafiltration of colloidal solutions. A. I. Rabinovich, P. Vasil'ev, and T. Gatovskaya. *Compt. rend. acad. sci. U.R.S.S.* [N.S.] 1, 3, 109-12 (1935).—By combining the relations $A_s = (A_i - A_u) + A_{ss}$ and $K_s = (K_i - K_u) + A_{ss}$, with the Donnan equations, where A_i and K_i represent activities of anion and cation and the indexes s , r and u , represent initial, final and ultrafiltrate, resp., and n is the vol. reduction of the sol, a general expression is deduced for the concn. of ions of both signs in the ultrafiltrate at any vol. reduction. By solving the resulting equation, $A_s = K_s = [(A_i + K_i)(n-1) + \sqrt{(A_i + K_i)^2(n-1)^2 - 4A_iK_i(n-1)}] / 2(n-2)$, at given values of A_i and K_i with variable n , the curve for $A_s = K_s$ against n shows a smooth curve following a linear trend parallel to the abscissa at high values of n , but dropping considerably at lower values of n . This type of function accounts for the apparent constancy of concn. of the ultrafiltrate previously observed. When solving from various ratios of A_i/K_i , it is seen that the drop of ionic concn. from initial sol to ultrafiltrate is more pronounced the higher the ratio A_i/K_i . The theory was verified by a series of measurements on Fe(OH)₃ sols dialyzed so as to obtain varying ratios of A_i/K_i .

C. E. P. Jeffreys
Electric properties of colloidal silicic acid. Korgun, *et al.* *Sotsialist. Rekonstruktsiya i Nauka* 1935, No. 5, 112.—Perfectly neutral sols of silicic acid were obtained by two methods (1) SiCl₄ was hydrolyzed and the product freed of the traces of HCl by electrolysis and (2) SiH₄ was oxidized with O₂ by passing the gases into H₂O. Cataphoretic measurements of the sols showed the insignificance of the charge on the particles and their immobility in the elec. field. On mixing sols of Ca salts with colloidal silicic acid adsorption compds. are formed instead of silicates. It is concluded that the acidity of the H₂SiO₃ sols is due mainly to foreign strong acids. The stability of colloidal silicic acid in an acid medium depends upon the anions of the foreign acid and at pH 9 upon the anions formed by silicic acid itself. At pH 6-9 the particles are only slightly protected by the charges and min. stability occurs.

B. V. Shvartzberg
Phosphatide autocomplex coacervates as ionic system and their relation to the protoplasmic membrane. H. G. Bungenberg de Jong and J. Bonner. *Protoplasma* 24, 198-218 (1935).—See C. A. 30, 354.

F. L. Dunlap
Influence of neutral salts on the optical rotation of gelatin. III. Effect of the halides of lithium, sodium, rubidium and cesium. D. C. Carpenter and F. E. Lovelace. *J. Am. Chem. Soc.* 57, 2337-42 (1935), cf. C. A. 25, 5821.—The effect of the halides of Li, Na, Rb and Cs on the sp. rotation of gelatin at 0.5° and 40° is reported for the soly. range of the salts. The results confirm the earlier conclusion that there is a definite Hofmeister series of anions (I > Br > Cl) in their effects on the optical rotation of gelatin. There is also a definite Hofmeister series

for cations (Li > Cs > Rb > Na) but the effects of cations are much less in magnitude than those of the anions. In the absence of added salts, the optical rotation of the gelatinates of the alkali metals increases slightly with at no to a max. rotation with K, after which the rotation slightly decreases. IV. Rotatory dispersion of gelatin in sodium iodide solutions. *Ibid.* 2342-6.—The rotatory dispersion of gelatin is reported in various concns. of NaI at 0.5° and 40° at 5 different wave lengths in the visible spectrum. A single Drude equation expresses the expit. results, an absorption band at 2200 Å. governs the dispersion; the data show that gelatin has a high absorption in this region. The rotatory dispersion constants at 40° follow the linear equation $k_{40} = 44.5170 - 6.220C_{NaI}$, at 0.5° the constants are expressed by the sum of 2 equations $C_{NaI} = (1/2.66) \log [a/(1-a)] - \log (1/K)$ and the linear equation $K_{40} = 46.3300 - 6.7605C_{NaI}$. The linear effect of salt concn. on the dispersion const. is probably due to a shift in the assocn. of the solvent (hydrol.-polyhydrol. equl.) or an assocn. between solvent and salt, the much greater effect of added salt at 0.5° is due to a dissocn. or assocn. of the gelatin mol. Based on the formulation of Lucas, it is shown that 2 and only 2 optically active species exist in gelatin solns or gels.

C. J. West
Redetermination of the solubility of chloropentammine cobalt chloride. F. J. Garrick. *Nature* 136, 1027-8 (1935).—The soly. in H₂O of this compd. purified by an improved method is 0.0211 and 0.00925 moles/l. at 25° and 0.20°, resp. This agrees with the results of Brønsted and Peterson, cf. C. A. 16, 670. Methods of pptg. the sample had no effect on the soly.

R. L. DeRicht
Solubility of barium iodate in salt solutions. G. Macdougall and C. W. Davies. *J. Chem. Soc.* 1935, 1416-19.—The soly. of Ba iodate monohydrate in aq. solns of KCl, KNO₃, KClO₄, CaCl₂ and KClO₄ at 25° is reported. Corrections for ionic assocn. remove the specific deviations found in dil. soln. and the results are in accord with the Debye-Hückel limiting formula. The dissocn. const. of the BaIO₃⁺ ion is 0.08 and that of BaClO₄⁺ is approx. 0.2. William E. Vaughan

Some physicochemical properties of mercurous perchlorate solutions. Edgar Newbery. *Trans. Electrochem. Soc.* 69, 17 pp. (preprint) (1936).—The system Hg₂(ClO₄)₂·H₂O was investigated and a soly. curve constructed. A simple quickly adjusted thermoregulator is found especially suitable for soly.-curve work. Small quantities of deliquescent crystals are rapidly dried in a tube centrifuge. Two hydrates, one with 4 H₂O (orthorhombic) and one with 2 H₂O (monoclinic) were recognized, the transition point being 36°. From strongly acid solns, the dihydrate is deposited at temp. considerably below the normal transition point. The presence of free acid lowers the soly. of the salt in such a manner that the total concn. of the common ion remains const., while the ionic product varies greatly. Hydrolysis occurs in 3 stages, at first Hg₂O Hg₂(ClO₄)₂ is formed and this, on treatment with more water, is first hydrated to Hg₂OH·ClO₄ and then hydrolyzed further to Hg₂O. The first of these compds. is dissolved by a warm soln. of the normal salt, from which, on cooling, it is slowly deposited in the form of lenses, which very slowly change to tetragonal crystals. The second compd. crystallizes in the hexagonal system and is decomposed by water with formation of a soln. of the normal salt and a ppt. of Hg₂O. The salt is hydrolyzed 2.5% in 0.1 M soln. In more concd. solns, the degree of hydrolysis is greater than would be expected, because of the formation of anhyd. basic salt, which is a weaker base than the hydrated form. The degree of dissocn. of the salt in dil. soln. appears to decrease with diln., either because of the formation of a soln. of unionized basic salt or the assocn. of single univalent to double bivalent ions. In highly concd. solns, abnormally high dissocn. is indicated both by cond. and by potentiometric methods. In such solns, the double mercurous ion is torn apart into single univalent ions by the powerful interionic forces present.

C. G. F.
Diffraction of x-rays in some solutions. J. A. Prins and R. Fonteyne. *Physica* 2, 1016-28 (1935); cf. C. A. 29,

7182², 7761¹.—Previous work of the authors is confirmed and extended. In addn. to the cases already reported of $\text{Th}(\text{NO}_3)_3$ and $\text{UO}_2(\text{NO}_3)_2$ it appears that a "superarrangement" of the cations at least is present with ThCl_3 , UO_2Cl_3 , $\text{La}(\text{NO}_3)_3$, $\text{Ce}(\text{NO}_3)_3$, $\text{Zn}(\text{NO}_3)_2$, $\text{Ni}(\text{NO}_3)_2$, ZnCl_2 , ZnI_2 , NiCl_2 . Moreover the multivalent anions of Na_2WO_4 , Na_2MoO_4 , $\text{H}_2\text{P}_2\text{O}_7$, HIO_4 , HClO_4 and H_2SO_4 seem to show a superarrangement. With univalent cations or anions no superarrangement could be found. A rule summarizing the results is given. On the other hand, HIO_4 was found to belong to the class with "gaseous distribution." This was also the case with CdI_2 in water and LiOH and with CdCl_2 , $\text{Hg}(\text{NO}_3)_2$, $\text{Na}_2(\text{PW}_{12}\text{O}_{40})$, $\text{Ce}_2(\text{SO}_4)_3$ and $\text{Zr}(\text{NO}_3)_4$ in water. In these cases the diffraction pattern gives information on the inner structure of the mols.

Harold Gershonowitz

Cryoscopic study of trichloroacetic acid and its hydrate in benzene and in dioxan solution R. P. Bell and M. H. M. Arnold. *J. Chem. Soc.* 1935, 1432-5.—Phase-rule studies show that the solid phase in these cryoscopic measurements on $\text{C}_2\text{H}_3\text{Cl}_3$ solns of trichloroacetic acid and its hydrate contains a little of the acid (probably in an absorbed state), the quantity is insufficient to interfere with a simple interpretation of the results. The dry acid in $\text{C}_2\text{H}_3\text{Cl}_3$ solns exists principally as double mols. over the concn range studied ($m = 0.01-1.6$). In dil. soln the hydrate exists as single mols. or forms double mols. at the higher concns. Several structures of the single and double hydrate mols. are proposed. In dioxan solns trichloroacetic acid is present as single mols., probably because of assocn. with the solvent. William F. Vaughan.

Mixed melting points in eutropic series H. D. K. Drew and J. K. Landquist. *J. Chem. Soc.* 1935, 1480-2.—Mixed m. p. of the tetraphenyl derivs of C, Si, Ge, Sn and Pb were detd., but no generalizations can be made. The data are tabulated. Mixed m. p. of the triphenyl derivs. in the series N, P, As, Sb and Bi show large depressions. The data are discussed. W. C. Vaughan.

Surface tensions of ternary solutions III. J. W. Belton. *Trans. Faraday Soc.* 31, 1648-52 (1935), cf. C. A. 30, 669².—Surface tension of solns. of sucrose and NaCl , dil. HCl and NaCl , and dil. HCl and KCl were measured by the bubble pressure method and the surface adsorption of H_2O calcd. In the sucrose NaCl soln. the adsorptions are much less than the sum each solute would produce separately. An amt. of acid that has slight effect upon the surface tension of H_2O produces a strong effect on the adsorption of H_2O on a salt soln. C. E. P. J.

Surface tensions of binary liquid mixtures containing benzene J. W. Belton. *Trans. Faraday Soc.* 31, 1642-8 (1935).—Surface tensions of mixts. of C_6H_6 with AcOH , CS_2 and CCl_4 were measured by the bubble-pressure method and surface adsorptions calcd. by the Gibbs equation. Measurements with AcOH were made at 20° and 35°, with CS_2 at 20° and 30° and with CCl_4 at 50°. The form of the adsorption compn. curves and the application of the gas laws is discussed. C. E. P. Jeffreys.

The surface tension of simple mixtures V. K. Semenchko, A. F. Gracheva and E. A. Davudovskaya. *Sotzialist. Rekonstruktsiya v Nauka* 1935, No. 5, 159-60.—In triple mixts. the surface tension within the limits of 0° and 80° does not depend upon the concn. of any one of the components; therefore it cannot serve as an indication of the presence of certain substances in the mixt.

B. V. Shvartzberg

The surface activity of ions II. Per Ekwall. *Acta Acad. Aboensis, Math. Phys.* 8, No. 2, 13 pp. (1933), cf. C. A. 28, 6048².—Alkyl-substituted NH_4 picrates gave sigmoid surface tension-concn. curves, the curves being initially concave to the concn. axis, then passing through an inflection point and becoming convex to that axis. The lower the mol. wt. the less marked the sigmoid form. This is taken to indicate an attractive force between ions or mols. in the surface. Data obtained with diethyl- and dipropylammonium picrate at high concns. agreed fairly well with values calcd. by Szyskowski's equation (cf. C. A. 3, 133) but were appreciably lower than these values at low concns. The equation $FA = RT$ (where F is the surface

tension lowering, A the surface area contg. 1 mol. of solute, R a const. and T the temp.), which should be valid if the solute in the surface behaves as a 2-dimensional gas (cf. Langmuir, C. A. 11, 2840), was tested by calcg. the value of $(FA)/(RT)$ for diethyl, mono-, di-, tri- and tetrapropyl NH_4 picrates. For the last salt the value remained unity for the whole range of concn. studied (up to a surface tension lowering of 3.5 dynes/cm.). For the other salts the value at first decreased, went through a min. and then increased rather steadily, the slope being greater the greater the mol. wt. of the salt. Thus strong attractive forces between the mols. were again indicated. This min. was lower the greater the no. of substituted alkyl groups or the longer the hydrocarbon chains. Comparison is made with similar calcns. by Schofield and Rideal (cf. C. A. 19, 3397, 20, 2005) whose work is briefly reviewed. Calcd. from data for the diethyl- and dipropyl-substituted salts, the coeff. of Traube's rule was smaller than the usually accepted value. M. G. Moore.

Interfacial tension of sugar solutions at various liquid surfaces of separation N. S. Stroganov. *Protoplasma* 24, 431-52 (1935).—An investigation of interfacial tension of glucose, galactose, maltose, sucrose and lactose by contact with phases immiscible with H_2O : benzene, toluene, petr. ether, paraffin oil, castor oil and olive oil. The degree of lowering of the interfacial tension varies for the different types of sugars at various liquid surfaces of sepn. It depends on the nature of the phases and on the nature of the active substance dissolved in the H_2O . According to the degree of lowering, the sugars for interfacial tension with respect to benzene, toluene, petr. ether and paraffin oil may be placed in the following series: glucose < galactose < maltose < sucrose < lactose. At the surfaces of sepn. with respect to castor oil and olive oil, this series does not hold. Seventy-one references.

F. L. Dunlap

Optical rotatory power of solutions in an electric field J. Kunz and Andrew McLean. *Nature* 136, 705-6 (1935).—When an elec. field is impressed across a benzene soln. of the polar optically active compd. 2-menthyl hydrogen 3-nitrophthalate, the rotation changes instantly by as much as 0.59° but resumes its normal value on removal of the field. The change reaches its max. at a field strength of 4000 units abs. and remains const. for greater fields. Unexpected results were obtained with the inactive 2-ethyl hydrogen 3-nitrophthalate under the same conditions. C. D. West.

The mobility of hydrogen and hydroxyl ions in aqueous solutions G. Wanner. *Ann. Physik* 24, 645-68 (1935).—The high mobility and small temp. dependence are attributed to a proton exchanged by the hydrated H and OH ions with a H_2O mol. The result is the same as that of actual movement. Models and their quantum mechanics are discussed and the results compared with the Debye-Hückel theory. The explanation of the temp. coeff. is not completely satisfactory. R. E. DeRight.

The sourness of acids R. M. Beatty and L. H. Cragg. *J. Am. Chem. Soc.* 57, 2347-51 (1935).—Sourness is expressed as the normality of an equally sour HCl soln. Equally sour solns. of acetic, malic, tartaric and chloroacetic acids required equal amts. of a phosphate buffer to bring the p_n to 4.4. This amt. of buffer brought carbonic acid to 5.3, possibly because of an error in tasting. This relation holds for buffers of p_n 6.9-7.4 and concns. of anhyd. Na phosphates from 0.04 to 0.35%. The sourness of acids too concd. or too dil. to taste can be detd. by the formula $S = X/K$, $X = \text{no. of buffer needed to adjust the } p_n \text{ of 1 cc. to a } p_n \text{ of 4.4}$ and $K = \text{characteristic const. for the buffer}$. R. L. DeRight.

Equilibrium in solutions of tertiary electrolytes K. Jablczynski and R. Legat. *Roczniki Chem.* 15, 351-8 (in German 353-9) (1935).—The equil. const. of dissoen. of BaCl_2 was detd. from cryoscopic and elec. cond. data; it is 0.0875. M. Wojciechowski.

The fourth ionization constant of ferrocyanic acid I. M. Kolthoff and Wm. J. Tomiscek. *J. Phys. Chem.* 39, 955-8 (1935).—The fourth ionization const. of $\text{H}_4\text{Fe}(\text{CN})_6$ is 5.6×10^{-11} at 25°. A. E. Beitch

The peculiar behavior of aqueous carbonic acid solutions Yrjö Kauko *Suomen Kemistilehti* 8B, 39-41 (1935)(in German)—The results and errors in the measurements of the first dissociation constant of carbonic acid by various researchers are discussed. The second dissociation constant was determined at 25° and found to have the value $5.3 \pm 0.3 \times 10^{-11}$ MacInnes and Belcher (cf. C. A. 29, 7760) found 5.61×10^{-11} E. E. Jukkola

The Wien effect for electrolytes investigated with the cathode ray oscillograph Wilhelm Huter *Ann Physik* 24, 253-72 (1935), cf. C. A. 28, 2975—The current-p d relation at high field strengths was studied for solutions of NaCl, CuSO₄, Ba₂[Fe(CN)₆], BaFe(CN)₆, HCl, H₂SO₄, KOH, NH₄OH and acetic, propionic, tartaric and citric acids. The results agree with those obtained previously by another method E. J. Rosenbaum

On the paper "The electrolysis of copper in potassium chloride" S. A. Artzibushev *Compt rend acad sci U R S S [N S]*, 3, 157-60 (1935)(in German), cf. C. A. 29, 2052—Some errors in the former paper are corrected. The mobility of the Cu ion is 2.425×10^{-11} m²/V sec (T = abs temp). An explanation of the diffusion of Cu into KCl based on a comparison of the ionic radii of the two ions is unsatisfactory A. B. F. Duncan

The stepwise titration of a dibasic acid S. Kilpi *Z physik Chem* A174, 441-4 (1935)—Conditions were derived for the stepwise titration of moderately strong and weak dibasic acids. The potential difference at the 1st stoichiometric equivalence point has a maximum when $K_1/K_2 > 13.93$ and a minimum at $K_1/K_2 < 13.93$, whence it can be assumed that $K_1 > K_2$. This indicates a change in the buffer action of the equimolar mixture of an acid and base from a minimum to a maximum at $K_{HA} K_{BOH} = 13.93 K_w$ or at $K_{HA} K_{BOH} = K_w/13.93$. The H ion concentration at maximum or minimum p d in the case of moderately strong or weak acids, like the H ion concentration at the first equivalence point, is independent of the value K_1/K_2 . With high values for K_1/K_2 the H-ion concentration at maximum p d, as well as the H-ion concentration at the 1st equivalence point, is independent of the strength of the acid R. H. Baechler

The potentials of cells in liquid-ammonia solutions The thermodynamic constants of the ammonium cadmium chlorides and of cadmium chloride Clifford S. Garner, Emerson W. Green and Don M. Yost *J Am Chem Soc* 57, 2055-8 (1935)—The e.m.f. of the cell Zn amalgam, ZnCl₂·6NH₃ (solid), NH₄Cl (solid in liquid NH₃), CdCl₂·6NH₃ (solid), Cd amalgam was measured at 25° at several concentrations of NH₄Cl and of the amalgams. Calculated to pure Zn and Cd, $E^\circ = 0.3605$ v. From the measured potential and its temperature coefficient, together with results of other investigators, ΔF° , ΔH° and ΔS° were calculated and tabulated for the solid ammonium cadmium chlorides and CdCl₂. Provisional values for the activity coefficients of NH₄Cl in liquid NH₃ at 25° are calculated and in combination with the free energy data yield the standard half-cell potentials, referred to H₂ in liquid NH₃, $Ti/TiCl_4 - 0.10$ v., $Zn/ZnCl_2 \cdot 6NH_3 + 0.7293$ v., $Cd/CdCl_2 \cdot 6NH_3 + 0.3688$ v. L. W. Elder

Application of the glass electrode to unbuffered systems Samuel B. Ellis and Samuel J. Kiehl *J Am Chem Soc* 57, 2139-44 (1935)—Coming off glass is too soft for glass electrode p_H measurement in distilled water. Ordinary soft glass can be used in a flow method which flushes out soil impurities. Streaming potentials are avoided by proper placing of the liquid junction. Measurements of potential vs. rate of flow for pure water and dilute solutions of Na₂HPO₄ and of KCl show that rates above 25 cc/min are necessary for unbuffered and weakly buffered systems L. W. Elder

The purification of water and its p_H value Samuel B. Ellis and Samuel J. Kiehl *J Am Chem Soc* 57, 2145-9 (1935)—A still embodying the principles of Bourdillon (C. A. 8, 1889; 22, 7) and Wieland (C. A. 12, 560) removes CO₂ but not all NH₃. Addition of alkali KMnO₄ or Nessler reagent to the stock distilled water used as feed did not remove NH₃ from the first portions of distillate. Intermediate fractions distilled from Nessler reagent were acid. H₂PO₄ in the feed water yielded distillates of constant

p_H. Measured by the authors' method (preceding abstract) the p_H was 7.01 ± 0.01 at 27.5° for samples collected in Ag vessels. L. W. Elder

Note on the paper on the antimony electrode for p_H measurements by P. Wulff, W. Kordatzki and W. Ehrenberg *Arvid Holmqvist Z Elektrochem* 41, 807 (1935), cf. C. A. 29, 7762—Priority is claimed for some of the observations given. Reply. P. Wulff and W. Kordatzki *Ibid* C. E. P. Jeffreys

Junction potentials between solutions of sugars and potassium chloride John M. Ort and Martin H. Roepke *J Phys Chem* 39, 941-3 (1935)—For most potential measurements made on glucose solutions, the salt junction potential may be ignored when saturated KCl salt bridges are used and the p_H of the glucose solution does not greatly exceed 10 and the sugar solution has not been heated or treated in any way that produces a large amount of ionized decomposition products A. E. Bettlich

Oxidation-reduction potential of reductone Rene Wurmser and Nélucia Mayer *Compt rend* 201, 1366-8 (1935); cf. C. A. 29, 1109—By means of solutions of reductone, CH(OH)C(OH)CHO, containing a leuco dye (e.g., leuco alizarin blue) suitably buffered, the oxidation-reduction potential was plotted against p_H for p_H 2-8, whence if the dissociation constants of reduced and oxidized reductone are taken as 10^{-10} and 10^{-11} , respectively, which gives a curve agreeing well with experiment up to p_H 6, the normal potential at p_H 0° and 38° is 0.283 v. Reductone reduced in this way is regenerated unchanged by I C. A. Silberrad

Thermal reaction between gaseous iodine monochloride and hydrogen W. D. Bonner, W. L. Gore and Don M. Yost *J Am Chem Soc* 57, 2723-4 (1935)—For the reaction of ICl and H₂ in the gaseous state values of k are 205° , 0.031 ± 0.006 , 230° , 0.17 ± 0.06 , 240° , 0.35 ± 0.06 . The tentative mechanism suggested is $H_2 + ICl = HI + HCl$ (slow); $HI + ICl = HCl + I_2$ (rapid). When the average values of the specific reaction rate constants are plotted against $1/T$ a straight line results. The energy of activation for the assumed slow reaction is 33,900 cal C. J. West

Equilibrium studies on the exchange reaction between acetylene and heavy water L. H. Reyerson and Bruce Gillespie *J Am Chem Soc* 57, 2250-1 (1935); cf. C. A. 28, 4373—An isotopic exchange occurs between C₂H₂ (I) and alk. solns. of D₂O (II). The reaction takes place because of the ionization of I, but the details of the change in d of II makes it possible to calculate K_2 . The equilibrium between I and aq. solns. contains 9.77 and 18.97% of II was studied at 0°, 25° and 100°. Average values of K_2 for the reaction $I + II \rightleftharpoons C_2D_2 + H_2O$ were found to be 0.365, 0.45 and 0.51 at 0°, 25° and 100°, respectively. In contradistinction to the findings of Bell (C. A. 29, 3506) positive proof of the existence of C₂D₂ in the equilibrium mixture was obtained by mass-spectroscopic investigation and the amount found compared favorably with that determined from the equilibrium study. A Raman spectrum determined of a sample of gas taken from the equilibrium reaction showed lines for the C₂D₂ molecule. It is felt that these equilibrium studies represent real equilibrium values within the limit of error of the experimental technique employed C. R. Addinall

A reaction of atomic iodine with quartz glass Gerhard Brauer *Z physik Chem* A174, 435-40 (1935)—Thermally dissociated I vapor on coming into contact with quartz glass produces a brownish coating which can be identified as SiI₄. If the O₂ is not conducted away, the coating consists of SiO₂. Optically dissociated I produces the same effect R. H. Baechler

The velocity of alkaline saponification of several crotonic esters E. Schjånberg *Z physik Chem* A174, 465-71 (1935)—The velocities of alkali saponification of several crotonic and butyric esters and its dependence upon temperature were determined. Esters of α, β -unsaturated acids saponify more slowly than their saturated analogs. There is a difference in the saponification velocities of primary and secondary alcohols. The activation energy and action constants were determined from the temperature coefficients. Secondary alcohols have smaller velocity constants because of their smaller action constants

Crotonic esters have smaller velocity constants than butyric esters because of their higher energy of activation.

R. H. Baechler

The velocity of thermal decomposition of ammonia on a quartz surface. J. A. Christiansen and Eggert Knuth. *Kgl. Danske Vidensk. Selskab Math.-fys. Medd.* 13, No. 12, 20 pp (1935) (English).—The authors detd the velocity of decompn of NH_3 in a quartz bulb of 200 cc vol and 210 sq cm surface heated in a manually regulated elec. furnace at temps of 106.2–1132°K with final pressures of 36.50–59.42 mm. The pressure changes were read on a Hg manometer to within 0.01 mm. They suggest the mechanism $\text{wall} + \text{NH}_3 \rightleftharpoons \text{NH} + \text{H}_2 + \text{wall}$, $\text{NH}^* \rightleftharpoons \text{NH}$, $\text{NH}^* + \text{NH}_3 \rightleftharpoons \text{N}_2 + 2\text{H}_2$, NH and NH^* are 2 different forms of the radical. The presence of NH , although in very small amts, was established by its conversion into NH_4OH and detection of the latter by the method of Blom (cf. C. A. 20, 1368). Numerical data and curves are given.

E. R. Schierz

The kinetics of the autoxidation of catechol in the presence of several foreign substances. G. E. K. Branch and M. A. Joslyn. *J. Am. Chem. Soc.* 57, 2388–94 (1935).—The oxidation is definitely a chain reaction because small amts of cysteine, K_2SO_4 and *o*-aminophenol inhibit during the initial period while hydroquinone, resorcinol, pyrogallol, gallic acid and *p*-aminophenol accelerate the reaction after an induction period. Large concns. of hydroquinone or pyrogallol increase the rate because of a process of chain exchange and there is no induction period. Initial rates in the presence of resorcinol are decreased but later become greater than those of catechol alone on account of the formation of a rapidly oxidized intermediate that acts as an accelerator.

R. E. DeRicht

Kinetics of the permanganate-oxalate reaction. I. Effect of various salts on the rate of reaction. R. W. Fessenden and Bryan C. Redmon. *J. Am. Chem. Soc.* 57, 2246–9 (1935).—This reaction was studied in the presence of small oxalate concns. and no manganous ion. A neg. kinetic salt effect was found with the sulfates of Na, K and Mg, while a pos. effect was found with Al, Zn and Cd sulfates. The cations of the salts that showed a pos. effect are known to form oxalate complexes. The rate varies inversely as the oxalate concn. A mechanism is proposed.

E. J. Rosenbaum

Allotropy of very pure calcium. Alfred Schulze. *Physik. Z.* 36, 595–8 (1935).—The changes from α to β and β to γ phases are shown very precisely with Ca 99.9% pure. The changes were followed by measuring 1 ps, elec. cond. of pure Ca wires and by dilatometric methods.

A. B. F. Duncan

Allotropy of calcium. M. C. Neuburger. *Z. Elektrochem.* 41, 790 (1935).—Analysis of published data show that Ca exhibits 3 and not 4 allotropes. Below 300° a cubic, face-centered (A_1 -type) is stable, at 300–450°, type 2 and above 450° a hexagonal (type 3) are the stable forms. The other form reported to exist above 450° was due to measurements on Ca contg. 4–5% N_2 . Ca, 99.9% pure, exists only in the hexagonal lattice form.

C. E. P. Jeffreys

Isotherms of methane between 0° and 150° and densities 19 and 53 Amagat (pressures between 20 and 80 atmospheres). A. Michels and G. W. Nederbragt. *Physica* 2, 1000–2 (1935).

Harold Gershinowitz

The phase diagram of low-melting mixtures. II. The melting diagram of oxygen-nitrogen and the phase diagram of nitrogen-carbon monoxide. M. Rubeman, A. Likhter and P. Komarov. *Physik. Z. Sowjetunion* 8, 326–36 (1935); cf. C. A. 29, 321.—Measurements of sp. heat show that CO-N mixts. form 2 complete series of mixed crystals. The system O-N has a eutectic at 50.1°K. and 23% by vol. of N. The O lattice dissolves 16% N and the N lattice 7% O. The heats of fusion of the N-O mixt. show a min. near the concn. of the satd. N crystal.

Morris Muskat

Layer formation in a two liquid system. R. V. Mertzlin and V. I. Ust-Kachintzev. *J. Gen. Chem. (U. S. S. R.)* 5, 771–8 (1935).—From a study of the isotherms of the

systems $\text{Et}_3\text{N}-\text{H}_2\text{O}-\text{KCl}$ at 0°, 10° and 15°, $\text{C}_4\text{H}_9\text{N}-\text{H}_2\text{O}-\text{KCl}$ at 0°, 20°, 50° and 80° and $\text{C}_6\text{H}_{11}\text{N}-\text{H}_2\text{O}-\text{KCl}$ at 20°, 40°, 60° and 80° it is concluded that the binary systems $\text{Et}_3\text{N}-\text{H}_2\text{O}$, $\text{C}_4\text{H}_9\text{N}-\text{H}_2\text{O}$ and $\text{C}_6\text{H}_{11}\text{N}-\text{H}_2\text{O}$ should have at low temps a min. crit. temp. of layer sepn. S. L. M.

Equilibrium diagrams of the system magnesium-lithium. P. Sal'dau and F. Shamrai. *Z. anorg. allgem. Chem.* 224, 388–98 (1935).—Mg forms 3 solid phases with Li, not 2 as has been previously claimed. The limits of the α -phase proceed from 10 atoms % Li at 15° to 12.5 atoms % Li at 465° and 19 atoms % Li at 500° until they cut the eutectic line at 588.2° at the point which corresponds approx. to 21% Li. Mg forms a fixed compd. with Li, Li_2Mg , which melts without decompn. and forms on crystn. of solid solns (β -phase) with both its components in the region 29–95 atoms % Li. The γ -phase which forms a solid soln of Mg in Li occurs between 98 and 100% Li.

Intermetallic compounds. Introduction. W. Klemm. *Angew. Chem.* 48, 713 (1935). Recent methods and results on the detection of intermetallic compounds. G. Grube. *Ibid.* 714–19.—The following methods are discussed: x-ray investigation, dilatometric method (thermal expansion), detn. of elec. resistance, as a function of temp. and the detn. of magnetic properties as a function of the concn. and temp. Many graphs and diagrams are shown. Equil. diagrams are presented for the amalgams of Cs, Rb, K, Na and Li. Compds. of Mg and Li with various other metals are discussed. Twelve references. The structures of intermetallic phases. Gunnar Hägg. *Ibid.* 720–3.—The literature findings are discussed and the properties of metallic phases are summarized. Energy and space problems in the formation of intermetallic compounds. Wilhelm Biltz. *Ibid.* 729–34, cf. C. A. 29, 3273.—The methods available for measuring affinity in alloys are discussed and a general summary of the most recent results is given. The space chemistry of intermetallic compds. is reviewed. Ten references. Magnetism and chemical bond in intermetallic phases. Eckhart Vogt. *Ibid.* 734–40.—An extensive discussion of magnetic phenomena in their relation to chem. bonds. Twenty-three references.

Karl Kammermeyer

System stannic chloride-hydrochloric acid. André Chrétien and Georges Varga. *Compt. rend.* 201, 1491–3 (1935).—The constitutional diagram shows, besides SnCl_4 and HCl , 2 compds: $\text{SnCl}_4 \cdot \text{HCl}$ (I) and $\text{SnCl}_4 \cdot 2\text{HCl}$ (II), melting congruently at -94.7° and -85.4° , resp. The eutectics are HCl and I, m. -121.4° , 6.8% SnCl_4 ; I and II, m. -96.2° , 30.0% SnCl_4 ; and II and SnCl_4 , m. -93° , 45.8% SnCl_4 .

C. A. Silberrad

System antimony iodide-sodium iodide-water. Félix François. *Compt. rend.* 201, 1489–91 (1935).—Solub. isotherms are traced for 15°, 35° and 60° for solns. of such compn. that SbI_3 is not hydrolyzed. Only 2 double salts, $\text{SbI}_3 \cdot 2\text{NaI} \cdot \text{H}_2\text{O}$ (I) and $\text{SbI}_3 \cdot \text{NaI} \cdot 6\text{H}_2\text{O}$ (II) were found, with no trace of $\text{SbI}_3 \cdot \text{NaI} \cdot \text{H}_2\text{O}$ or $2\text{SbI}_3 \cdot 3\text{NaI} \cdot 12\text{H}_2\text{O}$. By slow evapn. of suitable solns. I was obtained in orange prisms, II in long needles.

C. A. Silberrad

Binary addition compounds in ternary systems. IX. System phenacetin-sulfonal-resorcinol. Franciszek Adamus. *Roczniki Chem.* 15, 383–9 (in French 389–90) (1935); cf. C. A. 29, 6826.—By thermal analysis there were found a peritectic point 59.0° at 29% phenacetin, 37% sulfonal and 34% resorcinol, and a eutectic point 50.0° at 15.5% phenacetin, 43.5% sulfonal and 41% resorcinol.

M. Wojciechowski

Homogeneous catalysis—decomposition of acrolein catalyzed by iodine. H. W. Thompson and J. J. Frewing. *Trans. Faraday Soc.* 31, 1660–8 (1935); cf. C. A. 29, 1703.—The kinetics of the decompn. of acrolein catalyzed by I_2 are complicated and unsuitable for detailed analysis, but certain conclusions may be drawn. In the presence of I_2 vapor the temp. at which acrolein begins to decompose is more than 100° lower than in the absence of catalyst. There are indications that the decompn. is unimol. and yields more C_2H_4 than without I_2 . Acrolein appears to retard its decompn. presumably by some chain-breaking

process. The velocity is approx proportional to $[I_2]^{1/2}$. It is not possible to decide whether this implies catalysis by I atoms or molecules. The catalyzed reaction has an activation energy of about 32,000 cal. C. E. P. Jeffreys

Catalysis of oxidation at bounding surfaces D. B. Kroon *Acta Brevis Neerland Physiol. Pharmacol. Microbiol.* 5, 127-9 (1935), cf C A 29, 49031—A discussion

Catalytic oxidation of carbon Jesse E Day, Richard F Robey and Hypp J Dauben *J. Am. Chem. Soc.* 57, 2725-6 (1935)—The catalytic effect of NaCl on the oxidation of soot C, demonstrated by Taylor (C. A. 24, 4209), is exhibited by other salts (LiCl, NaCl, KCl, CaCl₂, SrCl₂, BaCl₂, Ca(OH)₂, Ba(OH)₂, Na₂SO₄ and K₂SO₄). Numerical values are given, at 575° the C burned off bare glass in about 180 sec, which was cut down to 20-30 sec by all the salts, at 515° the oxidation from the bare surface required 630 sec, this was cut down by Ba and Sr salts to 300, by Ca salts and NaCl to 230 and by KCl, LiCl, Na₂SO₄ and K₂SO₄ to about 170 sec. C. J. West

Application of Polanyi's potential theory to the van der Waals adsorption of gases on iron synthetic ammonia catalysts P. H. Emmett and Stephen Brunauer. *J. Am. Chem. Soc.* 57, 2732-3 (1935)—Potential-vol curves for the adsorption of N and O on a single promoted Fe synthetic-NH₃ catalyst are given, which seem to represent the isotherms very closely throughout the entire pressure range covered, including the region concave to the pressure axis where probably less than a mol. layer of gas exists, the linear portion that has been postulated to represent the building up of a second layer of gas on the catalyst surface and the higher-pressure portion, which is convex to the pressure axis and which, it is generally believed, represents the condensation of the gas to liquid in the capillaries of the adsorbent. The potential curves exhibit no variation with temp, the -183° and -195.8° points falling on the same curve. C. J. West

Effect of adsorbed water on the catalytic decomposition of hydrocarbons by a molecular beam method Otto Beecck. *Nature* 136, 1028-9 (1935)—Enough H₂O is necessary in a gas to maintain a unimol layer on the filament (Pt or C) if dehydrogenation is to take place. Excess H₂O inhibits at lower temps. Above 1550° all hydrocarbons except CH₄ decompose completely, indicating the formation of free radicals, by the rupture of a C-C, which are adsorbed on the walls. H₂O can be substituted by mols contg H and an electroneg element. H₂O is also necessary for hydrogenation. R. E. DeR.

Catalysis by fusions. I. E. Adadurov and F. D. Didenko. *J. Am. Chem. Soc.* 57, 2718-22 (1935)—Although orientation of a metal surface may be retained at the m. p., the decompn of CH₃OH on Zn surfaces is now found to be catalyzed by ZnO, hence the const. rise in activity from solid to liquid Zn found by Steacie and Ekin, C. A. 28, 9604, is not conclusive proof of the nonexistence of active centers. Further evidence is that the catalytic oxidation of NH₃ by Sn is due to the oxide; hence the rate increases upon fusion but the activity of Ag falls off abruptly at the m. p. and the nature of the reaction changes because the oxide is not formed. Mechanisms are cited for the formation of ZnO and expts show Zn chips to be coated with oxide. R. E. DeR.

A promoter effect of gases upon catalysts of hydrolysis

K. Ablezova and S. Rogunskii. *Z. physik. Chem.* A174, 449-64 (1935).—The promoter effect of H upon Ni was studied. A well-defined max in the curve $k = f(p/m)$, which represents the catalytic activity as a function of the gas content of the layer formed by condensation, was demonstrated, the optimum corresponds to 1 H₂ mol. to 100 Ni atoms. The curve explains a series of contradictions obtained in a study of the effect of the gas upon catalytic activity. R. H. Baechler

Heat capacity, entropy, and free energy of rubber hydrocarbon Norman Bekkedahl and Harry Matheson. *J. Research Natl Bur Standards* 15, 503-15 (1935) (Research Paper No. 844)—Values are given for the heat capacities at const. pressure (C_p) of the rubber hydrocarbon in its different forms from 14 to 320°K. The C_p value for both the metastable amorphous and crystalline forms at 14°K. is 0.064 joules/g./degree. With increase in temp the C_p increases gradually up to a transition at about 199°K., the amorphous form having a little the greater value. At 199°K. both the forms undergo a transition of the second order, the C_p rising sharply. For the amorphous form above this transition the C_p rises gradually without discontinuity to the highest temp. of the measurements. The crystalline form undergoes fusion (a transition of the first order) at 284°K., the heat of fusion being 16.7 joules/g. At 298.1°K. (25°C.) the C_p of the rubber is 1.880 ± 0.002 joules/g./degree C., its entropy 1.881 ± 0.010 joules/g./degree C., and its standard free energy of formation from the elements 1.35 ± 0.10 kilojoules/g. N. Bekkedahl

Phase-boundary energies in phase systems of pure electrically neutral phases H. Hohn and E. Lange. *Physik. Z.* 36, 603-21 (1935).—A discussion of thermodynamic relations between surface energy, work of adhesion, surface tension, work of cohesion, surface cohesion, immersion energy and free energy, interfacial tension and similar quantities. A table of formulas with 23 references is included. A. E. F. Duncan

Temperatures and heat tones of genotypical transformations of the alkali salts of long-chain fatty acids. Peter A. Thiessen, Jürgen v. Kleck, Hilde Gockowiack and Joachim Stauff. *Z. physik. Chem.* A174, 335-58 (1935).—The temps at which the heat tone corresponding to the genotypical transformation sets in were detd. by a simple differential process. The temp.-dielec. const. curve shows a break at the transformation. The optical refraction in a crystal of Na stearate changes sharply at the start of genotypical transformation and at 49° a monotropic transformation is indicated. The heat of transformation increases with length of the chain and depends upon the nature of the cation. A relation exists between the heat tone and the radius of the cation. The sp. heat-temp curve shows a break at the genotypical point, in agreement with the prevailing idea of the structure of long-chain fatty acids. App and technic are described. R. H. Baechler

X-ray structure and elec. resistance of Pd-Ag-H alloys (Rosenhall) 9. Chem. action caused by neutrons and γ -rays and the effects of these agents on colloids (Hopwood, Phillips) 3. Detn. of ionization by ultraviolet spectrophotometry, its application to the measurement of strength of weak bases (Flexser, et al) 3.

3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

The neutrino theory of light O. Scherzer. *Z. Physik* 97, 725-39 (1935)—A quant. application of the neutrino theory is made which gives the main optical phenomena correctly but does not avoid the problem of infinite proper energy of the electron. B. Swirles

Ionic generator for high potentials Marcel Pauthemer and Marguerite Moreau-Hanot. *Compt. rend.* 201, 1332-4 (1935); cf C. A. 26, 1184, 29, 684—A dust-laden gas is aspirated round a circuit passing first through an

ionizing tube in which the axial wire is maintained at a potential of ≈ 10 -15 kv., then through a U-tube of conducting material enclosed in the sphere to be charged (30 cm diam.), the middle portion of the U-tube being flattened so as to ensure contact therewith of the charged particles. A charge of 450 kv. was thus readily obtained on the sphere. Calcn. shows that there should be little difficulty in attaining much higher potentials. C. A. Silberrad

Thermal diffusion of color centers. O. Stasiv. *Physik.*

Z. 36, 737-40(1935); cf. C. A. 29, 3236⁶.—Thermal diffusion consts. of color centers in KCl were measured and found to lie between 0.057 and 0.4×10^{-10} sq. m./sec. at a temp. of 490-755°. The consts. were compared with older measurements of velocity of migration of pos. ions in an elec. field. Above 700° the electrons move at about the same rate as pos. ions. Below 700° there is some slowing down of the electrons by the pos. ions.

C. L. P. Jeffreys
The theory of electron motion in nonmetallic crystal lattices. I. Hund. *Physik Z.* 36, 725-9(1935).

C. E. P. Jeffreys
Electronic conduction in alkali halide crystals. R. W. Pohl. *Physik Z.* 36, 732-5(1935); cf. C. A. 29, 7801¹.—Color centers in alkali halide crystals permit optical measurements of electron velocity and the detn. of the no. of migrating electrons. The crystals with U-centers are semiconductors and may be studied as photoelec. conductors.

C. L. P. Jeffreys
Disarrangement phenomena in ionic lattices as basis for ionic and electronic conduction. Carl Wagner. *Physik Z.* 36, 721-5(1935).—Examples of 3 types of disarrangement in ionic lattices: in-between-lattice type, vacant-space type and substitution type, are discussed in relation to ionic and electronic conduction. Three types of oxides whose conductances vary with O₂ pressure are discussed from the point of view of disarrangement of electron distribution.

C. L. P. Jeffreys
The problem of ionic and electronic conduction in non-metallic solid substances. B. Gudden and W. Schottky. *Physik Z.* 36, 717-21(1935).—A general discussion.

C. E. P. Jeffreys
Glow electron emission and electronic conduction of solid substances. A. Gührts. *Physik Z.* 36, 704-7(1935).—Glow electron emission from cathodes covered with monatomic adsorption layers is a purely surface phenomenon, as in the case of homogeneous cathodes. The variance of the proportionality const. in the formula $I = ATe^{-T}$ from the theoretical value, 60.2 amp./cm.²/deg.³ is due to special properties of the adsorption layer and not to a relation between electronic conduction and glow emission.

C. E. P. Jeffreys
Concentration of sodium vapor in the electric arc. Thadée Peczalinski and Nicolas Szule. *Compt. rend.* 201, 1335-7(1935).—The spectrum of Na was observed by means of a current of 10-80 amp. passed between C electrodes embedded in NaCl. From the width of the lines D₁ and D₂ and the relation $D = 1.9 \times 10^{-7} \sqrt{n}$, where n is the concn. of the vapor (cf. Trumphy, C. A. 21, 1061) the concn. of Na atoms producing lines of emission (i. e., in the interior of the arc) is approx. 10 times that of atoms in the exterior portion, producing absorption, 7×10^{13} and 6×10^{14} , resp.

C. A. Sjöstrand
Negative glow discharge. Investigations of hindered discharges in hydrogen. W. Weizel and H. Fischer. *Ann. Physik* 24, 201-30(1935).—An auxiliary electrode was placed in the neg. glow of a H discharge tube and the currents resulting from various combinations of potentials were measured. The diffusion of the charge carriers was important. Rogowski's theory does not apply to these results.

E. J. Rosenbaum
The "counting" phenomenon as a space-charge problem. A. v. Hippel. *Z. Physik* 97, 455-81(1935); cf. C. A. 27, 2099¹.—The current-voltage characteristic for rarefied gases is considered and it is shown how a discharge becomes unstable because of a pos. space-charge and how stabilization occurs because of diminution in the no. of collisions. The region of validity of Paschen's law and an exact definition of sparking potential are given. The behavior of the characteristics for spark and steady discharge in a homogeneous field are given and a "counting region" and "counting conditions" are found. Further the pos. and neg. forms of discharge in an inhomogeneous field are explained, with applications to the actual form of the Geiger counter.

B. Swirles
Excitation function of mercury in atomic collisions. K. Gailer. *Ann. Physik* 24, 421-39(1935).—The excitation of Hg atoms by H atoms with energies in the range

2-40 e. kv. is at least 20 times as great as that by protons. The excitation function for the 2537 Å. line has a max. at 20 e. kv. In these collisions the Hg atoms only are excited. Excitation functions for H atoms and electrons are compared. In a collision, the effect of a fast particle does not depend on either its velocity or its kinetic energy alone but on the energy which can be transferred. This is a function of the excitation and ionization energies and of the masses of both collision partners. E. J. Rosenbaum

E. J. Rosenbaum
Energy losses of electrons in helium, neon and argon. R. Whiddington and F. G. Woodroffe. *Phil. Mag.* 20, 1109-20(1935), cf. C. A. 28, 4978⁸.—The accuracy of the method described previously has been increased. The electron energy used was around 100 e. v. The energy losses in He were 21.11, 23.06 and 23.70 e. v. with relative probabilities of 10, 2 and 1, resp. In Ne the prominent losses were 10.76, 18.62 and 10.08 e. v. with relative probabilities of 10, 4 and 8, resp., while in Ar the prominent losses were 11.77 and 14.23 e. v. Most of the energy losses could be correlated with particular excited states of these atoms. E. J. Rosenbaum

I. Rosenbaum
Collisions of slow electrons with methane molecules. Henry L. Brose and John E. Keaston. *Phil. Mag.* 20, 902-12(1935), cf. C. A. 24, 5218¹.—The min. effective collision cross section of CH₄ for slow electrons detd. by the Townsend method agrees with the value found by the Ramsauer method. The electron velocities for min. cross section are also in agreement. The similarities and differences of the interaction of CH₄ mols. and Ar atoms with electrons are discussed. The av. fraction of an electron's energy which is lost in a collision with a CH₄ mol. is several thousand times that for a similar collision with an Ar atom. The value of the electron energy for which the av. loss of energy is a max. corresponds to the wave length of the main infrared absorption bands of CH₄. I. Rosenbaum

I. Rosenbaum
Quantized velocity losses of slow electrons and effective cross sections in molecular gases. Helmut Löhrer. *Ann. Physik* 24, 319-60(1935).—The velocity losses of slow electrons in H₂, N₂, CO, NO, N₂O and CO₂ were studied by the Lenard method. Particular attention was paid to the smallest velocity at which inelastic collisions began. The smallest velocities are in v. H₂ 4.25, N₂ 2.45, CO 2.1, NO 3.65, N₂O 7.2 and CO₂ 7.1. The losses in v-osteric collisions are also discussed. The sepn. of the velocity-effective cross-section curve into parts due to elastic and inelastic impact and the relation of this curve to the velocity losses of electrons are discussed. E. J. Rosenbaum

E. J. Rosenbaum
Quantitative and qualitative observations on the electron diffraction pattern from the natural (111) face of diamond. R. Beeching. *Phil. Mag.* 20, 541-55(1935).—Intensity measurements were made on this pattern and details of the pattern are discussed. The inner potential detd. by the rotation and the Kikuchi line methods is 20.8 ± 0.7 v.

E. J. Rosenbaum
The oxygen afterglow. Eric M. Stoddard. *Proc. Roy. Soc. (London)* A153, 152-7(1935), cf. C. A. 29, 1323¹.—S. shows that the criticism of Rayleigh (C. A. 29, 5021¹) is not valid. The yellow O afterglow is obtained best with a min. amt. of H₂O vapor in the gas phase and a max. amt. adsorbed on the walls. A. B. T. Duncan

A. B. T. Duncan
Air afterglow. F. H. Newman. *Phil. Mag.* 20, 777-81(1935).—The air afterglow is very faint in a clean tube but increases in brightness after a discharge is passed. Its spectrum is continuous in the range 4200-6700 Å. with a no. of diffuse bands superimposed. It is quenched by the vapors of water, acetone and benzene. CS₂ forms a blue glow where it enters the airglow stream and S is deposited on the walls. The afterglow is attributed to an oxidation of NO by O₂, both of which are formed in the discharge. The O afterglow is similar. E. J. R.

E. J. R.
Paramagnetism. III. Light absorption in paramagnetic crystals and solutions. S. Datta and Manindramohan Deb. *Phil. Mag.* 20, 1121-30(1935); cf. C. A. 28, 5300¹.—The absorption spectra were studied for solns. of CrCl₃, CoCl₂ and NiCl₂ in H₂O, F₂OH and concd. HCl soln. at temps. in the range -115° to 60°. For all 3 solns. the absorption max. shifts from its position for aq. solns. to longer wave lengths if the dielec. const. is

less than that of H_2O or if an excess of HCl is present. The absorption max. of $EtOH$ and HCl solns. of $CoCl_2$ and $NiCl_2$ shift to shorter wave lengths as the temp. is lowered to -115° . At this temp. the values agree with those in aq. soln. Whenever the values from magnetic data are large the absorption max. is shifted to longer wave lengths and conversely. An explanation is discussed.

I. J. Rosenbaum

Adsorption of alkali metals on metal surfaces. VI. Selective photoelectric effect. J. H. de Boer and C. F. Veemans. *Physica* 2, 915-22 (1935), cf. *C. A.* 29, 7150*—The adsorbed atoms can give rise to a selective photoelectric effect for wave lengths relatively far in the ultraviolet. The spectral max. is situated at a wave length shorter than that of the ionization limit of the atom concerned. For large values of θ other atoms are adsorbed which are polarized in the opposite direction. This gives rise to a selective photoelectric effect with a spectral max. farther toward the long wave lengths. The results of I-IV are summarized.

Harold Gershonowitz

Neutrino theory of light III. R. de L. Kronig. *Physica* 2, 968-80 (1935), cf. *C. A.* 29, 7175* H. G. The cosmic radiation problem. P. M. S. Blackett. *Physik* Z. 36, 773-6 (1935).

Influence of the velocity of slow neutrons on their capture by certain nuclei. Peter Preiswerk and Hans von Halban, Jr. *Nature* 136, 1027 (1935).—The cross section for the capture of neutrons by Ag is inversely proportional to their velocity. An increased absorption by I was found for slow neutrons. The effect of temp. on velocity is discussed.

R. E. DeRight

Artificial radioactivity of scandium. G. Hevesy. *Kgl. Danske Vidensk. Selskab Math.-fys. Medd.* 13, No. 3, 17 pp. (1935) (English).—A sealed tube 5 cm. long and 3 mm. in diam. filled with a mixt. of Be powder and 200-300 millicurie Rn serving as the source of neutrons was placed in the center of a tube 12 mm. in diam. filled with Sc_2O_3 . The whole was imbedded in a block of paraffin 15 cm. on edge and left for a few days. A Geiger-Müller tube was used to measure the activity of the Sc_2O_3 after the removal of the neutron source. The Sc_2O_3 was dissolved in dil. HCl , 100-150 mg. NaCl and CaO added, then pptd. with NH_4 -free carbonate. The filtrate was treated with $H_2C_2O_4$; the ppt. of CaC_2O_4 was removed. The NaCl was recovered from the last filtrate. The CaC_2O_4 was inactive, the NaCl was very active owing to ${}^{11}K^+$ (half life time 16 hrs.) and the oxide owing to ${}^{48}Sc^+$ (half life time some years). ${}^{48}K^+$ emits β -rays having an Al. absorption coeff. 10 cm. $^{-1}$. Those of ${}^{48}Sc^+$ have a coeff. of 63 cm. $^{-1}$. It is probable that the formation of ${}^{48}K^+$ to which is due the natural radioactivity of K in geological times takes place in a way similar to that of ${}^{48}K^+$ in the lab.

Deuterium. I. D. MacGillivray. *Chem. Weekblad* 32, 490-3 (1935).—A review of the discovery of D and a description of a method of sepn. of D_2 and H_2 by diffusion. II. *Ibid.* 650-5.—A review of several phases of the D literature: concn. of D by fractionated freezing and crystn., phys. properties of H_2 , H_2O and the isotopic compds.

B. J. C. van der Hoeven

Isotopic constitution of iron. J. de Gier and P. Zeeman. *Proc. Acad. Sci. Amsterdam* 38, 959-61 (1935).—By use of a very pure sample of carbonyl with properly chosen canals the line of isotope 68 of Fe was identified. The abundance relative to 57 was obtained by varying the time of exposure. The relative abundance of the isotopes is: 54, 6.5%; 56, 90.2%; 57, 2.8%; 58, 0.5%.

C. E. P. Jeffreys

A simple apparatus for the demonstration of the diffusion of α -rays. R. Mercier and P. Scherrer. *Helv. Phys. Acta* 8, 589-90 (1935).—On a brass base sealed within a glass tube the Po source of the rays is fixed. The radiation is confined in direction by a narrow tube fixed at 45° to the center line of the base and enclosing tube. Over the end of the tube rests the foil which the rays are to penetrate. This whole assembly is fitted by a ground joint to a glass base having 2 arms at 45° to the center line above. One of these connects through a stopcock to the vacuum pump. The other contains the counter. By turning the ground joint the angle between the primary direction of the rays and the counter can be varied up to 90° .

Gregg M. Evans

Some properties of the radioactive series. E. Lopochnik. *Compt. rend.* 201, 1361-3 (1935).—On the basis of Perrin's models of at. nuclei extended to the heavier elements (cf. *C. A.* 26, 4238) certain regularities in the manner in which radioactive disintegrations occur in the elements subject thereto are traced.

C. A. Silberrad

Determination of small amounts of radium in rocks. J. A. Boettner. *Chem. Weekblad* 32, 482-6 (1935).—The Maché differential method (Hallebauer, *C. A.* 21, 3820) was used to det. small amts. of Ra, in it are used 2 ionization chambers (brass, 10×17 cm., cylindrical), one contg. the unknown emanation, and a Wolf double-wire electrometer. The emanation was obtained by bubbling dry air, free of activity, through the unknown soln., and drying the gas over soda-lime and Na. Details are given on standardization of the app., natural ionization,

etc. The accuracy is 10^{-14} g. Ra, giving 0.8% of the natural discharge rate. In Norwegian eschvite after proper chem. treatment a Ra content of $6.8\% \times 10^{-14}$ g. per g. was found.

B. J. C. van der Hoeven
Physical methods in the chemical laboratory XXVII
The application of x-ray methods to chemical problems
R. Brill and F. Halle *Angew. Chem.* 43, 785-95 (1934),
cf. C. A. 29, 6477.—A review Karl Kammermeyer

A back-reflection Laue method for determining crystal orientation. Alden B. Greminger *Z. Krist.* 91, 424-32 (1935) (in English). cf. C. A. 29, 1002.—In unsym. back-reflection Laue photographs (cf. C. A. 26, 5005) a quasi-sym. arrangement of spots is maintained to an extent which permits ready identification of important spots; this identification is accomplished from visual inspection coupled with the use of a "hyperbolic polar-coordinate plot." The plot is illustrated, and data for its drawing are given. The method is for cubic crystals, and can be extended to hexagonal, tetragonal and orthorhombic if the axial ratio is known. L. S. Ramsdell

New technique for obtaining x-ray powder patterns. R. A. Stephen and R. J. Barnes *Nature* 136, 793-4 (1935).—For obtaining powder lines that are sharp at large angles of diffraction from flat specimens such as are met with in metallurgy, the authors recommend that 2 apertures be used in front of the circular film and rotated with the specimen, to permit only such diffracted beams to reach the film as make small angles with the surface of the specimen. This arrangement is used to advantage with a wide beam of x-rays collimated by a multiple diaphragm system. C. D. West

Effect of the slit on distribution of intensities of lines in an x-ray powder diagram. Anatole Rogozinski *Compt. rend.* 201, 1354-6 (1935).—The error in the spacing, d , resulting from error in detg. the Bragg angle, θ , by reason of shifting of the max. of intensity in a line due to the breadth of the slit, $2e$, being finite is given by $\Delta d/d = 1/\cot\theta \cos 2\theta e/D$, where D is the distance of the substance under examn. (arranged in a band of width $2e$ and indefinite length) from the photographic plate, or d is known the same expression gives the value of $\Delta\lambda/\lambda$. The ratio of the intensity obtained by means of a slit as above to that with a circular aperture of radius e is $(4R/e)^{1/2}$, and the optimum length for the band of substance under examn. is $4\sqrt{Re}$, where $R = D \tan 2\theta$. C. A. Silberrad

Absorption of short-wave x-rays. W. V. Mayneord and J. E. Roberts *Nature* 136, 793 (1935).—A narrow band of x-rays of mean wave length 59 X U was isolated from a 250-kv source by a filter of Pb 3 mm., Sn 2 mm. and Al 3 mm. This was used to measure, for 18 elements between Li and Pb, the mass absorption coeffs. μ/ρ over a corresponding range 0.107-0.847. The mean absorption per electron for elements up to Ca is $\mu_e = 4.6 \times 10^{-28}$, in agreement with theory. The photoelectric absorption coeff. per electron $\mu_{pe} = \mu_e - 4.06 \times 10^{-28}$ is found to be proportional to the cube of the atomic no. For EtOH , $\mu/\rho = 0.142$, for H_2O 0.133, for 99% D O 0.118, in agreement with the expectation that μ/ρ for H should be about twice that for other light elements, notably D. C. D. West

Fine structure of the K edges of magnesium and aluminum. J. Veldkamp. *Physica* 2, 932-4 (1935).—It is shown that Sandstrom's explanation of the fine structure found at the K edges of Mg and Al (Dissertation, Uppsala 1935) cannot be correct. By comparing these fine structures with those of Ti and Ca it appears that they agree with Kromg's theory. H. G.

New data on K spectrum of copper. Yvette Cauchois. *Compt. rend.* 201, 1379-81 (1935), cf. C. A. 29, 41.—With the increased dispersion, (4.7 X U./mm.) available several lines are shown to be complex. C. A. S.

New data on K spectra of molybdenum and rhodium. Horia Hulubei. *Compt. rend.* 201, 1378-9 (1935); cf. C. A. 29, 41.—These spectra have been reexamined with H.'s app. and several lines, in particular β_2 and β_3 , have been resolved. C. A. Silberrad

Scattering of x-rays by silver. Alexander A. Rusterholz. *Helv. Phys. Acta* 6, 365 (1933); cf. C. A. 25, 1153.—Scattering of Cu K radiation by the (220) plane of Ag has been studied. The K electrons of Ag do not contribute to the scattering. B. C. A.

Contribution of x-ray analysis to the question of electron terms in ionic lattices. R. d. L. Kronig. *Physik Z.* 36, 729-32 (1935).—The factors governing the course of fine structure of ionic crystals are discussed. It is emphasized that a more accurate knowledge of the wave functions, and more expdt. work in the soft and ultra-soft x-ray region are necessary before electron energy levels in ionic crystals can be detd. C. E. P. Jeffreys

Atomic scattering factors of nickel, copper and zinc. G. W. Brindley and F. W. Spiers *Phil. Mag.* 20, 865-81 (1935).—The intensity of Cu K α x-radiation scattered by Ni, Cu and Zn powders was detd. by a photographic method. Relative scattering factors were converted to absolutes by a comparison with results on KCl powder. A correction was applied to get the scattering factors for the atoms at rest. E. J. Rosenbaum

X-ray examination of lattice distortion in copper and nickel powders. G. W. Brindley and F. W. Spiers *Phil. Mag.* 20, 882-93 (1935), cf. preceding abstr.—The at. scattering factors were detd. for Cu and Ni from measurements on both pptd. and filed powders. The values for the filed powders were lower than the others. Conclusion: Filing results in a random displacement of the atoms from their position in the undistorted lattice. The amt. of this displacement is 0.106 Å for Cu and 0.083 for Ni. Some preferential displacement affecting the (100) planes is indicated. E. J. Rosenbaum

X-ray investigation of lattice distortion in a copper-beryllium alloy. G. W. Brindley and F. W. Spiers. *Phil. Mag.* 20, 893-902 (1935), cf. preceding abstr. and C. A. 29, 5794.—The av. at. scattering factor was detd. for the filed powder of an α -phase Cu-Be alloy (0.72% Be). The exptl. values are less than those calcd. for an ideal lattice. The deviations are greater than those introduced by the filing process. It is suggested that the addnl. deviations are due to the presence of some atoms in the γ -phase. E. J. Rosenbaum

X-ray and magnetic measurements of potassium chloride powders in relation to lattice distortion and photochemical coloration. G. W. Brindley, F. W. Spiers and F. E. Hoare. *Phil. Mag.* 20, 1041-54 (1935), cf. preceding abstr.—X-ray measurements show that grinding a KCl powder produces very little, if any, lattice distortion. The fact that ground KCl powder is more rapidly colored by x-rays than a pptd. powder cannot be attributed to this effect. The diamagnetic mass susceptibility of ground KCl is approx. 1% less than that of the pptd. powder. This difference is attributed to the effect of grinding. E. J. Rosenbaum

Determination of the distribution of electron density and potential in a crystal lattice from x-ray data. V. E. Lashkarev. *Physik Z. Sowjetunion* 8, 227-39 (1935).—The use of the "equiv." atom, having spherical symmetry and an at. factor equal to the exptl. value, offers a new and simpler way of making the calcs. The equations are developed for cubic crystals. Calculation of potential distribution in certain crystal lattices. V. E. Lashkarev and A. S. Chaban. *Ibid.* 240-54.—The potential distribution is calcd. by the foregoing method and represented by topographic maps for the following cubic crystals: Li on (110) plane, Al on (100) and (111), NaCl on (100), diamond on (110). The potential at each point is detd. as the sum of potentials due to equiv. atoms situated at points of the actual lattice, the mean potential of the lattice being taken equal to zero. C. D. West

Spectrographic investigation of the thermoluminescence of feldspar. Satoyasu Imuro and Ei-ichi Iwase. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 147-51 (1935).—Irradiation with x-rays increased the intensity of the thermoluminescence without changing the wavelengths of the bands. Feldspar samples were irradiated, heated to 400° and the thermoluminescence spectra were photographed. These consist mostly of blue and yellow

bands whose intensity varies greatly from sample to sample. L. J. Rosenbaum

Line groups and fine structures. H. F. Paschen. *Sitzber preuss akad Wiss Physik-math Klasse* 1935, 430-43, cf C A 27, 1822.—The effect of the magnetic field of a nucleus on a group of lines, described previously, is here investigated for the narrow multiplets that occur in In II. It is shown that the no. distribution and intensities of the lines that make up a complex group can be quantitatively accounted for by certain simplifying consequences of the theory of Goudsmit and Bacher (C A 27, 4166).

C. C. Kiess
The intensity of $H\beta$ in the chromospheric spectrum. Philip C. Keenan. *Astrophys J* 83, 47-54 (1936).—From the measured d of $H\beta$ in the light of the chromosphere 2000 km above the photosphere the energy emitted at $H\beta$ over a hemisphere by 1 sq. cm. of the sun's surface was found to be 5×10^{10} ergs/sec. From this the no. of H atoms in the 4th quantum state at the same height is calculated as 7 atoms/cc. These results agree in order of magnitude with those found from eclipse observations.

C. C. Kiess
Second spark spectrum of mercury. Raymond Ricard. *Compt rend* 201, 1342-4 (1935).—By means of the electrodeless discharge 30 new terms of group E_2 (part of the Hg III spectrum), of which the most characteristic line at 4797.01 Å, excitation potential about 44 v., has been previously observed (Dejardin, C A 19, 1815).

C. A. Silberrad
The spectra of early type stars in the near ultraviolet regions. P. Swings and M. Désirant. *Astrophys J* 83, 31-46 (1936).—The lines that appear between 3570 Å and 3930 Å in the spectra of 14 early-type stars have been measured and, so far as possible, have had their chemical origins assigned.

C. C. Kiess
Nebular spectrum of Nova Herculis. Marie Bloch and Jean Dufay. *Compt rend* 201, 1463-5 (1935).—The spectrum of Nova Herculis from Oct. 18 to Nov. 14, 1935 showed permitted lines of H I, He I, He II, O II, N II, C II, O III, N III and probably C III, and forbidden lines of O I, N II, O II, S II, O III and Ne III and perhaps of Ne IV and F IV, while the origins of 4656 (perhaps identical with 4658.2 of Nova Pictoris) and the nebula of Orion) and 4603 (N V) are uncertain. The spectrum closely resembles that of the planetary nebulae (cf Bowen C A 29, 1711).

C. A. Silberrad
Reproducibility of the relative energy distribution of the continuous hydrogen spectrum emitted by a hydrogen discharge tube. V. E. Gonsalves. *Physica* 2, 1003-15 (1935).—Expts are described showing the dependence of the relative energy distribution on the pressure of H in the tube and the current. The intensity of the total ultraviolet between 1850 and 3200 Å is practically constant for $p = 3.0-3.4$ mm. if the current is constant. The relative energy distribution is independent of the current, measured between 150 and 250 mμ, if p is constant. The relative energy distribution does not change in the region of 1-3.5 mm. pressure for currents of 150-250 ma. These results indicate that the H tube can in principle be used as an ultraviolet standard lamp. Harold Gershonowitz

Predissociation in the A'' level of CO and the dissociation energy of this molecule. F. Brons. *Physica* 2, 1108-13 (1935).—A rotational analysis of the bands 10 → 19, 10 → 20 and 10 → 21 of the fourth pos. group of CO is given. From this analysis the rotational constants B and α were calculated, and compared with those from other investigations. For the R -branch $B' = 1.359$ cm $^{-1}$. For the rotational constants of the lower level $B''_0 = 1.585$, $B''_1 = 1.572$ and $B''_2 = 1.553$ cm $^{-1}$, $\alpha' = 0.024$ cm $^{-1}$ and $\alpha'' = 0.018$ cm $^{-1}$. The agreement is good. The height of the predissociation in the upper level A'' was calculated and ascribed to the dissociation state $^1P(\text{oxygen}) + ^1D(\text{carbon})$ of the mol., all other possibilities being excluded. This makes the value of 8.41 v. for the dissociation energy of CO perfectly certain. H. A. Smith

Dissociation energy of carbon monoxide. D. Coster and F. Brons. *Proc. Acad. Sci. Amsterdam* 38, 961-4 (1935).—On analyzing the rotational structure of the 4th

pos. group of the CO bands, a sudden disappearance of lines which combine with the vibrational level $v' = 10$ of the upper A'' level, which is 9.67 v. above the $X'^2\Sigma^+(v = 0, J = 0)$ state of the mol., was discovered. The difference 11.08 - 9.67 = 1.41 v. gives the energy of dissociation of the Angstrom bands. This is exactly the difference ^1S-D of the C-atom. This agreement proves the level diagram developed to be correct, and gives 8.41 v. = 193.9 kcal for the dissociation energy of CO. With this value the heat of sublimation of solid C is calculated to be 107.6 kcal.

C. E. P. Jeffreys
Dissociation energy of carbon monoxide. F. Brons. *Nature* 136, 766 (1935).—The structure of the fourth positive group of bands in the CO spectrum affords, in connection with other data, a certain explanation of the observed predissociations in the A'' and $B'^2\Sigma$ levels, and confirm the previous suggestion of Coster and Brons (C A 28, 6063) that the dissociation energy of CO is 8.41 v.

C. D. West
SiBr bands. E. Miescher. *Helv. Phys. Acta* 8, 587-8 (1935).—A photographic reproduction of the band structure of SiBr is given with the various bands graphically identified, with tables of frequencies and intensities.

G. M. Evans
Ultraviolet fluorescence spectra of iodine vapor. Influence of foreign gases. F. Duschinsky and Peter Pringsheim. *Physica* 2, 923-32 (1935); cf. C. A. 29, 7184, 30, 3807.—The intensive bands in the region of 3400 Å found in the fluorescence of I_2 with the admixt. of N_2 were further resolved and are tentatively classified. The influence of the noble gases in the place of N_2 was investigated. Helium gives a spectrum in the same position but much changed. N_2 also gives this spectrum but at higher temps. In the presence of traces of Hg the bands can be excited as sensitized fluorescence; HgI bands are also found. Energy relations are discussed. In an appendix the HgI band at 4400 Å is described. H. G.

The absorption spectrum of solid oxygen. H. A. Prinkothko and M. Ruheman. *Physik Z. Sowjetunion* 8, 294-9 (1935), cf. C. A. 29, 6141.—A study of the absorption spectrum of solid α -O between 3000 and 4000 Å. revealed the existence of a series of 5 bands similar to the 2 series in the visible region. Preliminary results were obtained concerning the band system below 2000 Å. Morris Muskat

Temperature of atmospheric ozone. J. Devaux. *Compt rend* 201, 1500-1 (1935), cf. C. A. 26, 3727.—With a similar arrangement the infrared spectrum (4-15 μ) of the atm. was automatically recorded at hourly intervals at the Pic-du-Midi. O_3 shows a strong band at about 10 μ. The temp. of the O_3 is much below 0°, and neither it, nor the height of the O_3 band, nor the amt. of O_3 shows any marked variation. C. A. Silberrad

Absorption spectra of nitrophenylhydrazines. A. Killen Macbeth and J. R. Price. *J. Chem. Soc.* 1935, 1503-7.—Data are given for o -, m - and p - $O_2NCH_2NHNH_2$, 2,4-(O_2N) $_2C_6H_3NHNH_2$, 3,4,6-Me(O_2N) $_3C_6H_2NHNH_2$ and 2,4-(O_2N) $_2C_6H_3NHNH_2$. The values of the λ_{max} of the band of shorter wave length common to all the curves of the $O_2NCH_2NHNH_2$ in aq. EtOH are nearly all the same; it seems reasonable to attribute this absorption to the electronic transition of the C-C system of the nucleus, the small differences being due to vibrational effects. The other λ_{max} recorded for the o -compd. differs markedly in location from the corresponding bands shown by the m - and p -isomers. This is true for both EtOH and aq. EtOH solns of the $O_2NCH_2NHNH_2$, and is in agreement with the spectra of the $O_2NCH_2NHNH_2$ in EtOH and of the Me(O_2N) $_3C_6H_2NHNH_2$ in ether EtOH or H_2O . Similar differences in the intensities of these bands of the m - and p -compds. are observed in all cases. The results can be accounted for on the assumption that the long-wave absorption is due to electronic excitation in the NO_2 group influenced by the nuclear NH_2 or $NHNH_2$ group. The view that the maxima of longer wave lengths in the nitroamines and nitrophenylhydrazines are due to an electron controlled by the N atom of the NO_2 group is supported by the spectra of 2,4-(O_2N) $_2C_6H_3NHNH_2$ (I),

3,4,6-Me(O₂N)₂C₆H₂NHNH₂ (II) and 2,4-(O₂N)₂C₆H₂NH₂ (III). Both the *o*- and *p*-nitrohydrazine effects persist in I tOH and aq I tOH solns, the former being characterized by the inflection at 392 mμ (I tOH), 403 mμ (H₂O) and 395 mμ (I tOH), 410 mμ (H₂O), and the latter by the bands at 372 mμ (I tOH), 376 mμ (H₂O) and 350 mμ (I tOH), 365 mμ (H₂O) in I and II, resp. The positions of the maxima do not coincide exactly with those of the simple *o*- and *p*-O₂N-C₆H₄NHNH₂, but this is to be expected as being the effect of introducing an addnl NO₂ group into the nucleus. Although the curves of the O₂N-C₆H₄NHNH₂ in I tOH and H₂O are similar in character, the positions of the maxima are appreciably altered. The displacements are in either direction, and although a strict comparison cannot be made, aq I tOH solns having been used instead of H₂O for the hydrazines owing to solubilities, yet the changes in frequency were, with 2 exceptions, generally of the same order as those recorded by the previous workers. C. J. West

The dispersion of carbon disulfide and carbon tetrachloride in the infrared A. H. Pfund *J. Optical Soc. Am.* 25, 351-4 (1935).—The following values of n_D^{20} were detd for various wave lengths in an app consisting of 2 mirror spectrometers in series with a hollow prism with rock-salt sides (angle 15°23'24") for the liquids CS₂, 0.5893 μ , n_D^{20} 1.6275, 0.740, 1.6085, 0.910, 1.5097, 1.32, 1.5904, 1.69, 1.5862, 2.41, 1.5815, 3.21, 1.5754, 3.92, 1.5666, 4.22, 1.5575, 4.67, 1.5540, 4.84, 1.5476, 5.14, 1.5411; 6.47, 1.5112, 5.80, 1.4812, 7.39, 1.7247, 7.62, 1.6975, 7.80, 1.6849, 8.06, 1.6711, 8.74, 1.6486, 9.32, 1.6381; 9.90, 1.6316, 10.45, 1.6277, 11.06, 1.6244, CCl₄, 0.5893, 1.4007, 0.740, 1.4541, 0.91, 1.4517, 1.32, 1.4489, 2.41, 1.4406, 3.92, 1.4434, 5.14, 1.4387, 5.47, 1.4374, 5.90, 1.4351; 6.11, 1.4356, 6.22, 1.4361, 6.41, 1.4360, 6.60, 1.4370, 6.80, 1.4315, 7.20, 1.4295, 7.46, 1.4274; 7.80, 1.4254, 7.98, 1.4248, 8.06, 1.4223, 8.45, 1.4183; 8.80, 1.4219, 9.02, 1.4090, 9.21, 1.4036. Anomalous dispersion occurs in each case at wave lengths corresponding to the absorption bands of the compd. By use of a specially cut cylindrical quartz cell to obtain very thin layers, the transmission of pure CS₂ was measured between 1949 and 5401 Å. A strong absorption band at 1965 and a weak band at 3276 were found. All the absorption bands will have to be considered in any calcn of dispersion. Janet F. Austin

The luminescence of frozen solutions of certain dyes. Frances G. Wick and Charlotte G. Throop *J. Optical Soc. Am.* 25, 368-74 (1935).—The intensity of luminescence of 0.0004 *M* solns of uranine (I), rhodamine B-extra (II) and naphthasulfam (III) in H₂O (1), Me₂CO (2), I tOH (3) and glycerol (4) at temps from 50° to the temp of liquid air were measured with a special app and an optical pyrometer with various color filters in the eyepiece. All solns. in (2), (3) and (4) and III in (1) showed luminescence at all temps. The luminescence of II in (1) ceased at 0° and reappeared in a different color with max intensity at -125°. I showed no luminescence below 0°. I frozen solns. of each in (2), (3) and (4) showed phosphorescence. The 2 regions of excitation and the approx limits of the fluorescence bands were detd for each soln. Marked changes in the brightness of luminescence-temp curves occurred at temps at which the phys condition of the solvnt changes, such as, at the f p, change to a viscous liquid, and from a viscous liquid to a glass. Other points of inflection may correspond to changes in states of assocn. of the solvents. Janet E. Austin

Absorption spectrum of nitrogen peroxide. Maurice Lambrey and Jean Corbière. *Compt. rend.* 201, 1334-5 (1935); cf. *C. A.* 25, 458.—The absorption coeffs., β , of N₂O₄ and NO₂ have been detd, for λ 3200-4105. Within the limits of observation (26-96°, and 580-730 mμ) there was no variation for temp. or pressure. For N₂O₄ $\beta \times 10^3$ rose from 0.70 for 3200 Å to a max. of 1.59 for 3400 Å. and then fell to 0.53 for 4105 Å.; for NO₂ the rise was from 0.50 for 3200 Å. to 0.52 for 3800 Å. and then a fall to 0.78 for 4105 Å. The accuracy is about $\pm 10\%$. C. A. Suberrad

First discharge spectrum across nitrogen peroxide.

Léon Grillet and Michel Duffieux. *Compt. rend.* 201, 1338-40 (1935).—The spectrum (3350-10,200 Å) was obtained by passing a rectified discharge through a very short tube through which a rapid current of NO₂ was passed. In addn to spectral O I, N I, the 2nd pos. group of N₂ with traces of the 1st, and the β bands of NO, there were observed a vibration-rotation band (nul line 5996, width 21.4 Å, corresponding to a moment of inertia of the mol of 17×10^{-40}), and several bands and lines (10 and 9, resp., measurable with the app used) of unknown origin. C. A. Suberrad

Absorption spectra of tautomeric selenazoles. R. F. Hunter. *Nature* 136, 1030 (1935).—Qual results for the shift of the absorption toward shorter wave lengths with tautomeric change is given. R. E. DeRight

Infrared absorption spectra of halogen derivatives of nuclear hydrocarbons. Jean Lecomte. *Compt. rend.* 201, 1340-2 (1935) cf. *C. A.* 28, 1926.—While for halogen substituted aliphatic derivs the vibration C-X corresponds to a definite absorption band, approx. the same so long as X is the same, with the halogen in the nucleus of a ring compd the vibrations and bands depend also on the nucleus and position of the halogen. Thus for the F, Cl, Br and I derivs of C₆H₅ the corresponding bands are at 802, 705, 677 and 659 cm⁻¹, but for the *o*-derivs of toluene at 749, 680, 655 and 644, resp., with similar differences for the *m* and *p* isomers, and also for other bands and those of X₂, X₃ and X₄ derivs. The results are confirmed by Raman spectra, but in some cases modes of vibration indicated by one method are not by the other. Similar results are obtained with cyclohexane and C₆H₅ derivs. C. A. Suberrad

Infrared spectra of amino acids and polypeptides. Irwin Heintz. *Compt. rend.* 201, 1478-80 (1935).—The infrared spectra (λ 0.8-8 μ) are plotted for glycocoll, *dl*-alanine, *d*-arginine, *l*-cystine, cysteine, *l* leucine, *d*-glutamic acid, *dl*-proline, tyrosine, *l*-histidine, phenylalanine, 3 peptones and albumose from casein. The λ of the absorption bands agree with those deduced from Vles's formula $\lambda \rho K = 21.2$ (*C. A.* 29, 2440). C. A. Suberrad

Influence of intermolecular forces on the Raman effect of liquids. Wolfgang Buchheim. *Physik Z.* 36, 694-711 (1935).—The influence of homogeneous elec fields on Raman scattering is theoretically evaluated. Conclusions: Raman lines should broaden with increasing field strength; this broadening should be most marked for vibrations connected with a 2nd-order change of the dipole moment of a mol; the lines should undergo a shifting of the center of gravity by the field smaller than the broadening; lines forbidden by mol symmetry may appear. These effects should be sufficiently large to be observed from fields arising in dipole liquids or electrolytes. Line broadening by infrared vibrations is theoretically of the same order of magnitude as the electrostatic effect. The change in the order of magnitude of the intensity distribution in the Raman spectrum on mixing scattering compds with others is expected to be a few %. This conclusion is verified in expts. with benzene, CCl₄ and CHCl₃. Allen S. Smith

The Raman effect of nitromethanes. Louis Médard. *J. chim. phys.* 32, 136-41 (1935).—The last sentence of the abstr in *C. A.* 29, 5350¹ should read "The resp structural formulas of C(NO₂)₄ and CH(NO₂)₃ are not believed to be

written." Harry D. Weiser
Ultraviolet spectrograph of large aperture. Albert Arnulf and Bernard Lyot. *Compt. rend.* 201, 1490-2

(1935)—The essential point of the spectrograph is the replacement of the object glass by a spherical mirror with an arrangement (preferably of 2 lenses) to correct spherical aberration. An instrument in quartz on these lines, with aperture $f/1$, mirror of radius 10 cm., and corrected for λ 2900, works well for $\lambda\lambda$ 2900–4000, and with 5 hrs' exposure showed λ 3022 in the night sky spectrum.

C. A. Silbernad

Separation of the mercury isotopes by a chemical method. K. Zuber. *Nature* 136, 790 (1935), cf. *C. A.* 29, 6140.—When a mixt. of Hg vapor and O_2 is irradiated with the Hg line 2537, the Hg is oxidized, presumably after excitation, according to the scheme $Hg^* + O_2 = HgO + O$. Following a proposal of Mrozowski (*C. A.* 27, 899), Z. irradiated such mixts with radiation which had passed through a filter transmitting only the hyperfine-structure components capable of exciting the isotopes 200 and 202. On examg. the isotopic compns. of the resulting Hg and HgO by his method of absorption of single hyperfine-structure components, Z. found samples in which the pressure ratio P_{202}/P_{200} and P_{202}/P_{200} differed by a factor of 4 from that of the starting material. The sepn., although not complete, is favored by the presence of N_2 .

C. D. West

Continuous spectrum of the night sky and diffusion of light in space. Jean Dufay. *Compt. rend.* 201, 1323–4 (1935), cf. *C. A.* 29, 5016.—The theory that part of the light of the night sky is due to diffusion of starlight by particles small compared with the wave length is discussed, and a formula for testing is deduced. *C. A.* 29, 5016.

The photochemical decomposition of nitric oxide. Paul J. Flory and Herck L. Johnston. *J. Am. Chem. Soc.* 57, 2041–51 (1935).—Products of the decompn. are N and O . The latter is quantitatively removed by compression in the McLeod gage with production of $HgNO_2$, which liberates NO ($k = 1.5 \times 10^{-4} \text{ hr.}^{-1}$). This rapid removal of O makes pressure measurements more sensitive. In the pressure range 0.02–7 mm. Hg decompn. is directly proportional to the rate of light absorption and to the pressure. The absorption obeys Beer's Law (extinction coeff. $= 2.9 \times 10^{-4}$ per mm., per mm. of pressure). Primary disson. is the 1st step, and the concn. of N has no effect. The use of filters indicates the Hg line λ 1822 which is absorbed by the $(1,0')$ band of the γ system as the effective radiation. Results with various metal sparks support this. The primary process is predissocn. occurring in the banded region, which agrees with the emission spectrum. Secondary processes are ruled out. The same mechanism may be applied to MacDonald's data at higher pressures (*C. A.* 22, 2112), but predissocn. from the β bands is the primary step. *R. E. DeRight*

Photobromination of tetrachloroethylene and of chloroform, with special reference to the effects of oxygen. John Willard and Farrington Daniels. *J. Am. Chem. Soc.* 57, 2340–5 (1935).—The rate of photobromination of liquid C_2Cl_4 with light of wave length 4360 Å. is increased by small amts. of O . When 1 atm. of O_2 is used, the photobromination is almost completely inhibited, probably because of competing Br-sensitized oxidation. The products of bromination inhibit the reaction. The temp. coeff. of the reaction is 1.12, the concn. of C_2Cl_4 is not important. The dark reaction is slow. The quantum yield varies from 24 to 0.009 mols. Br disappearing per quantum, with values of 1 to 5 most frequent. A mechanism for this reaction is suggested which involves the free radical C_2Cl_4Br . It is assumed that the life period of this radical is much shorter at higher temps. and that the radical is stabilized by O . The photobromination of $CHCl_3$ does not occur at 25° with light of wave length 2650 Å. in the absence of O but a reaction occurs in the presence of small amts. of O . *E. J. Rosenbaum*

Reaction between ethylene and chlorine in the presence of chlorine acceptors. The photochlorination of ethylene. T. D. Stewart and Bernhard Weidenbaum. *J. Am. Chem. Soc.* 57, 2036–40 (1935).—The rate of the initial stage of the photochlorination of C_2H_4 in the gas phase is proportional to the light intensity for a wave length of approx. 4360 Å. The quantum yield is probably large

1 Possible mechanisms are suggested. If H is present, none of it reacts in the dark and very little reacts under illumination. In $C_2H_4Cl_2$ and C_2H_5Cl soln., the reaction is rapid. Of the Cl used up in the $C_2H_4Cl_2$ soln. less than 10% is involved in a substitution reaction. In C_2H_5Cl between 37 and 73% of the Cl substitutes, and this fraction increases with the C_2H_4/Cl ratio. An explanation for these facts is discussed. *E. J. Rosenbaum*

2 The effect of wave length on the iodine sensitized decomposition of ethylene iodide in carbon tetrachloride solutions. Roscoe G. Dickinson and Nelson P. Nies. *J. Am. Chem. Soc.* 57, 2382–6 (1935).—Since the rate of decompn. is proportional to $I^{1/2}$, absorption coeffs. were detd. and the distribution of the intensity in the soln. was calcd. The relative values of the rate consts. were 1.0, 0.91, 0.867 at wave lengths 4358, 5461 and 5770 Å., resp. This difference is less than that found by Schumacher and Steger (*C. A.* 25, 3917) and is due to differences in absorption coeffs. The abs. values for the rate consts. at 76.6° in einsteins $^{-1/2} \times \text{cm}^2 \times \text{sec}^{-1/2}$ were 0.42, 0.39 and 0.37, resp. Thus, light corresponding to continuous absorption of I in the gas phase is slightly more effective than that in the discontinuous. *R. E. DeRight*

Photochemical investigations. II. The photochemical decomposition of ethylene iodide in solutions of carbon tetrachloride. Robert E. DeRight and Edwin O. Wig. *J. Am. Chem. Soc.* 57, 2411–15 (1935); cf. *C. A.* 29, 7899.—A mechanism and rate equation involving primary disson. into C_2H_4I and at . I is suggested. Absorption begins at 360 m μ . The apparent quantum yield was 0.76 for the Hg lines at 303 and 313 m μ . This includes the photochem. and subsequent thermal reactions. The rate reaches a definite max. after a certain amt. of decompn. 5 Increased initial concns. of C_2H_4I increase the rate slightly, ethylene has no effect and I decreases the rate. The results substantiate the theory of Franck and Rabinowitch (*C. A.* 28, 2269) for reactions in soln. *R. E. DeRight*

Spectrum, fluorescence and photochemical decomposition of acetaldehyde. H. W. Thompson and J. W. Linnett. *J. Chem. Soc.* 1935, 1452–9.—Two regions of absorption for acetaldehyde in the range 2000–7000 Å. were found: (a) from about 3800 to about 2900 Å. and (b) from 2320 Å. to shorter wave lengths. A preliminary analysis of the band system for (a) has been made. An attempt to excite fluorescence by irradiation with light corresponding to this region of absorption was unsuccessful. The quantum efficiencies of the photochem. decompn. and polymerization have been studied with light of 3665 and 3135 Å. The efficiencies of both reactions rise with increasing wave length; for the decompn. it is of the order of 10^{-4} at 3665 Å. and 0.15 at 3135, for the polymerization, 0.39 at 3665 Å. and 2.3 at 3135. The data are discussed. *William E. Vaughan*

Primary photochemical reactions. VII. Photochemical decomposition of isovaleraldehyde and dipropyl ketone. C. H. Bamford and R. G. W. Norrish. *J. Chem. Soc.* 1935, 1504–11, cf. *C. A.* 29, 5022.—The decompn. of isovaleraldehyde and Pr_2CO by Hg-vapor irradiation follows N 's previous findings on $MeEtCO$ (*C. A.* 28, 5758). The proportions of the 2 types of chance in isovaleraldehyde are: type 1 forming CO and isobutane, 47%; type 2 forming propylene and CH_3CHO , 53%. With Pr_2CO the proportions are: type 1 forming CO and hexane 37%; type 2 forming C_3H_6 and $MePrCO$, 63%. *Elliott J. Roberts*

Photochemical decomposition of nitrophenols. Jean Molnar. *Compt. rend.* 201, 1482–4 (1935), cf. *C. A.* 29, 5725.—An alk. soln. of picric acid (pa greater than 13) exposed to light develops a red-brown tint, slowly in diffused light, rapidly in sunlight and still more rapidly close to a Hg lamp, followed in the last case by a violet tint and then decoloration. Chem. analysis shows the formation of picramic and isopurpuric acids, HNO_2 , NH_3 and HCN . 2,5-Dinitrophenol behaves similarly. alk. solns. of other nitro- and dimnitro-phenols darken in color with formation of an amino group. There is no evi-

dence that the photolysis is selective as regards λ .

C. A. Silberrad

Fluorescence of some pure substances (alcohols). Étienne Canals, Pierre Peyrot and Roger Noël. *Compt. rend.* 201, 1488-9(1935); cf. *C. A.* 29, 6144¹—The depolarization factor, 100 ρ , and the value of $2f/(I + i)$ were detd. for several alcs. The factors of the normal series (C 1-4) are 6.0, 6.7, 6.9 and 8.6, resp., of the iso series (C 3-5), 5.0, 6.6 and 8.0, and of PhCH₂OH 56.8. All are slightly fluorescent, $2f/(I + i)$ for the aliphatic alcohols being 0.03-0.06, and for PhCH₂OH 0.18.

C. A. Silberrad

Determination of ionization by ultraviolet spectrophotometry, its validity and its application to the measurement of the strength of very weak bases. Leo A. Flexser, Louis P. Hammett and Andrew Dingwall. *J. Am. Chem. Soc.* 57, 2103-15(1935)—The ionization constants of weak org. electrolytes were detd. from intensity changes in the ultraviolet absorption spectra in going from the acid to the basic forms of these electrolytes. The method was tested with dil. aq. solns. of BzOH, 2,4-dinitrophenol and aniline and was found satisfactory. A method for considering the medium effect with very weak electrolytes is presented. The effect on indicators of a change of medium is discussed. The base strengths of acetophenone, BzOH, anthraquinone and phenylacetic acid were detd. The method is not suitable for *p*-nitrobenzoic acid.

E. J. Rosenbaum

Photochemical reactions connected with the quenching of fluorescence of dyestuffs by ferrous ions in solution. Joseph Weiss. *Nature* 136, 794-5(1935), cf. *C. A.* 29, 3901¹—The photochem. oxidation of ferrous ion in soln. contg. H₂SO₄ in the absence of O takes place in ultraviolet light with evolution of H₂ or in visible light if certain dye mols. are present, with reduction of the latter to the leuco form. The mechanism of these reactions is discussed and implications in connection with *biol. problems* are pointed out.

C. D. West

Phosphorescence and heterogeneities in crystals. Maurice Curie. *Compt. rend.* 201, 1352-3(1935)—Phosphorescence is associated with the presence of impurities, which produce abnormal levels of heterogeneity (and hence of energy) in their neighborhood. The electron responsible for the phosphorescence is driven by light to the level of appropriate energy and on its return therefrom produces the phosphorescence. This theory makes more definite C.'s view attributing phosphorescence of long duration

¹ (Lenard's d band) to collisions of the 2nd order. (Cf. *C. A.* 26, 3993, Tomaschek, *C. A.* 23, 5109.)

C. A. Silberrad

Chemical action caused by neutrons and gamma rays and the effects of these agents on colloids. F. L. Hopwood and J. T. Phillips. *Nature* 136, 1026(1935)—The effect of γ -rays on chem. reactions is enhanced by neutrons. The stability of neg. colloids was increased and of pos. colloids decreased by a source of neutrons. The effect of pure γ -rays was similar but only half as effective despite the fact that the sources produced 10^8 quanta of γ -rays per neutron. Anomalous results are obtained in the presence of foreign electrolytes.

R. E. DeRight

Heterogeneous reaction kinetics. Effect of light exposure on the kinetics of thermal decomposition of silver oxalate. Arthur F. Benton and Geo. L. Cunningham. *J. Am. Chem. Soc.* 57, 2227-34(1935)—The rate of the thermal decompn. of Ag₂C₂O₄ was studied by measuring the amt. of CO₂ formed. The rate at 100° is not greatly affected by drying or the presence of CO₂ or free Ag but is greatly increased by previous exposure to light of wave length less than 520 m μ . Contact with O during exposure retards the initial decompn. rate. The effect of exposure to light is less at higher decompn. temps. A quant. theory is developed which is in fair agreement with the data. Light of wave length 370 m μ produces about 0.1 mol. of CO₂ per quantum absorbed. The activation energy of nucleation is about 64 kg.-cal. while that for the growth of the nuclei is 8.5 kg.-cal.

E. J. Rosenbaum

Relations between electrochemical constants, infrared spectra and reactivities. Fred Vles. *Compt. rend.* 201, 1475-7(1935), cf. *C. A.* 29, 7798¹—The atom or group responsible for the absorption band giving the relation $\lambda pK = 21.2$ is identified in several cases, thus in Ph-COOH it is the CO group, in PhNH₂, N^{III}. In anthranilic acid the acid function $pK_a = 4.95$ and the basic $pK_b = 2.10$, correspond to $\lambda = 4.28$ and 10.1 μ , resp., while other values correspond to CO at 4.3 and N^{III} at 10.0 μ . Other examples are drawn from the values of $21.2/pK (= \lambda)$ for the half decompn. of urea by urease (indicating the presence of N^{III} and N^V and so supporting Werner's cyclic formula), and sucrose by saccharase (indicating attack of the aldehyde group).

4—ELECTROCHEMISTRY

COLIN G. PINK

Progress in design and application of electric furnaces. H. Knight. *Metallurgia* 13, 53-6(1935)—Melting and heat-treating furnaces recently installed in England are described.

J. L. Gregg

The power factor in spark-type high-frequency induction furnaces. R. Dufour. *Recherches et inventions* 16, 457-79(1935)—The elec. characteristics are investigated and discussed.

Leopold Pessel

Nitrogen in electric steel. N. Chuiko. *Domes* 1935, No. 8, 27-39—Absorption of N in steel was studied in connection with a no. of elec. steel furnaces. The atm. in the furnaces was found to contain a max. of 0.436% by vol. of oxides of N. Depending on length of melting operation a max. of 0.03-0.04% N was found. The rate of N absorption increased during the carburization period, and also with increase in voltage. The type of elec. arc, whether stationary or rotating, had no effect on the rate of absorption of N.

S. L. Madorsky

The preparation of artificial graphite electrodes. N. P. Bozhlo. *J. Chem. Ind. (Moscow)* 12, 1161-7(1935)—Various kinds of coke and anthracite were ground, mixed with pitch, shaped into electrodes and graphitized. Electrodes of lowest elec. resistance were obtained by heating them to 500° in 4 hrs., then to 1200° in 3.5 hrs. and keeping them at 1200° for 3 hrs. The temp. was then

finally raised very slowly to 2300-2400°. The greatest changes occurred at 1200° and at 2000-2300°. The resistance and ash content of the electrodes were greatly reduced by this treatment. Anthracite gave the best electrodes, although some kinds were better than others. When anthracite mixts were used, the properties of the resulting electrodes were the sum of the properties of the individual components. Fine-ground materials gave better results than coarser ones. A high ash content in the electrodes had a harmful effect. Repeated graphitization was of no value.

H. M. Leicester

Metallization of electrodes for electric furnaces. G. F. Morenko. *Domes* 1935, No. 8, 39-45; cf. *C. A.* 29, 4267¹—Graphite electrodes coated with Cu and Al were compared with non-coated electrodes in actual operation of smelting steel in an elec. furnace. Cu stood up better than Al under these conditions, but neither of these was as good as Fe or steel coatings.

S. L. Madorsky

Electrolytic cell for aluminum production. Evaluation of its design. A new automatic closed cell. Ferrand. *Procs. verb. séances soc. ing. civils France* 1935, No. 6, 130-8(March 22); *Chimie & industrie* 34, 848—To avoid having to open the cell at frequent intervals, it is necessary to: (1) regulate the anode feed automatically in order to distribute the c. d. evenly, (2) feed the Al₂O₃ under the

roof continuously and uniformly, (3) prevent anode effect. By oscillation of the anodes a slow stirring of the cryolite bath is produced and this, with the continuous feed of Al_2O_3 , prevents the anodes from burning. The new cell shows a reduction of 12500 kw-hr per ton Al. A. P. C.

The manufacture, properties and uses of refined aluminum. R. Gadeau. *Chimie & Industrie* 34, 1021-6 (1935).—Though Hoopes succeeded (cf. Frary, C. A. 19, 1665) in producing refined Al of 99.9% purity by a process derived from that of A. G. Betts (Fr. pat. 304,521, March 23, 1906) and even attained a purity of 99.99%, commercial application of the process has so far been found impossible. The Cie de Produits Chimiques & Electro-metallurgiques d'Alsais, Froges et Camargue has modified the process. It is producing regularly Al of 99.99% purity and even 99.9980%. The anode consists of a Cu-Al alloy containing 33% Cu, the bottom of the cell is of C and the walls are lined with ordinary MgO bricks (containing 90% MgO, besides Fe_2O_3 and SiO_2); the electrolyte consists of AlF_3 , 23, NaF 17 and $BaCl_2$ 60%. Electrolysis is carried out at about 750°, at 6 v. and 10,000 amp (or c d. of 40 amp/sq dm), anodic current efficiency, 100%, cathodic current efficiency, 97%. There is some volatilization of Al as $AlCl_3$, so that the composition of the fluoride portion of the bath approaches AlF_3 -3NaF. When this composition is reached, the refined Al may contain up to 3% Ba. Accordingly it is then necessary to add a little AlF_3 or NaF to the bath, when the Ba in the refined Al passes back into the electrolyte and the phenomenon does not recur. Highly refined Al is appreciably softer than ordinary Al, the difference between the conditions of the cold-hardened and annealed metal decreases as the degree of purity increases, highly refined Al (99.99%) exhibits an exceptionally high resistance to the action of acids. Possible applications are briefly outlined. Also in *Rev. met.* 32, 503-8 (1935). A. P. C.

Direct electrolytic manufacture of aluminum-magnesium alloys. I-IV. Ichitaro Namari and Tashio Ishino. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 583-91 (1935).—The direct electrolytic production of Al-Mg alloys by deposition of Mg on Al cathodes was investigated. The effects of NaCl or KCl added to the $MgCl_2$ electrolyte were the same, both lowering the temp. at which electrolysis could be carried out. The results were not affected by change in c d. and temp. of bath above 600°. An almost constant current efficiency of 94% was obtained. With $MgCl_2$ only, as electrolyte, the best results were obtained and the mean current efficiency was 95%, the only disadvantage being that electrolysis had to be performed at temps. about 700°. The alloys produced corroded in the air more readily if made in the KCl or NaCl-diluted bath, if $MgCl_2$ alone was used, the alloys were very resistant. However, the most suitable electrolyte for practical operation was $MgCl_2$ + 5-10% NaCl, temp. of electrolysis, about 670°. The time of electrolysis did not affect the current efficiency very much. The composition of the final alloys varied from the wt. increase of the cathode agreed with the analytical results. Fe and Si are possible impurities. Metallographic exams. showed that the produced alloys were of quite uniform composition and compact structure. Karl Kammermeyer.

Electrolytic production of boron and its alloys. J. L. Andreux. *Rev. met.* 32, 487-93 (1935).—In the electrolytic production of B, a graphite crucible was used as anode and a water-cooled Fe rod as cathode. The fused bath was composed of B_2O_3 , to which were added oxides and fluorides of metals (preferably Mg) which are able to reduce B. The bath is electrolyzed at 1100°. Mg concentrates around the cathode and reacts with the bath. Mg borates more basic and less fusible than the bath and metallic B are formed and deposit on the cathode. The deposit is subsequently treated with HCl, and a metal containing about 85% B is obtained. Electrolyzing borates in the presence of Ca, Ba, Sr, Ce and Mg halides results in the production of corresponding borides. Many alloys may be prepared by using cathodes made of the metal in question. The bath is heated to a temp. at which the cathodes are still solid but at which the eutectics with B melt and run down

For example Ni eutectic m. 900° and Fe-B eutectic m. 1174°. The composition of the alloys or borides so produced depends, within certain limits, on the temp. and duration of electrolysis. J. D. Gat.

Decomposition of barium sulfate by chlorine. A. Ya. Zvorukin. *Chimie & Industrie* 34, 760-4 (1935).—Experiments were carried out on the treatment of finely pulverized $BaSO_4$ by Cl_2 in a furnace heated electrically to 850-1050°. The proportion of $BaSO_4$ converted into $BaCl_2$ increases, under the conditions of the experiments, with temp., with the velocity of the Cl_2 current and with the fineness of $BaSO_4$, grinding. The unreacted Cl_2 may be reintroduced into the cycle. The presence of NaCl increases the yield of $BaCl_2$, the presence of SiO_2 or silicates decreases it. By combining addition of 5% NaCl and reutilization of the unreacted Cl_2 , a yield up to 92.8% $BaCl_2$ can be obtained. A considerable amount of decomposed can be obtained with dilute Cl_2 , even 1 part Cl_2 dilute with 6.5 parts of air will give a satisfactory yield of $BaCl_2$. The process seems capable of commercial application. A. Papineau-Couture.

The behavior of oxygen electrodes in alkali carbonate melts. Emil Baur and Roland Brunner. *Z. Elektrochem.* 41, 794-6 (1935).—An electrode consisting of a thermoelement and tube of Pythagoras material (Al silicate) with a ball of 2.2 g. fine Pt wire at its lower end was placed in a graphite crucible filled with a mixture of K_2CO_3 , Na_2CO_3 , NaCl and borax. When the electrode is fed with O_2 at 500-600°, the voltage is insufficient and strong polarization occurs, likewise with balls of Ag wire, of silvered Cu or steel wool. But if a mixture of O_2 or of air with CO_2 is used, the current-potential curves immediately show the influence. The reason for the improvement of the electrode with the addition of CO_2 is that oxides (NaO) form on the cathode which incrust the electrode. CO_2 must dissolve these. M. McMahon.

Polarization of electrodes during the decomposition of metals from solutions of complex cyanides. O. A. Esin and A. Matanzev. *Z. physik. Chem.* A174, 344-94 (1935).—Analysis of data by S. Glasstone (cf. C. A. 24, 4208) shows that the concentration polarization conditioned by accumulation of CN on the cathode in most cases indicates a relation between polarization and current density which is analogous to the equation for H overvoltage. This permits the assumption of chem. polarization in the separation of Hg from cyanide solutions, which polarization is conditioned by the overvoltage through retarded discharge in the sense of Volmer's theory (C. A. 28, 4164). The data on the deposition of Ag and Cd give no consistent indications. In Cu-plating no chem. polarization appears, but a depolarization is suspected. R. H. Baechler.

Electrodeposition of zinc and cadmium on aluminum and aluminum alloys. B. K. Braund and H. Sutton. *Trans. Faraday Soc.* 31, 1595-1611 (1935).—The effect of plating Al and Al alloys with Zn and Cd as a protection against corrosion under marine conditions was studied. None of the previous plating methods was found satisfactory. The most promising cleaning method was found to be anodic cleaning in 10% NH_4OH solution, but electrodeposits were usually satisfactory only on part of the article. In a bath prepared by dissolving Zn in 7% NaOH some Al was dissolved and a coating of Zn deposited which acted as a good undercoating for electrolytic Zn deposition. In some cases the zincate bath gave dark noncoherent deposits. Addition of a small amount of Na_2SO_4 to the bath improved the results. Surfaces of Al-rich casting alloys can be prepped and plated easily by this method, but Al and duralumin sheets require more care. Lower pH in $ZnSO_4$ baths was possible when the Al was prepped in this way than with sand blasted material. $ZnCl_2$ baths are also satisfactory at pH 4.0. Gas pitting was rarer than with the $ZnSO_4$ bath, and the deposits were superior to those obtained with cyanide baths. If Pb occurred even in small amounts in the HNO_3 used for cleaning, all Zn and Cd deposits were blistered and poorly adherent. Current distribution in the $ZnSO_4$ bath was studied. C. E. P. Jeffery.

Electrodeposition of nickel from nickel chloride solutions. N. I. edot'ev and R. Kinkulskii. *Z. anorg. allgem.*

Chem. 224, 337-50(1935).—Compact deposits of Ni can be obtained from NiCl₂ solns. without the addition of other substances; purer metal is obtained than with the sulfate, since contamination by S is eliminated. The optimum acidity of the electrolyte lies from pH 6.8 to 6.2. The Ni concn. of the electrolyte must not fall below 40 g/l.; otherwise the cathode ppt. is damaged. The temp. optimum is between 70° and 80°. At 60°, pH = 5.0, and for a concn. of 40 g Ni/l. the energy consumption at a c.d. of 1.5 amp/sq dm is about 2.0 kw hrs., with a c.d. of 4.5 amp/sq dm the consumption rises to 3.5 kw. Working of Ni ores by chlorination and subsequent electrolysis of the chloride is worthwhile. When ores are worked which contain rare metals as well as Ni, the Pt group metals will be obtained. M. M.

The effect of oxidizing agents on nickel deposition. II. Chromic acid. A. W. Hotherhall and R. A. I. Hammond. *Trans. Faraday Soc.* 31, 1574-82(1935). Cf. *C. A.* 29, 10177.—Previous investigations (cf. *C. A.* 24, 4611) on the effect of H₂CrO₄ on the cathode efficiency of Ni deposition and on the appearance of the deposit have been extended to explain the results and to compare them with the action of H₂O₂ and Ni(NO₃)₂. The H₂CrO₄ seems to have a two fold function: (1) with low concn. initial depolarization results in pptn. of basic Ni compds. contg. Cr at the cathode, the Ni ion concn. being thereby depleted. H-ion discharge and reduced cathode efficiency are thus favored, (2) with higher concn. H₂CrO₄ interacts chemically with the cathode metal forming a selectively permeable film on its surface. Ni deposition is consequently completely inhibited. With intermediate concns. both of these effects may occur simultaneously. Contrary to results with Ni nitrate and H₂O₂, the effects produced by H₂CrO₄ can only be connected indirectly and to a smaller degree with depolarization of H. M. McMahon.

Electric currents flowing over rusting iron. U. R. Evans. *Nature* 136, 792-3(1935).—Currents flowing over a flat Fe surface covered by filter paper wet with NaHCO₃ soln. are measured by a microammeter, contact with the filter paper being made through nonpolarizing electrodes of superficially oxidized Cu. A fresh scratch ruled on a clean salt Fe surface rusts intensively under these conditions. The scratch and the surface for 2 mm. on either side of it are found to be an anodic area, while areas further removed from the scratch, which do not rust, are cathodic. This confirms current ideas on the electrochemical mechanism of corrosion. C. D. West.

Hydrogen peroxide theory of electrolytic oxidation and the influence of the electrode surface on anodic processes. S. Glasstone and A. Hicking. *Trans. Faraday Soc.* 31, 1656-60(1935). Cf. *C. A.* 29, 1721.—Anodic overvoltages were found at smooth Pt, platinumized Pt, untreated and treated in various ways, Au, Mn, PbO₂, are gas C and Ni electrodes. The results show that overvoltages cannot be correlated in any simple manner with the efficiencies in the oxidation of acetate, thiosulfate and sulfite ions. It is believed that the rate-determining step is OH⁻ = O₂ + e (electrode) and H₂O₂ is formed by union of the OH radicals. The conclusions of Walker and Weiss (cf. *C. A.* 29, 7822) are criticized. No one mechanism is likely to account for the various types of anodic oxidations. C. E. P. Jeffreys.

The electrolytic preparation of deuterium from heavy water. I. L. Norling. *Physik. Z.* 36, 711-13(1935).—The app. described permits the prepn. of high-purity D from small quantities of D₂O under conditions excluding exchange reactions. It is cheap, requires little attention, and produces a yield of D but a few % under the theoretical. Enrichment in the last fraction is attained if the D₂O is not 100%. A V-shaped electrolytic cell is used with 3 electrodes. The third electrode, on the O side, is used to maintain const. pressure on both sides by an auxiliary electrolysis which occurs when the level varies from a pre-determined point. Allen S. Smith.

Efficiency of separation of hydrogen and deuterium by electrolysis. T. H. Odde. *Proc. Phys. Soc. (London)* 47, 1040-7(1935).—After correcting for losses due to escape and spraying, the efficiency (a) is shown to in-

crease with increasing current density. a is independent of pH and of the nature of the electrodes. The observed values agree with the theoretical values of Urey and Teal. S. Bradford Stone.

The oxidation potential of the system potassium ferrocyanide/potassium ferricyanide at various ionic strengths. I. M. Kolthoff and Wm. J. Tompkins. *J. Phys. Chem.* 39, 1645-54(1935).—The normal potential of the K₄Fe(CN)₆/K₃Fe(CN)₆ electrode is 0.3560 v. at 25° and not 0.41 v. as generally accepted. The change of the potential in a very dil. soln. with increasing ionic strength is greater than calculated on the basis of the simple Debye-Hückel expression because of incomplete dissociation of alkali and alk. earth ferrocyanides. While the anion effect for the same valence types of salts upon the potential is the same at the same ionic strength, the effect of cations decreases in the order Cs, Rb, K = NH₄, Na = Li for alkali ions and is of about the same order for alk. earth ions, the latter having much greater effect than the univalent cations especially at smaller ionic strengths. A. T. Beitch.

New method of preparing perfectly polished metallic surfaces. Pierre A. Jacquet. *Compt. rend.* 201, 1473-5(1935). Cf. *C. A.* 29, 5749.—The process has been slightly modified. The area of the cathode plate should be slightly greater than the area to be polished (anode). The soln. contains not less than 400 g/l. H₂PO₄ or H₂P₂O₇ (H₂PO₄ is useless), and temp. is 15-25°. The current required depends on the concn. of the soln. and position of the anode. With 530 g/l. H₂PO₄ and anode vertical 10 amp/sq dm was required, while with anode horizontal 6 sufficed in about 15 min. The p.d. should be such as does not quite cause bubbles to form on the anode. C. A. Silberrad.

The oxidation of cobalt amalgam. I. P. Dwyer and J. W. Hogarth. *J. Proc. Roy. Soc. N. S. Wales* 69, 105-10(reprint)(1935).—By electrolyzing CoSO₄ and Co(SO₄)₂ solns. with a pure Hg cathode D and H prep. Co₂Hg, which is a brittle, cryst., magnetic solid decomp. without melting. It is stable in vacuum, dry air, H₂, N₂, CO, and under acids and in water free from air. On exposure to air it decomposes with the sep'n. of a black powder Co₂O. This oxide decomposes into Co and CoO in the ratio 3:1. The CoO, because of its fine state of division, is a powerful reducing agent and on treatment with NH₄ salts gives a pyrophoric form of Co. E. R. Schierr.

The nature of the oxidation at a graphite anode and comparative electrolysis of δ -tartaric and mesotartaric acid in a solution of sodium hydroxide. V. Sihvonen and M. Pykläinen. *Suomen Kemistilehti* 8B, 37-9(1935)(in German).—One hundred cc. of 0.5 M Na tartrate and 3 N NaOH soln. was electrolyzed with Pt, Ni, Fe and C anodes and various c. ds. Analyses were made for O₂, glyoxylic acid, formic acid and CO₂. The results for the dextro- and mesotartaric acids were very similar. Oxidations at the graphite and Ni anodes were much alike contrary to expectation. I. E. Jukkola.

Electrolytic reduction potential of organic compounds. XXII. The mechanism of the electrolytic reduction. Isamu Tachi. *J. Agr. Chem. Soc. Japan* 11, 734-40(1935); cf. *C. A.* 28, 4085.—The deformation of a small drop of diffusible sol. org. compd. such as nitrobenzene, camphor oil and CCl₄ on a Hg cathode of small dimension was observed photographically. The drops gradually flatten on the cathode surface because of polarization but tend to restore to their original drop shape on further polarization. This phenomenon agreed with the electrocapillary phenomenon of polarized Hg. The contact angles of the various org. compd. globules to the plane of the Hg and the changes of the angles with polarization differ one from the other because of different properties of the compds. and their action on Hg. The contact angle of the camphor oil droplet was the largest. The nitrobenzene droplet was flatter in NaOH soln. than in HCl soln. The mechanisms of the reduction of nitrobenzene, and of camphor are discussed. Y. Kishara.

Electrolytic conduction of a solid insulator at high voltages—formation of the anodic oxide film on aluminum

E J W Verwey *Physica* 2, 1059-63 (1935).—The structure of γ - Al_2O_3 formed at the anode by electrolytic action at room temp is a solid soln of Al^{+++} in a face-centered cubic lattice of O atoms. The Al^{+++} atoms are distributed interstitially among the O atoms with the restriction that 70% of the cations have a coordination no of 6 while 30% have one of 4. The γ - Al_2O_3 is formed by the deposition of O atoms at the anode surface with highest symmetry packing. At high field strengths Al^{+++} atoms are liberated from the metal and drawn into the O lattice. Thus the O lattice is built up from the outside and the γ - Al_2O_3 lattice is built up from the metallic side. The building up process stops when the Al^{+++} atoms no longer have sufficient mobility or energy to cross the barrier set up by the O atoms. The current through such films may be expressed as $i = \alpha e^{e\phi}$ where $\alpha = (0.24ekT/a^2v_0)\epsilon^{-1/2}$ and $\beta = 3ae/8kT$. Here v_0 is the min potential barrier, τ the time of vibration, a the lattice parameter and F the field strength in v. The order of magnitude of α and β is checked with values previously published.

H. A. Smith

Spectroscopic observation of recurrent phenomena in discharge tubes. R H Sloane and C M Minnis *Proc Phys Soc (London)* 47, 1019-28 (1935).—Methods are given for the synchronous and for the direct photography of irregular moving striations. Pure A shows no appreciable recombination in the dark phase. A-Hg mixts show excitation of only the Hg lines in the dark phase.

S Bradford Stone

Sliding contacts—electrical characteristics. R M Baker. *Elec Eng* 55, 94-100 (1936).—Expts with oxidized and oxide free materials indicate that the elec. characteristics of the ordinary sliding contact are dependent upon the oxide film on the surface ring. Exptl results are shown and an explanation is made of the breakdown of the oxide film by the increase of current through the contact. Tests to det. the effects of liquid films on the contact voltage drop and the variation of thermal voltage in a sliding contact are discussed.

W. H. Boynton

Advances in the chemistry of the manufacture of dry batteries. C. Drottschmann *Chem-Ztg* 59, 881-4 (1935).

E. H.

Relative temperatures and pressures of gases in an electric arc. G Righini *Physica* 2, 585-90 (1935).—The temps and pressures of different parts of a C arc were detd by the intensity of the CN bands. The (0,0) and (1,1) bands of the violet group $\Sigma^--\Sigma^--$ were used; the arc was formed between core C electrodes, 9 mm diam, 5 mm apart (anode above), 5 amp. The pressures of C were calcd from CN. The temps varied from 3800° to 4800° abs.

Manuf. and applications of Mg and Mg alloys (Deveraux) 9. Examn of electrodeposited Ni coatings by x-ray diffraction (Wood) 2. Industrial heating app [elec] (Can pat 354,059) 21. Fe alloys [for elec heating resistance] (Brit. pat 434,849) 9.

Storage battery. Edgar W. Allen. U S 2,027,262, Jan. 7. Structural features.

Storage battery. Edward W. Smith (to Electric Storage Battery Co.). U S 2,027,310, Jan. 7. Structural features.

Vent plug for storage batteries, etc. Joseph L. Woodbridge (to Elec Storage Battery Co.). U S 2,028,113, Jan. 14. Various details.

Battery terminals of hard and soft metals. Thomas H. McGrath. U S 2,027,646, Jan. 14. Structural details. Lids for electric batteries. The Ever Ready Co. (Great Britain) Ltd and Edward Noel Rowbotham. Brit 435,235, Sept. 17, 1935.

Condensers. Porzellanfabrik Kahla. Brit 436,056, Oct. 3, 1935. In arrangements for obtaining condensers of const capacity or circuits with const. characteristics with variations of temp., having condensers with pos and neg temp.-capacity characteristics assembled together, the elements with neg. characteristics are constructed with a dielectric of a sintered ceramic material contg TiO_2 .

Condensers. Francis C. Stephan, Frederick L. G. Betttridge and The Telegraph Condenser Co. Ltd. Brit. 436,195, Oct. 7, 1935. Tubular condensers are made by applying directly to the glass or ceramic dielectric a layer of adherent graphite and electroplating a metal onto the graphite layer.

Electrodeposition of metals of the platinum group. Alan R. Powell and Emory C. Davies (to Johnson Matthey & Co. Ltd.). U S 2,027,358, Jan. 7. A plating bath for deposition of metals such as Pt, Pd or Rh comprises a soln of a sol double Na nitrite of the metal rendered slightly acid by the addn of a small proportion of an inorg acid such as H_2SO_4 or H_3PO_4 , the anion of which is neither oxidized at the anode nor reduced at the cathode during plating.

Electrodeposition of nickel, etc. Louis Weisberg and Wm B. Stoddard, Jr. (to Weisberg & Greenwald, Inc.). U S 2,026,718, Jan. 7. A soln contg. Ni sulfate or chloride is electrolyzed in the presence also of an NH_4 salt such as the sulfate, a formate such as that of Ni or Na and formaldehyde, which also may be used with a Co salt.

Apparatus for electrodeposition of precious metals on metal bands. Albert Oberhauser. Fr. 788,417, Oct. 10, 1935.

Electroplating aluminum and its alloys with other metals such as nickel, iron, chromium, etc. Oscar Bornhauser (to Société d'électrochimie, d'électrometallurgie des aciéries électriques d'Ugine). U S 2,028,312, Jan. 21. The article to be plated is preliminarily heated to above 100°, plunged into a coned bath of basic Al chloride brought to the same temp and then withdrawn from the bath when a violent reaction with attack of the metal is produced, this preliminary treatment serves to produce a film of Al hydride which facilitates plating.

Removing iron from chromium electrolytes. Siemens & Halske A.-G. (Johannes Fischer, inventor). Ger. 619,883, Oct. 9, 1935 (Cl. 48a 6 04). Fe is removed from Cr electrolytes by addn of compds of metals with a lower potential than Fe in solid powd form. To produce a readily filtered sludge, carbonates of alk. earth or alkali metals, in amts sufficient to ppt completely the SO_4 ions present, are added. Thus, a Cr bath contg 31.4% Cr_2O_3 and 1.7% Fe is given an addn of powd MgCO_3 to ppt the Fe as $\text{Fe}(\text{OH})_3$. The $\text{Fe}(\text{OH})_3$ is then filtered off. Cf. C. A. 29, 5028³.

Producing oxide coatings on aluminum and its alloys. Siemens & Halske A.-G. (Nikolai Budiloff, inventor). Ger. 622,480, Nov. 29, 1935 (Cl. 48a. 16). Addn to 607,012 (C. A. 29, 1766⁴). The metal or alloy is subjected to anodic oxidation in a CrO_3 soln to which a low const voltage, e. g., 20 v., is applied at a temp. of at least 65°. The coatings so obtained are absorbent and are particularly suitable for use in the photographic marking or ornamenting process described in Ger. 607,012. Cf. C. A. 29, 2460¹.

Electrolytic production of oxide coatings on aluminum and its alloys. Aluminum Colors Inc. Ger. 622,451, Nov. 28, 1935 (Cl. 48a. 16). Addn to 600,397 (C. A. 28, 6375¹). The process is effected at atm temp and an initial voltage of 6-12 in H_2SO_4 of 20-35% concn by wt.

Electrolytic metallization. John Kronsbein and Charles P. Neale. Fr. 787,992, Oct. 2, 1935. Means for supporting the articles treated is described.

Electrolytic decomposition apparatus operated under pressure. Ludwig Schürmer. Ger. 622,121, Nov. 25, 1935 (Cl. 12a. 13).

Apparatus for electrically heating metal blanks. John R. Blakeslee (to Ajax Mfg. Co.). U S 2,027,416, Jan. 14. Various structural, mech and operative details.

Carbon black. John J. Jakosky (to Electroblacks, Inc.). U S 2,027,732, Jan. 14. An electrode is specified for use in the electrothermal disson of org liquids to form C black that is easily dispersed in a rubber mixt by an ordinary rubber milling procedure.

Electrolytic furnaces. Louis Ferrand. Brit. 434,001, Aug. 23, 1935. The electrodes have their major axes horizontal and are so mounted as to be subjectable to a

slight longitudinal reciprocatory movement superimposed upon an oscillatory movement

Induction furnaces Siemens & Halske A.-G. Brit. 431,909, Sept. 11, 1935 In a polyphase furnace with an open core, the hearth is angular in cross section with plane walls and a pole of the core is arranged at the geometrical center of each of the walls

Induction furnace for metals Allgemeine Elektricitäts-Ges. Fr. 788,006, Oct. 2, 1935

Electrolytic reduction furnaces Det Norske Aktieselskab for Elektrokemisk Industri Fr. 788,063, Oct. 3, 1935 Electrodes in furnaces for the production of Al and like metals are protected against corrosion by air by metal plates extending too near the surface of the bath

Apparatus for heating surfaces by induced currents, e. g., metal bodies for surface hardening, glass sheets for cutting Edwin F. Northrup (to Electric Furnace Co. Ltd.) Brit. 435,313, Sept. 19, 1935

Electric heating units Allgemeine Elektricitäts-Ges. (Walter Dressler, inventor) Ger. 622,172, Nov. 22, 1935 (Cl. 21k 2 01) Elec. heating units comprising oxide-coated conductors embedded in an insulating compn are improved by adding gypsum to the insulating compn

Nonmetallic electric heating unit Globar Corp. Ger. 619,501, Oct. 2, 1935 (Cl. 21k 1) The prepn of a heating unit by recrystallization of SiC is described

Electric resistance units Paul G. Andres (to P. R. Mallory & Co.) U. S. 2,027,413, Jan. 14, 1935 A metallic contact member of high thermal and elec. cond. is placed adjacent to an elongated resistance unit including a metallic conductive oxide such as oxides of Cu, Fe, Mn, Pb or Cd so as partly to cover the resistance unit but leaving another part uncovered, and part of the unit is heated to reduce its resistance

Negative resistance units suitable for electric circuits Frich Habann U. S. 2,027,277, Jan. 7, 1935 Discrete particles of materials such as TiO_2 , Mn_2O_3 , ZnO , Cr_2O_3 , Fe_2O_3 , WO_3 , CuO or SnO_2 are compressed into a body and a high-voltage elec. current is passed through the compressed body, of low initial but slowly increasing intensity, until puncturing of the body occurs and it is given a desired cond. Various operative details are described

Metal anode plates Heinrich Leiser Fr. 788,528, Oct. 11, 1935 A metal such as Ni is deposited on a supporting plate and the layers of Ni are sepd. from the support by passage between 2 rolls traveling at a slightly different rate. The sepn. is made more easy by a slight oxidation or greasing of the support

Oxide cathodes Telefunken Ges. für drahtlose Telegraphie m. b. H. (Horst Rothe, inventor) Ger. 619,503, Oct. 2, 1935 (Cl. 21g 17 02) The cathode layer carrier is coated with a heavy-metal oxide and binding agent. This layer is coated with a second layer of an alk. earth metal compd. which, on heating, decomposes to the metal and a gaseous or solid residue not affected by the electron emission. The second layer may be $BaNi$ or $Ba(CN)_2$

Cathode for photoelectric cells The General Electric Co. Ltd. Fr. 788,097, Oct. 14, 1935 The interior surface of the vitreous envelope is exposed to attack by an alkali metal, e. g., Cs, or by a compd. of an alkali metal,

1 before the formation of the sensitive cathode with which the cell is finally provided

Photoelectric cells N. V. Philips' Gloeilampenfabrieken Brit. 435,109, Sept. 11, 1935. In mfg. photoelec. electrodes by reducing a metallic oxide by a photoelec. metal, the oxide is interspersed or coated with metallic particles prior to exposure to the photoelec. metal. In 1 method, the oxide is partly reduced by H at 150° , less than 50% being so reduced if Ag_2O is used, Cs is then admitted and the tube filled with A, Xe or Kr at a few hundredths mm pressure

Photoelectric cells The General Electric Co. Ltd. and Charles H. Summs Brit. 436,023, Oct. 3, 1935 In the manuf. of cells, where Cs vapor acts upon a cathode of oxidized metal, e. g., Ag, the variability of the emission is reduced by exposing the interior of the vitreous envelope to attack by Cs or a Cs compd. before the final formation of the sensitive cathode is begun

Photoelectric device Jan H. de Boer and Marten C. Teves (to Radio Corp. of America) U. S. 2,027,025, Jan. 7, 1935 A device is described comprising an envelope with an interior partition on one side of which are an anode such as one of W wire and an alkali metal cathode such as Cs and on the other side of which an alk. earth metal such as Ca is placed with means for vaporizing it

Removing phenolic catalysis inhibitors from aqueous solutions such as those used for treating flue gases Henry F. Johnstone (to Board of Trustees of the Univ. of Ill.) U. S. 2,027,982, Jan. 14, 1935 The soln. is subjected to d.-c. electrolysis and simultaneous aeration, the anodic c. d. being controlled in accord with the character of the phenolic compds. to remove them completely by oxidation from the soln. and the rate of flow of the soln. being controlled in accord with the concn. of such compds.

Electric discharge tubes N. V. Philips' Gloeilampenfabrieken Fr. 788,250, Oct. 7, 1935 The electrode (of W or Mo) is coated, at least in part, with ZrO_2

Incandescent cathode-discharge apparatus The British Thomson-Houston Co. Ltd. Brit. 435,442, Sept. 20, 1935 Thermionic valves, rectifiers, etc., are protected during starting by the provision of starting resistances with neg. temp. coeff. in the anode circuit, e. g., UO_2

Electric lamps Émile P. Hirtz. Fr. 787,877, Sept. 30, 1935 The life of elec. lamps is prolonged by using ether, particularly sulfuric ether, as a constituent of the gas therein

Flash light lamps N. V. Philips' Gloeilampenfabrieken Brit. 434,253, Aug. 28, 1935 Mg-Al alloys, excluding the series having a Mg content of 13-85% are used. Salts influencing the photographic properties of the light, e. g., of Sr, Ca, Na and Hg, and O-yielding salts, e. g., $KClO_4$, may be provided on the alloy, which may contain small proportions of Zn or Mn

Leading-in wires for electric incandescent lamps Clemens A. Lave and Jacob Kurtz Brit. 434,192, Aug. 23, 1935 A composite bar, rod or wire having a core of Cu or Cu alloy, e. g., Cu-Be, surrounded by and welded to a covering of Ni or Ni alloyed with Ta, Ti, Pt, Au, Ag, etc., which may contain Mn and preferably has a thin film of hydride on the surface, is welded to a member of a refractory metal, e. g., W, Mo, Re or Ta, by bringing it into contact therewith and heating, the alloy formed by the constituents of the wire serving as the brazing material.

5—PHOTOGRAPHY

E. R. BULLOCK

New emulsions for special fields in motion-picture photography. W. Leahy. *J. Soc. Motion Picture Engrs.* 25, 214-53 (1935).—Characteristics of the Agfa Infrared, Linopan, and Superpan Reversible are described.

Speedy finishing methods for rush photographs. J. I. Waters and S. B. Clason. *Camera* (Phila.) 51, 169-70 (1935).—Working instructions of the U. S. Army Air Corps are given for extremely rapid processing. With this

method, the exposure can be made, the negative processed, printed, and a dry print obtained in 5 min. The negative is developed for 20 sec. in a concd. caustic M-Q developer, rinsed in a stop bath for 15 sec., and fixed in a "speed" fixing bath for 1 min. Without washing, it is placed in the printer and a sheet of Kodaloid is squeezed to the emulsion. Three exposures are made with varying exposure times and developed by inspection in full-strength Kodak D-72 developer for 30 sec. The best print is fixed in a

standard acid hardening fixing bath for 1 min., rinsed in H₂O for 15 sec., and soaked in alk. for 15 sec. The print is suspended by one corner and the alc. is lighted and allowed to burn off. H. A. Kurtzner

Blackening law of the photographic plate H. Kienle *Naturwissenschaften* 23, 7, 2 (1935).—The subject of photographic photometry is discussed in the light of the no. of papers which have been published recently on the subject of reciprocity-law failure and the intermittency effect. These papers are criticized and their bearing upon photographic photometry is summarized. J. H. Webb

Action of various elements and compounds on photographic plates H. Shinichi Aoyama and T. Fukuroi *Bull. Inst. Phys. Chem. Research (Tokyo)* 14, 481-96 (1935). cf. C. 4 29, 60².—Direct chem. action of activated gases on the photographic plate is a more plausible view than emission of radiation when the gases associate. B. C. A.

Effect of soaking a plate in sodium salicylate solution as regards contrast for light of 4000-2400 Å Tin Kiu *Compt. rend.* 201, 1348-50 (1935).—Soaking a plate in soln. of Na salicylate (cf. Thovort, C. A. 27, 506²) not only increases the sensitivity in the ultraviolet, but also stabilizes and increases the γ . C. A. Silberrad

Recent fine grain and compensating developers Adolf Lux *Photofrend* 15, 200-11, 232-3 (1935).—A comprehensive bibliographic summary. L. E. Muehler

Reducing the contrast and grain of small negatives by redeveloping with p phenylenediamine Gerd Heymer *Veroffentlich. v. Zentral-Lab. phot. Abt. Agfa* 4, 198-200 (1935).—Bleach in CuSO₄, H₂O 100 g., NaCl 100 g., concd. H₂SO₄ 25 cc. and H₂O 1 l. Redvelop, until the image ceases to darken as viewed from the back, in p phenylenediamine base 3 g., Na₂SO₃ 20 g., H₂O 1 l. The resulting negative, which is brownish in tone, is both notably softer than the original and improved as regards graininess. E. R. Bullock

Brown tones by development Paul Hancke *Atelier Phot.* 42, 158 (1935).—Tones ranging from warm black through sepia to reddish tones can be obtained on gaslight papers with the following developer: aduril 4 g., hydroquinone 4 g., Na₂SO₃ 30 g., Na₂CO₃ 25 g., KBr 1/2 g., and H₂O 600 cc. With normal exposure and 15 min. development, this gives a warm black. By dilg the developer, adding KBr, and increasing the exposure and development times, the tone can be varied through sepia to reddish brown or red. H. Parker

Traces of hypo decrease blue black tones with developers containing nitrobenzimidazole Edith Weyde *Lichtbild* 11, 26-7 (1935).—Low concns (0.05 to 0.1 g. per l.) of nitrobenzimidazole, benzotriazole, etc., in developers for AgCl papers give blue-black tones but the addn. of small amts. of hypo (0.3 to 0.5 g. per l.) to such solns. decreases or eliminates the blue-black tones, giving a warm brown instead. L. E. Muehler

Chrome alum and warm developing conditions H. P. *Photofrend* 15, 236 (1935).—Alkali or alkali metal salt adds to chrome alum fixing baths remove the hardening properties. To insure adequate hardening, a stop bath of 20% chrome alum contg. Na₂SO₄ is suggested. Treatment in the bath should be for not more than 5 min. So-called alkali free developers, such as the following, are also suggested with chrome alum fixing and stop baths: Na₂SO₄ 30 g., chrome alum 20 g., H₂O 1 l., for use, add 5 g. of amidol. L. E. Muehler

Developers for papers Anon. *Phot. Chronik* 42, 341-2 (1935).—Thirteen formulas for developers suggested by various firms for producing blue black and brown tones on papers are given. L. E. Muehler

p Phenylenediamine research F. W. Lowe *Leica Photographic No.* 36, 10 (1935).—It is claimed that the 2 factors that exert the greatest influence in improving the fine-grain characteristic of a p phenylenediamine developer are (1) a chem. reaction between the developer constituents that occurs on aging the soln. before use, and (2) the accumulation of Ag or Ag salts in the soln. The exact nature of the 1st phenomenon is not known. Several

methods of adding Ag salts to the soln. with different formulas are described. G. E. Matthews

Thirty-five mm. film development in a Kodak tank Lynn S. Wells *Camera (Phila.)* 51, 91-3 (1935).—A method of processing miniature 35 mm. film in a Kodak film tank. H. A. Kurtzner

Sensitometric studies of processing conditions for motion picture films H. Meyer. *J. Soc. Motion Picture Engrs.* 25, 230-47 (1935).—Test-object negatives were sent to 8 Hollywood labs. and later prints from these negatives were obtained. M's data indicate an approx. const. printing factor of 11%. Selected prints use one half the toe region and one half the straight-line portion of the over-all reproduction curve, and the over-all reproduction curve has an av. slope of 1. C. M. T.

Double-coated Schumann films H. P. Knaus and R. V. Zumstein *Phys. Rev.* 45, 124 (1934).—K. and Z. have found that it is possible to ppt. a thin Schumann emulsion directly onto the sensitive surface of Eastman 33 plates, thereby obtaining plates that are not only as fast in the Schumann region as 3 other ultraviolet-sensitive materials with which they were compared but are equally as fast as the Eastman 33 plates themselves for the longer wave lengths. E. R. Bullock

Determination of the color sensitivity of negative materials for pictorial exposures Martin Biltz and John Eggert *Veroffentlich. v. Zentral-Lab. phot. Abt. Agfa* 4, 35-41 (1935); cf. C. A. 30, 390¹.—A somewhat more detailed account of the work already described. E. R. Bullock

Recent characteristic surfaces Hans Arens *Veroffentlich. v. Zentral-Lab. phot. Abt. Agfa* 4, 15-25 (1935), cf. C. A. 29, 783²; 30, 35¹.—Addnl. illustrations are given of surfaces representing the variation of the photographic d. with the logarithm of the intensity and with the logarithm of the time of exposure, for normal and solarizing exposures, the Villard effect, and for phys. development. E. R. Bullock

Making harmonious enlargements from small negatives Arpad v. Biehler *Veroffentlich. v. Zentral-Lab. phot. Abt. Agfa* 4, 193-7 (1935).—A method which is described for obtaining harmonious enlargements from negatives having a great range of d. consists in first toning the negative blue [with Fe] and then enlarging it on a contrasty paper. Author

Oxide coatings on Al and its alloys [used in photographic marking] (Ger. pat. 622,480) 4

Color photography Béla Gáspár. *Fr.* 787,937, Oct. 1, 1935. Into light-sensitive layers or solns. or emulsions used for their production, the dye is introduced in coarse dispersion in a noncoloring or only slightly coloring state, a state in which it is almost nonabsorptive. After exposure the dye is brought, at any point of the treatment of the image, to an active coloring state. This may be realized by treatment with solvents or chem. agents.

Photographic development I. G. Farbenind A-G *Fr.* 783,472, Oct. 10, 1935. Films may be developed in a bright light if the exposed films are treated before development with solns. of dinitro or polynitro derivs. of imidazole, triazole or pyrazole, or if these are added to the developer.

Photographic development Gevaert Photo-Produeten, N. V. *Fr.* 788,511, Oct. 11, 1935. Emulsions are developed without fogging by adding to the developer substances obtained by condensing thiothiazolidine or its homologs and derivs. with nonbasic cyclic aldehydes. The prepn. is given of 5-benzal-2-thiothiazolidine-4-ketothiazolidine from 2-thiothiazolidine-4-ketothiazolidine and BzH₂ and 5-piperonylidene-2-selenoketo-4-ketothiazolidine from 2-selenoketo-4-ketothiazolidine and hehtopropine.

Photographic emulsions I. G. Farbenind A-G *Fr.* 788,043, Oct. 2, 1935. A Ag halide emulsion has, in addn. to orthochromatic sensitization (I), a sensitization (II) for the deep red and infrared region of the spectrum and a sensitization gap between 5,900 and 6,200 Å. For I dyes of the group benzothio-, benzocleno-, thio-

pseudo-, selenopseudo-, seleno- and oxocarbo-cyanines, and for II, thiopentacarbo-, selenopentacarbo-, thioheptacarbo- and selenoheptacarbo-cyanines are appropriate.

Sensitizing photographic emulsions I G. Farbenindustrie A.-G. Brit 434,235, Aug 28, 1935 Ag halide emulsions are sensitized by incorporation therein of unsym. pentacarbocyanine dyes of formula $YCR^1CR^2CR^3CR^4$, wherein Y and Z

are S, Se or -CH-CH-, R^1, R^2, R^3 and R^4 are H, alkyl or aryl or R^1, R^2 and (or) R^3, R^4 together represent a substituted or unsubstituted phenylene, naphthylene or other polynuclear arylene group, R^1 and R^2 are alkyl and X is an acid radical such as Cl, Br, I, ClO, MeCfH₂SO₃, MeSO₃, EtSO₃, lack of symmetry being fulfilled by either Y and Z or R^1, R^2 and R^3, R^4 differing, or both. The H atoms of the polymethylene chain may be replaced by alkyl and, in the case that Y or Z is -CH-CH-, the polymethylene chain may be linked to the heterocyclic ring in the 4-position instead of the 2-position. The dyes are made by the process of Brit 434,234 (C. A. 30, 6909) Examples of 28 dyes with sensitizing data are given. 1,1'-Diethyl-2-(6-methylquino)-benzothioheptacarbo-cyanine iodide is made by condensing p-toluenediamine-EtI and α -phenylamino- γ -phenyliminopropene-HCl and condensing the product with 2-methylbenzothiazole EtI Cf C. A. 29, 3249².

Photographic sensitizers I G. Farbenindustrie A.-G. (Martin Dablow and Alfred Philips, inventors) Ger 622,211, Nov 22, 1935 (Cl. 22e 3) See Brit 378,239 (C. A. 27, 2896)

Photographic diazotype layers N V Philips Gloeilampenfabriek Brit. 433,999, Aug 23, 1935 Light-sensitive layers contg. a diazonium compd. and a coloring component, especially 1 having a self-developing property, i. e., of producing a color after exposure, by treatment with H₂O vapor, are prepd. by applying to the carrier of the diazonium compd., in pulverulent form, 1 substance assisting in the production of color and 1 substance that absorbs moisture from the atm. while retaining its pulverulent form and not assisting in the production of the coloring material. In examples, (1) paper is coated with p-diphenylaminobenzenediazonium chloride in the form of the ZnCl₂ double salt, dried, rubbed with rice meal and powd. α -naphthol (I) is dusted thereon, or the rice meal and I may be mixed and rubbed in, and (2) 4-dimethylaminobenzenediazonium borofluoride is applied to paper which is then rubbed with a mixt. of rice meal, phloroglucinol and anhyd. Na₂CO₃. In 434,761, Sept. 9, 1935, prints are produced by giving to a layer sensitized with a diazonium compd. that will combine with its light-decomp. product to form a colored substance an exposure such that the diazonium compd. is only partly decompd. and subsequently bringing about the decompn. of the diazonium compd. in the parts not exposed to light by means other than light action, e. g., by heat and (or) moisture. A Cu salt may be included in the layers, which should be stored in a dry atm. before use. Among examples, 2-hydroxy-5-sulfobenzenediazonium salt and Cu(NO₃)₂ are developed either by keeping the layer in an atm. satd. with H₂O vapor for 3 days or 30 min., the

material in the latter case being ironed under a damp cloth at 100°.

Photographic layers for accelerated diazo printing Walker M. Hinman (to Frederick Post Co.) U. S. 2,027,229, Jan 7 A carrier such as paper is provided with a thin layer of material contg. a light-sensitive diazonium compd. and the essential component parts of a light-sensitive salt such as a higher oxide compd., e. g., ferric oxalate and an org. reducing agent. Numerous examples are given.

Photographic negatives Arthur E. Field U. S. 2,027,271, Jan 7 For treating a negative to produce an improved tone-printing image, as for use in photo-mech. printing work, a fixed negative is subjected to the action of a first soln. comprising a bleaching reagent such as I and KI soln. which produces on the plate a Ag halide photographic image of positive appearance, then treating the plate with a second soln. that is a solvent for the Ag halide so as to effect the requisite retouching on the positive image without redeveloping it to a negative image, and finally with a third soln. which blackens the Ag halide image and reconverts the image of positive appearance to a negative image. Various details are given.

Colloid reliefs Kodak A.-G. Ger 619,605, Oct. 4, 1935 (Cl. 57d 2/2) In making metal molds for printing copies by the aid of colloid reliefs, colloid layers contg. metal salts are used. These are exposed under a copying app., heated and developed. The layers are coated with lacquer before developing. The lacquer may contain for example, cellulose nitrate, tritoly phosphate and AcOEt.

Film for color photography John G. Capstaff (to Eastman Kodak Co.) U. S. 2,026,964, Jan 7 A light-transmitting support of cellulose compn. contains a neutral dye and has minute lenticulations on one surface, and on the other surface carries a sensitive, panchromatic layer and an outer antihalation layer contg. a material such as MnO₂ or Ag which is absorptive of light of all colors and is readily removable in the baths of a photographic reversal process.

Laminated sheet material suitable for photographic films Max Hagedorn (to Agfa Anso Corp.) U. S. 2,027,688, Jan 14 An internal stratum contg. an org. cellulose ester such as cellulose acetate carries on both surfaces external strata of regenerated cellulose carrying outer adhering layers of a colloid less sensitive to water than cellulose hydrate, such as a specified nitrocellulose compn.

Television films Fernseh A.-G. Brit 434,873, Sept. 10, 1935 A film for television is exposed with the light-sensitive layer in a coagulated condition without being completely dried. The thickness of the coagulated layer is about that of the dimension of a picture point. The emulsion contains a larger Ag salt content and a smaller colloid content than normal.

Retouching photographic films or plates Karl Kipphan (to Agfa Anso Corp.) U. S. 2,026,899, Jan 7. For applying brightening retouches to a photographic material, there is finely distributed in a light-sensitive layer a compd. such as Fe(OH)₃, resisting photographic baths and diminishing the transparency to light of the layer, and the layer is partly cleared by a chem. reagent such as 5% oxalic acid soln. in conformity with parts of a picture to receive a greater transparency.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Chemistry of bromine. I. Preparation of bromine dipyrindine perchlorate and bromine dipyrindine nitrate H. Carlsohn Ber. 68B, 2209-11(1935)—Br in CHCl₃ added to a cooled soln. of AgNO₃ in CH₃IN gave bromine dipyrindine nitrate, [Br(pyr)]NO₃. AgNO₃ in CH₃IN soln. treated with NaClO₄ gave silver dipyrindine perchlorate, [Ag(pyr)]ClO₄ (A). Treating A with Br in CHCl₃ soln. gave bromine dipyrindine perchlorate [Br(pyr)]ClO₄. II. Preparation, properties and constitution of some

water-pyridine compounds of bromine oxides Ibid. 2212-14—A preliminary discussion R. C. Roberts

Amphoteric oxide hydrates, the solutions of their hydrolyzed salts and their high-molecular compounds XXX. Iso- and heteropolypyridine acids in particular relation to the formation mechanism of arseno- and phosphotungstic acids. Gerhart Jander and Hans Banthien Z. anorg. allgem. Chem. 225, 162-72(1935); cf. C. A. 29, 5371¹⁶.—In P- and As-free as well as in tungstate solns

contg. P and As the monotungstate with increasing H-ion concn is converted first into *hexatungstic acid*, therefore a polyacid. This is stable in acid soln. This hexatungstic acid combines with phosphoric acid, again with the aid of H^+ , to form *1-phospho-1-hexatungstic acid* (I), a new compd. The tendency of I to secondary disson depends upon the H^+ and tungstic acid concn of the soln. Increase in both concns suppresses it. With higher H-ion or phosphate concn I can again combine with other hexatungstic or phosphoric acid mols to form various *x-phospho-y-hexatungstic acids*.

H. Stoertz
A study of the dehydration of hydrated cobaltic oxide. H. Armin Pagel, Wm K. Noyce and Myron T. Kelley. *J. Am. Chem. Soc.* 57, 2552-3 (1935).—A careful study of hydrated cobaltic oxide at temps. between 155° and 260° has been made. The percentages of Co_2O_3 and H_2O found are tabulated. Co_2O_3 could not be oxidized to Co_3O_4 at 100 atms and 200° to 400°. More drastic treatment shows the O disson pressure of Co_2O_3 is greater than 127 atms at 315°. Particle size and porosity are believed to be important factors in rate of dehydration. Presence of the wet monohydrate during drying at these temps for short periods of time prevents much decompn into Co_2O_3 .

Raymond H. Lambert
Constituents of nitrous vapors. A Sanfourche and Jean Bureau. *Compt. rend.* 202, 66-8 (1936).—Contrary to the usual mode of reaction (cf. C. A. 15, 3352) "nitrous anhydride" when passed into a soln. of $PhNH_2$, HCl reacts mainly as a mixt. of NO and NO_2 , $2(NO + NO_2) + PhNH_2 = PhN(OH) + HNO_2 + 2NO$. This is demonstrated by dividing a stream of " N_2O_3 " into 2 equal parts and passing one into such a soln. and the other into H_2SO_4 (1.833), and detg. the amts. of azo, nitrous and nitric N resulting in each (cf. C. A. 18, 1552). C. A. S.

The formation and composition of lithium aluminate. Harold A. Horan and John B. Damiano. *J. Am. Chem. Soc.* 57, 2434-6 (1935), cf. C. A. 26, 936.—An insol. Li aluminate is pptd., practically quantitatively, when a soln. of an Al salt contg. sufficient Li salt is made alk. with NH_3 . Analysis shows that the ppt. contains Li and Al in the at. ratio 1:2. Upon ignition at a high temp. this substance becomes const. in wt. The wt. of the residue, obtained from a ppt. const. a known amt. of Al, suggests the formula $Li_2O \cdot 2Al_2O_3$. W. C. Fernelius

Anhydrous sulfates of the magnesian series. Fritz Hammet. *Compt. rend.* 202, 57-9 (1936).—X-ray examn of the anhyd. sulfates of Mg, Mn, Fe^{++} , Co, Ni, Cu and Zn show them all to be orthorhombic, the values of a , b and c being (Mg) 4.8, 6.7, 8.3, (Mn) 4.8, 6.8, 8.5, (Fe^{++}) 4.8, 6.8, 8.6, (Co) 4.6, 6.6, 8.4, (Ni) 4.6, 6.5, 8.4, (Cu) 4.8, 6.6, 8.3, (Zn) 4.7, 6.7, 8.5. C. A. S.

Cesium iodomercurate. Fernand Gallais. *Compt. rend.* 202, 54-6 (1936).—Cond. and magnetic rotation detos. of solns. contg. varying amts. of $HgCl_2$ and CsI indicate Cs_2HgI_4 to be the only double iodide. C. A. S.

Ortho- and meta tellurates. Salts of benzidine. Marcel Patry. *Compt. rend.* 202, 64-6 (1936), cf. C. A. 29, 5724.—Neutral orthotellurate of benzidine, $C_{12}H_{16}N_4 \cdot Te(OH)_6$, is obtained by adding an alc. soln. of benzidine to an aq. soln. of orthotelluric acid, of such strengths that the mixt. contains less than 30% EtOH, if stronger in EtOH a mixt. of neutral and acid orthotellurates results. The orthotellurate forms amber-colored leaflets, slightly sol. in H_2O (1.1%), and EtOH (1.46%). At 80° it loses 4 H_2O , forming $TeO_3 \cdot C_{12}H_{16}N_4$. In similar fashion polymetalluric acid in aq. or alc. solns. forms the neutral metatellurate $C_{12}H_{16}N_4 \cdot H_2TeO_6$ if the mixt. solns. contain less than 30% EtOH, if more the product contains more or less acid metatellurate, which is obtained pure ($C_{12}H_{16}N_4 \cdot 2H_2TeO_6$, 44.3% Te) with pure EtOH as solvent. Both are gray amorphous powders, sensitive to the action of light, but permanent in moist air, and rapidly blackening above 60°. Kretov's failure (C. A. 27, 42) to prepare a tellurate was due to his use of benzidine HCl. With mineral alkalis both telluric acids yield the same product. C. A. Silberrad

Rubidium and cesium fulminates. Louis Hacksplid and Willy Schumacher. *Compt. rend.* 202, 60-71 (1936).—

These fulminates were prepd. by Wöhler's method (Ber 38, 1355 (1905)), i. e., by the action of an amalgam of Cs or Rb on Hg fulminate suspended in MeOH at -15° for $\frac{1}{2}$ hr., the Cs or Rb fulminate then being pptd. by Et_2O . As thus prepd., they always contain some Hg double salt from which the pure Cs or Rb salt is obtained by resoln. in MeOH and reprecip. by Et_2O . Both closely resemble the corresponding Na and K salts, save that they are very deliquescent, and detonate more violently the higher the mol. wt. The double Hg salts are still more sensitive, the RbHg fulminate exploding at 45°. C. A. Silberrad

Reactions in the action of hydrogen sulfide upon bisulfite solutions. J. Janickis. *Z. anorg. allgem. Chem.* 225, 177-203 (1935).—In the action of H_2S upon bisulfite solns. whose pH lies between 5.1 and 2.3, thiosulfate, trithionate, tetrathionate, pentathionate, S and H^+ are produced. At 1st the main products are $S_2O_3^{--}$ and $S_4O_6^{--}$, but when sufficient $S_2O_3^{--}$ and H^+ ion concns. have been attained, $S_2O_3^{--}$ and $S_4O_6^{--}$ are formed. The latter is assumed to be produced as follows: $H_2SO_3 + 2HSO_3^{--} \rightarrow S_2O_3^{--} + 2H_2O$. Addn. of $S_2O_3^{--}$ to initial soln. increases the yield of all polysulfates, this increase being greater with greater initial H^+ ion concn. $S_2O_3^{--}$ is formed as follows: $S_2O_3^{--} + HSO_3^{--} \rightarrow S_4O_6^{--} + S_2O_3^{--} + H^+$ and trithionate partially by the reaction $S_2O_3^{--} + HSO_3^{--} \rightarrow S_2O_3^{--} + S_2O_3^{--} + H^+$ and also by $H_2SO_3 + 2HSO_3^{--} \rightarrow S_2O_3^{--} + 2H_2O$. H. Stoertz

Permanent electric moment and structure of phosphorus pentachloride. Pierre Trunel. *Compt. rend.* 202, 37-9 (1936).—Extrapolated to infinite diln. the polarization and mol. refraction of PCl_5 at 25° in soln. in either CS_2 or CCl_4 are, resp., .51 and 35.5, giving an elec. moment, $\mu = 0.8$, which indicates a nonsym. structure, explicable either by nonequivalence of all 5 Cl atoms or the nonplanar character of the mol. (cf. Simons and Jessop, C. A. 25, 2837). C. A. Silberrad

Remarks on the red and green form of Magnus's salt. H. D. K. Drew and H. J. Tress. *J. Chem. Soc.* 1935, 1580-8.—The red form is not identical with the empirically isomeric triamine platino-salt which is much more sol. in H_2O . They are clearly distinguishable by chem. tests. In prep. according to Jørgensen and Sørensen (*Z. anorg. Chem.* 48, 441 (1906)) occasionally gray or gray-green mixts. of the 2 forms were obtained. The 2 forms are similar in cryst. form, soly and chem. reaction. They probably have the same mol. wt. and dichroism cannot explain their formation. The red form can be prepd. from certain chloroplatinate solns., even in concd. HCl. Some samples of the red form are stable to considerable boiling in H_2O , to hot HCl and to seeding with the green form. The condition of the chloroplatinate ion detos. whether the red or green form will be produced. It is suggested that the 2 forms are electroisomers. Foster Dee Snell

Chemical formula of malachite. Marcel Guillot and Georges Geneslay. *Compt. rend.* 202, 136-7 (1936).—The hydrated basic Cu carbonates prepd. by the interaction of satd. solns. of K_2CO_3 , Na_2CO_3 , $KHCO_3$ or $NaHCO_3$ and $CuSO_4$, or by hydrolysis of various alkali cupricarbonates all give products which x ray examn. shows to be identical, and also with Auger's "hydrated malachite" (C. A. 8, 2126), and with natural malachite, to which the formula $8CuO \cdot 4CO_2 \cdot 5H_2O$ is assigned. C. A. Silberrad

Complex dipyrrolyl salts of nickel and copper. F. M. Jaeger and J. A. van Dyk. *Proc. Acad. Sci. Amsterdam* 38, 972-7 (1935).— $[Ni(Dipyr)](NO_3) \cdot 5H_2O$ is formed when 1, 2 or 3 equivs. of dipyrrolyl (I) are added to a soln. of $Ni(NO_3)_2$ and the soln. is evapd. at room temp. The red crystals are hexagonal bipyramidal. The dimensions of a unit cell are $a_0 = 13.5 \text{ \AA}$, $c_0 = 10.8 \text{ \AA}$. The cell contains 2 mols. After deprotonation of this salt a ppt. of violet needles is obtained which has the compn. $[Ni(Dipyr)](NO_3) \cdot 3H_2O$. The crystals are monoclinic prismatic, $a \ b \ c = 0.3912:1.0 \ 0.3825$, $\beta = 73^\circ 43'$. They are dichroic. For vibrations parallel to the c axis they are pink, and perpendicular blue. From a soln. treated with $\frac{1}{2}$ equiv. of I a blue salt of the compn. $[Ni(Dipyr)](H_2O)_2 \cdot (NO_3)_2 \cdot H_2O$ is formed. No measurable crystals were ob-

tained. From NiCl_2 solns. treated with 2 or 3 equivs of I the salt $[\text{Ni}(\text{Dipyridyl})_2]\text{Cl}_2 \cdot 7\text{H}_2\text{O}$ was obtained. The crystals are monoclinic prismatic, $a:b:c = 0.6113:1:2.0941$, $\beta = 72^\circ 55'15''$. The crystals were isomorphous with corresponding Zn and Cu salts. On heating, the anhydridipyril salt is formed. When 1 equiv of I is added, and after deposition of a tripyridyl salt, some crystals with the compn. $[\text{Ni}(\text{Dipyridyl})(\text{H}_2\text{O})_2]\text{Cl}_2$ were pptd. Reexamination of the crystals of $[\text{Cu}(\text{Dipyridyl})_2]\text{Cl}_2 \cdot 7\text{H}_2\text{O}$ shows it to be monoclinic prismatic with $a:b:c = 0.6111:1:2.1278$, $\beta = 72^\circ 54'15''$. C. E. P. Jeffreys

Osmotic complex with two stationary liquids F. A. H. Schreinemakers and J. P. Werre *Proc. Acad. Sci. Amsterdam* 38, 952-8 (1935).—An osmotic complex, $\pi(W) \cdot L_1(z) \cdot L_2(u) \cdot L_3(v)$, 20.37% NaCl, where the invariant liquids z and u are H_2O and 20.37% NaCl sep. from the variable liquids s and v by 3 pig bladder membranes, was studied. Liquids s and v were initially varying mixts. of NaCl and Na_2CO_3 . The paths of concn. of NaCl in the variable liquids were followed during osmosis and depicted graphically. When a complex contains 1 variable liquid only, the liquid will, during transition toward a stationary state, proceed along a path, the shape of which does not depend upon the quantity of liquid. In a complex with 2 or more variable liquids the path depends upon the quantity of each of the liquids. C. E. P. Jeffreys

Constitution of thioether compounds of platinum K. A. Jensen. *Z. anorg. allgem. Chem.* 225, 115-41 (1935).—

1 Cond. of aq. solns. of $\beta\text{-}[\text{PtCl}_2(\text{Et}_3\text{S})_2]$ depend upon an extremely rapid hydration— $[\text{PtCl}_2(\text{Et}_3\text{S})_2] + 2\text{H}_2\text{O} \rightarrow [\text{Pt}(\text{H}_2\text{O})_2(\text{Et}_3\text{S})_2]^{2+} + 2\text{Cl}^-$. In CH_3OH a similar "alcoholation" occurs which can be followed by cond. measurements. An important difference between α - and β -thioether compds. exists only in the velocity of, but not the magnitude of, alcoholation. The chlorides, bromides and nitrites are only slightly, the nitrate and sulfate on the other hand are almost completely, alcoholated. By mol. wt. determ. it is shown that formulae of compds. of the type $[\text{PtCl}_2(\text{R}_3\text{S})_2]$ should be doubted. There are only 2 isomers of the type $[\text{PtX}_2(\text{R}_3\text{S})_2]$ — $\alpha\text{-}[\text{PtCl}_2(\text{Pr}_3\text{S})_2]$ and the α - and $\delta\text{-}[\text{PtCl}_2(\text{Bu}_3\text{S})_2]$, mentioned by several workers, are claimed by J. not to exist. H. Stortz

The preparation of potassium molybdo- and molybdicyanides Holmström H. Willard and R. C. Thielke. *J. Am. Chem. Soc.* 57, 2609-11 (1935). Cf. Sand and Burger, *Ber.* 38, 3344 (1905).—Tri- and quadrivalent Mo thiocyanate complexes are only partially extd. by ether. A 70-78% yield of $\text{K}_2\text{Mo}(\text{CN})_2 \cdot 2\text{H}_2\text{O}$ (I) is obtained by first pptg. a quadrivalent Mo pyridine thiocyanate (thick oil) in NH_3 soln. and then treating with KCN. Quant. yields of unstable $\text{K}_2\text{Mo}(\text{CN})_2$ in soln. are obtained by oxidizing I with MnO_2 in aq. soln. and removing Mn by oxidation to MnO_2 with MnO_2 after making the soln. alk. Quadrivalent Mo is best prep'd by electrolytic reduction of MoO_3 in 8 N HCl to Mo followed by oxidation with MoO_3 . W. C. Ierrehus

7—ANALYTICAL CHEMISTRY

W. T. HALL

The limitations of colorimetric analyses by present methods. E. L. Armstrong and M. L. Kuder. *J. Lab. Clin. Med.* 21, 181-7 (1935).—Errors in the colorimetric methods for analysis of sugar, nonprotein N, urea N and uric acid are discussed. A new type of photoelectric colorimeter is described. E. R. Main

Aromatic analysis. A useful technic in estimating small amounts of heavy precipitates V. R. Damerell and M. Axelrod. *J. Am. Chem. Soc.* 57, 2724-5 (1935).—Details are given of a simple technic whereby compact circular (or square) piles of ppt. of reproducible dimensions can be obtained in the center of the flask bottom. The apparent areas of these "spots" can be readily measured and compared with the areas produced by known amts. of ppt. C. J. West

Problems and methods in industrial spectroscopy. S. Judd Lewis. *J. Soc. Chem. Ind.* 54, 427-32T (1935).

Qualitative and quantitative spectrographic analysis W. Gerlach. *IX Congr. intern. quim. pura applicada Madrid, 1934; Neues Jahrb. Mineral. Geol., Referate* I, 1935, 13; cf. C. A. 29, 1736¹, 3225¹.—A review of app. methods and results J. F. Schairer

Spectral analytical studies Walther Gerlach. *Z. anal. Chem.* 103, 356 (1935).—W. Kramer. *Ibid.*—Polemical concerning previous papers by Kramer, C. A. 28, 2641¹, 4312¹, 5771¹. W. T. H.

The use of spectral analysis for the determination of alkalis and alkaline earths. V. The direct photoelectric estimation of alkalis W. H. Jansen, J. Heyes and C. Richter. *Z. physik. Chem.* A174, 291-300 (1935); cf. C. A. 29, 2171¹.—The quant. spectral analysis for alkali metals is simplified. The air-C₂H₄ flame sprayed with the liquid to be tested stands before a monochromator which permits the principal line of the elements being detd. to reach the photocell. The liberated electron stream is measured by a charge process with a Lindemann electrometer. The linear relation between the measurements and concn. of elements makes possible the calcn. of alkali by linear interpolation of the measurements. The method is accurate to 5%. Tables contain measurements of the individual alkali ions and the size of error. R. H. Baechler

The practicability of conductometric methods with

visual observation for titration in the presence of many indiffer. foreign electrolytes G. Jander and A. Thiert. *Z. Elektrochem.* 41, 700-4 (1935).—The app. and expl. arrangements for conductometric titrations in the presence of extraordinarily large amts. of foreign electrolytes in the soln. are described. A sufficiently concd. reagent soln. and a calibrated microburet must be used, and care must be taken that in the addn. of the reagent soln. a too decided decrease in cond. does not occur because of diln. Polarization influence is prevented or reduced to a min. by polarizing the electrode, and temp. must be kept const. M. McMahon

Detection and separation of difficultly soluble compounds by concentrated hydriodic acid. F. A. R. Caley and M. Gilbert Burford. *Ind. Eng. Chem., Anal. Ed.* 8, 63-7 (1936).—Substances such as SnO_2 , Cr_2O_3 , BaSO_4 , SrSO_4 , PbSO_4 , $\text{Cr}_2\text{H}_2(\text{SO}_4)_3$, AgI , AgBr , AgCl , CaCl_2 and anhyd. CrCl_3 can be decomposed by heating with HI and it is recommended in qual. analysis to test any residue insol. in HCl or aqua regia with 6 ml. of HI, d. 1.7, per g. of sample. The residue from this treatment should be tested for CaI_2 , Al_2O_3 and SiO_2 in the usual way. W. T. H.

Calculating the blank Bartholow Park. *Ind. Eng. Chem., Anal. Ed.* 8, 32 (1936).—Instead of actually running a blank it is recommended to det. the end point for portions of 10, 20, 30 and 40 cc. and assume that the blank is the same in each titration. Then by simple computations it is easy to compute the numerical value. W. T. H.

Critical studies concerning organic compounds as analytical reagents IV. p-Nitrobenzenesulfonate orcinol as a reagent for magnesium I. Laird Newell, Nathan R. Pike and Joseph B. Icklen. *Z. anorg. allgem. Chem.* 225, 241-4 (1935).—In spite of encouraging reports from Saito and Okuma, C. A. 20, 3000¹, Pegriew, C. A. 23, 2903¹ and Ruigh, C. A. 23, 2905¹, this reagent is not as sp. as might be desired, although it may be useful in helping to identify Mg. The test is reliable, however, only in the absence of NH_4 salts and ions other than those of As^{+++} , Be^{++} , Ce^{+++} , I^+ , Na^+ , Ag^+ , Fe^{++} , Ti^+ , AcO^- , Cl^- , MnO_2 , NO_2^- , NO_3^- , SO_4^{--} and VO_2^{++} . W. T. H.

New organic reagent for cadmium Alfred W. Scott and Eleanor G. Adams. *J. Am. Chem. Soc.* 57, 2541-2 (1935).—1-(2-Quinoly)-4-allyl thiosemicarbazide, $\text{C}_{12}\text{H}_{11}\text{N}_3\text{S}$

NHCSNHNHC₄H₉N (0.5 g. in 100 cc. of 50% alc.) is a sensitive precipitant for Cd⁺⁺ and can be used for detecting Cd in the presence of Cu. W. T. H.

Standardization of permanganate solutions with sodium oxalate. Robert M. Fowler and Harry A. Bright. *J. Research Natl. Bur. Standards* 15, 493-501 (1935) (Research Paper No. 843).—The usual procedure for standardizing KMnO₄ consists in slowly titrating the hot, acid soln. with the temp. at least 60° at the finish. The results agree better with those obtained by other methods of standardization, if the following procedure is used, because there is less danger of decomg. the oxalate by the hot, dil. acid. To 250 ml. of 1.9 N H₂SO₄, which has been recently boiled for 10-15 min. and then cooled to 27-30°, add the accurately weighed Na₂C₂O₄ (0.3 g.) and when, with the aid of stirring, the sample has all dissolved, add 39-40 ml. of approx. 0.1 N KMnO₄ in a steady stream during about 90 sec. while stirring slowly. Let stand until the pink color of the KMnO₄ has disappeared (45 sec.), heat to 55-60° and finish the titration by the dropwise addn. of the KMnO₄. Toward the last be careful not to add a new drop of the KMnO₄ soln. until the color of the previous drop has disappeared. The end point should persist for 30 sec. W. T. H.

Procedure for the separation of the six platinum metals from one another and for their gravimetric determination. Raleigh Gulchurst and Edward Wichers. *J. Am. Chem. Soc.* 57, 2565-73 (1935).—A new and reliable procedure is given for the sepn. and detn. of Os, Ru, Pt, Pd, Rh and Ir which is much simpler than methods hitherto employed. The Os is first distd. off as OsO₄ from HNO₃ soln. through which a current of air is passing. The OsO₄ is absorbed in HCl which is satd. with SO₂, from the resulting soln. the Os is eventually pptd. by hydrolysis and weighed as metal after reduction in H₂. After the removal of the Os, the soln. is heated with HCl and fumed with H₂SO₄. NaBrO₃ is added and RuO₄ distd. off and absorbed in HCl which is satd. with SO₂. This element is pptd. in much the same way as Os by adding NaHCO₃ and boiling; the hydrated ppt. is ignited in H₂ and weighed as Ru. Next, the Pd, Rh and Ir are sepd. from Pt by a controlled hydrolytic pptn. from which the Pt alone remains in soln. It is pptd. as sulfide and weighed as metal. The hydrated dioxides of Pd, Rh and Ir are dissolved in HCl, the Pd is pptd. with dimethylglyoxime and the ppt. is dried and weighed. After the removal of Pd, the soln. is treated with H₂SO₄ + HNO₃ to destroy the excess org. reagent and the Rh is pptd. by means of TiCl₄. The pptd. metal is dissolved in H₂SO₄ and the pptn. repeated. The last ppt. is again dissolved in acid and the Rh is thrown down as sulfide, ignited in H₂ and weighed as metal. Finally, the Ti is removed with cupferron, the soln. freed from org. matter by treatment with H₂SO₄ + HNO₃ and the Ir pptd. by hydrolysis as hydrated dioxide which is ignited in H₂. W. T. H.

Determination of aluminum and alumina in steels. G. T. Motok and E. O. Walte. *Iron Age* 135, No. 26, 23-5 (1935).—The Al is detd. in a soln. of 10 g. drillings in 100 cc. of 4 N HCl, and the Al₂O₃ in the residue. The latter is washed successively with 0.6 N HCl, hot water, 3% Na₂CO₃, 1.2 N HCl and hot water. It is then ignited, dissolved in strong acid and the soln. made strongly basic with NaOH. After filtering, the Al is pptd. by adding HCl till acid and NH₄OH till neutral. In the Al detn., the Al is first pptd. as AlPO₄ in the usual way and the ppt. treated the same as the original residue was. The method is not applicable to stainless steels. Thirty-three references. F. G. Norris.

Estimation of minute amounts of arsenic in organic material. K. Winterfeld, E. Dorle and C. Rauch. *Arch. Pharm.* 273, 457-67 (1935).—App. and procedures are illustrated and described for the convenient and accurate mineralization of As in org. material, whereby the As is distd. off as AsCl₃ from the reduced material. For the titrimetric estn. (up to 15 mg. As) a procedure is suggested, which involves a simple specially constructed app. designed to convert the AsCl₃ into AsH₃ and absorb the latter in Hg-Cl₂. Smith's method for the iodometric titration of AsH₃,

absorbed by HgCl₂, has been developed into a dependable procedure. The results attained in the present study indicate that by means of the simplest possible app. a micro method for extg. As is now available. W. O. E.

Analysis of beryllium, aluminum and magnesium in ferrous metals. R. Gadeau. *Rev. met.* 32, 398-400 (1935).—One-half g. of metal is dissolved in HCl or H₂SO₄, baked to dryness, didd. and neutralized with NH₄OH after addn. of 5 g. of tartaric acid. Fe is pptd. with H₂S, filtered off and washed with H₂O water. After the H₂S is boiled off, the soln. is made slightly acid with acetic acid and Al pptd. with 8-hydroxyquinoline. Beryllium is pptd. in the filtrate with Na H₂NH₄ phosphate. The filtrate is then made basic with NH₄OH and Mg is pptd. with 8-hydroxyquinoline. J. D. Gat.

Determination of chromium and nickel in ferrous alloys containing manganese and more than one percent of carbon. Tadeusz Cichocki. *Przemysł Chem.* 19, 12 (1935).—From 0.1 to 0.5 g. of alloy is heated for 20 min. with 30 cc. of HClO₄ (d. 1.12), 40 cc. of H₂O is added to the orange-red soln., contg. CrO₃, and it is titrated with standard aq. Mohr salt (NH₄Fe(SO₄)₂ indicator); the mean error is 0.01-0.03%. Ni is detd. in a similarly prepd. soln. by Chugaev's method. Si, if present, is pptd. in a readily filterable form from the soln. B. C. A.

Iodometric determination of copper. Adjustment of hydrogen ion concentration. Wm. R. Crowell, Thomas B. Hillis, Sidney C. Rittenberg and Raymond F. Evenson. *Ind. Eng. Chem., Anal. Ed.* 8, 9-11 (1936).—In the Park method for detg. Cu, C. A. 25, 660, the use of K biphtalate is unnecessary. The p_H at the end point is nearer 3.3 than 4.0 and yet the end point is practically permanent. Completely to ext. all Cu from an org. contg. S or As, a double treatment with HNO₃ + HCl or a single treatment followed by the addn. of satd. Br₂ soln. is advisable. W. T. H.

Inorganic complex compounds in analytical chemistry. III. Detection and determination of copper. C. Mahz. *Z. anorg. allgem. Chem.* 225, 386-92 (1935). *cf. C. A.* 27, 5023.—Reinecke's salt, NH₄[Cr(CNS)₃](NH₄)₂ H₂O, is an excellent reagent for the detection or detn. of Cu. The desired ppt. forms in solns. which are strongly acidic in mineral acid, and ions other than those of Hg, Ti and Ag do not interfere. As little as 3.2 γ of Cu can be detected in the presence of considerably more Bi, Cd, Zn or Pb. To carry out the test dissolve 0.1 g. of K₂SnCl₄(H₂O)₂, by heating with 1 cc. of N HCl, and add 1-2 cc. of the HCl soln. to be tested. After mixing, add 1 drop of a freshly prepd. and filtered soln. of 0.2 g. Reinecke's salt in 10 cc. of hot N HCl. A silky, lustrous, yellow ppt. soon forms or, when very little Cu is present, a yellow color is visible. To det. Cu, take a soln. contg. about 25 mg. Cu, and not over twice this quantity, in 100 cc. and add HCl until the soln. is at least N but not over 3 N in this reagent. If a ppt. of PbCl₂ forms, filter it off and wash with N HCl. Heat to boiling, introduce solid K₂SnCl₄(H₂O)₂ until the green soln. is colorless and add 0.2-0.5 g. of the salt in excess. Meanwhile dissolve for each 10 mg. Cu, 0.1 g. of Reinecke's salt in 10 cc. of 1-2 N HCl at 50°, filter and allow this soln. to drop into the soln. of cuprous salt. Boil for a short time, allow to stand 5 min. and make sure that the pptn. is complete by adding more reagent. Filter through a sintered glass filter, wash the voluminous yellow ppt. with cold 2 N HCl until the filtrate is free from Sn and then with hot water. Dry at 110°. The ppt. contains 16.26% Cu when weighed in this form and not 16.67% Cu according to the formula Cu[Cr(CNS)₃](NH₄)₂. The ppt. can also be dried by washing with alc. and ether. A more rapid method of finishing the analysis consists in dissolving the Cu ppt. in concd. HNO₃, oxidizing the Cr to chromic acid by heating the didd. soln. with HCl and sufficient KBrO₃, decomg. the excess bromate by evap. with (NH₄)₂SO₄ and then detg. the CrO₃ iodometrically. One cc. 0.1 N Na₂SO₃ = 1.589 mg. Cu. W. T. H.

Determination of the total oxidizing power, the nitrite, the ozone and the total chlorine content of ordinary and poisoned air. H. Cauer. *Z. anal. Chem.* 103, 321-34 (1935).—The method of detg. the total oxidizing power of

the air is described and the expts. performed to show the accuracy and reliability of the procedure are summarized. In brief, the method consists in passing air through a suitable wash bottle congl. dil. KI soln with sufficient added acid to make the pH below 2.8. The I content of the KI soln is detd. colorimetrically by comparing the color of the CHCl_3 ext. after treating with a little nitrite, shaking and centrifuging, both before and after the air has passed through the KI soln. Any I_2 developed as a result of oxidation of KI by the air is carried away mechanically and is detd. by difference. Under the prescribed precautions a good indication of the quantity of oxidizing gas present in the air is obtained. The removal of such gas is practically complete but, to some extent at least, the values obtained are only relative and do not give the actual content of oxidizer present. The procedure, however, appears to be capable of practical application. W. T. H.

Field method of determining gold content of ore. K. Pozharitzkii. *Soviet Zolotoprom* 1935, No. 6, 20-2—A review. S. L. Madorsky

Rapid method for the volumetric determination of indium. Henry B. Hope, Madeline Ross and J. F. Skelly. *Ind. Eng. Chem., Anal. Ed.* 8, 512 (1936).—The method is based on the titration of In acetate soln with $\text{K}_2\text{Fe}(\text{CN})_6$ to an end point with diphenylbenzidine which changes from green to blue. W. T. H.

Colorimetric determination of iron by means of ferric thiocyanate. M. Bertaux. *Documentation scientifique* 4, No. 32, 49-52 (1935). *Chimie & Industrie* 34, 1058-9.—The usual method has been modified with a view to eliminating the errors due to differences in color resulting from differences in the concn. of alkali thiocyanate and in the nature and concn. of the acid used for dissolving $\text{Fe}(\text{OH})_3$. Dissolve the sep'd. $\text{Fe}(\text{OH})_3$ (contg. not more than 0.04 g. Fe) in 30 cc. of 50% HCl , add 5 cc. of a mixt. of 2 parts of 36% Be HNO_3 , 2 parts of 3% H_2O_2 and 1 part H_2O , dil. to 500 cc. with distd. or Fe-free tap water, add 25 cc. NH_4CNS (exactly 175 g. per l.), and dil. to 900 cc. To each of 2 other flasks add 30 cc. of 50% HCl and 5 cc. of the $\text{HNO}_3\text{-H}_2\text{O}_2\text{-H}_2\text{O}$ mixt., dil. to 500 cc., add 25 cc. NH_4CNS , dil. to 900 cc., to 1 of the flasks add a 0.1 g. per l. soln. of FeCl_3 till the color is just slightly less than that of the sample, and in the other sufficient of the soln. to give a slightly deeper color, and such that the difference in the amts. added to the standards does not exceed 0.001 g. FeCl_3 . A. Papineau-Couture

Accurate separation of precipitated mercuric sulfide and sulfur in the gravimetric determination of mercury. Earle R. Caley and M. Gilbert Burford. *Ind. Eng. Chem., Anal. Ed.* 8, 43 (1936).—Instead of attempting to dissolve out the S it is recommended to weigh the ppt. of $\text{HgS} + \text{S}$, dissolve the HgS in cold, concd. HI and weigh again. The results obtained with samples of com. HgS apparently justify this procedure. W. T. H.

Potentiometric determination of quadrivalent osmium with chromous sulfate. Wm. R. Crowell and Harlan L. Baumbach. *J. Am. Chem. Soc.* 57, 2007-9 (1935).—App. and procedure for storing and handling CrSO_4 solns for standardizing with $\text{K}_2\text{Fe}(\text{CN})_6$ and $\text{K}_2\text{Cr}_2\text{O}_7$ and for detg. Os in K_2OsBr_6 and K_2OsCl_6 by potentiometric titration. In the reaction, quadrivalent Os is reduced to the trivalent state and bivalent Cr is oxidized to the trivalent state. The titer of the CrSO_4 soln. remained const. for 1 month. The error in the titration with 0.01 N CrSO_4 was less than 0.2%. W. T. H.

Determination of radium in carnotite and pitchblende. L. D. Roberts. *Ind. Eng. Chem., Anal. Ed.* 8, 5 (1936).—Ra is detd. electroscopically by means of radon introduced into an electroscope chamber. With a Lind electroscope, accurate values can be obtained. Fuse the ore with Na_2CO_3 , chill the melt suddenly by immersing the Pt boat in cold water, dissolve the melt in HNO_3 and collect the radon. W. T. H.

Determination of rhenium. I. Qualitative. Loren C. Hurd. *Ind. Eng. Chem., Anal. Ed.* 8, 11-15 (1936).—The bibliography of Re is given and most all of the tests that have been proposed are considered critically. The colorimetric detn. of Re as developed by Geilmann,

Wrigge and Weibke, *C. A.* 27, 42, is the most convenient lab. test for the rapid detection of heptavalent Rh. In the Noyes-Bray scheme of analysis, Re was found in the Te group by Kao and Chang, *C. A.* 28, 3695¹; in the Prescott and Johnson scheme, the element will appear in the test for As. The spectroscopic identification is easy when much Re is present but considerable trouble in identifying 4 of the lines is encountered when much Fe, Mn or Mo is present. If solns. contg. Mo and Re are treated with Ft xanthate, a Mo complex is formed which can be removed by shaking with CHCl_3 and the Re can then be detected easily. W. T. H.

Colorimetric determination of silver in minerals. C. F. Miller. *Chemist Analyst* 25, No. 1, 8-10 (1936).—From 1 to 20 mg. per l. of Ag can be detd. by reducing the Ag^+ to a clear yellow sol. with $\text{Na}_2\text{S}_2\text{O}_4$ in the presence of a stabilizer such as gelatin. The Ag content is detd. by comparison with standard solns. treated similarly. The Ag is first ppt. as AgBr , the small ppt. is dissolved by long digestion with strong NH_4OH , 0.03-0.06 g. of the powder reagent is added and the sample is heated to 50°. W. T. H.

Rapid method for the determination of titanium. Henry B. Hope, Raymond F. Moran and Arthur O. Ploetz. *Ind. Eng. Chem., Anal. Ed.* 8, 48-9 (1936).—Instead of reducing the Ti in a Jones reductor and titrating with an oxidizing agent such as KMnO_4 , it is recommended to reduce with liquid Zn-amalgam and titrate the soln. with ferric alum to an end point with KCNS soln. (cf. Knecht and Hibbert, *Ber.* 36, 146 (1903)). W. T. H.

The iodometric titration of zinc according to Rudolf Lang. Chr. W. Raadsvelde. *Chem. Weekblad* 32, 653-7 (1935).—The theoretical factor, rather than the empirical factor given by Lang (*C. A.* 24, 1055), should be used in computing the results, but the result of many analyses indicate that the method is useful only as an approximation method. N. Bekkedahl

The determination of phosphorus by the x-ray spectrograph. A. Merkel. *Ber. Naturf. Ges. Freiburg* 34, 249-52 (1934). *Neues Jahrb. Mineral. Geol.*, Referate I, 1935, 131. Spectrographic analysis of an eruptive rock for P_2O_5 gave 0.27%, chem. analysis 0.21%. An intensity factor is necessary. J. F. Scharer

The determination of sulfur in soluble sulfides by photometric titration. Shiro Hirano. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 598-601 (1935), cf. *C. A.* 29, 5379².—As standard titrating solns. (1) $\text{Pb}(\text{NO}_3)_2$, (2) HgCl_2 and (3) BiCl_3 were used. Data show that methods (1) and (2) can be used in the presence of reducing agents such as sulfites, thiosulfates, etc. All 3 methods are suitable for detg. S in sol. sulfides in solns. of deep color or contg. a protective colloid. Karl Kammermeyer

Analysis of calcium phosphate. Hans Trapp. *J. prakt. Chem.* 144, 93-105 (1935).—In the analysis of a sample of $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ good results can be obtained in detg. Ca by dissolving the sample in 30% $\text{AcOH} + 1$ cc. of concd. HCl , dilg. to 400 cc. and adding 4 g. of $(\text{NH}_4)_2\text{C}_2\text{O}_4$. Weighing as CaC_2O_4 after moistening the ignited ppt. with $(\text{NH}_4)_2\text{CO}_3$ soln. and heating again is advocated. Fairly good results are also obtained by pptg. and weighing the Ca as $\text{Ca}_3(\text{PO}_4)_2$. To accomplish this, dissolve the sample in dil. HCl , dil. with hot water to 250 cc. and add NH_4OH dropwise until a neutral reaction to phenolphthalein is obtained, then add 25 cc. of 10% NH_3 soln. in excess. After standing overnight, filter and wash the ppt. with hot water. The sample can also be analyzed volumetrically by adding a measured vol. of NaOH , filtering after 12 hrs., titrating the excess NaOH with acid and detg. thereby the quantity of base required to convert CaHPO_4 into less sol. $\text{Ca}_3(\text{PO}_4)_2$. Some studies were carried out with respect to weighing the yellow phosphomolybdate ppt. The difficulty in obtaining a const. wt. after drying is not due to the variability of the Mo/P ratio but rather to a reduction and formation of a blue compd. insol. in NH_4OH . By dissolving out the unchanged NH_4 salt, it is fairly easy to oxidize the blue compd., but no recommendation is made with respect to preventing its formation. W. T. H.

Determination of water in glycerol. C. P. Spaeth and

G F Hutchison *Ind Eng Chem, Anal. Ed* 8, 29-32 (1936) —A crit study of the modified Rojahn method, C A 14, 2602, shows that it only approximates the true H_2O content of glycerol. A new method is described which is based on the removal of water at 100° under 2-3 mm pressure. The volatility of glycerol and low-boiling impurities is controlled by a condenser. The error of the method is not over 3% when the water content is 0.5 to 5% W T H

Source of loss of ammonia in Kjeldahl distillations. Method of eliminating this loss. Høke S Miller. *Ind Eng Chem, Anal. Ed* 8, 50-1 (1936) —There is danger of some NH_3 being lost during the first few min of a Kjeldahl distn. This loss can be prevented to a large extent by using a delivery tube contg small holes which cause the first air bubbles that come over to be so broken up that small quantities of NH_3 are more readily absorbed in the acid W T H

An x-ray investigation of the solid-solution nature of some nitrate contaminated barium sulfate precipitates. Geo H Walden, Jr., and M U Cohen *J Am Chem Soc* 57, 2591-7 (1935) —The app used is described. A series of ppts contaminated with nitrate were prep'd and exam'd. The compn of the ppts with respect to nitrate appears to be a function of the Ba^{++} concn from which the ppt is formed and the nitrate concn has little effect. Apparently the contaminant enters the $BaSO_4$ lattice with the formation of a solid soln. The role of such a solid soln in the general problem of ppt contamination is discussed W T H

Method of analysis for fluoride. Application to determination of spray residue on food products. W M Hoskins and C A Ferris *Ind Eng Chem, Anal. Ed* 8, 6-9 (1936) —The method of Armstrong, C A 23, 2397, 5273, which involves the titration of the F^- in 50% alc with Th^{+++} soln in the presence of Na alizarinsulfonate was studied and modified. In the revised form the method is capable of detg 0.006 to 0.09 mg of F in 5 cc of soln, within 1% of the truth. In a vol of 50 cc equally accurate results were obtained with 0.057 to 0.76 g of F W T H

Iodometric determination of sulfates. S Rivas Goday and A Calatayod *Bol Farm Militar* 13, 361-4 (Dec. 1934), *Chimie et Industrie* 34, 792 —A modification of Hummer's method (*Ann J. Sci and Arts* 114, 478 (1877)) in which the soln is made basic to phenolphthalein with NaOH after adding $BaCl_2$ and before adding $K_2Cr_2O_7$ A Papineau Couture

Rapid gravimetric determination of silicic acid. N A Tananaev and M K Buichkov *Z anal Chem* 103, 349-53 (1935) —The results of 20 analyses for detg the SiO_2 content of limestone, quartzite, glass, clay and loam prove that good results can be obtained in about 2.5 hrs by a treatment which consists in fusing the sample with a considerable excess of Na_2CO_3 , pouring the melt in a thin layer on to a flat piece of porcelain. Ni, polished steel or Pt, treating with concd HNO_3 , eventually dilg with at least 4 times as much water, adding 6-15 cc of hot 0.1% gelatin soln, filtering, washing with 3% HNO_3 , igniting and weighing W T H

A new test for tartaric acid. Maurice Pettez *J pharm chim* 21, 542-6 (1935), cf C A 30, 1517 —The reagent (A) is a soln of 2 g resorcinol and 10 g KBr in 100 cc H_2O , with 1 cc H_2SO_4 added when soln is complete. To apply the test, add 0.1 cc of A to 2 cc H_2SO_4 (d 1.84), then 0.1 cc (2 drops) of 2% tartaric acid (B) soln and heat on a steam bath. A pale blue color appears in 1 min, it becomes deeper in 5 min, and intense when cautiously heated over a direct flame. When neutralized by NaOH, a violet tint is obtained. Addn of 1 cc H_2O to the blue soln changes it to current-red, addn of 10 cc H_2O causes it slowly to fade. The blue color is formed with a 1% soln of B in 2 mm, with a 0.1% soln in 5 mm. The reaction is sp for resorcinol, also for B except in the case of chloral, with which the same tints are produced (cf Ware, C A 30, 953) but which can previously be removed by heat. Hypochlorites, chlorates, nitrates and permanganates can be eliminated by

previous reduction with a Zn-Cu couple (5 cc of a soln contg Zn and 4.5 drops of aq. satd $CuSO_4$ soln). The test permits detection of B in presence of bromides, bromates, nitrites and ferric salts S Waldbott

Eliminating the effects of phosphate radical in qualitative analysis. I-V Saburo Ichimaru *Science Repts Tohoku Imp Univ, First Ser* 24, 426-80 (1935) —See C A 27, 3806, 5029, 5670, 28, 1950⁴, 29, 2884⁴ G G

The separation and determination of the metal ions and phosphate radical in the presence of one another. I, II Saburo Ichimaru *Science Repts Tohoku Imp Univ, First Ser* 24, 481-92, 493-511 (1935) —See C A 28, 6392⁴, 29, 2848⁴ G G

Detection of the oxalate ion. N A Tananaev and A A Budkevich *Z anal Chem* 103, 353-5 (1935) —Under the conditions given, neither indigo nor oxalic acid is oxidized by $Cr_2O_7^{--}$ but when both these substances are present, both are oxidized. By the resulting decolorization of the indigo soln, very little oxalic acid can be detected. If S^{--} , SO_3^{--} or $S_2O_3^{--}$ is present there is interference because these anions react with $Cr_2O_7^{--}$. When they are present proceed as follows: Take 2-3 cc of the soln to be tested and add an excess of 7 N H_2SO_4 . Boil until there is no more odor of H_2S or SO_2 . Filter if there is much S pptd. To the clear soln add some 0.01 N $K_2Cr_2O_7$ soln. In another test tube heat 0.01 N $K_2Cr_2O_7$ with enough indigo soln to give a distinct blue color. Now mix the 2 solns and if the soln is 0.01 N in $C_2O_4^{--}$ decolorization results within 2 min. As little as 0.03 mg of $H_2C_2O_4 \cdot 2H_2O$ can be detected W T H

Destruction of organic matter prior to the determination of mercury in organic compounds. C V Bordenau *Ann sci univ Jassy* 20, 129-31 (1935) —Treat 0.3-0.5 g of the comp'd in a 250-cc Erlenmeyer flask with 1-1.5 g of powd $KMnO_4$ + 10 cc. of concd HNO_3 . After the mixt stands 30 min at room temp add 1-2 cc of concd H_2SO_4 and allow to stand 15-20 min longer. Then dil with 50-60 cc of water and heat on the water bath. Decolorize the soln with 3% H_2O_2 and det. Hg by the thiocyanate titration. If halide is present it is necessary to heat with H_2SO_4 more strongly, in order to remove all halide. The results obtained in the analysis of several Hg org compds were satisfactory. W T H

Determination of organic sulfur by the liquid ammonia-sodium method. F J Sowa, V G Aracchi and J A Newland *Ind. Eng. Chem, Anal. Ed* 8, 49-50 (1936) —Compds. sol in liquid NH_3 which do not form intermediate products that cannot be reduced easily can be detd accurately by reducing with Na whereby either Na_2S or Na_2SO_3 is formed. By adding Na_2O_2 and evap., the S is oxidized to sulfate and can be detd as $BaSO_4$. Excellent results were obtained with 16 typical org compds W T H

Determination of formic acid in pyrolytic liquors. Herman D Weihe and P. Burke Jacobs *Ind Eng. Chem, Anal. Ed* 8, 44-7 (1936) —Neutralize with NaOH and add 20% in excess. After 24 hrs. add 5 cc of syrupy H_3PO_4 and distil by heating to 150° in a glycerol bath. Neutralize a suitable aliquot with $Ba(OH)_2$ to a phenolphthalein end point and evap to dryness on the water bath. Dissolve the residue in 50 cc of warm water and transfer to a reaction flask. Add a small piece of paraffin to reduce foaming and 5 cc of NAOH. Dil to about 100 cc and boil 10 min while passing CO_2 -free air through the app to remove any dissolved CO_2 . Then add 20 cc of $Hg(OAc)_2$ oxidizing soln (100 g H_2O dissolved in 11 of 0.5 N NAOH and boiled 1 hr to remove CO_2). By means of the Hg salt, the formic acid is oxidized to CO_2 which is absorbed in a known vol of standard $Ba(OH)_2$ soln and the excess is detd by titration. Small quantities of formic acid can be detd within 3% of the truth and large quantities within about 0.5% W T H

The use of the original Hanau lamp in qualitative analysis. I. Photoanalysis in the pyridine and indole series. Hans Freytag *Z anal Chem* 103, 334-40 (1935) —If Schleicher & Schüll filter paper No. 589 is dipped in an approx 0.2% soln of pyrazolone and is then dried without exposure to daylight, a very sensitive test paper for pyri-

dune and its derivs. is obtained. Under the ultraviolet rays of the quartz lamp, a spot produced with 0.01 cc. of a soln. contg. pyridine will soon show a red or gray coloration, which will become changed to an ultramarine blue in less than 10 min. The test paper, however, must be kept in the dark as it turns brown when exposed to light and thereby loses its ability to react with pyridine. If 0.01 cc. of a soln. in alc. or in aq. alc. of indole is dropped upon a Schleicher & Schüll filter paper and then treated with a drop of the same size of dil. H_2SO_4 , exposure to the rays of the quartz lamp will soon cause the appearance of a pink or flesh-colored spot. The reaction takes 250 times as long in diffuse sunlight as it does under the quartz lamp.

W. T. H.
Potentiometric determination of mercaptans. Miroslav W. Tamele and Lloyd B. Ryland. *Ind. Eng. Chem., Anal. Ed.* 8, 16-19 (1936).—Use enough 0.1 N NaOAc dissolved in 96% EtOH to dissolve the sample. Titrate with 0.01 N $AgNO_3$ dissolved in isopropyl alc. contg.

about 9% water. Det. the end point potentiometrically with an electrode of Ag as indicator and a Hg half cell as the other electrode. The results are good. W. T. H.

Colorimetric determination of salicylic acid. P. Karsten. *Chem. Weekblad* 32, 526 (1935).—Heestermans observation was confirmed (C. A. 30, 702). For detn. of salicylic acid colorimetrically in 50 cc. of soln. in acid is used 2 cc. of a soln. contg. 54 mg. $FeCl_3 \cdot 6H_2O$ and 10 cc. AcOH in 100 cc.

B. J. C. van der Hoeven
Color reaction for detection of cyclopentadiene. Boris N. Alanas'ev. *Ind. Ing. Chem., Anal. Ed.* 8, 15 (1936).—Mix 1 drop of the liquid with 1 cc. each of $CHCl_3$ and glacial AcOH and treat cautiously with 2-3 drops of concd. H_2SO_4 . As little as 0.1 mg. of the compd. suffices to give a distinct violet coloration. W. T. H.

Detn. of phosgene in gases from expls. fires extinguished with CCl_4 fire-extinguisher liquid (Yant, et al.) 13.
Stepwise titration of a dibasic acid (Kilpi) 2

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAUER

Auromiridium. O. Zvyagintsev. *Sotzislst. Rekonstruktsiya*: Nauka 1935, No. 3, 176.—A new mineral has been found composed of Ir 52, Os 25, Au 19 and Ru 3.5%, it represents a natural alloy in the form of grains 0.2-2 mm. in diam. B. V. Shvartzberg

Todorokite, a new manganese mineral from the Todoroki mine, Hokkaido, Japan. Toyotomi Yoshimura. *J. Faculty Sci., Hokkaido Imp. Univ. Ser. IV* 2, 279-37 (1934). *Neues Jahrb. Mineral. Geol., Referate I*, 1935, 147.—Todorokite is monoclinic with cleavages on 100 and 010. It is sol. in HCl and in hot concd. H_2SO_4 , and analysis gave K_2O 0.54, Na_2O 0.21, MgO 1.01, CaO 3.28, BaO 2.05, Al_2O_3 0.28, Fe_2O_3 0.20, MnO 65.89, O 12.07, H_2O +9.72, H_2O -1.56, SiO_2 0.45, TiO_2 and CO_2 traces, P_2O_5 0.42, SO_2 0.28, invol. 1.28, sum 93.24%. Formula $3(Mn_2O_3 \cdot 3MnO_2 \cdot 2H_2O) \cdot 2RO \cdot MnO_2 \cdot 2H_2O$, with $R = Ca, Mg, Ba$ and Mn^{IV} . J. F. Schauer

Mineral formation in the system. Al_2O_3 - SiO_2 - H_2O . W. Noll. *Neues Jahrb. Mineral. Geol., Beilage-Bd. 70A*, 65-115 (1935).—Böhmite ($Al_2O_3 \cdot H_2O$) is the stable hydrothermal hydrate of alumina. The following cryst. phases were encountered: bayerite ($Al_2O_3 \cdot 3H_2O$), corundum (Al_2O_3), kaolin ($Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$), a "pyrophyllite mineral" ($Al_2O_3 \cdot 4SiO_2 \cdot H_2O$), montmorillonite ($Al_2O_3 \cdot 4SiO_2 \cdot H_2O \cdot nH_2O$). SiO_2 remained amorphous. J. F. Schauer
Almandine from some deposits of North Caucasus and the Ukraine. D. Serdyuchenko. *Mem. Soc. russe Mineral.* 62, 97-101 (1933). *Neues Jahrb. Mineral. Geol., Referate I*, 1935, 167.—Chem. analyses of almandine are given. J. F. Schauer

X-ray examination of phyllite from clay-with-flints of Vernon (Eure). Boris Branjnikov and Pierre Urban. *Compt. rend. soc. géol. France* 1934, 203-5.—A red-brown phyllite occurs in the clay-with-flints, filling cavities in the chalk near Vernon. Samples of (1) the crude clay, (2) the phyllite dried and powdered and (3) as (2) but completely decolorized by treatment with HCl, were examd. by x-rays. All gave identical spectra. The color is due to leaflets of $Fe_2O_3 \cdot nH_2O$. The spectra are also identical with that of typical montmorillonite, which is decolorized by HCl exactly as this phyllite. This makes it doubtful whether montmorillonite is, as hitherto supposed, a hydrated ferric silicate. C. A. Silberrad

X-ray investigation of turquoise. Fritz K. Mayer. *Chem. Erde* 9, 311-17 (1935).—X-ray examn. of 12 natural (d. 2.687-2.816) and 3 synthetic (d. 2.46-3.173) turquoises and of wavelite (d. 2.416) and chalcocyanite (d. 3.211) showed all to give similar diagrams with numerous lines, slight differences in those of the turquoise being due to slight differences in compn. (mainly varying proportions of Fe, turquoise and chalcocyanite being connected by an isomorphous series). Removal of H_2O (17.69-20.86% in the natural, 11.96-12.20 in the artificial) by heating

turquoise in a flame caused no distortion in the lattice, but a diminution in grain size. C. A. Silberrad

X-ray investigation of turquoise and other phosphates. Hermann Jung. *Chem. Erde* 9, 318-20 (1935), cf. C. A. 26, 3754.—J. doubts Mayer's conclusion (preceding abstr.) as to the similarity of the Debye-Scherrer diagrams of turquoise and wavelite, finding that of $FePO_4$ distinctly different from that of $AlPO_4$, which again differs from that of turquoise. Moreover the great difference in d. and of turquoise (2.81 to 1.62) and wavelite (2.33 and 1.53) points to divarication, while the diagram of harborite (cf. Brandt, C. A. 27, 1795) of compn. similar to that of turquoise differs from that of wavelite. The suggestion that the apparent absence of distorting effect on the lattice of the removal of H_2O from turquoise points to the H_2O being zeolitic is inconsistent with the absorption spectrum, which points to the presence of (OH) and not of H_2O . C. A. Silberrad

The indices of refraction of scheelite from Japan. Junpei Harada. *J. Faculty Sci., Hokkaido Imp. Univ. Ser. IV* 2, 279-87 (1934). *Neues Jahrb. Mineral. Geol., Referate I*, 1935, 163.—Precise optical constns. are given for scheelite from Gyōzōyōmen, Japan. J. F. Schauer

Critical observations of mineral behavior when associated with superheated water. Arthur J. Crowley. *Eng. Mining J.* 137, 27-30 (1936).—The phenomenon discussed is believed to function importantly in the processes of mineral depositions in nature. The S-luqueifer described and illustrated permits the production of 99.5% S from a 80% S flotation concentrate from Nevada ores. It seems likely that similar conditions may have caused the formation of certain S deposits. W. H. Boynton

Geology and mines of environs of Giromang (Belfort). Ch. Thurion. *Bull. soc. géol. France* [5], 5, 33-63 (1935).—An account is given of mines 15 km. north of Belfort, which in early times were an important source of Ag, Cu and Pb. The veins contg. galena, chalcocyanite, tetrahedrite and sphalerite, with occasionally pyrite, malachite, pyromorphite, cerussite, arsenopyrite with some danite, chalcocite, zinkenite and cinnabar, with quartz and fluorite and less commonly barite and siderite as gang. The country rock is mainly volcanic—dacite, albized rocks, tufts and breccias and the ores have resulted from hydrothermal action. Many of the mines were abandoned early in the 17th century, and all by the middle of the 18th, save for unsuccessful attempts at reopening since. C. A. S.

A tin occurrence in the limestone at Arandis, German Southwest Africa. Paul Ramdohr. *Neues Jahrb. Mineral. Geol., Beilage-Bd. 70A*, 1-48 (1935).—The Sn occurrence is characterized by a large suite of contact-metamorphic minerals, particularly those contg. Cl, F and B. An unknown mineral believed to be Sn_2S_3 is reported. J. F. S.

9 Weathering of rocks and the composition of clays Antti Salminen *Maatalouskoulantoksen Maatutkimusosasto Agrgeol Julkaisu* (Soil Div Central Agr Expt Sta Finland) No 40, 1-149 (1935) (available in English) —Phenomena influencing the compn of clay sediments were studied and the chem, mineralogical and mech compn of Finnish clays at various places are presented A sample of Rapakivi (a diabase) was found to have lost Al_2O_3 , CaO , Na_2O and Fe in the process of weathering and to

have gained in Fe^{+++} , SiO_2 and K_2O . In a sample of granite Al_2O_3 , Fe_2O_3 , FeO , CaO , Na_2O , P_2O_5 and TiO_2 decreased while SiO_2 and K_2O increased. Changes in this granite were shown by microscopic exam. to be due mainly to weathering of biotite and plagioclase. New analyses of a peridotite boulder showed little change in chem. compn on weathering, indicating that the minerals concerned, olivine and augite, are resistant. A rather strongly weathered mica-schist, consisting of quartz, biotite and feldspar, was found to have lost $1/4$ of its Fe , $1/2$ of its MgO , $1/2$ of the K_2O and some of the Al_2O_3 , while SiO_2 , CaO and Na_2O increased. H_2SO_4 present in this rock accelerated the weathering which occurred mainly by decompos. of the biotite. Samples of serpentine, always contg. dolomite or magnesite and tremolite, talc or sometimes olivine, lost, on weathering, 50% of the Al_2O_3 , 90% of the CaO , 50% of the CO_2 and some MgO , while SiO_2 , S and H_2O increased. Atm. weathering in Finland is negligible, but considerable weathering occurs beneath the surface of the soil soln. contains H_2SO_4 . Differences in the reaction of the soil soln. are the fundamental cause of the variations in the trend of weathering in different climatic zones. When the reaction is acid, weathering causes loss of Fe and Al, i. alk., SiO_2 decreases, and Fe and Al gain. The pH of spring waters in the eastern Rapakivi area varied from 4.6 to 5.93. The wear of angular and rounded rocks on sandy and stony beaches was studied by placing rock fragments of known weight on the beach and recording the loss in weight at intervals. Both angular and round fragments show rapid wear. A moderate wind velocity grinds the rock material to a product resembling clay. The wear during an equal no. of speed-hrs. (miles per sec. multiplied by time in hours) is independent of the velocity of the wind. Wave action is discussed. The reaction of the water that comes into contact with the finely ground material during the sedimentation process is important. The pH of sea water around Finland varies from 7.70 to 8.48. The surface layers of Finnish lakes are nearly neutral but the deeper water has a pH of about 5. Rocks and minerals are more sol. in sea water than in distd. H_2O . The trend of weathering in sea water is opposite to that on land. The av. compn. of bedrock in Nivala and Ylivieska was calcd. from analyses and the area occupied by each variety. The results were SiO_2 63.22, TiO_2 0.57, Al_2O_3 16.67, Fe_2O_3 0.97, FeO 4.47, MnO 0.4, MgO 3.37, CaO 4.68, Na_2O 3.22, K_2O 2.67 and P_2O_5 0.14%. The chem. and mineralogical compn. of Finnish clays from the same regions was investigated by sampling, with a borer, clays of different ages from the same vertical profiles, subjecting them to mech. and complete chem. analysis, and fixing the age by diatom detn. The mineralogical compn. was calcd. from the results. The chem. compn. of a clay is dependent mainly on the amt. of the finest grain-size group. With increasing amts. of the finest grain-size group the bases increase and SiO_2 decreases. Neither the age of the clay nor the underlying bedrock had much effect on its compn. The chem. compn. of the clays can be explained by the enrichments in micas without much effect due to chem. weathering. Differences in chem. and mech. compn. are caused mainly by heterogeneity of the original rock. The clays of the eastern Rapakivi granite region were investigated in the same manner as those above but not as completely. Bedrock (diabase) and clays from the island of Valama were studied. Because of the sorting action of H_2O and the well-mixed parent moraine material, the clays have a similar compn. over a wide variety of rocks. The chem. compn. of artificially sepd. clay fractions from various countries is discussed, as is also the enrichment of TiO_2 , Fe oxides and Al_2O_3 in clays. Variations in layers of laminated late-glacial clays are explainable in the same manner as in other clays. Investigations of Finnish clays also indicate that chem. weathering was unimportant and that the kaolin content is very small. One hundred and two references. Colin W. Whitaker.

Gneissic complex of the Darjeeling District, Bengal. S. K. Ray. *Quart. J. Geol. Mining Met. Soc. India* 7, 27-44 (1935).—Analyses of sillimanite-gneiss, feldspathic

mica-schist and the Kalupang gneiss are given.

Alteration in quartz in sedimentary rocks. Jacques Boucart. *Compt. rend. soc. géol. France* 1934, 55-6, cf. *Ibid.* 1933, 197.—The corroded quartz found in some Tertiary and Quaternary limestones in Morocco and Spain, and thought to be due to the action of CaCO_3 on SiO_2 at a high temp., is always associated with phosphate. On the analogy of the assoc. of the disease of "mottled enamel" with F in the H_2O B suggests that the corrosion may be due to the combined action of F in soln. and phosphate on SiO_2 . C. A. Silberrad.

The composition of "burnt-rock" from Kusnezsk-Becken. B. Behlov. *Trav. Inst. petrog. Acad. Sci. U. R. S. S.* 4, 91-101 (1933). *Neues Jahrb. Mineral. Geol.*, Referate II, 1934, 865.—Chem. and mineralogical data support the conclusion that the rock was formed by the melting of a clay-bearing sandstone. J. F. S.

Studies of two samples of sediments from the Mugselsee. W. Benade. *Mitt. Lab. Preuss. Geol. Landesanstalt* 19, 31-43 (1933).—Data are given on the phys. properties and complete chem. analyses of 2 sludges. The ash content and solvent effect of alc., CCl_4 and Na_2SO_4 were detd. as well as the C and N contents of the material extd. by the solvents. For methods used cf. C. A. 29, 4113. J. F. Schärer

Studies of four samples of sediments from the Sakrower See. W. Benade. *Mitt. Lab. Preuss. Geol. Landesanstalt* 19, 45-58 (1933).—cf. preceding abstr. J. F. S.

Spongillae and silicified gypsum in the upper Eocene of the Berry. André Vatan. *Compt. rend.* 201, 1402-4 (1935).—At various places in western Cher there occur pebbles and buhrstones of skeleton crystals of gypsum more or less silicified, and in places lenticular masses of similar compn. approximating to opalite, all pointing to lagoon or lacustrine origin in an arid climate. C. A. Silberrad

The gases, sublimation and encrustation products and thermal waters of the "lades" of Merapi. M. Hartmann. *Vulkanol. seismol. Mededel.* No. 12, *Dienst van der Mynd. van Nederlandisch Indie* 117-31 (1933); *Rei. Geol.* 15, 242.—The sublimation products found around the "lades" of the volcano Merapi, after the eruption in 1930, consisted of chlorides and sulfates. Secondary fumaroles showed temperatures between 90° and 110°. The escaping gas contained CO_2 , H_2S , SO_2 and COS. The last gas is not primary but is formed from org. material and primary S at a temp. over 400°. Analyses of the thermal waters show large quantities of dissolved material. J. F. Schärer

Content of less common elements in eruptive rocks. E. Tröger. *Chem. Erde* 9, 286-310 (1935).—The occurrence in eruptive rocks of the chief rock-forming minerals contg. the less common elements (P, Ti, Zr, Hf, Th, Ge, Sc, Ga, B, V, Cr, W, U, Mn, Ni, Co, Cu, Zn, Pb, Be, Sr, Ba, Li, Rb, Cs, F, Cl, S and the rare earths) and their mutual relations, with special reference to the at. radii of the elements, are discussed. Thence with the aid of some 1000 analyses, the av. content of these elements in each of 28 classes of eruptive rocks is deduced. C. A. Silberrad

Geochemistry of the alkali metals. II. V. M. Goldschmidt, H. Bauer and H. Witte. *Nachr. Ges. Wiss. Göttingen, Math.-physik. Klasse* 1, 39-55 (1935); cf. C. A. 27, 4757, and Tolmachev and Filipov, C. A. 29, 3009, 4295.—The qual. spectrographic method of Tolmachev (C. A. 28, 4679) for Rb and Cs is quant. if the mineral is mixed with an equal wt. of NaCl to insure complete volatilization of the alkalis, and the photographs are compared with standards. The most suitable lines are 7800.30 and 7947.63 for Rb, 8521.15 and 8943.60 for Cs. The Rb detn. can also be made by comparison with added Rb. As expected, Rb and Cs are especially high in the K-silicates of pegmatites. The at. ratio Rb/Cs is somewhat variable, but approximates 45. Green amazonites are found to be much higher in Rb and Cs than intimately assoc. red microclines. Michael Fleischer

The geochemistry of selenium. II. V. M. Goldschmidt and L. W. Strock. *Nachr. Ges. Wiss. Göttingen, Math.-*

physik Klasse 1, 123-42(1935); cf. *C. A.* 27, 4757—The Se content of sulfides was detd by soln in HNO_3 and Br, evapn with H_2SO_4 , distn by a modification of the method of Robinson, Dudley, Williams and Byers (*C. A.* 28, 5763), and colorimetric detn by the Cousen method (*C. A.* 18, 1735). The Se content of sea water was detd by pptg $\text{Fe}(\text{OH})_3$, which adsorbs the Se, and analyzing the ppt as usual. The Se content of primary, magmatic sulfides was higher than that of other materials, but the Se S ratio was highest in sedimentary Fe and Mn oxide ores. Sea water, salt beds and sedimentary rocks are very low in Se. North Sea water contained 3.8×10^{-7} g/l. This is due to the fact that Se reaching the ocean is not oxidized to selenate, but is adsorbed by pptg. Fe and Mn hydroxides. The only salt deposit high in Se is the Chulcan caliche, formed under conditions sufficiently oxidizing to convert the Se to selenate.

Michael Fleischer
Selenium content of European and Japanese clay shales
F. Minami. *Nachr. Ges. Wiss. Göttingen, Math.-physik. Klasse 1*, 143-5(1935)—The Se content of European and Japanese paleozoic and Japanese mesozoic clays was detd by the method of Goldschmidt and Strook (cf. preceding abstr.). The Se content varied somewhat, but the at. ratio S Se was approx. 10,000 for all 3. M. F.
Occurrence of vanadium in fossil coals V. A. Zilber-

mintz. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 3, 117-20(1935)—Over 500 samples of coals from Russian fields were analyzed for V. In most of them only insignificant amts. (0.02-0.3% V_2O_5) were found. A no. of samples of definite vegetable origin, of Jurassic age, in the Ural region showed 0.56-8.79% V_2O_5 . Most of these coals belong to the clareno-vitrene type and often have a lignite structure. Most of the V content is ascribed to infiltration of V-bearing material during the laying down of the coal beds. C. E. P. Jeffreys

9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR E. HARDER AND RICHARD KIMBACH

Application of chemistry to metallurgy E. I. Orlov. *Trans. VI Mendeleev Congr.* 1932, II, 1, 378-95(1935).—A progress report on the iron and steel industry. Among new developments in the U. S. S. R. are to be noted investigations on the direct production of iron from ore without the blast furnace process, on the utilization of complex iron ores and on the use of O. E. E. S.

Rapid determination of solid phase in flotation pulp L. M. Iol'son and E. I. Dubovitskaya. *Zavodskaya Lab.* 4, 1106-8(1935)—With the aid of prep. comparative tables, the percentage of solids in a flotation pulp is detd from the d. of a sample of the pulp obtained by weighing and measuring it. A long handle porcelain scoop and a buret are illustrated and described. Chas. Blanc

Practical examples of ore preparation in Bolivia István Szegedy. *Bányász Kohász Lapok* 68, 422-8(1935)—Difficulties encountered after modernization and rebuilding of the plant of the Sociedad Española Morococala, where pyritous cassiterite ores are prep. and enriched, are discussed. A special lab. pulsation sedimenting app. is described. S. S. de Finály

Beneficiation of low-grade ores will prolong life of Mesabi Range E. W. Davis. *Iron Age* 136, No. 20, 30-1, 41(1935), cf. *C. A.* 29, 3952⁴ F. G. Norris

Roasting and sintering dusts and powdery ores in a Saint-Jacques turbulent-flow furnace Camille Saint-Jacques and Louis Poupet. *Rev. met.* 32, 581-8(1935)—The pulverulent nature of most materials to be sintered interferes with heat transfer, increasing both the time and heat consumption of the operation. In the present furnace, roasting is carried out when particles are suspended in hot gases. The operation takes only seconds and the material reaches the bottom of the furnace in an incandescent state so that it sinters easily. Mech. details of the furnace, which was in com. operation for more than a year, are given together with a description of its application for calcining phosphate rocks, clinkering cement mixts or roasting and sintering blast furnace dust and ores. The furnace is small and inexpensive both to build and operate. J. D. Cat

Manganese ores of Urkut István Vitéz Bányász Kohász Lapok 68, 346-58, Roy Hung. Palatin-Joseph Univ. Tech. Econ. Sci., Sopron, Pub. Dept. Mining Met. 7, 54-74(1935)—At Ujakra a new deposit has been found of ores contg. in certain portions of the deposit 46-52% Mn. A special enriching process was worked out to produce a

concentrate contg. 40% Mn from ores contg. 23-27% Mn S. S. de Finály

Low-temperature reduction of magnetite ore. Effect of catalytic compounds G. C. Williams and R. A. Ragatz. *Ind. Eng. Chem.* 28, 130-3(1936)—Certain Na and K compds greatly accelerated the rate of reduction of magnetite ore at 600°. No other materials, except certain Ba compds, showed a similar effect. Hardwood charcoal was a much more active reducing agent than metallurgical coke and responded to the action of Na carbonate as a catalyst. The catalytic effect of various compds was a function of their concn in the reducing mixt. The presence of SiO_2 tended to inhibit the catalytic effect of Na carbonate. A considerable loss of Na occurred in using a reducing mixt. contg. Na carbonate. Leopold Pessel

Itogon—a Philippine gold producer, Ralph Keeler. *Eng. Mining J.* 137, 3-8(1936)—A description of the mining operations of the Itogon Mining Co. where 10,000 tons of ore is treated per month by all chmng, counter-current cyanidation, with close to 92% recovery. A flow sheet and numerous illustrations are included. W. H. Boynton

Continuous determining of the specific gravity of a cyanide solution A. A. Linevskii. *Tekhnika* 1935, No. 32—A description of a continuously acting areometer in which the funnel is counterbalanced with wts. on the balance principle. B. V. Shvartzberg

Flux and reduction experiments with iron-rich bauxites J. Székely and A. Romwarter. *Roy. Hung. Palatin-Joseph Univ. Tech. Econ. Sci., Sopron, Pub. Dept. Mining Met.* 7, 42-51(1935)—Expts. were made with a homogeneous colloidal, deep red Hungarian ore mixt. contg. SiO_2 0.9, TiO_2 1.8, Fe_2O_3 24.3 (= 18.99% Fe) and Al_2O_3 47.75%, loss on ignition was 25.38%. Magnetic sepn. of reduced samples of this ore was unsuccessful. The reduction product probably contained both magnetic and Al_2O_3 mols. within its colloidal particles. Economical working up of such ores seems possible by means of a special reducing soda flux by which both Al_2O_3 and a spongy metallic iron can be produced. S. S. de Finály

Treatment of pulverized materials M. Gutman and G. Leizerovich. *Trans. VI Mendeleev Congr.* 1932, II, 409-20(1935)—A review of existing technical trends in the treatment of pulverized raw materials in the non-ferrous metal industry and of recent progress in the industry of the U. S. S. R. E. E. Stefanowsky

Economics of the aluminum industry. Francis C. Trary. *Ind. Eng. Chem.* 28, 146-52 (1936). G. G.

The thermal processes in the blast furnace. Alfonz Nahoczky. *Bányász Kohász. Lapok* 68, 449-57 (1935). Thermal processes are shown by curves of heat in kg-cal plotted against temp. Heat consumption in the blast furnace depends on the indirect reduction processes, the more richer the ore. Above 80% Fe_2O_3 the blast furnace is much more sensitive to thermic influences.

S. S. de Findly

Distribution of burden at the top of a blast furnace. H. L. Goldstein. *Domes* 1935, No. 8, 1-10. A math discussion of the distribution of burden, with regard to lump size, as it drops from the hopper into the blast furnace.

S. L. Madorsky

Operating conditions in the melting stage of an open-hearth furnace. I. D. Semkin. *Domes* 1935, No. 8, 10-25. A discussion of the relation between the life of a furnace roof and conditions prevailing in the combustion zone of an open-hearth furnace.

S. L. Madorsky

Relation between angle of incline of the flame and horizontal cross section of an open hearth furnace. M. S. Sokolov. *Domes* 1935, No. 8, 25-7. A study of data from successfully operating open hearth furnaces leads to the conclusion that the best results are obtained when $E/L = \sin \varphi$, where F and L are width and length of the hearth and φ is angle of incline of the flame to the horizontal, also, when $\alpha + \beta = 2\varphi$, where α and β are angles of incline of gas and air channels of the furnace.

S. L. Madorsky

Further notes on open-hearth boils. Henry D. Hubbard. *Iron Age* 136, No. 13, 98, 104, 108 (1935). Cf. C. A. 20, 566. The results of early investigations of the gases exd from pig iron and Bessemer steel are cited. Certain relations between these results and the requirements for making running steel are inferred.

F. G. Norris

Slag systems. R. Hay, James White and A. B. McIntosh. *J. West of Scotland Iron and Steel Inst.* 42, Part 6, 90-104 (1935). Cf. C. A. 28, 6407. The nonexistence of grunerite, $FeO \cdot SiO_2$, is established by thermal and optical evidence. A previously unidentified substance with $n = 1.74$ is a eutectic of fayalite and silica. In the ternary system $FeO-MnO-SiO_2$ a deep trough extends from 1155°, the m. p. of the fayalite- SiO_2 eutectic, with a gradual rise in m. p. to 1200° at the rhodonite-tephroite eutectic. No ternary eutectic was found. The binary $MnO-Al_2O_3$ was studied thermally and optically. The addn of Al_2O_3 lowers the m. p. of MnO from 1785° to the eutectic at 21% Al_2O_3 and 1520°. With further addns of Al_2O_3 the liquidus rises continuously to 2050°, the m. p. of Al_2O_3 . The compd. $MnO \cdot Al_2O_3$ m. 1560° incongruently, is hard and brittle, is amber but appears white under the microscope, is isotropic, and has a n between 1.70 and 2.00. All melts in this system have low surface tension. Al_2O_3 is sol. in solid MnO . Thermal data and absence of eutectic at 60% Al_2O_3 indicate MnO is sol. in the compd. The soln of MnO changes the color from amber to bright emerald green. The reaction of $FeO \cdot MnO \cdot SiO_2$ slags with C was studied at 1310°. The oxides were melted and then crushed and remelted with C rod and the gas pressure was measured. The order of activity is FeO , knebelite, fayalite and Mn silicate. Use of high C steel as a source of C indicates the same order of activity. With excess MnO , Fe is a reducing agent. The resulting Mn alloys with the Fe and C. Work is in progress with white cast Fe as a source of C. FeO is the most active oxidizer in this ternary system. At 1310° fayalite is only partially dissociated. In the presence of MnO , stable Mn silicates are formed lowering the concn of free SiO_2 and thus increasing the free FeO. Mn silicates are less active toward C because they are less dissociated, and because MnO is less reducible.

I. G. Norris

Distribution of phosphorus between metal and slag in puddled iron. Nello Collari. *Ann. chim. applicata* 25, 432-47 (1935). In detg. P in Fe it is necessary to det the partition of P between metal and slag. The P in the slag (occlusions) is present as phosphate, while that in the

metal is present as phosphides. Therefore, detn. of the total P and of phosphate P is sufficient. A. W. C.

Foundry coke. W. E. Mordecai. *Colliery Guardian* 151, 1079-81 (1935); C. A. 29, 2337. A discussion of the influence of the phys. and chem. properties of coke on cupola operation. Also in *Gas World* 104, No. 2083 Coking Sect., 3-5, 11 (1935).

Joseph H. Wells

Circulation of gas in mold. The formation of scums and their classification. A. Collin. *Bull. assoc. tech. fonderie* 9, 305-8 (1935). Scums on the casting surface are due to the passage of gas through the metal and the mixing of sand particles with the metal. G. T. Motok.

Nonmetallic impurities in open-hearth steel. Folke W. Sundblad. *Iron Age* 136, No. 20, 21, 76-7 (1935). Various impurities can be eliminated from the bath by the boil on a rod or pole. This method is recommended especially in case of a large bath which is stated to be inferior to a small bath in respect to cleanliness. F. G. N.

Comparative investigations of the effect of special deoxidizers with soft steel. P. Zimmermann. *Mitt. Kohle- und Eisenforschung G. m. b. H.* 1, No. 3, 29-49 (1935). The various deoxidizers for steel have a decided influence on segregations, no. size and distribution of non-metallic inclusions, pipe formation and tendency to aging. The deoxidizers tested and their percentage compns. are: (1) ferrosilicon, Si 70.12, Fe 23.88, (2) calcium silicon,

Si 55.84, Ca 29.25, Fe 14.91, (3) ferrosilite, Si 30.50, Al 19.15, Ti 1.32, Fe 43.13, (4) Sumanal, Mn 19.44, Si 20.95, Al 16.16, Ti 1.50, Fe 31.95, (5) Alsilme, Si 34.10, Al 41.74, Ti 2.88, Fe 18.28, (6) Aluminum, A. 98.50, Fe 1.50 and (7) ferrosilicon plus aluminum. The most effective agent was (6), which produced a melt with high Si, and the steel showed few inclusions and the least pipes, there were, however, some alumina inclusions. A similar effect was obtained with (4). All agents reduced segregations, inclusions were higher for (1) and (2) than for the other agents, (2) gave only small and uniformly distributed inclusions in the ingot, and killed the steel completely without addn of Al. The S content was not reduced with this deoxidizer. The least effective was pure Al, it produced the most and coarsest inclusions in very irregular distribution and the greatest segregations. The action of (7) was unfavorable but less so than that of pure Al.

Compared with not-killed soft-steel melts, all melts treated with addl. deoxidizers showed deoxidation products in the solidified steel and tendency to pipe formation, but no difference could be found in mech. properties and deep-drawability between killed and not-killed soft steel. It is concluded that for many purposes soft steel without addl. deoxidizers is superior from several angles. A table gives test results of phys. properties and deep-drawability for steels deoxidized with the above-mentioned agents.

Twenty-two references. M. Hartenhiem. Survey of the testing methods for the determination of the mechanical strength of aluminum castings. A. v. Zeidler. *Aluminum* 17, 670-4 (1935). The manner in which a specimen has been made for tensile or hardness tests is of utmost importance. Separately cast and specimens cast with or taken from the casting are discussed and the tests described. The best results are obtained with horizontal casting.

Control of grain size and structure in large forgings by heat treatment. G. J. Horvitz and G. Brinton Jack, Jr. *Iron Age* 136, No. 13, 48-50 (1935). Frank G. Norris. Brass and copper forgings—their manufacture, properties and uses. E. F. Cone. *Metals & Alloys* 6, 337-41 (1935). Downs Schaal.

Tensile testing of bearing metals at elevated temperatures. Jean Galibourg, Leon Guillet, Jr., and Popoff. *Rew. met.* 32, 373-7 (1935). A series of tests made on bearing metals, the analysis of which was not specified, indicated that with the same loads and with const. and changing temps the appearance of the time-elongation curves is approx. the same. At the beginning elongation is slow, the curve being nearly a horizontal line; then the rate increases and for a short time the curve makes an angle of about 45° with the axes, in the final period the curve is nearly vertical. J. D. Gat.

Heat-treating spring leaves. H. J. Langley, *Ind. Age* 14, No. 7, 7, 8, 16(1930).—For the heat treatment of automobile springs, a special gas fired furnace is used which insures a reducing atm. and the avoidance of oxide or scale, except mill scale, and the maintenance of the required soaking temp. prior to quenching. The steel is then removed from the furnace, automatically clamped, formed, and quenched in oil by a specially designed machine. The temp. of the quenching oil is maintained below 100°F by cooling.

Temper hardening of commercial nickel-coppers containing phosphorus. E. C. Rollason and T. G. Bamford *Metals & Alloys* 6, 345-6, 340(1935).—An investigation of the temper hardening of 3 Cu alloys contg. (1) 1.72 Ni, 0.03 P, trace Fe, (2) 1.73 Ni, 0.11 P, 0.01 Fe, (3) 2.33 Ni, 0.03 P, 0.03 Fe.

Temperature measurement of liquid and solid metals as represented by irons. Rudolf Hase *Z. Ver. deut. Ing.* 79, 1351 (1935).—Temp. of molten metals is usually measured by radiation methods, either total radiation or partial radiation. Rapid temp. changes can be observed with an optical pyrometer used with an oscillograph. Fundamentals of emissivity and black body conditions are reviewed. The detn. of the relative radiation of molten metals is difficult because temps. are measured in the runner or metal streams and variations are caused by the formation of oxide coatings which depend on temp. and metal compn. W-Mo thermocouple in a sillimanite protecting tube can also be used for detg. the temp. of molten metals. A recent development is the color pyrometer. Use of an optical pyrometer and a partially closed graphite dip tube overcomes some of the disadvantages of variations in radiation and sudden temp. changes. Temp. measurements in solid metals are best made by thermocouples. The use of melting bodies, change in color, metallographic evidences of temp. change, and measurement of expansion are discussed.

A malleable cast iron from an ordinary cupola furnace. E. Rappoport, E. Kogan, N. Poplavko and P. Tokarevskii *Tekhnika* 1935, No. 11.—The complicated duplex process for pig iron for malleable castings was replaced by a system of casting from a cupola. The rate of casting and the difficulties surmounted are described. A metal is obtained contg. C 2.3-2.5, Si 0.9-1.1, S 0.1 and Mn 0.13%.

Influence of the accompanying and addition elements Si, P, Ni, Cr, Mo, W and Cu on the sensitivity of gray cast iron to variations in wall thickness. E. Hugo, E. Piwowarsky and H. Nipper *Giesserei* 22, 421-8, 452-8 (1935), cf. *C. A.* 30, 637.—Alloy adds were made to 31 casts of cupola I.e., each contg. approx. 3.25% C, 0.60% Mn and 0.12% S. The effect of variations in each element separately and of Ni and Cr in combination was studied. In addn. to regular test bars, a hollow block was cast with each wall of a different thickness, viz., 20, 40, 60 and 80 mm. The tensile strength, bending strength, shear resistance, Brinell hardness, carbide content and structure were detd. for each wall thickness. In a new method of measuring shear resistance a sample 1.6 mm thick is held down on an anvil contg. a slot 3.15 mm wide. The shearing force is exerted by a plunger 3 mm wide and 19.8 mm long centered over the slot. One advantage of the new method is that it can be used to measure the strength of the entire cross section. The results are compared with those of the Sipp-Rudeloff and of the Fremont method. Both tensile strength and bending strength are proportional to the shear resistance. Although the cooling conditions of the 20-mm. wall and of the 30-mm. diam. rod are similar, the worked 30-mm. rod has higher tensile strength and less scattering of the values. The tensile strength, hardness and carbide content are logarithmic functions of the wall thickness. Si decreases the value of all phys. properties, particularly the shear resistance. P decreases the phys. properties, though not as markedly as does Si. Ni and Mo increase the properties to about an equal extent. W increases the properties. The effect of Ni, in contrast to that of Cr, is beneficial especially if it replaces part of the Si. Cu has a favorable effect. J. G. Norris

Nitricastiron cylinder sleeves. A. T. Colwell *Iron Age* 136, No. 25, 31-3(1935).—A survey of the causes of wear in cylinders indicates that in addn. to high hardness the cylinder must have strength, soundness and corrosion resistance in order to be wear resistant. A hardness of 800 to 1000 Brinell for a depth of 0.004 to 0.006 in. results from nitriding centrifugally cast Fe liners contg. total C 2.93, graphitic C 2.31, combined C 0.62, P 0.058, S 0.029, Mn 0.76, Si 2.69, Cr 1.28, V 0.18, Mo 0.24 and Al 0.10%. The liner will serve for 300,000 to 400,000 miles after which it must be replaced because it cannot be reconditioned as can gray Fe blocks and alloy sleeves. Nitrided cylinder liners are recommended particularly for truck service.

Cementation of iron and ferrous alloys with beryllium. J. Laissus, *Rev. mét.* 32, 293-301, 351-60, 401-22(1935), cf. *C. A.* 29, 1046.—Cementation expts. previously made by Feszczenko-Chopinski (cf. *C. A.* 22, 2535) and by Cazaud are described. In the expts. described in the paper, specimens were placed in powd. 98% Be or in 80% Fe-Be contained in a receptacle closed with threaded plugs. This container was then placed in a closed box filled with charcoal and cast iron chips so as to prevent O₂ attack on the cementation powder. Cementation formed on electrolytic Fe a case consisting of a zone of solid soln., of solid soln. with some eutectoid and an outside zone of hypereutectoid alloy contg. much FeBe. Diffusion in C steels is similar to the diffusion in electrolytic Fe, with the difference that the presence of C results in more complex structures. The constituents of the case produced in C steels in the outward order are an area with gradually decreasing pearlite content, a practically decarburized layer, a solid soln. of Fe-Be-C, a sharply defined hypereutectoid layer of solid soln. Fe-Be-C and a triple eutectoid, eutectoid zone and hypereutectoid zone. Cementation with 80% Fe-Be gives the same results as with 98% Be. For electrolytic Fe the thickness of case is directly proportional to time and temp. of cementation. In higher-C steels the width of the decarburized layer passes through a max. with increasing temps. and grows with cementation time. C content has a retarding action on the speed of penetration. Hardness of case increases with C content but is not a function of temp. Case produced on electrolytic Fe reads 268 Vickers, on 0.9% C steel 1596 Vickers. Cementation with Be reduces resistance of steel to scaling and to chem. attack by most of the reagents. It increases the resistance to atm. corrosion and to fresh and salt water attack, to HNO₃ (provided the case does not have any cracks) and to bleaching liquor.

Steel scrap addition in chilled casting melting. Hugo Patsch *Giesserei* 22, 584-6(1935).—The literature is meager on steel addn. to chilled castings. The effect of the addn. of steel to gray iron and the mechanics of graphite formation in cast iron are discussed. Addn. of steel to chilled iron increases the mech. properties and the depth of chill.

Cast iron and steel differentiated. A. L. Norbury *Iron Age* 136, No. 19, 25, 104-12(1935).—The recommendation published by the Brit. Cast Fe Research Assn. is based on the presence or absence of carbide or graphite eutectic in the microstructure. Many previous definitions are critically reviewed.

Effect of mixed acids on irons and steels. Justice Eddy and F. A. Rohrman *Ind. Eng. Chem.* 28, 30-1(1936).—Loss of wt. tests showed that the tendency of plain C steels to resist mixed acids and to retain their passivity with increasing adds of water increased with their C content. Samples high in S and Mn showed greater losses of wt. and less tendency to retain passivity in dil. solns. than those low in these 2 constituents. Other alloying constituents improved the resistance. Quenched steels showed greater resistance than those cooled in the furnace.

Some trends in steel metallurgy during 1935. J. H. G. Monypenny *Metallurgia* 13, 50-2(1935).—New and cheap low-alloy steels are mentioned. Grain size control is discussed and it is concluded that it is too often specified

Many specifications also limit visible nonmetallic particles. The invisible particles may be just as harmful. For many purposes acid-open-hearth steel is just as good or even better than elec.-furnace steel. Highly polished corrosion resistant sheets are now being produced.

Causes and effects of brittleness in steel. C. L. Shapero. *Heat Treating and Forging* 24, 467-72, 517-21, 560-74, 576 (1935).—See C. A. 29, 3861.

Soft spots on hardened steel. H. H. Bleakney. *Iron Age* 136, No. 24, 32-3, 94-6 (1935).—Soft spots either may penetrate to the core or, as is more common, may be superficial layers overlying fully hardened steel. The superficial type is attributed to the faster critical cooling speed of the hypereutectoid surface layer relative to that of the eutectoid zone beneath. The C content of the case should be as nearly eutectoid as possible. This condition is easier to attain with gas than with pack carburization. If a higher C case is used, the quenching temp. should be high enough completely to dissolve the carbide. If low quenching temps. must be used with excess C, a normal steel and a drastic quench with adequate circulation is required.

Heterogeneity of steel ingots. W. H. Hatfield. *Iron and Steel Ind.* 9, 57-65 (1935).—Work to date of the Ingot Comm. (6 reports) is summarized. Shape and form of an ingot are frequently determined by the subsequent use of the ingot and consequently the question of heterogeneity becomes secondary. Ingots are classified into the following types: (1) solid ingot with pipe restricted to that portion of the mold which was lined by the refractory liner, (2) rimmed-steel ingot with a solid exterior but a large no. of blowholes in the interior, (3) ingot contg. a deep pipe and exterior blowholes, (4) ingot contg. a shallow pipe and numerous blowholes. It is partial to the use of type 1 ingots. Heterogeneity assumes different aspects with large ingots and small ingots, in a very large ingot a steel is poured in the bottom different in compn. from that added to the top. Influence of casting temp. on crystal size and therefore heterogeneity is traced, when freezing begins at a vast no. of nuclei, a mass of small crystals results and heterogeneity is at a min. Sprints and macro etchings of the various types of ingots are given. In rimmed ingots the run is shown to be pure metal. It postulates that this is indicative that the rimming may be explained by a consideration of the allotropic modifications of Fe which is deposited from the liquid solns. under these conditions. A centrifugally cast ingot shows a "bacon" effect, which may indicate a heterogeneity in the liquid phase. The detn. of O in steel, effect of N in steel, discussion of rimming steel, and pyrometry are but mentioned since they are covered in detail in the 6th report recently issued.

Tool steels. H. André Michel. *Métallurgie* 10, 180-7 (1935), cf. C. A. 30, 64.

Application of alloy steels. H. W. McQuaid. *Iron Age* 136, No. 26, 18-22 (1935).—A nontechnical review of the effect of alloy additions.

Color-producing reactions for microscopic examination of carbon steels. Joseph Maletic. *Comp. Rend.* 201, 1353-7 (1935).—To prep. the reagent, "M(Mo) normal," 15 g. $\text{NiH}_2\text{molybdate}$ is dissolved in H_2O and the soln. made up to 100 cc.; this is poured into 100 cc. HNO_3 (1.2), allowed to stand 4 days and filtered, of it 2 cc. is added to 100 cc. LiOH , and the polished sample is placed therein for 30-45 min. The various constituents (except C which remains black) then assume different colors, violet, blue, green, yellow, etc., while ferrite shows different colors according to the orientation of the crystals. A more delicate reagent "M(Mo) slow" is obtained by using 2 to 4 times as much LiOH . Similar but different colors are obtained if $\text{NiH}_2\text{vanadate}$ or vanadate replaces the molybdate . The method is applicable to steels, irons and some cast irons.

Hardening characteristics and other properties of commercial one % carbon tool steels. T. G. Digges and Louis Jordan. *J. Research Natl. Bur. Standards* 15, 385-407 (1933) (Research Paper No. 837).—The effect of the

initial structure prior to heating for hardening upon the austenitic grain size and grain growth was studied on 2 selected brands of 1% C tool steel having widely differing hardening characteristics. Comparison of the steels was also made with respect to their behavior in the transformation temp. range during thermal analysis, relative rate of transformation of the cementite, Charpy impact strength, susceptibility to grinding cracks, Rockwell hardness on quenching at different rates, structural normality, performance as lathe tools, and the effect of rate of heating to the hardening temps. on the depth of hardening. The relation between austenitic grain size and the critical cooling rates over a range of quenching temps. of 1425° to 1775°F. was influenced by the initial structure of the steel at quenching temps. below that at which all the C is completely dissolved in the austenite. Above that temp., each steel approached both a grain size and critical cooling rate characteristic of the steel regardless of its initial structure. At the highest temp., i. e., 1775°F., the characteristic grain size and cooling rate was higher in the so-called "controlled" steel than in the "non-controlled" steel, the effect of the grain size on the critical cooling rates was marked through the entire range of quenching temps. The critical cooling rate of the controlled steel may change considerably with little or no change in the austenitic grain size, the controlling factors at lower quenching temps. being differences in the C content and C distribution in the austenite, and at higher temps. oxides or carbides introduced for grain control. The initial structure of the controlled steel exerts an influence on the grain size-critical cooling rate relations at both low and high quenching temps. A non-controlled steel contg. C above eutectoid compn. in a given austenitic grain size showed a lower critical cooling rate than the same steel with eutectoid compn. Differences in the transformation of the steels on slow heating to the temp. range of austenite are believed to be due to variations in the rates of C diffusion, the controlled steel having a higher rate than the non-controlled one. On slow cooling from the austenitic temp. range, the controlled steel was more abnormal in structure. The depth of hardening of the 2 steels was not influenced by the rate of heating to the hardening temp., and no marked differences of the 2 steels were observed as to tool performance, Charpy impact values, Rockwell hardness and susceptibility to grinding cracks.

Hardness testing of nitrided steels. John H. Ruska. *Iron Age* 136, No. 13, 22-3, 20-8, 30, 58 (1935).—A critical review. The Herbert pendulum is the only app. that gives satisfactory results on the hardness of nitrided steels at elevated temps. Superficial Rockwell tests are satisfactory at room temps.

Nitrided tool steels. Horace C. Knerr. *Iron Age* 136, No. 13, 44, 5, 96 (1935).—The compn., heat treatment and application of 2 typical nitriding steels are described.

The science of metals grows apace—many new alloys and methods of treatment. Nonferrous physical metallurgy. Introduction. Robert F. Mehl. *Mining Met.* 17, 42 (1936). Secondary metals more closely examined. W. Romanoff. *Ibid.* 42-3. New lead and tin alloys seen in batteries, bearings and bullets. Geo. O. Hiers. *Ibid.* 43-4.—The feasibility of making grids for some types of storage batteries from an alloy contg. Ca 0.1% and Pb 99.9% is indicated. Dispersion hardening, accompanied by heat treatment, appears necessary to obtain strength or hardness = to Sb-Pb. Batteries using Ca-Pb grids show less self discharge than when employing Sb-Pb, and there is better elec. cond. Sn-base Babbitt metals have been replaced to some extent in automobile engines, but with the trend toward greater cooling capacity in engines Sn-alloys should regain some ground. The Pb-Cu alloys (30-50% Pb) used as thin linings on steel backs require the Cu to exist in dendritic crystals branching away from the steel. Diesel engines in new high-speed trains use bearing linings of a Pb alloy contg. a few % of several elements including Ca and Sn. Small amts. of Zn markedly increase the surface tension of molten monotype metal; Na decreases it, small amts. of As, Bi, Cd, Mg, K,

and Fe have little effect. Transformation of Sn to gray Sn is inhibited by 0.0035% Bi and not by 0.001%. New and old aluminum alloys meet a rapidly expanding demand. L. W. Kempf *Ibid* 44 5.—Two new types of Al alloys were put on the market in 1935—(1) free cutting of duralumin type for screw-machine stock and (2) an alloy for die-casting burner heads for gas ranges. The use of Al alloy pistons in motor-vehicle engines is increasing; most are of Si type alloy with an electrolytically produced oxide coating. Al alloy cylinder heads are used where max engine performance is desired. The recently developed wrought Al alloys of the Al-Mg type are increasing in popularity because of their high mech. properties and excellent workability. Brass and copper mills continue efforts to secure highest quality in products. John L. Christie *Ibid* 45-6.—Progress has been made in com. application of controlled furnace atms. in bright annealing. Fluxes and deoxidizers used in making castings for wrought Cu, brass and bronze are getting more attention. Two processes—the Eldred and the Hazlet—produce semi-finished material direct from molten metal. Extrusion of tubing is increasing. Advances have been made in hot working of alloys that formerly were not considered hot-workable. Uniformity in annealing is increasing. Wide diversification in use leads to biggest year in nickel. Robert C. Stanley *Ibid* 46-7.—The field of use of Ni alloys is being extended. Use of corrosion- and erosion-resisting materials and of alloy cast Fe is increasing. New alloys are being developed for weight reduction. Thickness of coatings has been increased. The outstanding development in this field has been the perfection of the process for bright Ni plating. Ni is being used with Sn in bronzes to improve mech. properties. Ni bearing Al alloys are increasing in popularity, especially for casting. Uses of Ni in the mining industry are listed. Die castings and electrogalvanizing boost use of purest zinc. W. M. Pierce *Ibid* 48.—Several new developments in use of silver and precious metal alloys. Robert H. Leach *Ibid* 48.—Developments in the chem., food and elec. industries have caused the principal increase in demand. Use of Ag solders has been extended. Prepn of Ag-Ni, Ag-Mo, Ag-W and Ag-graphite for elec. contacts by pressing and sintering metal powders has increased. Use of small amts of Ag in alloys is being pushed. Magnesium alloy products improve in quality and size. John A. Gann *Ibid* 49.—Alden H. Emery.

Permanent magnet materials. C. S. Williams. *Elec. Eng.* 55, 19-23 (1936).—The essential properties of some new materials are enumerated and comparison is made with the characteristics of the more familiar C, Co and Cr steels. The new materials listed are: Ni-Al-Fe alloys, Co-Mo-Fe alloys and Co-W-Fe alloys, a non-metallic material composed of Co and Fe oxides and a Co-Ni-Ti-Fe alloy. Magnetic and phys. properties of the alloy types are discussed, also their economic status. W. H. B. X-ray study of aluminum zinc alloys at elevated temperatures. E. A. Owen and Llewelyn Pickard. *Phil. Mag.* 20, 761-771 (1935).—Powder photographs were taken of a series of alloys which were kept at high temps. in a vacuum. The phase structure found previously was confirmed. The comps. of the phase boundaries at 315°, 340° and 360°, resp., are in wt. % Al between $\alpha + \beta$ and β , 17.4, 18.0 and 19.0, between β and $\beta + \gamma$, 29.5, 28.0 and 23.5, and between $\beta + \gamma$ and γ , 32.0, 47.6 and 58.5. The temp. of the eutectoid transformation β to $\alpha + \gamma$ is 272°. As the temp. increases, the Zn content of the phase increases and the parameter value decreases. The compn. range of the $\beta + \gamma$ region at 360° is about 3%.

E. J. Rosenbaum. Scientific work on the production of iron alloys. B. Siseev. *Sotzialist. Rekonstruktsiya i Nauka* 1935, No. 4, 154 v.—Work on iron alloys for the past 2 yrs. is summarized. Ferrochrome with 0.02-0.05% C is obtained by refining at 1650° and a lowered pressure of about 25 mm. Ferrochrome was refined from 6 to 1% C by blowing air through the molten metal in an arc furnace and a subsequent reduction with ferrosilicon. Better results from blowing were obtained in an induction furnace, in shorter

time. The original content of C, Si and Cr changed from 6.8, 2.02 and 59.9% to 1.5-0.6, 0.61-0.15 and 60-62%. Decarbonizing and dephosphorizing of ferromanganese by treating with an ore was not successful. By silico-thermic reduction a noncorrosive chrome steel was produced directly from the ore. Work in a closed furnace and the use of magnesite slags of higher basicity increased the output of Cr and lowered the amt. of ferrosilicon used from 750 to 450 kg. per ton of ferrochrome. Magnesite proved to be a stable lining material. B. V. S.

Metals and alloys. XV. X-ray analysis of lithium zinc alloys. E. Zintl and A. Schneider. *Z. Elektrochem.* 41, 764-7 (1935), cf. *C. A.* 29, 5400⁷.—X-ray examn. of Li-Zn alloys gave results essentially the same as those obtained by Grube and Vosskuhl (cf. *C. A.* 28, 859⁹), namely, that 5 intermediary kinds of crystals occur at room temp. XVI. Structure of platinum-thallium alloys. E. Zintl and A. Harder. *Ibid* 767-71.—Pt takes up little Tl and conversely the soly. of Pt in Tl seems to be very slight. Both metals only form an intermediary kind of crystal of the formula PtTl which has hexagonal lattice $a = 5.605 \text{ \AA}$, $c = 4.639 \text{ \AA}$, $c/a = 0.828$ with 6 atoms per cell in the following positions: 000, $1/2, 1/2, 0$, $1/2, 0, 0$, $1/2, 1/2, 1/2$, $1/2, 1/2, 1/2$. Tl forms no compd. with Pt which has a Ni arsenide structure. XVII. X-ray analysis of lithium amalgams. E. Zintl and A. Schneider. *Ibid* 771-4.—X-ray analysis gave results in agreement with thermo-analytical results. In the system LiHg at room temp. in the region from 0 to 78% Li, 5 intermediary phases of the following approx. compn. occurred: LiHg, Li₂Hg, Li₃Hg, Li₄Hg and Li₅Hg. LiHg, Li₂Hg and Li₃Hg cannot yet be structurally explained. From Li₄Hg, a hexagonal elementary body with $a = 6.240 \text{ \AA}$, $c = 4.794 \text{ \AA}$, $c/a = 0.768$ is derived. Li₅Hg has the structure of β -brass with $a = 3.287 \text{ \AA}$. Li₅Hg has the same structure as Cu₅Al, the β -phase of the system Cu-Al. M. McMahon.

Lattice distortion and coercive force in single crystals of nickel-iron-aluminum. W. G. Burgers and J. L. Snoek. *Physica* 2, 1064-74 (1935).—A report on preliminary results obtained in a correlated investigation of the aging characteristics of alloys of the Ni-Fe-Al system wherein a simultaneous study of the ferromagnetic and x-ray diffraction properties is being made. Single crystals 6 mm. square and 10-20 mm. long have been made of the alloy 28.3% Ni, 12.6% Al and 59.1% Fe. Three methods of heat treatment were used: (a) the sample is quenched and reheated to the desired temp., (b) the sample is quenched to the desired temp. and held there, and (c) the sample is quenched at varying cooling rates. In agreement with Glocker (*C. A.* 29, 5794⁹), lines of the γ -phase are only visible after cooling rates which are considerably slower than those required to produce the max. coercive force (590 gauss after cooling from 1200-700° in 45 sec.) and superlattice lines of the FeAl type were always observed in almost constant relative intensity. Line-broadening results do not agree with those of Glocker. Marked line broadening (1310) Co K_{α} radiation occurs wherever the coercive force differs much from zero. When the coercive force has reached its max. value and is decreasing the usual type of line broadening occurs. Previous to this value, the photometer curves show an increasing blackening of background with no loss in definition of the doublet. This latter type of broadening is thought to be due to the formation of regions of slightly larger and slightly smaller spacing in the matrix lattice which has not lost its coherence. Tentatively, a no. of possible explanations are given for the behavior of coercive force and line broadening. H. A. Smith.

Recent developments in the manufacture and applications of magnesium and magnesium alloys. W. C. Devereux. *Metallurgia* 13, 47-9 (1935).—Mg is now produced in England and Austria by reduction of MgO with C in an arc furnace in a H atm. Crude metal is purified by distn. in inert atm. Properties and uses of Mg alloys are discussed. J. L. Gregg.

Magnesium alloys in airplanes. E. R. Gadd. *Aircraft Eng.* 7, 299-302 (1935).—The resistance to corrosion is increased by immersing the part in a hot aq. soln. contg.

$K_2Cr_2O_7$, $(NH_4)_2SO_4$, $(NH_4)_2Cr_2O_7$ and NH_3 . Another method employs an aq. soln. of SeO_2 and $NaCl$ at room temp. M. W. Schwarz

X-ray structure and electrical resistance of palladium-silver-hydrogen alloys. Gunnar Rosenhall. *Ann. Physik* 24, 297-325 (1935); cf. C. A. 28, 167. —Methods heretofore used for fixing compns. of alloys in this system are shown to be faulty. The system is represented on a triangular equilateral diagram for the components Ag-PdH-Pd. The system Ag-Pd is one-phase, the system Pd-PdH is two-phase, but the gap of immiscibility is narrowed by the introduction of Ag, all alloys contg. 25 atoms % or more being one-phase. Pd alone takes up 0.8 H per Pd, but 70Ag-30Pd is unable to take up any H. Lattice consts. and sp. resistances are given for over 100 preps. The expansion of the lattice following introduction of H, as shown by x-rays, is confirmed by direct linear measurements. In the one-phase region the lattice expands regularly with increasing H-concn., but the resistance passes through a sharp min. as the H-concn. increases. Hypotheses as to the position of the H in the crystal lattice are discussed in the light of these observations. C. D. West

Sodium alloy lamps. Gorton R. Fonda. *J. Optical Soc. Am.* 23, 312-18 (1935). —Results of expts. with alloys in the standard type of a c. Na lamp filled with Ne at 1.5 mm. pressure are given, with 2 tables and 4 diagrams. The closest approach to white light was given by alloys contg. Na 40%, Cd 30-65% and Hg 30-65%, the most pleasing light being from Na 40%, Cd 45% and Hg 48%. Alloys gave better results than phos. mixts. of the elements, and they were prepd. by Vanstone's method (*Trans. Faraday Soc.* 7, 42 (1911)). J. H. Moore

Modern uses of monel metal. James A. Rabbitt. *Japan Nickel Rev.* 3, 513-84 (1935). E. H.

Fabrication of monel metal in chemical equipment. Sakai Nakamura. *Japan Nickel Rev.* 3, 602-10 (1935). E. H.

Melting points of eutectics. Lipowitz alloy and Wood's metal. Sidney J. French. *Ind. Eng. Chem.* 28, 111-13 (1936). —Melting and cooling curves of Lipowitz alloy and Wood's metal were detd. To eliminate the confusion existing between the compn. and m. p. of these alloys, it is suggested to drop both names and to call the eutectic alloy a quaternary eutectic, stating its compn. and melting-freezing range. Leopold Pessel

X-ray studies on the systems tin-antimony and tin-arsenic. G. Hägg and A. G. Hybnetta. *Phil. Mag.* 20, 913-29 (1935). —With the Sn-Sb system at room temp., the SnSb phase has a homogeneity range between 45 and 55 atoms % Sb. At the Sn-rich limit it has a deformed NaCl structure with rhombohedral unit cell, $r = 6.117 \text{ \AA}$, $\alpha = 89.70^\circ$ and the vol. is 238.9 cu. Å. The deformation increases with increasing Sb content. At the Sb-rich limit, $r = 6.183 \text{ \AA}$, $\alpha = 89.18^\circ$ and the vol. is 231.2 cu. Å. The change is attributed to the fact that Sb atoms are larger than Sn atoms. In the Sn-Sb system As is not sol in Sn. Around a concn. of 40 atoms % As, lines due to $Sn_{1/2}As_{1/2}$ were found. The Laue symmetry of this phase is D_{2h} , with a rhombohedral cell contg. 7 atoms $\%$, $r = 12.23 \text{ \AA}$ and $\alpha = 19.22^\circ$. SnAs has a NaCl structure with a lattice const. of 5.716 Å. which does not

change with compn. Arsenic can dissolve 21 atoms % Sn. With increasing Sn concn. the rhombohedral edge of the As phase increases and the rhombohedral angle decreases. These results disagree with those of Bowen and Jones (C. A. 25, 5885) and Willott and Evans (C. A. 28, 6680). E. J. Rosenbaum

Metal cleaning here and abroad. R. W. Mitchell. *Iron Age* 136, No. 13, 112-13, 116-17, 122, 126, 132, 134, 141-3 (1935), cf. C. A. 29, 4307. —Various types of equipment are discussed. Methods are classified as phys. and chem., which include the use of solvents, saponifiers, and emulsifiers. F. G. Norris

The preparation of light-metal surfaces for painting. G. O. Taylor. *Paint Manuf.* 6, 19-21 (1936). —A review of methods of prep. light-metal surfaces to secure max. adhesion of paint under conditions of vibration, stress and corrosion. Mech. and chem. methods of roughening are noted. The water-EtOH-H₂O₂ soln. degrades the surface, roughens and etches it and renders it passive by the formation of a thin film of insol. $AlPO_4$. Al alloys such as duralumin are protected by (1) electrooxidation or (2) by chem. oxidation. Special treatment for Mg alloys is touched upon. The patented alkali-chromate treatment for these alloys and Se processes are briefly discussed. W. H. Boynton

Galvanizing defects on steel sheets due to defective base material. M. von Schwarz and H. Fromm. *Korrosion u. Metallschutz* 11, 241-5 (1935). —The connection between carbide structure and appearance of the Zn coating is shown by photomicrographs of 4 types of sheet steel contg. 0.12, 0.07, 0.06 and 0.016% C. The more complete the formation of cementite, the more regular and attractive the appearance of the coating. Degenerated pearlite has a depreciating effect. This is explained by the assumption that normal pearlite as well as free boundary cementite constitute normal equi. in which the carbide is densely embedded in the ferrite, while in intermediate stages microcapillary cavities are present which cause H₂ absorption during pickling and thus affect the Zn coating. Leopold Pessel

The mercurous nitrate test. H. C. Jennison. *Metals & Alloys* 6, 348-9 (1935). —Specifications are cited showing the proper manner of using the $HgNO_3$ test in evaluating Cu alloys. The quant. application of this method is shown to be very misleading. Downs Schaaf

Progress in corrosion- and heat-resisting steels. W. H. Hatfield. *Metallurgia* 13, 41-4 (1935). —A review of the development and use of these steels. J. L. G.

Corrosion of lead-alloy-coated steel cylinders used as fire extinguishers. W. L. Hewlett. *Chemistry & Industry* 54, 1094-5 (1935). —Immersion expts. with partly stripped steel plates coated with Pb-Sn alloys in a $NaHCO_3$ soln. showed increasing corrosion of the exposed steel surfaces with decreasing Sn content of the coating. The potentials of the cells likely to occur, i. e., of Fe-Cu, Pb-Cu, Pb-Fe, Sn-Fe and Sn-Pb, in satd. $NaHCO_3$, were observed for 35 days. The alloy layer is subjected to preferential attack, while a protective basic carbonate film forms on the steel. This film was broken down, and corrosion initiated, by the presence of NaCl, phthalic, malic or citric acid. Use of water free from excessive amts. of chlorides, sulfates, NH_4 salts and org. acids is recommended. Saponin, due to the formation of acidic sapogenins, may cause corrosion. The addn. of 1 oz. of tribasic Na phosphate per gallon of soln. is recommended. Greasy protective layers, such as lanolin, should be avoided. Leopold Pessel

The corrosion of Elektron Alloy AM 503 by leaded fuels. I. Mechanism of attack. G. D. Bengough and L. Whitby. *J. Roy. Aeronaut. Soc.* 39, 1144-53 (1935). —Specimens of the wrought sheet alloy (Mn 2.5, Al, Zn and Cu 0.2 each, Si 0.4, impurities 0.5%, Mg remainder) were tested. After pickling in 10% HNO_3 , the samples were placed in various fuel mixts. contained in glass vessels held in a mech. shaker. Expts. were conducted in an open shed, and daily max. and min. temps. were recorded. The fuels studied were a 40% tech. benzene mixt., a straight-run paraffin type aviation gasoline, and a naph-

themic-type fuel. Summary. Liquid H_2O is necessary for corrosion. Gasoline and H_2O mixed with $PbEt_4$ or with $n-C_4H_9Br$ alone do not cause appreciable corrosion, but when mixed with both products, intense attack may occur.

M. W. Schwarz

Welding in the chemical engineering industry. N. P. Inglis and W. Andrews. *Iron & Steel Inst., Symposium on the Welding of Iron and Steel 1*, 259-65 (1935). E. H.

Electric welding of heat resistant steels. N. Kreshchanovskii. *Novosti Tekhniki, Mashinostroenie* 1935, No. 30, 12-13. In elec welding of heat-resistant steels contg Cr, Ni and Si the electrodes must be coated. The first coating of the electrode consists of fluorspar 50, K_2CrO_4 10, ferromanganese (Mn 75%) 5, ferrosilicon (Si 75%) 5, water glass 15, and H_2O 10 parts. The electrode, 5 mm. thick, is dipped into the coating material and then dried at 150-60°. On the first coating, 0.5-0.7 mm thick, a second coating is formed consisting of marble 25, fluorspar 15, ferromanganese 5, KOH 6, water glass 30, and H_2O 10 parts. B. V. Shvartzberg

Safety and sanitary measures in the welding and oxygen-cutting of metals. R. Granjon. *Rev soudure autogene* 27, No. 255, 8-10 (May, 1935). *Chimie & industrie* 34, 1082. In CaH_2 welding the combustion gases have no injurious effects on the operators, and special ventilation is required only when the operation is carried out in confined spaces. In elec-arc welding great care is required to avoid eye-injury through fatigue, ultraviolet rays, and the even more dangerous infrared rays. The present-day practice of using, in arc welding, electrodes with thick coatings contg volatile or noxious substances necessitates not only adequate ventilation of the premises, but also direct aspiration of the fumes, vapors and dust. Welding of painted or galvanized parts necessitates adequate ventilation or the wearing of a mask. The same precautions are required in the blast-cutting of structures covered with Pb paints or anti-fouling coatings, which should be completely scraped off or otherwise destroyed.

Mineral flotations. Frederick G. Moses, Raymond W. Hess and Robert L. Perkins (to Barrett Co.) U. S. 2,027,357, Jan. 7. A diaryl disulfide such as ditolyl disulfide and a thiophenol or a mercaptan are used together for treating Cu sulfide ore materials or the like.

Setting apparatus for concentrating ores, etc. Wilhelm Oberjohann. Ger. 622,023, Nov. 18, 1935 (Cl. 1a, 4). An automatic device for regulating the discharge of the gang is described.

Setting apparatus for concentrating ores, etc. Schuchtermann & Kremer Baum A-G für Aufbereitung, Ger. 622,024, Nov. 18, 1935 (Cl. 1a, 4). An automatic device for regulating the discharge of the gang is described.

Extraction of ore. George J. MacKay. Can. 354,049, Nov. 12, 1935. Refractory ores are prepd. for extrn. by mixing the concentrate with a carbonate or nitrate of Na or K and the mixt is heated to 950-1250°F, but below the temp. of fusion. During this treatment Na polysulfides are formed by removal of one atom of S from the FeS_2 , and Na thioarsenate is formed by action on the arsenopyrite particles. The heated mixt is quenched in water to form sol. salts of the precious metals, and is then treated with lime and filtered.

Blast-furnace throat. Franz Suck. Ger. 619,908, Oct. 11, 1935 (Cl. 18a, 6.05).

Open hearth furnace for steel manufacture. Martin J. Conway. U. S. 2,027,151, Jan. 7. Various structural and operative details, including means for balancing the pressure of preheated air entering the furnace and products of combustion or waste gases leaving the furnace.

Nonreversing open-hearth furnace. Fred H. Loftus. U. S. 2,028,290, Jan. 21. Various structural and operative details.

Muffle furnaces. Brayshaw Furnaces and Tools Ltd., Shipley. N. Brayshaw and Frederick C. Newman. Brit. 434,593, Sept. 2, 1935. In a gas- or oil-fired muffle furnace for the heat-treatment of steel, etc., the muffle atm. is circulated by a fan or air propeller.

Annular muffle furnace for the continuous distillation of zinc, cadmium, mercury and like metals. Fried. Krupp Grusonwerk A-G. Ger. 622,472, Nov. 29, 1935 (Cl. 40a, 5.01).

Bell-type annealing furnace suitable for annealing metal articles. Albert N. Otis (to General Elec. Co.). U. S. 2,028,106, Jan. 14. Structural details.

Metal-heating furnaces. Henry W. Spencer and Leonard S. Davis. Brit. 436,181, Oct. 7, 1935. The suspended roof is enclosed in an outer insulating housing to provide

a jacket through which air, in regulatable quantity, is forced by a blower, the air thus heated being supplied to the burners

Method and apparatus for hardening the surfaces of metal articles, e. g., gear-wheels, by means of a burner Gleason Works Brit 435,831, Sept 30, 1935

Apparatus for hardening tools by treatment with a blow-pipe flame followed by chilling I G Farbenind A-G Ger. 622,126, Nov 21, 1935 (Cl 18c 234)

Case-hardening E I du Pont de Nemours & Co Brit. 434,961, Sept 12, 1935 Fe and steel articles are case-hardened by immersion in a bath comprising a fused nonoxidizing salt having a suitable m. p., or a mixt of such salts, to which has been added a suitable org N compd., the articles thereafter, if desired, being quenched The bath may comprise 1 or more alk. earth salts, preferably the halides, or a mixt of 1 or more such salts with 1 or more alkali metal salts, preferably the halides and (or) carbonates, or 1 or more alkali cyanides and (or) 1 or more alk. earth cyanides Among org N compds that may be used are arylamines, alkylamines, pyridine, ammoniated org substances, e. g., ammoniated peat, or org CN compds, e. g., HCN or a polymer thereof, CNNH₂, dicyanodiamide, or melan

Case-hardening tools I G Farbenind A G (Hermann Holler, inventor) Ger 619,694, Oct 11, 1935 (Cl 18c 112) In case hardening, the tools are heated by a blow flame and chilled A pyrometer and switch arrangement ensure that the gases of the flame are stopped at a desired temp and a chilling agent such as water applied

Heat-treating steels and iron alloys Shinta Matsunawa, Fusatoshi Nozawa and Masahiro Suzuki Brit 435,223, Sept 17, 1935 The heated steel, etc., are quenched in a cooling medium comprising an emulsified mixt. of H₂O and mineral and (or) fatty oil contg up to 15% of an emulsifying agent, e. g., an inorg. base, e. g., NaOH, KOH, Ca(OH)₂, an org. acid, e. g., oleic, a soap or a mixt contg 2 or more such substances mixed or combined, except petroleum when a mineral oil is used alone In an example, a spring is heated to 850° and quenched in an emulsified mixt of fish oil 75, NaOH 0.1 and H₂O 25%

Apparatus (with a muffle-surrounded nickel container) for heat-treating high-speed steel with fused boric oxide Chester B. Sadtler (to Barber-Colman Co.) U S 2,027,065, Jan 7 Various structural and operative details

Heat treating cobalt-tungsten-chromium alloys Werner Köster (to Veteinigte Stahlwerke A-G) U S 2,027,780, Jan 14 An alloy contg Co about 40-85, W 5-40 and Cr 10-40% and not over 0.3 C, is subjected to a pptn hardening by heating to about 1000° or higher but below the m. p., rapidly cooling and annealing at 500-900°

Annealing metal bands Matthias Ludwig Ger 619,835, Oct. 9, 1935 (Cl 18c 610) App for even cooling or chilling is described

Annealing steel Vereinigte Stahlwerke A-G (Franz Eisenstecken, inventor) Ger. 622,078, Nov 19, 1935 (Cl 18c 880) Addn to 621,346 (C. A. 30, 10204) The process of Ger. 621,346 is modified for using Co or Mo or an alloy thereof as the catalyst for deoxidizing the protective gas

Steel-making slags Augustus B Kinzel (to Electro Metallurgical Co.) U S 2,027,868, Jan 14 For improving the working characteristics of basic open-hearth steel slags, there is added to them a substantial quantity (suitably about 5-10%) of Fe oxide so that the fluidity of the slags is increased and their cutting action on the hearth and lining of the furnace is decreased

Phospho magnesium slags Forges et aciéries du nord et de l'est. Fr 787,803, Sept 30, 1935 In making slags in a Thomas converter, 30-50% of the lime, according to the amt. of metal to be treated, is replaced by fritted dolomite in pieces the size of which is appropriate to the content of MgO to be obtained

Sintered hard metals Gustav Boecker (to "Acidia")

U. S. 2,027,763, Jan. 14 See Fr. 780,081 (C. A. 29, 58039)

Metal powders. Établissements Expert-Bezançon Fr. 788,358, Oct. 9, 1935 Metals of relatively low m. p., e. g., Zn, Sn, Sb, Cd, Al and especially Pb, are poured molten into a heated vessel in which they are subjected to the action of an agitator which pulverizes them to fine droplets A gaseous current poor in O, or inert or having a reducing action is passed through the vessel and carries the fog of metal to deposition chambers where it is collected as a powder

Aluminum powder Hartstoff-Metall A-G (Hametag). Ger 619,624, Oct 4, 1935 (Cl 22f 13) Al powder is obtained by grinding Al in an atm of indifferent gas with a 1-3% content of O or water vapor The powder is suitable for making Al paint

Fluxes for aluminum Horace C Hall Brit 435,270, Sept 18, 1935 A flux for Al and its alloys is prep'd by mixing ZnCl₂ with NaF, with or without KF, in the presence of H₂O so that ZnF₂ is formed. The ZnCl₂ may be replaced up to 10% by MgCl₂ and the NaF or KF may be replaced up to 20% by the phosphates or borates BaCl₂ and SrCl₂ may be added to reduce the m. p. and increase stability under heat, and NaMnO₂, or K₂MnO₄, K₂CrO₄, or Na-CrO₄, K₂SO₄, or Na₂SO₄, to increase reactivity

Refining aluminum and its alloys British Non-Ferrous Metals Research Association, Daniel Hanson and Ian G Slater Brit 435,104, Sept 16, 1935 In treating molten Al, etc., prior to casting, the metal is agitated while maintained in an atm., free from H₂, H₂O-vapor or other H gas, supplied to the space above the metal, the surface of the Al, etc., being simultaneously treated with a flux that dissolves any oxide present or formed during the process The atm may consist of dry N, CO or CO₂ and the flux consists of KCl 50, NaCl 40 and NaF 10 parts

Flux for cadmium and its alloys American Smelting & Refining Co. Fr 788,493, Oct 10, 1935. A flux for use in fusing Cd and its alloys is composed of CdCl₂ and (or) CdBr₂ and one or more alkali salts of the group comprising chlorides and bromides of Li, K and Na An example contains CdCl₂ 58, KCl 22 and NaCl 20%

Metallic lithium Miles G Hanson U S 2,023,390, Jan 21 Reduction of Li-O by Mg or Al is effected at a pressure below 6 mm. of Hg and at a temp. of 760-900° and the liberated metal is condensed on a cooled portion of the app used

Magnesium Oesterreichisch Amerikanische Magnesit A-G Brit 435,231, Sept 17, 1935 See Fr. 787,476 (C. A. 30, 10174)

Obtaining hard bodies Anton Kratky Brit 434,830, Sept 10, 1935 Hard bodies, particularly for tools, are obtained from carbides, etc., with or without addns such as nitrides, metals, etc., by heating a shaped block or blank of the material above a matrix into which the material is then forced under pressure App is described. Cf C. A. 30, 10207

Carbides, nitrides, borides, silicides, carbonitrides and titanides Vereinigte Edelmetall A-G. Brit 435,751, Sept 23, 1935 Carbides, etc., adapted for the manuf. of tools, etc., are obtained from compds. contg the desired elements, e. g., chlorides, fluorides, iodides, oxides, carbonyls, by supplying heat to these in the gaseous or vaporous state within the free space of a chamber which is heated solely from the exterior thereof to 800-2500°, the desired compds being ppt'd. in solid form. In a modification, at least 1, but not all, of the elements is supplied in the gaseous or vaporous elemental form. Among examples, (1) a mixt of hydrocarbon gas and H₂ is passed through a C₆H₆ soln. of W carbonyl and then through a C tube heated to 1200-1400° to produce W₂C, and (2) N is passed through MoO₃ heated to 1400° in an alumina crucible, the resulting gases being blown into a reaction chamber at 800-1400° contg a hydrocarbon to produce MoC. The carbides, etc., may be fused or sintered together or embedded in a matrix of a binding agent, e. g., a metal. Alternatively, the carbides, etc., may be

obtained from the gaseous phase simultaneously with the binding agents, both carbide-forming and metal-forming compds being introduced into the heated chamber.

Boron carbide articles such as bearings, dies or sand blast nozzles Raymond R. Ridgway and Bruce L. Bailey (to Norton Co.). U. S. 2,027,786, Jan. 14. B carbide granules are heated in a neutral environment to a temp. at which they will cohere under pressure, pressed in a C mold to the desired shape without permitting molten material to remain in contact with the carbon, thus forming a B carbide article having a conchoidal cryst. fracture which appears substantially as a single phase free from parting planes of graphite. App. is described.

Wire-drawing die or boron carbide Raymond R. Ridgway and Bruce L. Bailey (to Norton Co.). U. S. 2,027,787, Jan. 14. Boron carbide of the formula B_4C is used. U. S. 2,027,788 relates to bearings formed of B_4C and suitable for spindles of textile machinery, etc.

Photograph reproducing and recording needles with tips of titanium carbide Louis E. Turner. U. S. 2,026,760, Jan. 7.

Permanent magnets Robert Bosch A-G. Brit. 435,544, Sept. 23, 1935. See Fr. 783,309 (C. A. 29, 79307).

Forming articles from plated metal powders Charles Hardy (to Hardy Metallurgical Co.) U. S. 2,027,532, Jan. 14. A powder such as Fe powder plated with Cu is compressed into a coherent mass while wet with water and before the original soft amorphous character of the plating has been altered by heating.

Apparatus for tin plate manufacture Alexander R. Weibel and Wm. Jones (to Jones & Laughlin Steel Corp.). U. S. 2,028,306, Jan. 21. Various structural, mech. and operative details.

Compound metal articles Frederick F. Gordon. Ger. 622,484, Nov. 29, 1935 (Cl. 49f. 5). In the manu. of plates, billets, tubes, etc., of superimposed metal layers, the layers are united with a binder comprising Mn or an alloy or mixt. thereof with Ni, Fe, Co and (or) Cr, such mixt. or alloy contg. at least 10% of Mn. The binder may be taken in the form of powder or granules or in coherent form, e. g., as sheet or strip, and may be used alone or with a flux, e. g., borax. The metal layers are united by heating them with the interposed binder to about 1350°, with or without pressure. The process is particularly suitable for uniting layers of iron or steel. Numerous binding compns. are described, and various details are given.

Apparatus for making composite metal strips The Cleveland Graphite Bronze Co. Brit. 435,309, Sept. 19, 1935. A strip, e. g., of steel, is passed through a bath of molten coating metal, e. g., especially of Babbitt-metal in the manu. of bearings, and is withdrawn through a die opening, molten metal being removed from the lower side by a scraper.

Raw pig iron Max Paschke and Eugen Peetz. Fr. 788,009, Oct. 2, 1935. Raw pig iron is made from a fusion bath rich in acids or S by means of a fuel contg. more or less S by adding the substances to form the slag, e. g., $CaCO_3$, only in such amts. that an easily fusible acid slag is formed and crude iron having a high S content. This crude iron is desulfurized after casting by a basic slag or other usual means. The operation may be carried out in a blast, oscillating or drum furnace.

Malleable iron Karl Roesch and Otto J. Schleimer. Brit. 434,846, Sept. 10, 1935. See Fr. 774,805 (C. A. 29, 21414). In 435,602, Sept. 24, 1935, addn. to 434,846, the castings contain C 2.2-3.2, S less than 0.15, Si less than 0.8 and Mn at least twice the Si but not greater than 2%.

Sponge iron Casimir J. Head. U. S. 2,028,105, Jan. 14. See Brit. 421,566 (C. A. 29, 36454).

Wrought-iron articles Martin J. Conway. Brit. 434,910, Sept. 11, 1935. See U. S. 2,012,599 (C. A. 29, 6874).

Cementation of iron and steel Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Ger. 622,445, Nov. 28, 1935 (Cl. 18c. 3.15). A fused cementation bath

1 comprises inert salts, an alk. material and C. A typical bath comprises a fused NaCl-KCl mixt. contg. subdivided wood charcoal 3 and NaOH 10%.

Plating iron with steel. Tenner Walzwerk A-G. Ger. 622,422, Nov. 29, 1935 (Cl. 49f. 5). Addn. to 589,298 (C. A. 28, 13174). The mech. process of plating Fe with Cu or Ni or their alloys, described in Ger. 589,298, is now applied to the plating of strip iron, preheated to 500-700°, with Cr-Ni steel.

2 Steels Marc Burkigt. Brit. 435,576, Sept. 24, 1935. Steels for the manu. of poppet and like valves contain C, Cr and Si with 1 or more of the metals Ni, Mn, Mo, Co and W in specified proportions.

Steel Veremigte Stahlwerke A-G (Eduard Herzog, inventor). Ger. 622,077, Nov. 19, 1935 (Cl. 18b. 10). A plant is described for making highly deoxidized steel by passing the fused metal through a slag of high SiO_2 content. Cf. C. A. 29, 47282.

3 Steel Walther Mathesius. Fr. 788,476, Oct. 10, 1935. A Ti steel is made by covering a bath of steel with a slag poor in silicic acid and composed approx. of TiO_2 70 and CaO 30%, the content of Ti in the bath by reduction of TiO_2 of the slag being sufficiently high so that, after satn. of the N, S and O of the bath by Ti, the C enters into combination as TiC . A suitable slag is obtained by refining an ordinary bath of steel with the correct amt. of titaniferous Fe ore and lime. For tempered steels the content of C should be 0.3% and more, for constructional steels 0.1-0.2%, for steels resistant to corrosion 0.1% and for sheet steel to be subjected to deep stamping below 0.1%.

4 High-speed steels Herarus Vacuum-Schmelze A-G and Werner Hessebruch. Brit. 435,552, Sept. 19, 1935. Great hardness is produced in steels contg. Fe 0.1-3, C 0.2-2.5, W 12-25, Mo 0-17.5 and V 0-7.5% by quenching from 1100-1350° and then aging or annealing at 400-700°. The steels may also contain Cr about 3-5% and Co about 3-15%. In an example, a steel contg. W 18, Cr 4, C 0.8, Mn 0.2, Si 0.2 and Be 0.6 is quenched in oil from 1320° and annealed at 500° for 1 hr.

Open-hearth steel Alvin A. Claassen (one-half to James L. Hyland). U. S. 2,027,300, Jan. 7. A molten metal charge in an open-hearth furnace, covered with a thick layer of slag, is heated, worked and refined and finally tapped out of the furnace, and the C content of the molten metal is controlled by introducing beneath the slag-covered surface of the molten metal a liquid material contg. C which can be absorbed by the molten metal.

Extrusion apparatus for production of steel tubes or the like Ernest F. Jones. U. S. 2,026,979, Jan. 7. Mech. features.

7 Alloy steel The Earl of Dudley's Pound Oak Works Ltd. and John T. Wright. Brit. 434,828, Sept. 10, 1935. Steel for structural purposes contains C up to 0.3, Cr up to 0.69, Cu 0.2-0.45, Mn 0.4-1, Si 0.05-0.3 and Ni 0.1-0.5, the sum of the Ni and Si exceeding the Cu.

Austenitic chrome nickel steel alloy products Paul Schafmeister and Erwin A. Spenle (to Fried. Krupp A-G). U. S. 2,027,554, Jan. 14. In treating products such as metal sheets having a stable surface, a first heating within the carbide pptn. range is followed by cold working and then reheating above the recryst. temp. but below the temp. at which the carbides redissolve, to effect recryst. of the cold worked metal.

Magnet steel containing nickel and aluminum Tokushichi Mishima. U. S. 2,027,994, Jan. 14. Permanent magnets are formed of metal contg. Fe together with Ni 5-40 and Al 7-20%. U. S. 2,027,995 relates to magnets of similar alloys with the further addn. of Cr 1-5, W 0.5-8 or Mo 10% or less. U. S. 2,027,996 relates to magnets contg. Fe together with Ni 5-40, Al 7-20 and Co 0.5-30%. U. S. 2,027,997 relates to magnets formed of alloys contg. Fe together with Ni 5-40, Al 7-20 and Cu from a trace to 20%. U. S. 2,027,998 relates to magnets formed of alloys contg. Fe together with Ni 5-40, Al 7.20, Co 0.5-30 and Cr 1-5%. U. S. 2,027,999 relates to magnets formed of alloys contg. Fe together with Ni 5-40, Al 7-20 and Mn 0.5-10%. U. S. 2,028,000 relates to magnets formed of

alloys contg. Fe together with Ni 5-40, Al 7-20 and V 1 from a trace to 10%.

Nitrogen-containing metals and alloys. Wm. C. Read (to Electro Metallurgical Co.). U. S. 2,027,837, Jan. 14. An exothermic mixt. of a N-contg. oxidizing agent such as NaNO_3 and a strong reducing agent such as Si or Al is caused to react in close assocn. with metallic materials such as *ferro-Cr*, at least one of which has a substantial affinity for N and which are substantially free from metal oxides, so that N is liberated and brought into contact with the molten constituents.

Die-casting alloys. John R. Freeman, Jr. (to American Brass Co.). U. S. 2,023,129, Dec. 3. Zinc alloys which as cast have a good surface finish contain Cu 0.5-7.5, Pb 0.25-3.0, Sn 0.25-3.0, Al 0.05-1.0 and Si 0.05-0.5%.

Hard alloys. Fried. Krupp A.-G. (Karl Schröter, Kurt Agte, Kurt Moers and Hans Wolff, inventors). Ger. 622,341, Nov. 26, 1935 (Cl. 40b 17). W carbide contg. 3-7% of C is mixed with an auxiliary metal of lower m. p., e. g., Fe, Ni, or Co, and also with Ti carbide, and the powd. mixt. is compressed and sintered. The proportions are W carbide at least 35, metal up to 25, and Ti carbide up to 40%.

Sintered hard metallic alloys. Karl Becker, Karl Schröter and Hans Wolff (to General Elec. Co.). U. S. 2,026,938, Jan. 7. Hard material suitable for tools, etc., contains a W carbide contg. C 3-7, an auxiliary metal such as Fe, Co or Ni not over 20, together with V carbide 0.01-30%.

Wheel runs, etc., of special alloys. Herman J. van Royen. U. S. 2,028,029, Jan. 14. Wheel runs, etc., of high resistance to abrasion and of lamellar-pearlitic structure are formed of steel contg. C 0.65-0.78, Si 0.4-0.8, Mn 0.4-0.85%, together with a double carbide-forming metal such as Cr 0.3-0.8, W 0.25-0.7 or Mo 0.22-0.65%, the balance being mainly Fe and the total amt. of double carbide-forming metals being such that the compn. is eutectoid and that the finished article of the steel has a lamellar pearlitic structure. Cf. C. A. 30, 1019¹.

Dental alloy. Arthur W. Gray. Can. 353,526, Oct. 15. An alloy for dental amalgam is composed of finely divided solid particles, nearly all of which are hard, dense and free from cracks. The particles have an av. length of about 30 μ with a width and thickness well within the same order of magnitude. The alloy comprises Ag 67-70, Sn 25-9, Cu 3-5, and Zn less than 1%. When it is combined with Hg, a plastic mixt. results which will harden rapidly into a solid metallic body.

Aluminum alloys. Fred Keller, Jr., and Richard S. Merritt (to Aluminum Ltd.). Brit. 434,925, Sept. 11, 1935. This corresponds to U. S. 2,003,524 (C. A. 29, 4729¹), the Cu being 0.05-0.45%.

Aluminum alloys. Aluminum Ltd. Fr. 787,996, Oct. 2, 1935. Solid CO_2 is placed on the surface of molten Al alloys whereby a dry relatively cold atm. of CO_2 is formed which prevents access of air to the alloy.

Aluminum alloys. Aluminum Ltd. Fr. 788,458, Oct. 10, 1935. Al alloys which are not submitted to a thermal treatment to improve their phys. properties contain Mn 0.1-3.5, Cu 0.1-0.45, Mn 0.1-1 and Cr 0.1-0.5%, e. g., 1.4, 0.5, 0.4 and 0.25%.

Beryllium alloys. Compagnie de produits chimiques et électrometallurgiques Alais, Fröges et Camargue. Brit. 433,747, Sept. 26, 1935. In making alloys by reducing Be compds by an alloy of Mg with a metal less electropos. than Be, e. g., Cu, Al, Zn, which it is desired to alloy with Be, alkali double fluorides are used contg. less alkali fluoride in proportion to the BeF_2 than is indicated by the formula $\text{BeF}_2 \cdot 2\text{NaF}$. An alloy of Zn and Be thus obtained may be remelted in a flux of equal parts of BaCl_2 and BaF_2 to distill off the Zn and leave molten Be. Be alloys may be formed with any metal that alloys with Zn and is not volatile at 1300°, e. g., Fe, Ni. Thus, a Zn alloy contg. Mg 17.1 and Fe 6.13% is melted in a crucible with $\text{BeF}_2 \cdot \text{NaF}$ to give a Zn-Fe-Be alloy contg. Be 7, Fe 7 and Mg 1-3%. This is heated to 1300° in a suitable flux and yields an alloy contg. Fe 50 and Be 50%. A Cu-Mg alloy contg. 12% Be is obtained by adding a

Cu-Mg alloy contg. 26.7% Mg to $\text{BeF}_2 \cdot \text{NaF}$ in a crucible heated to 1000°, pouring the Cu alloy contg. Be 11 and Mg 3%, and re-melting to get rid of the Mg.

Alloys containing boron. Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine and Jean L. Andrieux. Fr. 788,145, Oct. 4, 1935. A calcd. amt. of an alk. earth boride, particularly of Ca or Ba, is mixed with the metal to be alloyed with B, or with the alloy into which B is to be introduced, or an oxide or a salt of the metal to be alloyed with B, and the mixt. is then heated under a layer of flux to a temp. sufficient to melt the whole. The reduction of the oxide or salt may be effected by means of the boride itself or by Al, Mg, Ca, Na, C or Si.

Cadmium alloys. General Motors Corp. Fr. 788,117, Oct. 4, 1935. Alloys for journal bearings contain Cd and a small amt. of Ag, and preferably, a small amt. of Cu and (or) Ni, e. g., Cd 97-8, Ag 1.75-2.5 and Cu or Ni 0.25-0.5%.

Columbium alloys. Electro Metallurgical Co. Fr. 787,843, Sept. 30, 1935. See Brit. 434,400 (C. A. 30, 717¹).

Copper alloys. Elmer L. Munson (to American Brass Co.). U. S. 2,027,750, Jan. 14. Alloys which have good hardness, strength and ductility contain Cu about 91.75-98.75, Ni 2.0-5.0, Al 0.5-2.0 and Be 0.75-1.25%.

Ductile copper base alloys. Henry L. Burghoff and David E. Lawson (to Chase Cos. Inc.). U. S. 2,027,807, Jan. 14. Alloys contg. Cu 75% or more, Te 0.05-1.75% and which also may contain Si, Zn, etc., have substantially better machinability than similar alloys not contg. Te.

Iron alloys. Hans von Kantzow. Brit. 434,849, Sept. 10, 1935. An Fe alloy for an elec. heating resistance contains Cr 2-30, Al 2-6, Si 2-20 and Co 0.1-30, with or without Mn 0.5-12 and V (or) Zr 1.8%. C may be present up to 0.5%.

Iron alloys. Crane Ltd. and Horace H. Shepherd. Brit. 435,656, Sept. 25, 1935. The phys. properties of malleable and gray cast Fe are improved by adding Cu 0.25-3, Ti 0.05-0.5 and, optionally, Al 0.015-0.15%.

Cast-iron alloys. James E. Hurst and Bradley & Foster Ltd. Brit. 435,316, Sept. 19, 1935. In the production of N-hardenable cast Fe alloy castings contg. Si, Al and Cr, with or without Ni, Mo, Cu, Ti, etc., the castings are formed in a sand mold and the alloy contains C 2.5-4, Si up to 1, Al 0.3-1.75 and Cr 0.5-2.0%. The Al varying inversely with the total of Si, Ni or other graphitizing elements and the Cr varying directly with the graphitizing elements so that the casting is devoid of graphite either in the as-cast condition or after a short annealing. The combined content of Ni, Mo, Cu or Ti does not exceed 3%. Prior to nitriding, the castings are annealed at 850-1050° and slowly cooled or are hardened by quenching from 800-875° in an oil or molten salt bath at 150-200° and then reheated to 700-750°.

Iron-silicon alloys. Isabellen-Hütte G. m. b. H. Brit. 434,847, Sept. 10, 1935. See Ger. 608,194 (C. A. 29, 2501¹).

Iron-silicon alloys. Isabellen-Hütte G. m. b. H. and Friedrich Heusler. Brit. 435,093, Sept. 13, 1935. Divided on and added to 434,847 (preceding abstr.). In a modification of 434,847, the alloys are prep. by melting down the pig Fe, adding Si or Fe-Si to the melt and removing the graphite that seps from the melt. The alloys may also contain Ni or Cu up to 3%. Cf. C. A. 29, 2501¹.

Ferromanganese. Mannesmannröhren-Werke and "Sachtleben" A.-G. für Bergbau und chemische Industrie. Fr. 788,070, Oct. 3, 1935. Ores or slags contg. Mn and Fe but not in the correct proportions for Fe-Mn, are fused, if necessary with the addn. of CaCO_3 , fluorspar, etc., to produce a slag of protoxide of Mn of low f. p., and a reduction is carried out at a temp. below that of the reduction of Mn, so as to withdraw an amt. of Fe to leave an intermediate product contg. the correct amt. of Fe and Mn. This is then reduced in the usual manner to Fe-Mn.

Zinc alloys. The New Jersey Zinc Co. Ger. 622,240,

Nov 23, 1935 (CI 406 13). See U S 1,716,599 (C. A. 30, 3657)

Treatment of zinc alloys. Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Ger 622,449, Nov. 23, 1935 (CI 404 220) Zn alloys not susceptible to cementation e. g., brass, are improved in their mech. properties by treatment for short time in a fused bath comprising inert salts, e. g., NaCl and KCl, and a cyanide. The proportion of cyanide in the bath must exceed 5% and may be up to 30%. The alloys may be heated in a non-oxidizing gas before the treatment

Bronzing Henry Michault. Fr. 787,938, Oct. 1, 1935 Fe and steel are bronzed rapidly by dipping them into a bath containing e. g., water 100, litharge 20, KCN 8, FeSO₄ 5, PbSO₄ 10 and MnO₂ 0.04 g

Producing polychromatic designs on aluminum and its alloys Ernest Windsor-Bowen and Charles Hugh Roberts Gower. Ger 622,186, Nov 23, 1935 (CI 484.3). See Brit 412,193 (C. A. 28, 7242*)

Bath for galvanizing coils for evaporators and other heat exchangers by treatment with fused tin Wilhelm J. Heilenbroich. Ger 622,050, Nov 18, 1935 (CI 480.2) Structural features are described

Preventing corrosion John Graham Brit 435,420, Sept. 20, 1935 Corrosion of a metal article formed by working a metal body at an elevated temp is prevented by applying a paint, e. g., comprising white lead and boiled linseed oil, to the new surfaces exposed by the working after the body has cooled down to 60-120°. The work piece may be decaled prior to painting

Rust preventing Victor Chemical Works. Fr. 788,036, Oct. 2, 1935 Fe is protected against rust by treating it with an aq. soln. of a hexavalent Cr compd (chromates, dichromates, chromic acid and anhydride) and H₂PO₄ and then drying. The ratio of, e. g., dichromate to H₂PO₄ is about 25 to 100 and the concn of H₂PO₄ about 10-20%

Metals resistant to gaseous corrosion Soc. d'Electrochimie, d'Electrometallurgie et des aciers Electriques d'Ugine. Fr 788,359, Oct. 9, 1935 A metal such as Fe contg 1 or more other metals, e. g., Al 4 or Cr 12%, is made resistant to the action of a corroding gas such as O or at a vapor at a high temp., by subjecting the metal at a

1 sufficiently high temp., to the action of the said gas or vapor at a partial pressure appreciably higher than the dissociation temp., at that temp., of the noncorrodable compd. which it is desired to form at the surface of the metal, but keeping the partial pressure sufficiently low so that the layer does not become permeable by formation of too great a proportion of the noncorrodable compd.

2 Counteracting electrochemical corrosion of metal apparatus Fried. Krupp A.-G. (Andreas Gotta, inventor). Ger. 622,444, Dec. 9, 1935 (CI 127.3). Electrochem. corrosion in app. where surfaces of two different metals are in contact is counteracted by interposing between the surfaces a removable layer of the less electropositive metal. When the interposed layer has been sufficiently corroded, it is removed and replaced by another similar layer

3 Inhibiting corrosion of magnesium and its alloys Josef M. Michel (to Magnesium Development Corp.). U. S. 2,028,343, Jan. 21 Corrosion by solns. such as those of glycol or glycerol is inhibited by incorporating in the liquid about 0.1% or more of an alkali fluoride such as KF

4 Welding-rod alloys. Richard A. Wilkins (to Revere Copper and Brass Inc.). U. S. 2,027,330, Jan. 7. Hot and cold workable alloys capable, when deposited by a welding process, of forming a dense, machinable, hard weld metal of high-tensile strength, and characterized by materially reduced fuming as compared to brass of the same Zn content, contain Cu together with Si 0.05-0.3, Ni 0.25-5, Fe 0.25-3 and Zn 35-50%

5 Welding-rod alloys Homer W. Butterbaugh (to American Brass Co.). U. S. 2,028,317, Jan. 21. A filler material for welding or brazing comprises an alloy containing Cu 55-65, Ni 0.1-3.0, Si 0.02-0.75 and Zn 31.25-44.88%

6 Welded ferrous metal pipe Geo. G. Walker (to Republic Steel Corp.). U. S. 2,028,096, Jan. 14. A ferrous metal pipe, having longitudinal elec. resistance butt weld and a tensile strength in excess of about 75,000 lb. per sq. in. of metal, contains Fe together with about 0.1-0.45, Mn 0.7-1.7, P about 0.015-0.020, Cu about 0.5-1.05% and substantially no Si. Various details of app. and mfg. operation are described.

10—ORGANIC CHEMISTRY

CHAS. A. ROULLIER AND CLARENCE J. WEST

The structure of organic compounds K. K. Dubrovskii "Sotsialist. Rekonstruktsiya Nauki" 1935, No. 4, 17-32, No. 5, 44-67, No. 6, 20-49 —A theory is advanced of the tetrahedral structure of org. compds. continuing fully the ideas of van't Hoff on the basis of generalizations of modern roentgenoscopic material leading to new structural conceptions. The mol. is considered as a static system with a definite direction of valences which are forces resulting from the forces of attraction and repulsion. In methane between the C and H atoms there is attraction while the H atoms are mutually being repulsed. The dimension of the central angle between 2 valences in the tetrahedron of methane is 109°28'. The C atoms are in the center of the tetrahedral system and therefore the direct rectilinear combination of 2 such atoms in the form of "C-C connection" is impossible, which also invalidates the Bayer strain theory. Connection of 2 atoms occurs always on a broken line and the breaking point where one by one or two by two or more valences of 2 such atoms are interconnected is called the nodal point of the connection. These points act as regards attraction as do the H atoms. The hydrocarbon radicals are considered as tetrahedral systems with a central C atom and with free valences where the interconnection of the radicals takes place. Having studied the distribution space of a series of compds. consisting of 2 interconnected radicals, D. gives calcs. of the distance in angstrom units between the atoms in the case of interconnected hydrocarbon radicals in paraffin, olefin and acetylene chains. These distances are for

C₁-C₂ 1.54 (the same as for diamond), 1.45 (the same as for graphite) and 1.03; for H-H 2.52, 2.52 and 4.10; for C-H in all cases 1.54; for H₁-H₂ 1.45, for C₁-H₁ 1.61, 2.11 and 2.56; the rate of the chain-lengthening as one homolog passes into another one is 1.27. Rejecting the plane structure of benzene given by Kekulé-Tsje, D. gives his own structure of benzene and also a description and pictures of C₆Me₆, Ph₆, cyclooctatetrene, C₁₀H₈, an thracene and phenanthrene structures as deduced from this theory.

Chemistry of the acetylenes. III. Cracked gasoline as a source of α-olefins for the preparation of acetylenes. Homer J. Hall and G. Bryant Bachman, Ind. Eng.

Chem 28, 57-9(1936); cf. C. A. 30, 77-1-Pentene and 1-hexene were prep'd. in pure form by bromination and subsequent debromination of the corresponding olefins which were fractionated from Gyro process gasoline. The plays consist, were for 1-pentene, b_p 39.5-41.0°, d_4^{20} 0.6945, n_D^{20} 1.3847, Hg deriv., m. 117.0-8.3°, and for 1-hexene, b_p 71-2°, d_4^{20} 0.7170, n_D^{20} 1.3988, Hg deriv., m. 90.0-6.4°, 13 references. E. W. Tillotson

Oxidation of 3-methyl-3-pentene and 2-methyl-2-pentene by selenium dioxide André Guillemonat *Compt. rend.* 201, 904-6(1935) cf. C. A. 26, 5085a— $MeCH_3CMeCH(OH)Me$, b_p 139-40°, d_4^{20} 0.860, n_D^{20} 1.4430 (acetate, b_p 62-3°, d_4^{20} 0.9010, n_D^{20} 1.4318), $Me_2CCHCH(OH)Me$, b_p 61-3°, d_4^{20} 0.857, n_D^{20} 1.446 (acetate, b_p 61-3°, d_4^{20} 0.9037, n_D^{20} 1.4318), were prep'd. in the manner previously described The Raman spectra for the above are given. Julius White

Raman effect and organic chemistry Study of isopropylacetylene, isopropylethylene and several of their derivatives Blanche Giedy *Bull. soc. chim.* [5], 2, 1951-8(1935), cf. C. A. 29, 5877- Treatment of the mixt. of chlorides formed by the action of 77 g. of Me_2CHAc on 250 g. of PCl_5 with $NaNH_2$ contg. a trace of $NaOH$ gave 3.5 g. of isopropylacetylene (I), b_p 28-9°, and a residual monochloride (II), Me_2CCH_2Cl , b_p 94-9°, n_D^{20} 1.4380, d_4^{20} 0.925, M. R. 29.66 (calcd. 29.69) Raman spectra detns. showed the presence of traces of the isomer, $Me_2CHCHClCH_3$. The mixt. of $Me_2CHCHClCH_3$ and Me_2CCH_2Cl obtained by the dehydration of iso- $AmOH$ over Al_2O_3 at 450° was passed into chilled Br_2 and the resulting mixt. of dibromides was fractionally distd. The main fraction consisted of 133% of $Me_2CHCHBrCH_2Br$ which, on distn. from KOH , yielded 700 g. (90%) of $Me_2CHCHBrCH_2Br$ (III), b_p 102-10°, n_D^{20} 1.4574, d_4^{20} 1.356, M. R. 32.84 (calcd. 32.59), contg. a trace of $Me_2CHCHClCH_2Br$ as indicated by the Raman frequency 1620. Treatment of 650 g. of III with $NaNH_2$ at 150° for 7 hrs. gave 75 g. (25%) of I, b_p 27.5-8.5°, n_D^{20} 1.3785, d_4^{20} 0.666, M. R. 23.54 (calcd. 23.29) The methylation of 20 g. of I with 25 g. of $NaNH_2$ and 70 g. Me_2SO_4 produced 9 g. (36%) of Me_2CHCMe (IV), b_p 72.0-2.5°, n_D^{20} 1.4078, d_4^{20} 0.716, M. R. 28.19 (calcd. 27.61), catalytically reduced to pure cis-4-methyl-2-pentene, $Me_2CHCHCH_2Me$ (V), b_p 58.0-8.6°, n_D^{20} 1.3858, d_4^{20} 0.663, M. R. 29.72 (calcd. 29.44) The reaction of 30 g. of I with the $EtMgBr$ from 15 g. Mg and 85 g. of $EtBr$ in the cold and the addn. of 50 g. of AcH gave, after 2 hrs. heating and the usual treatment, 30 g. of $Me_2CHCCH(OH)Me$ (VI), b_p 155-7°, n_D^{20} 1.4418, d_4^{20} 0.85, M. R. 34.25 (calcd. 34.05), giving, on treatment with $NaNH_2$, the brick-red Na deriv. characteristic of acetylenic secondary alcs. The Raman spectra contained a line at 1680 attributed to an impurity due to the polymerization of the AcH . Methylation of 24 g. of VI with 12 g. $NaNH_2$ and 42 g. Me_2SO_4 in anhyd. Et_2O yielded 16 g. of $Me_2CHCCH(OH)Me$ (VII), b_p 133.0-3.5°, n_D^{20} 1.4190, d_4^{20} 0.893, M. R. 39.60 (calcd. 38.78), showing a slight elevation corresponding to that previously noted (C. A. 29, 6829) The lower-boiling fractions 3 and 4 (213 g.) of $Me_2CHCHBrCH_2Br$ were treated with 130 g. of Zn in abs. alc. Distn. of the hydrocarbon produced gave a main fraction consisting of $Me_2CHCH_2CH_3$ (VIII), b_p 20.0-0.5°, n_D^{20} 1.3725. The detn. of the Raman spectra of VIII completes the study of this series. I has the lines 2119 and 3304 characteristic of the true acetylenes but the line 345, characteristic of the radical $-CH_2CCH$, is missing as a matter of course. The strong line 375 generally found in the Me -substituted acetylenes does not appear in the spectra of IV or in those of CH_3CMe and C_2H_5CMe . Apparently the line 375 is characteristic of the group $-CH_2CMe$. VI is similar to $CH_3CCH(OH)Me$ in possessing only 1 acetylenic line at 2241. The Me ether, VII, is similar to the other secondary ethers studied in having a unique strong line at 2241 but differs somewhat in showing no other lines at higher frequencies. VIII differs from the other pentenes but possesses the 5 lines 1286, 1417, 1641, 2998 and 3083 characteristic of a terminal double linkage. Comparison of the

Raman spectrum of V with that of the *trans*-isomer shows that the ethylenic line is displaced from 1674 to 1659 in passing from the *trans*- to the *cis*-isomer, that the lines 1351 and 1301 are weakened while the band 1257 is intensified. The influence of the Br atom is shown in the occurrence of the ethylenic line at 1630 in III and a similar influence of the Cl atom is shown by the line 1672 in II. All the compds. studied, with the exception of II, show a line whose frequency varies from 2065 to 2080. This line is not generally found in straight-chain aliphatic compds. and is attributed to the vibration of the isolated H atom of the iso- Pr radical. C. R. Addinall

The synthesis of ethyl alcohol from artificially prepared gases Oil Institute in Baku *Seizhalist Rekonstruktsiya i Aanka* 1935, No. 4, 118-At a semiautomatic plant the utilization of not less than 80% C_2H_6 was attained while employing up to 2.1% of H_2SO_4 for a unit of alc. An exp'tl. plant based on the utilization of oil gases is being constructed. B. V. Shvartberg

Polymerization of methyl esters of higher unsaturated fat acids XVI Polymerization of methyl esters of stearic acid Kichuro Kano *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 28, 140-5(1935), cf. C. A. 29, 2913- The central position of the triple bond in stearic acid (I) might confer properties other than those possessed by CH_3CH or long-chain mols. with a terminal triple linkage. Polymerization exp'ts. were carried out to exam. the behavior of I in contrast to that of mols. contg. a double bond. A soln. of 1 kg. of oleic acid dibromide in 1 l. of com. $AmOH$ was heated with 800 g. of KOH for 4 hrs. at 150°. The resulting soap was decomp'd. with dil. HCl and the crude acid after recrystn. from 80% $EtOH$ gave I, m. 47-8°, I no. (Wys) 87.2 (calcd. 89.93), neutralization no. 200.2 (calcd. 200.15), mol. wt. 273 (calcd. 280.26), Me ester (II), I no. 85.3 (calcd. 86.3), sapon no. 196.0 (calcd. 190.64), mol. wt. 259 (calcd. 294.3) I was heated in a H atm. for 20 hrs. and the product was sepd. into $MeOH$ -sol. and -insol. portions. The latter showed the presence of a dimer (III), I no. 82.0 (calcd. 89.93), neutralization no. 182.4 (calcd. 200.2), and mol. wt. 500 (calcd. 500.5). III probably contains a double linkage. Color changes noted during the Wgs. detn. indicate that, structurally, the polymerization of I takes place similarly to that of the Me esters of linolic and linolenic acids. C. R. Addinall

Compounds of bivalent carbon. XI. The carbon monoxide acetal cleavage of the esters and amides of diphenoxyacetic acid which occurs in chemical reactions Helmut Scheibler and Maximilian Depner. *Ber.* 68B, 2136-43(1935); cf. C. A. 29, 124- $(PhO)_2CHCO_2Et$ (I) with $NaOEt$ gives $(PhO)_2C=COEt$; (II) and at the same time the $C-C$ union is ruptured, with formation of $C(O)Ph$. In the prep'n. of I from Cl_2CHCO_2Et and $NaOPh$ it was frequently observed that the yield was considerably lower than when it was prep'd. under the same conditions from Cl_2CHCO_2Na . This suggested that the $NaOPh$ does not merely substitute the Cl atoms of the Cl_2CHCO_2Et but also adds to the ester group and the resulting ortho ester at once undergoes the carbon monoxide acetal cleavage. To obtain light on the cleavage process the action of $KOPh$ on I and of $NaOEt$ on $(PhO)_2CHCO_2Ph$ (III) in benzene was studied. Among the volatile products which distd. over with the benzene HCO_2H was detected in both cases, while the residue, after treatment with water, contained $PhOH$ and alkali formate. The reactions with I may be represented as follows: $I + PhOK \rightarrow (PhO)_2CHC(OEt)(OPh)OK \rightarrow C(OPh)_2 + HC(OEt)(OPh)OK$ (IV) $\rightarrow C(OPh)_2 + HC(OEt)(OPh)OK$. $C(OPh)_2$ could not be isolated and only its hydrolysis products, $PhOH$ and HCO_2H , were obtained. In the reaction of III with $NaOEt$ there occurred, along with the above cleavage, the other reaction, resulting in the formation of II. It may be assumed that III first changes into I which with the $NaOEt$ then forms II. The carbon monoxide acetal cleavage occurs more rapidly in alc. than in benzene, as in the prep'n. of I from Cl_2CHCO_2Et and $PhONa$, where considerable HCO_2Na is formed at the expense of the yield of I. The carbon mon-

oxide acetal cleavage is also observed in the action of Et_3NMgBr on I, which gives a neutral unsaponifiable product, b_p 55°, contg. the EtO group. The low b_p indicates that it is a HCO_2H deriv., possibly $\text{HC}(\text{OEt})_2\text{OPh}$, formed by exchange of the ester groups (*Umsetzung*) in $\text{HC}(\text{OPh})_2\text{OEt}$, the addn. product of EtOH to $\text{C}(\text{OPh})_2$. Such a reaction presupposes the splitting off of EtOH , which might take place thus: $(\text{PhO})_2\text{CHC}(\text{OEt})(\text{OMgBr})\text{NEt}_2 \rightarrow \text{C}(\text{OPh})_2 + \text{HC}(\text{OEt})(\text{OMgBr})\text{NEt}_2 \rightarrow \text{EtOH} + \text{C}(\text{OMgBr})\text{NEt}_2 \rightarrow \text{HNEt}_2 + \text{HCO}_2\text{MgBr}$. A considerably higher yield of such a neutral, EtO -contg. compd. was obtained when the product of the reaction between Et_3NMgBr and I was heated with alc. under pressure at 150°. There was also obtained PhOEt , probably formed thus: $\text{HC}(\text{OPh})_2\text{OEt} \rightarrow \text{PhOEt} + \text{HCO}_2\text{Ph}$. To prevent the reaction with the $\text{C}(\text{OPh})_2$ of the EtOH split off, the EtO -free compds. III and $(\text{PhO})_2\text{CHCONH}_2$ (V), instead of I were treated with Et_3NMgBr . III proved to be considerably more stable than I, it reacted only when heated in benzene suspension at 150° under pressure. Fractionation of the product yielded PhOH and HCO_2H , i.e., the PhOH split off has as much a disturbing influence as does EtOH in the case of I. With V, only splitting off of PhOH was observed. *Ph diphenoxycetic acid* (III), obtained in 80% yield from $(\text{PhO})_2\text{CHCO}_2\text{H}$ treated in ether with 2 mols. pyridine, then slowly with 1 mol. SOCl_2 , and finally with 1.1 mols. PhOH and heated to 40°, in 95°. *Diphenoxycetic acid* (50.6% from I and NH_4Et at 150° in sealed tubes), in 137°. XII. The carbon monoxide acetal cleavage of diphenoxycetic acid and its derivatives produced by thermal decomposition. *Ibid* 2144-51— $(\text{PhO})_2\text{CHCO}_2\text{H}$ (I) cannot be distd.; on heating it breaks down into PhOH with evolution of gas. Already at 120° several cleavage reactions occur simultaneously with formation of different products, chiefly PhOH and CO , along with CO , H_2O , HCO_2Ph , Ph_2CO , and a high-boiling substance (II), probably diphenoxymaleic anhydride. Because of the usually predominant PhOH formation, the carbon monoxide cleavage plays no significant role, since in addn. to CO only the small amt. of HCO_2Ph formed can be regarded as the product of such cleavage. A no. of derivs. of I have been prepd. in the hope of finding some which were thermolabile. The chloride (III), from I cautiously treated with SOCl_2 , splits off CO at 170-80° and yields $(\text{PhO})_2\text{CHCl}$ on distn.; $\text{C}(\text{OPh})_2$ and HCOCl are probably intermediate products. The mixed acetic diphenoxycetic anhydride (IV), from III and AgOAc (or from the Ag salt of I and AcCl), very easily loses AcOH , even during its prepn. in ether, giving $(\text{PhO})_2\text{C}=\text{CO}$ (V). In attempts to prep. the anide from III and NaN_3 , the reaction did not proceed as expected but followed the course $\text{III} + \text{NaN}_3 \rightarrow \text{V} + \text{NaCl} + \text{NH}_3$. From the reaction mixt. was isolated $(\text{PhO})_2\text{CHCO}_2\text{Ph}$ (VI), formed by the action of PhOH on V, the PhOH itself was probably formed by hydrolysis of part of the di- PhO groups by traces of moisture in the presence of NaN_3 . VI was also formed in the reaction between III and Ag_2O in benzene. To det. whether V is an intermediate product in the prepn. of VI from III and PhOH in pyridine, III in ether was treated with pyridine and then with PhN^+CHPh , but instead of the lactam $(\text{PhO})_2\text{C}=\text{CO} \cdot \text{NPh}$ CHPh the product was the

anide, *m.* 124°, of I, the pyridine in this case does not split off HCl . Cleavage of HCl was effected, however, by the action of $p\text{-HOC}_6\text{H}_4\text{N}_3\text{Ph}$ (VII) on III, the resulting unstable primary mol. compd. immediately decomposed into the known HCl addn. product, *m.* 169°, of VII. The triphenylmethyl ester (VIII) of I, from the Ag salt and Ph_3CCl , decomposed in a high vacuum only at 160°, giving CO , CHPh , and PhOH . II *b.p.* 160-8°, *m.* 153°, is highly unsatd. toward KMnO_4 in Na_2CO_3 , adds Br vigorously, reacts strongly acid. III, light yellow oil, IV, light yellow oil. VIII (yield, 75%), *m.* 112°. XIII. Diphenoxychloromethane (formyl chloride diphenyl acetal) and its conversion into tetraphenoxethylene [di(carbon monoxide) tetraphenyl acetal] *Ibid* 2151-3— $(\text{PhO})_2\text{CHCOCl}$ on heating loses CO to form di-

phenoxychloromethane (II) (see preceding abstr.), which may be regarded as formyl chloride di- Ph acetal. It is characterized by the great reactivity of its Cl atom. Even atm. moisture decomposes it, partially into HCO_2Ph , PhOH and HCl . The HCO_2Ph readily changes further into PhOH and HCO_2H , and the PhOH reacts with NaOH to form the qu'at stable crystal, tri- Ph orthoformate which seps. when I is exposed a long time to moist air. Attempts to split off HCl from I with tertiary bases (quinoline, NEt_3) had resulted (Schneider, *Duss. Tech. Hochschule Zurich*, 1916) in the formation of addn. products which had not been investigated with any great thoroughness. Nor could HCl be split off by heating I. The desired cleavage can be effected indirectly, however. Ph_3CN with I might have been expected to yield $(\text{PhO})_2\text{CHCPh}_3$ (II), but in spite of the mild conditions of the reaction (in ether at 15-20°) only the cleavage products of this acetal were obtained, besides CHPh_3 there was formed a compd. (III) having the compo. of $\text{C}(\text{OPh})_2$, but with double the mol. wt. Hence III is di(carbon monoxide) tetra- Ph acetal (diphenoxylene di- Ph acetal, tetraphenoxethylene), $(\text{PhO})_2\text{C}=\text{C}(\text{OPh})_2$. This structure is confirmed by the hydrolysis of III to $(\text{PhO})_2\text{CHCO}_2\text{Ph}$. The primarily formed II therefore immediately breaks down into CHPh_3 and $\text{C}(\text{OPh})_2$, which under the exptl. conditions dimerizes to III. I (64% yield from $(\text{PhO})_2\text{CHCOCl}$ in a Clausen flask slowly heated (with an abundance of clay fragments) to 180°, the gases being removed (through a CaCl_2 tube) by means of a water pump), light yellow oil, *b.p.* 130-2°. III, *m.* 168°, mol. wt. (Rast) 390, immediately decolorizes alc. KMnO_4 - Na_2CO_3 , adds Br energetically, with evolution of heat, in CHCl_3 . C. A. R.

Ester enolates and ketone acetals XIX Diphenylketene diphenyl acetal and diphenylmethyl phenyl ether Helmut Scheibler and Maximilian Depper *Ber.* 65B, 2154-7 (1933); cf. C. A. 28, 6700; preceding abstr.—Dimethylketene di-Et acetal, $\text{Me}_2\text{C}=\text{C}(\text{OEt})_2$, cannot be prepd. in the usual way from $\text{Me}_2\text{CHCO}_2\text{Et}$ because the latter reacts only with great efficiency with NaOEt . Diphenylketene di-Et acetal is the primary product of the action of pyridine on $\text{Ph}_2\text{CClCH}(\text{OEt})_2$ (I). It has not yet been obtained in pure form, however, as it splits off C_6H_5 to form PhCHCO_2Et when distd. Diphenylketene di- Ph acetal (II), from $(\text{PhO})_2\text{CHCO}_2\text{Et}$ and PhMgBr , gives with SOCl_2 and pyridine in ether diphenylketene di- Ph acetal (III). While I with PhMgBr forms PhCl and an organomagnesium compd. which undergoes the carbon monoxide acetal cleavage ($\text{I} + \text{PhMgBr} \rightarrow \text{PhCl} + (\text{EtO})_2\text{CHCPh}_2\text{MgBr} \rightarrow \text{C}(\text{OEt})_2 + \text{HCCPh}_2\text{MgBr}$), III gives the enol ether, *o,o*-diphenylmethyl Ph ether, $\text{PhOCH}=\text{CPh}_2$ (IV), and PhOMgBr . The same reaction, with splitting off of a PhO group, is effected with Zn in AcOH -pyridine. III readily splits off HCl , yielding the crest diphenylketene di- Ph acetal (V), which can be divid. without decompn. in a high vacuum. The reaction is best carried out in quinoline. V is also obtained from II with P_2O_5 and NEt_3 . It can be hydrolyzed to $\text{Ph}_2\text{CHCO}_2\text{H}$ or its esters, the Ph ester is obtained with $\text{HBr} \cdot \text{AcOH}$ at 15-20°, and the Et ester with $\text{HCl} \cdot \text{EtOH}$. The sapon. takes place so readily that Br in CCl_4 , which is rapidly decolorized, forms no Br addn. product but only PhCHCO_2Ph and $\text{Br}_2\text{C}_6\text{H}_5\text{OH}$. Traces of moisture therefore first liberate PhOH which reacts with the Br , forming the HBr necessary for the further hydrolysis of V. II (yield, 95.8%), *m.* 103°. III (97.5% yield), viscous oil solidifying to a glass which gives off HCl when heated above 100°. V (obtained in 69% yield by treating III in benzene with quinoline, allowing the benzene to evaporate gradually and heating the residue 8 hrs. at 160°), *m.* 112°, *b.p.* 155°, strongly reduces Na_2CO_3 , KMnO_4 , and vigorously adds Br . The splitting off of HCl can also be effected with heavy metal salts (Ag_2CO_3 , AgCN , $\text{Hg}(\text{CN})_2$) but the isolation of V is then difficult. IV (4.2 g. from 4 g. III with PhMgBr), *b.p.* 165°, *m.* 60°, is strongly unsatd. toward KMnO_4 , adds Br energetically, is not attacked by boiling dil. H_2SO_4 or alc. KOH , is also obtained with Zn dust in pyridine, AcOH and a few drops of water.

C. A. R.

The introduction of chlorine into nitromethionic acid. H. J. Backer. *Rec. trav. chim.* 54, 899-904 (1935); cf. C A 25, 915.—The secondary bromine and Ba salts and the tertiary K, Ti and Ba salts of $\text{CH}(\text{SO}_3\text{H})_2\text{NO}_2$ (I) were prep'd. The tertiary salts were explosive. When Cl was passed through a soln of the di-K salt of I at 60° , the di-K salt of chloronitromethionic acid (II) was formed. II was isolated as the tetrahydrate which lost H_2O over P_2O_5 , giving the dihydrate, m. 95.5° . The strychnine, brucine, Ba, Ti, Ag and Ca salts of II were prep'd. II reacted with K_2SO_4 to give I, but not with AgNO_3 .

E. W. Scott

Multimembered heterocyclic compounds VIII Higher mono- and polylactone rings M. Stoll and A. Rouvé. *Helv. Chim. Acta* 18, 1087-1125 (1935). cf. C A 29, 5074f.—By the method previously described (C A 29, 1063f) the following acids were lactonized in boiling C_6H_6 with PhSO_3H . $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave predominantly the monomeric lactone $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ (I) gave 13%, unchanged I. 32.6% lactone, b. $98-100^\circ$, d. 1.0693 , 1.4611, 3.8% dimeric lactone, b. $120-30^\circ$, m. $11-11.5^\circ$, d. 1.0268 , n. 1.4418 , n. 1.4379 , and 3.8% trimeric lactone b. $190-205^\circ$, d. 1.052 . $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave impure lactone, dimeric lactone, m. $40-1^\circ$, d. 1.018 , n. 1.4690 , and trimeric lactone, b. $202-5^\circ$, d. 1.051 , n. 1.4671 . $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 0.95% lactone, d. 0.9848 , and 97% dimeric lactone, m. $92.5-3.5^\circ$, b. $150-2^\circ$, d. 1.0739 , n. 1.4444 . $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ (II) gave 4% dimeric II, 1.2% lactone, b. $71-8^\circ$, m. $24-6.5^\circ$, d. 1.013 , n. 1.4691 , 80% dimeric lactone, m. $56-7^\circ$, b. $155-8^\circ$, d. 0.9583 , d. 0.9819 , d. 1.0171 , n. 1.4563 , and 14% trimeric lactone, b. 240° , m. 20° , d. 1.007 . $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ (III) gave 11% mono- and polymeric III, 1.4% lactone, b. $67-75^\circ$, m. $4-5^\circ$, d. 1.001 , n. 1.4673 , 68% dimeric lactone, m. $96-7^\circ$, b. $190-2^\circ$, and 12% trimeric lactone, m. $28-9^\circ$, b. $267-70^\circ$, d. 0.9942 , n. 1.4711 . $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 11% lactone, b. $58-60^\circ$, d. 0.9828 , n. 1.4727 , 69% dimeric lactone, m. $71.5-2^\circ$, and 20% trimeric lactone. $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 16% lactone, b. $88-90^\circ$, m. 0° , d. 0.9743 , n. 1.4697 , 70% dimeric lactone, m. $100-1^\circ$, and 12% trimeric lactone. $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 41% lactone, b. $139-42^\circ$, m. $50-1^\circ$, d. 0.9014 , n. 1.4707 , 39% dimeric lactone, m. $80-1^\circ$, and 15% trimeric lactone, $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 53% lactone, b. $106-9^\circ$, and 36% dimeric lactone, m. $106-7^\circ$. $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 67% lactone, b. $105-7^\circ$, m. $34-5^\circ$, 27% dimeric lactone, m. $108-8.5^\circ$, and 1.7% trimeric lactone, m. $70-2^\circ$. $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 58% lactone, b. $135-8^\circ$, and 24% dimeric lactone, m. $96-7^\circ$. $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 76% lactone, b. $136-8^\circ$, m. $36-7^\circ$, d. 0.9075 , d. 0.9344 , n. 1.4681 , and 20% dimeric lactone, m. $113-14^\circ$. $\text{HO}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 61% lactone, b. $174-6^\circ$, m. $35-6^\circ$, d. 0.9118 , d. 0.8971 , n. 1.4678 , and 33% dimeric lactone, m. $104-5^\circ$. $\text{Me}(\text{HO})\text{CH}(\text{CH}_2)_n\text{CO}_2\text{H}$ gave 42% lactone, b. $108-9^\circ$, and 20% dimeric lactone, m. $117.5-18^\circ$. Sapon. of the lactones was accomplished by extn. with pentane, in which the dimeric lactones are insol., and distn. of the sol. mono- and trimeric lactones. To a soln. of Na (7.4 g) in $[\text{CH}_3(\text{OH})\text{CH}_2]_2\text{O}$ (15 g) was added $\text{Br}(\text{CH}_2)_n\text{CO}_2\text{Me}$ (90 g). After 1 day at 150° the soln. was poured into H_2O (3 l). Extn. with Et_2O , sapon. and recrystn. from C_6H_6 -pentane gave $\text{HO}(\text{CH}_2)_n\text{O}(\text{CH}_2)_n\text{O}(\text{CH}_2)_n\text{CO}_2\text{H}$ (IV) (36 g), m. $52-3^\circ$. IV on lactonization gave 73% lactone, b. $120-5^\circ$, d. 1.017 , n. 1.4662 , and 5.8% dimeric lactone, m. $54.5-55^\circ$. $\text{HO}(\text{CH}_2)_n\text{O}(\text{CH}_2)_n\text{CO}_2\text{H}$, m. $50-50.5^\circ$ (Et extn), b. $164-7^\circ$, m. $22-3^\circ$, d. 0.9352 , n. 1.4510 , was prep'd. as IV. On lactonization this gave 67.4% lactone, b. $14-5^\circ$, d. 0.9904 , n. 1.4679 , and 21.4% dimeric lactone, m. $50-60^\circ$. From the data thus obtained values for the cyclization const., C, and the "degree of cyclization," γ , are calcd. C is shown to be directly proportional to the intermol. collision frequency. In lactone rings contg. more than 8 members neither sapon. side-reactions nor reactions involving interchange of ester groups or resinification affect the end results under these exptl. conditions, and the percentage compn. of the

1 reaction product gives a true picture of the course of the reaction. Other theoretical considerations and their bearing on the formation of large lactone rings are discussed. R. C. Elderfield

General method for the synthesis and the chemical properties of β -ethylene isocyanates, $\text{RCH}(\text{CR}'\text{NCO})\text{CO}$. Joseph Hoch. *Compt. rend.* 201, 733-5 (1935). cf. C A 30, 430f.—The treatment of $\text{RCH}_2\text{CR}'\text{NCO}$ -Et as previously described gave the following: $\text{EtCH}(\text{C}_6\text{H}_5)\text{NCO}$, b. $55-6^\circ$ (86% yield), phenylurea, m. 102° . $\text{C}_6\text{H}_5\text{NCO}$ (I), b. $61-3^\circ$ (82% yield), phenylurea, m. 107° . β -Me $\text{C}_6\text{H}_4\text{NCO}$, b. $73-4^\circ$ (74% yield); phenylurea, m. 170° . $\text{CH}_3\text{C}_6\text{H}_4\text{NCO}$, b. 99° (40% yield), phenylurea, m. 142° . $\text{MeCH}(\text{C}_6\text{H}_5)\text{NCO}$, b. $110-12^\circ$ (40% yield), phenylurea, m. 153° . I gave the following derivs: $\text{C}_6\text{H}_5\text{NHCONH}_2$, m. 130° (impure), $(\text{C}_6\text{H}_5)_2\text{NHCONH}_2$, m. 196° , $\text{C}_6\text{H}_5\text{NHCONHPh}$, m. 88° ; $\text{C}_6\text{H}_5\text{NHCOEt}$, b. $14-9^\circ$, $\text{C}_6\text{H}_5\text{NHCOCHMe}$, b. $147-8^\circ$, $\text{C}_6\text{H}_5\text{NHCOPh}$, m. $106-7^\circ$, $\text{C}_6\text{H}_5\text{NHCONC}_6\text{H}_5$, m. 119° ($\text{C}_6\text{H}_5 = \Delta^1$ -cyclohexenyl). Julius White

Effect of an element or a negative group on the relative mobilities of alkyl radicals in their chloroformates. Perre Carré and Henn Pascoudet. *Compt. rend.* 201, 898-900 (1935). C A 29, 5417.—The effect of an element or a neg. group on the mobility of an alkyl radical in the chloroformates is the reverse of the chlorosulfites. Hence the previous explanation offered for this is ineffective and the mechanism must be more complex.

Julius White

New uses of magnesium in organic syntheses II. The barbituric acid condensation Hakon Lund. *Apt. Danske Vidensk. Selskab. Math.-fys. Medd.* 13, No. 13, 11 pp (1935). C A 28, 2333f.—Substituted barbituric acids were readily prep'd in good yields by using $\text{Mg}(\text{OCH}_3)_2$ as a condensing agent. Mg (3 g) was dissolved in dry MeOH (75 cc), 10 g. of urea was added and then 0.1 mol of the appropriate malonic ester. The soln. was refluxed for 24-48 hrs. After deducting the recovered unchanged ester, the yields varied from 81-66%. Using thiourea, malonic ester gave only a small amt of 2-thiobarbituric acid. However 2-amino-3-isopropylbarbituric acid, m. 178° , was obtained in 68% yield. F. W. S.

The remarks of K. Freudenberg and E. Braun on 2,3,6-trimethylglucose anhydride. K. Hess and F. Neumann. *Ber.* 68B, 2167 (1935); cf. F. and B., C A 30, 719f.

C. A. R.

The synthesis of monoalkylamino acids of the chitosamic type. E. Votoček and R. Lukeš. *Collection Czechoslov. Chem. Communications* 7, 424-9 (1935); *Chem. Listy* 29, 338-10 (1935). cf. C. A. 28, 4387f.—The hitherto unknown acids of the type $\text{CH}_2(\text{OH})_4[\text{CH}(\text{OH})_2]\text{CH}(\text{NHR})\text{CO}_2\text{H}$ are easily prep'd with satisfactory yields by the method shown in the following example: *Monomethyl-d-glucosaminic acid*, m. 230° (decompn.) from 50% EtOH, [a]_D (initial in HCl) 4.0° , (final) 7.5° , was obtained thus: d-Arabinose (41 g) was dissolved in 63 g 25% MeNH₂ and left for 6 days, after which 40 cc of 25% HCN was added and the whole left for 2 weeks. Then the mixt. was chilled and added to 200 cc. concd. HCl. After a few days the soln. was evaporated to dryness *in vacuo* and the residue hydrolyzed by being steam-distd in Ba(OH)₂; this also removed excess MeNH₂. All the more ions were then ppt'd by a series of reactions and the soln. was evaporated almost to dryness below 50° . Some crystals were frozen out and more were obtained by adding EtOH. *Monomethyl-d-glucosaminic acid*, m. $228-9^\circ$ (decompn.), [a]_D (initial in HCl) -18.2° , (final) -33.5° , was prep'd in a similar manner from d-glucose. Its *ethyl isocrotonate deriv.*, m. 210° from aq EtOH, was prep'd. by treating the acid in aq KOH with PhNCO.

Cellulose (reply to the latest communications of K. Hess and K. Drenzel and of C. Tregus and K. Hess). L. Zechmeister and G. Tóth. *Ber.* 68B, 2134-6 (1935); cf. H. and D., C. A. 29, 7069f., T. and H., C. A. 29, 6813f.

C. A. R.

The phenylbenzylsuccinic acids. R. Stoermer and H. Stroh. *Ber.* 68B, 2112-16 (1935).—Avery and Upson

8°. 3-Isopropylidene acid (VII), m. 143–4°; it is best prepd. by passing HCl gas through II in boiling concd. HCl for 15–30 min. VIII, m. 167–8°. XI, m. 161–2°. XII, m. 210–11°. Me ester of XV, m. 72°. p-Nitrophenylhydrazide of XV, m. 181°. Me ester of XVI, m. 64°. XIV, m. 183–4°. di-Me ester, m. 125°. XVII, m. 111–12°, anilide, prepd through the chloride, m. 165–6°

The peculiar position of a truxillic acid. Truxillic ketones R. Stoermer and K. Cruse *Ibid* 2117–21.—Of the 3 *cis*-dicarboxylic acids (γ , *pers*, ϵ), the wholly sym. ϵ -acid (I) (with 2 *cis*-CO₂H and 2 *trans*-Ph groups) alone does not form a monomeric anhydride, although it gives a monomol imide and phenylimide. Renewed attempts, in the most varied directions, to prep such an anhydride have again been without success. The methods of which most was hoped were heating the acid at 250° *in vacuo* or depolymerizing the polymeric anhydride under 0.5 mm. The latter method resulted in a surprising isomerization, accompanying the depolymerization, to the stable monomol. γ -anhydride and even to the *pers*-anhydride. This is the only known case of a change in the configuration of the ϵ -acid. The stability of I led to an attempt to prep the corresponding alc acid (II) with MeMgI as described for the α - and γ -acids in the preceding abstr., dehydrate the resulting II to the unsatd acid (III) and convert the III by ozonization into a diphenylcyclobutanecarboxylic acid of definite configuration or, by ring cleavage, into I of the 2 phenylbenzylsuccinic acids. But here again the peculiar position occupied by I came disagreeably into evidence. The mono-Me ester of I gave with the Grignard reagent a very considerable amt of the ditertiary alc, this was reduced somewhat by decreasing the amt of MeMgBr but was still much greater than with the other acids and pointed to a primary disproportionation of the mono-Me ester to the di-Me ester and free I, resulting in a greatly decreased yield of II. With dehydrating agents II in no case gave III, the whole mol was completely broken down in a manner hitherto never observed in the truxillic acid series, giving PhCH=CHCO₂H, together with a soda-insol, high-boiling, and completely unsaponifiable oil. With PhMgBr instead of MeMgI, none of the HIO acid at all was obtained; the products were a large amt of free I and a soda-insol, unsaponifiable, satd di-Ph diketone (IV), formed in considerable amt even when an excess of PhMgBr was used. Like the Stobbe truxillic ketones (C. A. 24, 92), IV forms no oxime or semicarbazone but with alc. NH₂OH gives an isomeric diketone (V), apparently not identical with any of Stobbe's products (the latter, however, were not available for direct comparison). The structures of IV and V were established by depolymerization; both, on cautious distn. under atm. pressure, gave PhCOCH=CHPh. The ϵ -configuration may be assumed for IV; that of V is uncertain. Attempts were made to convert the different truxillic acids directly into the Ph ketones. The dichloride of the α -acid with AlCl₃ in benzene gave exclusively the known α -truxone; with the γ -acid it was therefore attempted to effect the reaction in steps by first converting the acid into the Bz acid (VI), but the chloride of VI gave with AlCl₃ and benzene only an exceedingly small amt. of an indifferent substance (VII), m. 92–3°, whose compn. approximated only grossly that of a truxillicone. Truxillic anhydride with 2 parts somewhat weathered AlCl₃ in

benzene occasionally yielded, along with VII and γ -truxonic acid, a very small amt. of an indifferent substance (VIII), m. 77–8°, whose compn. corresponded quite closely to that of a truxillicone but whose formation apparently depends on the quality of the AlCl₃, for it was not obtained with another sample of AlCl₃. Often, however, with 0.6–0.7 part AlCl₃ there was obtained (about 5%) a likewise soda-insol compd. m. 195°, of the compn. (C₁₁H₁₀O₃). Mono-Me ester of I, prepd from the monoanilide by treatment with Me₂SO, and subsequent d.compn. with HNO₃ or better by partial sapon of the di-Me ester with KOH in boiling MeOH, m. 131°. 2',4'-Diphenyl-3-(α -hydroxyisopropyl)cyclobutane-1'-carboxylic acid (II), m. 145°, Me ester, prepd. with CH₃N₃, does not melt. ϵ -Tetramethyltruxillicol, m. 146°. 2',4'-Diphenyl-1',3'-dibenzoylcyclobutane (IV) (yield, up to 50%), m. 207–8°. V, m. 222°. 2',4'-Diphenyl-3-benzoyl-1'-cyclobutanecarboxylic acid (VI), from γ -truxillic anhydride, AlCl₃, and benzene, m. 227°. Me ester, m. 169°. Et ester, m. 162°. phenylhydrazide, m. 100° with vigorous foaming (apparently forming the lactam) and becomes insol in soda. On heating or on short treatment with concd H₂SO₄, VI is depolymerized to PhCH=CHCO₂H and PhCOCH=CHPh. Chloride of VI, prepd with SOCl₂ in benzene, m. 150–2°. The hemitruxonic acids of the truxillic acid series and the still missing truxone, *pers*-truxone R. Stoermer and Fr. Möller *Ibid* 2124–34.—Of the 5 truxillic acids (I), the α -, γ -, *pers*- and ϵ -acids can theoretically yield hemitruxonic (or, for short, truxonic) acids (II), and of the 4 latter, in turn, only the α - and *pers*-acids can form diketones or truxones (III). α -III has long been known, and the *cis*- or *pers*-truxone, which was as yet lacking, has now been prepd γ -II, previously made by internal condensation of the truxillic anhydride with AlCl₃, was prepd. from the mono-Me ester chloride with AlCl₃ in CS₂ on the water bath. It is characterized by its resistance to all attempted rearrangement methods which ordinarily convert the γ - into the α -derivs. It forms an oxime and a phenylhydrazide. *pers*-II was prepd from the anhydride, while α - and *epi*-II were made from the ester chlorides. Some difficulty was encountered in the prepn of α -II, for the Me ester on alk. sapon rearranged into γ -II, but acid hydrolysis yielded α -II. *pers*- and *epi*-II offered considerably greater difficulties because, on the one hand, of the lability of the *pers*-II, and, on the other hand, of the labor involved in the prepn of *pers*-I, from which alone *epi*-I can be prepd. The prepn of *pers*-I was improved by heating the necessary γ -anhydride in a tube under N to only about 280° instead of in a high vacuum at 300°. Decompn of the γ -acid by atm. O is thereby largely avoided, the acid being recovered pure in considerable amt and the yield of *pers*-anhydride being thereby indirectly increased to about 29%. In the rearrangement there seems to be established, between the 2 anhydrides, an equilibrium which below 260° still lies completely on the γ -anhydride side but shifts more and more to the *pers*-anhydride side with increasing temp. Above 280° it would probably shift still further in this direction were it not that incipient decompn limits the yield. Further progress required a careful study and a detn. of the constitution of some derivs of *pers*- and *epi*-I, which resulted in the prepn of the 2 *epi*-ester acids. There had already (C. A. 18, 2172) been obtained from the *pers*-anhydride with hot concd NH₄OH an amidic acid (IV) which with HNO₃ gave *epi*-I, showing that the *pers*-form is rearranged into the *epi*-form not only by strong alkalis but also by weak alkalis at high temps. The exceedingly stable monomol truxillic imide (V) formed at the same time is a deriv. of *pers*-I, which alone can yield such an imide. The true *pers*-truxillic acid (VI) is obtained by treating the *pers*-anhydride in alc. suspension with NH₃ gas; when heated with aq. NH₄OH it changes over, with partial formation of V, into the *epi*-amidic acid (IV). Sapon of VI with HNO₃ or mere boiling in AcOH gave very pure *pers*-anhydride. The 2 CO₂H groups in *epi*-I are not equiv.; the one standing alone with H atoms on 1 side of the cyclobutane ring is designated δ , and the other, on the

same side of the ring as the CO_2H groups, is designated α . In the rearrangement of VI into IV, only the CONH_2 changes position, hence IV is the β -amino acid. Esterification of VI with CH_3I , and sapon of the ester with HNO_3 gives without rearrangement the known *pers*-ester acid, m. 193°. The pure α -Me ester (VII) of *epi*-I m. 204.5°, the isomeric β -ester (VIII) m. 141°. The Me ester, m. 228°, of IV with HNO_3 gives VII, which had formerly been obtained by half sapon of the di-Me ester of *epi*-I, the β - CO_2Me group in the di-Me ester is sapon more rapidly than the α CO_2Me standing between the Ph groups. Conversely, on esterification of the free *epi*-I, the β - CO_2H group is esterified first; with MeOH -HCl the product obtained is VIII. VII and VIII yield the same di-Me ester, m. 111-12°. In the acid chloride of VIII, the α COCl group should react with the adjacent Ph group in the Friedel-Crafts reaction, and as a matter of fact the chloride does give the Me ester, m. 106-7°, of *epi* II. *pers* II has a higher m. p. than any of its isomers but stands between α - and γ -II in its soly. All its salts are readily sol. With alc. NH_4OH it gives the oxime of *epi*-II. No rearrangement occurs in the formation of the phenylhydrazones, which, however, does not melt sharply, this indicates that *pers* II, in spite of repeated purification, is not completely homogeneous. The AlCl_3 used in its prep. gives rise to a rearrangement which had hitherto not been observed in this field, even when the purest *pers*-anhydride is used there is formed, along with *pers*-II, some γ -II. The chloride of *pers* II with AlCl_3 in CS_2 gives *pers* III, which differs from the α isomer in being easily sol. in AcOH and acetone and melts almost 100° lower. It could not be rearranged into the α -compd. either by heating it alone above its m. p. or with concd. HCl in a sealed tube at 180°. The mono-Me ester, m. 184°, of γ -I, formerly prep. from the anhydride with MeOH and Na_2CO_3 , is also very conveniently obtained in 68% yield by half-sapon of the di-Me ester in cold MeOH with HCl gas. Boiled in benzene suspension with excess of SOCl_2 , it readily forms the ester chloride, m. about 86°, which with 5 parts AlCl_3 in CS_2 , on the water bath gives 83% of the Me ester, m. 127-8°, of II, sapon. by alc. KOH to the free γ -II, m. 152° (oxime, m. 207°, amide, from the chloride (prep. with PCl_5) and NH_3 gas in ether, m. 236-7°, phenylhydrazones, light yellow, m. 225°). Mono Me ester of α -I, m. 195°. Me ester of α -II (88% yield), m. 186°, sapon. by heating in AcOH contg. a few drops of concd. H_2SO_4 and a little water to the free α -II, m. 216° (phenylhydrazones, m. 239°) α III, m. 293°. Anhydride of *pers* I, obtained in 12% yield, together with 62% recovered *pers*-I, m. 287°. VI, m. 256.5°; Me ester, obtained with CH_3N in (CH_3OH) , m. 197-8°. V, m. 237°, mol wt (Rast) 264.2-295.7. IV, m. 263°. *epi*-II, from its Me ester with KOH in MeOH , m. 100°; oxime, m. 200° (decomp.) *pers*-II, m. 221-4°. phenylhydrazones, canary-yellow, m. 189°. *pers*-III (yield, 90-3%), m. 194°. monophenylhydrazones, from III heated with PhNHNH_2 -AcOH, yellow, m. 217°; diphenylhydrazones, from the monophenylhydrazones or III itself heated with PhNHNH_2 at 150-60° in a current of N, m. about 280° (decomp.)

C. A. R.

Plane "radiary" compounds I. Hexahydroxymethylbenzene and its derivatives. H. J. Backer. *Rec trav chim* 54, 833-7 (1935), cf. C. A. 27, 639.—Hexa-acetoxymethylbenzene (I), m. 163°, was prep. by heating hexabromomethylbenzene (II) with AcOK and Ac_2O for 5 hrs. at 135°. I was sapon. in EtOH with KOH to hexahydroxymethylbenzene (III), m. 310-11°. The hexa-propionate of III, m. 99-100°, was prep. from II and EtCO_2K . The hexamethyl, hexaethyl and hexaphenyl ethers of III, m. 100°, 93° and 221°, resp., were prep. from II and NaOMe , NaOEt and NaOPh . III in warm HNO_3 formed the hexanitrate, m. 176.5° (decomp.) III possessed the properties of an extremely compact mol., i. e. high m. p., low soly and ease of crystn. Its derivs showed similar properties to a lesser extent. II. Hexamercaptomethylbenzene and its thio ethers. *Ibid* 905-15.—Hexabromomethylbenzene (I) was heated with thiourea in abs. EtOH to give the hexahydrobromide of

1 hexa-sithioureamethylbenzene (II), decomp. 250°, which with cold NaOH (6 mols.) formed II, decomp. 290°, or, by heating with excess NaOH (15 mols.) and neutralizing the excess NaOH , hexamercaptomethylbenzene (III), m. 225-6°. The following hexaethers of III were prep. by heating I and a Na mercaptide in EtOH or AmOH : Me, m. 220-222°; Et, m. 131°, Pr, m. 55.5°; *iso*-Pr, m. 232.0-2.5°; Bu, m. 34.0-4.5°; *iso*-Bu, m. 94°; *sec*-Bu, m. 172°; *tert*-Bu, m. 304°; Am, m. 25.5-6.0°; *tert*-Am, m. 293°; hexyl, m. 11.5-12.0°; Ph, m. 191-2°, *p*-tolyl, m. 183.5-4.0°; *p*-chlorophenyl, m. 179-80°; *p*-*tert*-butylphenyl, m. 182.5-3.0°; benzyl, m. 143°. III and its derivs showed the properties of filled mols. The *n*-ethers of III showed a lowering of the m. p. as the alkyl group was increased. Branching of the alkyl group caused an elevation of m. p. as the mols. thus became more compact.

E. W. Scott.

2 The catalytic dehydrogenation of ethylbenzene to styrene. Yu. S. Zal kind and G. L. Bulavskii. *Plasticheskie Massy* 1935, No. 3, 9-12.—PhEt mixed with N is passed over a catalyst of 10% ZnO and 90% Al_2O_3 at 10-13 mm. pressure, 600-70°, and a rate of 1 g. per min. to yield 82.74% styrene.

H. M. Leicester.

3 Action of phenylmagnesium bromide on *N*-dimethyl- α -bromobutyramide. Sou Phou Ti. *Bull soc chim* [5], 2, 1799-1800 (1935); cf. C. A. 25, 4525.—The action of org. Mg derivs on α -halogenated amides gives tertiary alcs. of the general formula $\text{Et}_3\text{NCH}_2\text{C}(\text{OH})\text{R}_1$, in the case of $\text{CH}_3\text{CONEt}_2$. To study this curious transposition with amides of higher mol. wt., PhMgBr was reacted in toluene with EtCHBrCONMe_2 (I), b. 123-4°, prep. by the condensation of EtCHBrCOBr and NHMe_2 in Et_2O at -10°. The reaction gave a small yield of PhBr , a considerable amt. of PrCONMe_2 (II), b. 162-5°, some $\text{MeCH}=\text{CHCONMe}_2$ (III), traces of PrCOPh (IV) and $\text{Me}_2\text{NCH}=\text{C}(\text{OH})\text{Ph}$ (V). Sapon of III, b. 200°, gave NHMe_2 and $\text{MeCH}=\text{CHCO}_2\text{H}$, converted into $\text{MeCHBrCHBrCO}_2\text{H}$, m. 87°. The semicarbazone of IV was identical with that of a sample prep. by the condensation of PrCOCl and benzene in the presence of AlCl_3 . V, m. 58° (picrate, m. 155°), was purified through the perchlorate, m. 182°. Treated with AcCl in CHCl_3 it furnished $\text{Me}_2\text{NCH}=\text{C}(\text{OAc})\text{Ph}$ (picrate, m. 138°). V was decomposed by treatment with 48% HBr into NHMe_2 and EtCOCHPh through the intermediate $\text{Me}_2\text{NC}(\text{Et})\text{CPh}$. In the presence of an excess of Mg a part of I is probably converted into $\text{EtCH}(\text{MgBr})\text{CONMe}_2$ (VI), which is decomposed by H_2O to give II. By the action of PhMgBr on the CO group of VI an intermediate compd. is formed which is hydrolyzed to IV. In all probability III is formed by the action of $\text{Me}_2\text{N}(\text{OH})$, on unreacted I.

C. R. Addinall.

7 Purification of dimethylaniline. Use of aqueous formic acid to remove aniline and monomethylaniline. Frank O. Ritter. *Ind Eng Chem* 28, 33-5 (1936).—By treatment of a mixt. of aniline, mono- and di-methylaniline with 85% HCO_2H , the primary and secondary amines are formylated. PhNMe_2 of high purity then can be distd. from the higher boiling formamides.

E. W. Tullitson.

8 Alkylated ethanediamine derivatives. IV. The reaction between 1,2-bis(benzylideneamino)ethane, phenyl isocyanate and water. J. van Alphen. *Rec. trav chim* 54, 883-7 (1935), cf. C. A. 29, 3991.—The reaction of 1,2-bis(benzylideneamino)ethane (I) with 2 mols. of PhNCO (II) in moist Et_2O gave 1-(phenyl-3'-ureido-2'-ethyl)-2-keto-3,4-diphenylisazane-1,3-cyclobutane, m. 208° (decomp.). With equimol. quantities of I and II in moist Et_2O , 1-benzylideneamino-2-(phenyl-3'-ureido)-ethane (III) was formed. III was hydrolyzed by dil. HCl and the product was benzoylated giving 1-(phenyl-3'-ureido)-2-benzoylaminoethane, m. 210°. Reduction of III with Na and EtOH and benzoylation gave 1-(benzylideneamino)-2-(phenyl-3'-ureido)ethane.

E. W. S.

as Diphenylhydrazine (melt undercooling and molecular configuration). D. Vorlander and Carmen Butins. *Ber* 68B, 229-9-76 (1935).—as-Diphenylhydrazine (I) on account of its mol. dissymmetry (cf. C. A. 24, 4944) should and does have a greater tendency to remain melted than

PhNHNH₂ (II) and hydrazobenzene (III) under the same conditions of undercooling. This behavior is not connected with lower *m. p.* since I *m. 44°*, II *m. 19.5°*, and III *m. 127°*. *N*-Formylphenylhydrazine, *m. 117°*, and the *N,N*-di-*Ac*, *m. 125°*, and dipropionyl, *m. 99–101°*, *derivs.* are easily undercooled but the *N*-mono-*Ac* (IV), *m. 186°*, and monopropionyl, *m. 179°*, *derivs.* cannot be undercooled. There are various processes of crystg. and melting depending on the mol. configuration, uniformity and phys. sphere of the compd. It only remains certain that the arrangement of I is found in many *derivs.* The *derivs.* of I are not cryst. liquids. *Na α,α*-diphenylhydrazine-β-acetate (V), *m. 80°* in its H₂O of crystn., decomp. 180–5°, was prepd by heating 9.2 g, 4.1 g BrCH₂CO₂Et and 25 cc alc. or I HCl, NaOEt soln and BrCH₂CO₂Et on a H₂O bath 1.5 hrs and treating with 10–15% NaOH to hydrolyze the ester and ppt the salt. Pb, Hg, Mg, Ca, Sr, Zn, Cd and Al salts can be pptd from the H₂O soln of V but the Ba and K salts are also sol. The Ag ppt is reduced to Ag on warming. *α,α*-Diphenylhydrazine-β-acetic acid (VI), *m. 87°* (cloudy, clear 96°), ppts from H₂O solns of V on addn of AcOH, as an oil which crystallizes after a few hrs at 15–20°. It often seps as an oil even on dropping the alc soln on ice. On heating, the crystal powder changes into doubly refracting 4-sided rhombic leaf-like leaves which will not seed the undercooled melt (dumorphism). Oxidizing agents give color reactions, FeCl₃ red-violet, concd H₂SO₄ moss-green, AcOH and PbO₂ red-violet. *N*-Acetyl-α-diphenylhydrazineacetic acid (VII), *m. 185°* (cor +2°), from heating V 0.5 hr at 95° with 5 pts Ac₂O; remains only on slight undercooling. With concd HNO₃ in AcOH soln at 15–20° it gives a diminoacetylphenylhydrazineacetic acid, *m. 210°*. When I reacts with BrCH₂CO₂H or ClCH₂CO₂H or ester in the presence of H₂O, soda or NaOAc a compd, *m. 214°*, probably the diphenylhydrazide of VI, seps its *Ac* deriv. *m. 229°* (cor +4°). *α,α*-Diphenylhydrazine-*p*,*β*-diacetic acid, an oil, resulted from the action of excess BrCH₂CO₂H on I in alc. or from BrCH₂CO₂Na and V in H₂O. *β*-(*p*-nitrobenzenesulfonyl)-*p*-phenyl-*α*-acetylhydrazine, *m. 241°* (cor +5°), was formed by dropping an AcOH soln (30 cc) of Na *p*-nitrophenylnitrosamine (VIII) (1.9 g) into a soln of IV (1.1 g) in 25 cc AcOH. Similarly, *β*-(*p*-nitrobenzenesulfonyl)-*p*-phenyl-*α*-acetylhydrazine-*α*-acetic acid was formed from VII and VIII. Both compds form an amorphous lacquer on melting and cooling. Even with great excess of VIII only 1 of the 2 Ph groups reacts, possibly because the influence of the amine N is distributed unevenly. Janet C. Austin.

The hydrogenation of technical phenols in the vapor phase. M. I. Belotzerkovskii, *Prikladnaya Khimiya* 1935, No. 3, 12–16.—Ordinary Ni catalysts are rapidly poisoned by technical PhOH. A catalyst prepd by heating Ni(NO₃)₂ to 200° and passing H₂ over it will hydrogenate tech. PhOH at 175–80°. Cresols can also be hydrogenated if they are first freed from thiophene. Higher temps. favor ketone formation. H. M. Leicester.

The constitution of β-ergosterol. F. Laucht, *Z. physikal. Chem.* 237, 239–46 (1935).—Hydrogenation of ergosterol occurs in 2 stages, (1) the double bond at C₅-C₆ becomes satd and the C₇-C₈ double bond in ring B shifts to C₇-C₈ in ring C, yielding α-dihydroergosterol, (2) the double bond in the side chain of the latter at C₁₇-C₁₈ becomes satd, yielding α-ergosterol. The same product is obtained in a single step by hydrogenation of 22-dihydroergosterol, whereby the C₅-C₆ bond is satd and the C₇-C₈ bond shifted, or by shifting the bond in γ-ergosterol. The double bond in the isomeric β-ergosterol is now shown to be at C₅-C₆ in ring D. The proof consists in ozonization of β-ergosterol acetate to a keto alc. which represents a removal of ring D and the side chain, leaving Me at C₁₃ and O at C₁₄, and Se dehydrogenation of the ketone to 2-methylphenanthrene. The 3 isomeric ergosterols represent, therefore, successive shifts of the double bond to an adjacent position; thus γ-C₇-C₈ → α-C₇-C₈ → β-C₇-C₈. Ozonization of α-ergosterol acetate and decompn. of the ozonide by Zn dust gave a mixt. of 2 isomeric dehydroergosterols, *m.*

132°, [α]_D²⁰ -56.1°, and *m.* 114–6°, [α]_D²⁰ -81°, resp. Ozonization of β-ergosterol acetate and distn. of the neutral portion gave the acetate of a keto alc. C₂₇H₄₄O₂, and the primary ozonization product, C₂₇H₄₄O₄, *m.* 144°, [α]_D²⁰ 92.5°, which on hydrolysis and CH₃N₃ esterification gave a Me ester C₂₇H₄₄O₄, *m.* 51°, [α]_D²⁰ -24.6° (acetate *m.* 124°, [α]_D²⁰ 14.3°). By heating the keto alc. acetate to 320° with Se the 3-ring system was stripped of H and the Me at C₁₃, yielding 2-methylphenanthrene, *m.* 53° and identical with the synthetic substance. Ring D and the side chain had been split off as an aldehyde from which the semicarbazide C₂₇H₄₂N₂O, *m.* 125–31°, was prepd.

A. W. Dorr. Action of isobutylene on methyl phenol ether and the structure of pseudobutyl methyl phenol ethers. B. M. Dubinin, *Compt. rend. acad. sci. U. R. S. S. (N. S.)* 3, 263–6 (1933).—Excellent yields of Me₂C(CH₃)₂ (I) were obtained by passing Me₂C(CH₃)₂OH over clay heated to 340–60° and drying the product over KCl. The passage of I into 5% solns of AlCl₃ in phenol ethers gave 53, 61 and 71% yields of the pseudo-Bu *derivs.* of *o*-MeOC₆H₄Me (II), *b₁* 112–13°, *p*-MeOC₆H₄Me (III), *b₁* 94–5°, and *m*-MeOC₆H₄Me (IV), *b₁* 120–2°. The latter reaction also gave 3,4,5-Me₃O(Me₂C)₂C₆H₂OMe (V), *m.* 75°, *b₁* 123–31°, sepd from IV by crystn. from petroleum ether. The structure of III was detd by bromination in CHCl₃ to give 2,4-BrMeC₆H₂OMe (VI), *b₁* 126–30°, which was converted into 5,2-Me(MeO)C₆H₂CO₂H, *m.* 67–8°, through the Mg deriv 5,2-Me(MeO)C₆H₂MgBr (VII). The addn of 35 g of Me₂CBr to the orig. Mg compd from 52 g of VI, 6.27 g of Mg and 90 cc of Et₂O gave, after heating at 100° for 1 hr and the usual decompn. procedure, 11 g of III, *b₁* 111–3°. Both this compd and III as prepd above were nitrated to 5,2,3-Me(MeO)(NO₂)C₆H₂Me₂ (VIII), *m.* 93.5°. The further nitration of VIII by addn to HNO₃ (d 1.51) at -5° to -8° formed 5,2,3-Me(MeO)(NO₂)C₆H₂NO₂, *m.* 122°, by replacement of the CMe₂ group. In the nitration of IV, especially in AcOH solns, an intense blue color is produced. This is attributed to the formation of an oxonium quinoid salt which is only possible from phenol ethers wherein the *p*-position with respect to the OH group is free. The absence of blue color on nitrating V shows that both *p*-positions to the MeO groups are occupied by Me₂C groups. A soln of 20 g of 4,5-Me₂C(MeO)C₆H₂OMe in 40 cc of benzene was added dropwise to 200 cc of cooled HNO₃ (d 1.4). The sepd benzene layer was washed free from acid, dried and, on concn., yielded 11 g. of 2,4,5-O₂N-(Me₂C)(MeO)C₆H₂OMe, *m.* 188–92°, *m.* 99–100°, which was converted by nitration with HNO₃ (d 1.51) in the presence of Ac₂O into 2,4,5-(O₂N)₂(Me₂C)C₆H₂OMe (IX), *m.* 157°. The nitration of V gave 2,4,5-O₂N-(Me₂C)(MeO)C₆H₂OMe, *m.* 99–100°, which on further nitration was converted into IX. C. R. Addinall.

Halogen derivatives of procaine II (*p*-bromo-*o*-amino-benzoyldiethylaminoethanol). J. Frejka and F. Vymetal, *Collection Czechoslov. Chem. Communications* 7, 436–43 (1935), cf. C. A. 19, 2332.—In order to study further the effect of halogens in the ring of procaine on the physiol. properties of the compds it was decided to invert the positions of the Br and NH₂ in bromoprocaine to obtain 4-bromo-2-amino-benzoyldiethylaminoethanol. This was found to be an oil that gave a HCl salt, *m.* 166°. Both caused an intense anesthesia of the tongue. The HCl salt was prepd (17% yield) by heating 1 g. 4-bromo-2-amino-benzoyldiethylaminoethanol (I), *m.* 80–1°, and 0.6 g. NH₄Cl in a sealed tube at 110° for 10 hrs. The contents of the tube were extd. with abs. Et₂O, this soln. was extd. with the calcd. amt. of aq. HCl, the aq. soln. was treated with the calcd. amt. of K₂CO₃ and extd. with Et₂O, and finally the Et₂O soln. was pptd with HCl in EtOH. I was prepd (23%) by heating 1 g. of 4-bromo-2-amino-benzonic acid (II), *m.* 222°, and 0.7 g. CH₃CH₂CH₂OH in 3 cc. concd. H₂SO₄ for 6 hrs. on a water bath. Considerable difficulty was experienced in finding an efficient method of prep. II. Three methods were tried: (1) NaNO₂ (9 g.) in 50 cc. concd. H₂SO₄ was added to 20 g. 4-BrC₆H₄NH₂Ac in H₂SO₄ to give 80% 2-nitro-4-bromo-

acetanilide, m 103-4°. This was saponified with 50% H_2SO_4 to give 83% 2-nitro-4-bromoaniline, m 112°. This was very difficult to diazotize and gave only 12-15% of 2-nitro-4-bromobenzenitrile, m 98-9°, which was hydrolyzed by 50% H_2SO_4 to give 75% of 2-nitro-4-bromobenzoic acid (III), m 163-4°. This was reduced by Fe and HCl to give 76% of II. (2) When 2- $\text{O}_2\text{N}_2\text{C}_6\text{H}_4\text{Me}$ was brominated, using Fe, a mixt of isomers were formed from which 15% 2-nitro-4-bromotoluene (IV), m 43°, was isolated. It was almost impossible to oxidize IV to III. The only practical method, heating it in a sealed tube at 150-70° for 10 hrs with 30% HNO_3 , gave only 48%. (3) However, reduction of IV with Fe and HCl and steam distn gave 80% 2-amino-4-bromotoluene, an oil, acetate, m 165°. One g of this acetate in 500 cc H_2O contg MgSO_4 was easily oxidized by KMnO_4 in 6 hrs to give 90% 2-acetyl-amino-4-bromobenzoic acid, m 290° (220° ?), which was hydrolyzed by 50% H_2SO_4 to give 93% II. J F M

Configurational relationships of methylphenyl- and methylhexylacetic acids and an attempt at the correlation of the configurations of 2 hydroxy acids with those of disubstituted acetic acids containing a methyl group. P A Levene and Stanton A Harris. *J Biol Chem* 112, 195-208 (1935).—The configurations of $\text{MeCHPhCO}_2\text{H}$ and $\text{MeEt(C}_6\text{H}_{11})\text{CH}$ are correlated. Acids contg a Ph or cyclohexyl group are correlated among themselves and to the corresponding normal acids. Successive increase in the distance of a Ph group from the asym center of a substituted AcOH causes an alternation in the shift of the mol rotations. Substitution of C_6H_5 for Ph and C_6H_{11} for Ph(CH_2), enhances the rotation. With cyclohexyl no periodicity or marked difference was noted in either the normal or cyclic series. The 2 HO acids are correlated with the disubstituted AcOH series on theoretical grounds based on Boys' theory. Carbinols of the type $\text{R}(\text{CH}_2)_n\text{CH}(\text{OH})\text{Me}$ are correlated with hydrocarbons of the type $\text{R}(\text{CH}_2)_n\text{CH}(\text{Me})\text{Et}$, where R is Ph or cyclohexyl. When $n = 0$ or 1 substitution of C_6H_5 by C_6H_{11} has a similar effect on the mol rotation in both alcs and hydrocarbons. The effect of Ph is in the opposite sense in the carbinols with that of the hydrocarbons. When $n = 2$ substitution of C_6H_5 for C_6H_{11} has little effect on the rotation, substitution by Ph produces an identical effect in both cases. To $\text{BrMg}(\text{CH}_2)_2\text{MgBr}$ (from $\text{Br}(\text{CH}_2)_2\text{Br}$ (90 g)) was added 1-EtMeCHO, 20 g. Hydrolysis with NH_4Cl soln gave a mixt of 1-1-sec-butyl-1-cyclohexanol and sec-butylcyclohexene 1 carbinol, b_p 161-162°, $[M]_D^{25}$ 3.96°. To this (19.5 g) in CHCl_3 at 0° was added Br in CHCl_3 until no further decoloration occurred. After washing, the product was fractionated, giving 1-1-sec-butyl-1-cyclohexene (I), b 172-4°, d_4^{25} 0.820, n_D^{25} 1.4590, $[M]_D^{25}$ -4.06°, and a compd, $\text{C}_{10}\text{H}_{18}\text{OBr}_2$, b_p 161°, of undetd structure. I reduced with PtO_2 gave d-2-cyclohexylbutane, b 178-8°, d_4^{25} 0.815, n_D^{25} 1.4460, $[M]_D^{25}$ 0.59°. Active AmMgBr and $\text{C}_6\text{H}_5\text{CHO}$ gave 3-methyl-5-undecanol, b_p 70-5°, b_n 115°, d_4^{25} 0.8272, n_D^{25} 1.4307, $[M]_D^{25}$ 17.4°. This with anhyd HI gave 3-methyl-5-iododecane, b 88°, d_4^{25} 1.1972, $[M]_D^{25}$ 45.7°. This, reduced with Raney's catalyst, gave methylcyclohexylmethane, b_p 94°, d_4^{25} 0.7491, n_D^{25} 1.4216, $[M]_D^{25}$ 17.4°. R C E

Synthesis of alceines, derivatives of o-phenylacetic and o-phenylphenylglycolic acids. E Plazek, Z Rodewald and D Krzyżaniak. *Rozprawy Chem* 15, 360-4 (in German 364) (1935).—Esters of these acids with tropine and $\text{Me}_2\text{NCH}_2\text{CH}_2\text{OH}$ were prepd. Equimol ams of o- $\text{PhC}_6\text{H}_4\text{OCH}_2\text{CO}_2\text{H}$ and tropine were heated to 110-20° for 4 hrs, dry HCl being simultaneously blown through the molten mass, then concd K_2CO_3 added. The alcine was extd with ether and distd at 208° under 1 mm pressure. By mixing ether solns contg equimol ams of o- $\text{PhC}_6\text{H}_4\text{OCH}_2\text{COCl}$ and $\text{Me}_2\text{NCH}_2\text{CH}_2\text{OH}$, oil of alcine-HCl was formed, then the free alcine was obtained by treating with K_2CO_3 . Extn with ether gives a product b_p 148-150°. Esterification of o-phenylacetic acid by tropine gives the product b_p 149-150°. The product of esterification of o-phenylacetic acid by $\text{Me}_2\text{NCH}_2\text{CH}_2\text{OH}$ b_p 110°, m 75°. M Wojciechowski

Constituents of red sandalwood. Homopteroecarpin. H. Leonhardt and E Oechler. *Arch Pharm* 273, 447-52 (1935), cf C A 29, 2543°.—Homopteroecarpin shows agreement with pterocarpin in the function of 2 O atoms. The detection of the quinoid character of dihydrohomopteroecarpin is important from the standpoint of the sandalwood dyestuffs. Dihydrophenylhydrazones of homopteroecarpin, $\text{C}_{20}\text{H}_{20}\text{O}_4\text{N}_2$, brownish red needles, m 292° (decompn). Dihydrohomopteroecarpone, $\text{C}_{20}\text{H}_{20}\text{O}_4$, by oxidation of 1-dihydrohomopteroecarpin, lemon-yellow needles, m 178.5°, dinitrophenylhydrazone, $\text{C}_{20}\text{H}_{20}\text{O}_4\text{N}_2$, decomp 258° without melting, p-nitrophenylhydrazone, $\text{C}_{20}\text{H}_{20}\text{O}_4\text{N}_2$, decomp 148° without melting, monoxime, $\text{C}_{20}\text{H}_{20}\text{O}_4\text{N}$, yellow needles decomp 225° (dinitrophenylhydrazone, $\text{C}_{20}\text{H}_{20}\text{O}_4\text{N}_2$, copper needles decomp 199°). Acetylation of dihydrohomopteroecarpin in the presence of nascent H gives an Ac deriv $\text{C}_{20}\text{H}_{20}\text{O}_4$, m 122-3°. W O E

Obtaining bornyl chloride. E N Rostovskii and T V Sheremeteva. *Plasticheskie Massy* 1935, No 3, 87-4.—Bornyl chloride can be prepd without decrease in yield by satg pinene with HCl at 90°. Cu and Pb surfaces cause a smaller yield at this temp, and are themselves corroded unless they are coated with lacquer. H M Leicester

Synthesis of methylcyclohexanethrenecarboxylic acid and 4-methylphenanthrene. Georges Darzens and André Lévy. *Compt rend* 201, 730 3 (1935), cf C A 29, 6232°.—Di-Et tetrahydro- β -naphthylmethylmalonate, b_p 179°, m 123°, on decompn by heat gave tetrahydro-naphthylpropionic acid, m 127°. Di-Et tetrahydro- β -naphthylmethylallylmalonate, b_p 189-90°, gave on sapon the malonic acid which decomposed on heating and gave tetrahydronaphthylallylpropionic acid (I). Cyclization of I as previously described gave octahydromethylphenanthrenecarboxylic acid (II), b_p 187°, m 148-9°. II heated with Se caused dehydrogenation as well as decarboxylation and gave 4-methylphenanthrene, b_p 160°, m 116°. Julius White

Preparation of β -(1-naphthyl)propionic, β -(2-naphthyl)propionic and β -(2-tetrahydronaphthyl)propionic acids. Synthesis of dihydrophenalene and tetrahydro 5,6-benzindan-1-one. Georges Darzens and André Lévy. *Compt rend* 201, 902-4 (1935), cf preceding abstr.— $\text{C}_{10}\text{H}_7(\text{CH}_2)_2\text{CO}_2\text{H}$ (I), b_p 179°, m 156° (amide, m 133°, Me ester, b 162°, acid chloride (II), m b_p 179-80°, m 26°), was prepd by heating the corresponding malonic acid. These const are different from those reported by others. Likewise β - $\text{C}_{10}\text{H}_7(\text{CH}_2)_2\text{CO}_2\text{H}$ (III), m 127° (amide, m 133°, acid chloride, b 162°, m 2°, Me ester, b_p 183°), and β - $\text{C}_{10}\text{H}_7(\text{CH}_2)_2\text{CO}_2\text{H}$, m 135°, were prepd. II, treated with AlCl_3 in PhNO_2 , gave dihydrophenalene (IV), m 88° (oxime, m 126°). III treated gave tetrahydro-5,6-benzindan-1-one (V), b_p 167°, m 47° (oxime, m 224°). V on oxidation gave 1,2,4,5-C $_7\text{H}_4(\text{CO}_2\text{H})_2$, m 275°. Julius White

Terpene furoates. J N Borghin. *Ind Eng Chem* 28, 31-2 (1936).—The prepn of fenchyl furoate, b_p 275°, n_D 1.6019, acid no 0.7, bornyl furoate, b_p 275°, acid no 1.8, and fenchyl tetrahydrofuroate, n_D 1.4790, are described and their properties as plasticizers discussed.

E W Tillitson

Sulfur compounds of terpenes. VIII. Actions of gold chloride on thioborneol and thioamphor. Akira Nakatsuchi. *J Soc Chem Ind, Japan* 38, Suppl binding 617 (1935), cf C A 30, 1042°.—An oily compd was obtained from the reaction of thioborneol and aq AuCl_3 and with alc a white ppt was formed. The Au compd

was sol in Et_2O , C_6H_6 and CHCl_3 , m. 194–5°, decomp. at 204°, and contained 53.36% Au and 9.00% S. The reaction product from AuCl_3 and thiocamphor at 80° gave a greenish black amorphous ppt. when treated with Et_2O . The ppt. was sparingly sol in CHCl_3 and did not show any definite decomp. point. It contained 81.18% Au and 10.37% S. Analogous results were obtained when the reaction took place at 29°, but different results at 0–1°, when a compd., sol in Et_2O , was obtained which m. 179–80° (decomp.) and contained 63.71% Au and 10.05% S. IX. Actions of gold chloride on various terpene sulfur compounds. *Ibid.* 617.—The S compd. from Δ^2 -p menthene gave an amorphous white ppt. with AuCl_3 , which was sol in Et_2O , C_6H_6 and CHCl_3 , m. 92° and decomp. at 171°. It contained 53.40% Au and 9.01% S. Analogous results were obtained with the S compd. from Δ^{10} -p menthene. The S compds. of α -phellandrene (I), linalyl acetate (II) and linaloolene (III) were treated with aq. AuCl_3 under ice cooling, followed by heating to 95°. By treating the reaction product with alc. Au, decomp. point 158–63°, 77.93% Au and 8.22% S, II, 192–3°, 73.00 and 9.23, III, 161°, 74.25 and 9.44. These compds. were sol in CHCl_3 and sparingly sol in Et_2O , C_6H_6 and alc. Karl Kammermeyer.

Addition compounds of benzidine with some phenols and acids. Konstanty Hrynakowski, Henryk Staszewski and Marja Szmyt. *Roczniki Chem.* 15, 391.8 (in German 398–9) (1935).—Thermal analysis of binary systems of benzidine with phenol and acids proves the high reactivity of benzidine in the formation of addn. compds. There were found compds. with resorcinol, hydroquinone, salicylic acid, BzOH , α - and β -naphthol.

Benzophenones from carboxylic acids. H. P. Newton and P. H. Groggins. *Ind. Eng. Chem.* 27, 1397–9 (1935).—Condensation of BzCO_2H , p - $\text{ClC}_6\text{H}_4\text{COCO}_2\text{H}$, p - $\text{MeC}_6\text{H}_4\text{COCO}_2\text{H}$ and terephthalic acid with chlorobenzene by the Friedel-Craft reaction is reported, with practically quant. yields, the formation of o - and p -isomeric benzophenones is established. In the ammonolysis of halo-benzophenones the presence of Cu is desirable for obtaining a satisfactory rate of amination. Under suitable conditions in the amination of (4- ClC_6H_4) $_2\text{CO}$ it is possible to effect the replacement of only 1 halogen. 3,3',4,4'-Tetrachloro-4'-benzoylbenzophenone, m. 69–71°, is prep'd by condensing terephthalic acid with PhCl in the presence of anhyd. AlCl_3 ; oxime, m. 210°, anilide, m. 288°. 4-Chloro-4'-methylbenzophenone, m. 129.5–9°, 3,4-dichlorobenzophenone, m. 101–1.5°, 2-chloro-4-methylbenzophenone, m. 99.5°, 4-amino-4'-methylbenzophenone, m. 186–7°.

4,4'-Dibenzylidiphenylmethane. Edmond Connerade. *Bull. soc. chim. Belg.* 44, 411–24 (1935).—To 50 g. Ph_2CHCl (I) and 15 g. methylal in 300 g. AcOH was added slowly with vigorous shaking 50 g. conc'd H_2SO_4 . After several hrs. a mixt. of 300 g. of each of the 2 acids was added and finally, after several hrs. of shaking, 500 g. conc'd H_2SO_4 . After diln. with H_2O , extn. with hot PhMe and removal of PhMe in *vacuo*, the mass was extd. with boiling EtOH . I from the EtOH soln. there crystd. 4,4'-dibenzylidiphenylmethane (II) (2–3% yield), m. 91.5°. Oxidized by CrO_3 in boiling AcOH II gave 4,4'-dibenzoylbenzophenone (III), m. 227.5°. The reaction of PhLi with (p - ClC_6H_4) $_2\text{CO}$ (IV) gave an amorphous product and PhLi IV with $\text{C}_6\text{H}_5\text{Li}$ in the presence of AlCl_3 gave I and a resinous product, but not II. The action of (p - ClC_6H_4) $_2\text{CO}$ with $\text{C}_6\text{H}_5\text{Li}$ in the presence of AlCl_3 gave a quant. yield of 4,4'-dibenzoylbenzophenone (V), m. 217–5°, which was obtained in cryst. form only with difficulty. Oxime, m. 130–1°, decomposes in light, and is easily hydrolyzed by acids. V, reduced with Na-Hg in EtOH , gave the carbinol, which could not be crystd. Oxidized with CrO_3 in boiling AcOH , V gave III. The trimer of III is unstable. The mixt. obtained by treating (p - ClC_6H_4) $_2\text{CO}$ in $\text{C}_6\text{H}_5\text{Li}$ with AlCl_3 was extd. with boiling AcOH . From this ext. III was obtained in 20–5% yield. The residue insol in AcOH was a mixt. of benzophenone-3,4'-dicarboxylic acid, in

360°, and 4-benzoylbenzophenone-4'-carboxylic acid, m. 268°. Reduction of III with Na-Hg in 95% EtOH at 70° gave 2 forms of [$\text{PhCH}(\text{OH})\text{C}_6\text{H}_4$] $_2\text{CHOH}$. One form, supposed to be the *syn* form (VI) because of its relative stability, m. 176.5° and decomposes 180°; the *anti*-form (VII), m. 105–10° and decomposes 115°. Both were oxidized by CrO_3 to III. When suspended in C_6H_6 and treated with dry HCl , VI gave a *tri-Cl* deriv., yellowish, m. 73–4°, and VII gave a *tri-Cl* deriv., which could not be crystd. Louise Kelley.

The hydrogenation of unsaturated compounds. N. K. Yurashevskii. *J. Gen. Chem.* (U. S. S. R.) 5, 1098–1107 (1935).—When mixts. of olefin derivs. are catalytically hydrogenated, it is not always true that the component with the greatest no. of H atoms attached to the doubly linked carbons hydrogenates first, to the exclusion of the other components. A higher energy content (heat of combustion) also favors hydrogenation. *Mixts. studied.*—Benzoylbenzene (I)—stilbene (II) simultaneous absorption of H, a little more rapidly by I. I—Na cinnamate (III) at 50°, complete hydrogenation, I was 70% hydrogenated, III 30%. III pulegone (IV) IV begins to absorb H only after the reaction with III is complete. IV—fumaric acid (V). V hydrogenates first, but IV begins to take up H before the reaction with V is complete. IV—allyl alc. (VI), III–VI in both pairs VI reacts completely before the other component begins. II–VI simultaneous absorption of H. Limonene–III. III is hydrogenated first. IV—MeC₆CHME (VII). IV hydrogenates first, then VII. III–Me cinnamate (VIII), cinnamic acid–VIII. VIII hydrogenates first. *Exptl.*—Hydrogenation was carried out according to the directions of Ginsberg and Ivanov (*C. A.* 25, 4173). One g. Ni, 0.1 g. PdCl_2 , 2NaCl, 30 cc. solvent (alc. alone or 30 cc. alc. plus varying amts. of H_2O or AcMe), and electrolytic H were employed. A correction was made for H absorbed by the catalyst. The course of hydrogenation was the same with the mixt. III–VI whether the solvent was 40 cc. alc. plus 3 cc. H_2O or 15 cc. AcMe plus 15 cc. alc. plus 5 cc. H_2O . L. W. B.

The nitration of α -ethylanthralene. Georges Lévy. *Compt. rend.* 201, 900–2 (1935), *C. A.* 27, 717.—The nitration of α - $\text{C}_6\text{H}_4\text{Et}$ as previously described gave a mixt. of isomers from which 1,4- $\text{C}_6\text{H}_4\text{Et}(\text{NO}_2)$ was isolated and identified by reduction to the amine.

Addition of substituents in the anthraquinone series. Ch. Marschall. *Bull. soc. chim.* [5], 2, 1809–30 (1935), *C. A.* 22, 74.—Certain sulfonic acids of the anthraquinone series are characterized by the peculiar mobility of the conjugated SO_3H group. A study of the action of alk. cyanides on 1,4-dihydroxy-2-anthraquinonesulfonic acid (I) has shown that the final product is 2,3-dicyanoquinizarin (II) and that the reaction is not a simple substitution. To a soln. of 10 g. of the Na salt of I, prep'd according to Ger. pat. 287,867, in 500 g. H_2O and 5 g. Na_2CO_3 was added 10 g. KCN and the mixt. was heated at 90° for 30 min. Oxidation of the leuco form with 3.5 g. (NH_4) $_2\text{S}_2\text{O}_8$ gave a blue-violet salt which was filtered off, washed free from KCN and decomp'd. with boiling dil. HCl . The orange ppt. was recrystd. from PhCl and yielded 7 g. of orange-brown crystals of II, $\text{C}_{14}\text{H}_6\text{N}_2\text{O}_2$, m. above 300°. By heating a suspension of 5 g. of quinizarin (III) in a soln. of 40 g. KCN in 200 cc. H_2O for 5 hrs. and operating as described above a yield of 1.7–1.9 g. of II was obtained. The intermediary formation of a quinizarin-quinone and the interpretation of the reaction as the addn. of HCN are excluded since all operations are carried out in the absence of air and in the presence of a reducing agent. Sulfonation of 0.5 g. of II with 10 cc. of 20% oleum at 140–50° in the presence of a trace of yellow HgO yielded a sulfonic acid, sol. in H_2O and which gave a blue Alkale similar to that produced by the transformation product of 2,6-quinizarindisulfonic acid with KCN which contains a conjugated SO_3H group that renders it sol. in H_2O . A soln. of 30 g. of 1-amino-4-hydroxyanthraquinone-2-sulfonic acid (IV) (Ger. pat. 286,308) in 2000 cc. H_2O contg. 45 g. KCN and 10 g. Na_2CO_3 was heated for 3–4 hrs. at 90–5°. The cooled soln. was treated with

10 g (NH₄)₂S₂O₈ and yielded 9 g of 1-amino-4-hydroxy-2,3-dicyanoanthraquinone (V). Similar treatment of the 3-sulfonic acid isomer of IV gave an analogous dinitrile. Heating 5 parts of II in 40 parts by vol. of 90% H₂SO₄ at 150° for 1-1.5 hrs gave the insol anhydride of 1,4-dihydroxy-2,3-anthraquinonedicarboxylic acid (VI), sol in dil alk carbonates or NaOH. The acidulation of these alk salts gave dull-gold leaflets of the corresponding acid (VII), identical with the acid prep'd from 1,4-dihydroxy-2,3-dimethylantraquinone (Fr pat. 739,506). This identification establishes the correctness of the formulation of II, VI and VII. The partial decarboxylation of VII by the action of conc'd H₂SO₄ in the presence of H₂BO₃ at 200° gave 2-quinizarincarboxylic acid (VIII), m 244-6°, identical in its sulfoboric acid and spectra with the acid prep'd by the oxidation of 2-methylquinizarin (Ger pat. 273,341). Oxidation of VIII with MnO₂ transformed it into 2-purpurincarboxylic acid, m 222-4°. By the above method of hydrolysis 10 g of II was transformed directly into 6 g of VIII. Controlled alk hydrolysis of VI gave VIII but if the heating with 5% NaOH was continued for several hrs the entire material was converted into III. A suspension of 10 g of VI in 1100 cc of 1.5% Na₂CO₃ was boiled for 10 min, dild with 1100 cc. H₂O and filtered. The soln was cooled to 2° and to it was added, dropwise, 4 g of 87% Na₂S₂O₄. After standing for 1 hr below 4° in the absence of air 60 cc of 30% NaOH was added and the leuco deriv. formed was oxidized by a current of air. Purification of the product gave 8 g of VIII, m 245-7°. Operation at room temp. with an excess of Na₂S₂O₄ gave dihydroquinizarin, m 158°. The constitution of II demonstrates the complexity of the fundamental reaction and it is certain that the CN group at position 3 must be the result of an addn reaction. The cyanides act slowly on I at room temp. and it was found possible by this means to isolate the intermediate in the formation of II. Air was bubbled through a cooled soln of 20 g of the Na salt of I, 20 g Na₂CO₃ and 16 g KCN in 4 l H₂O for 5-6 days. The soln was acidulated with HCl, boiled and filtered and salted out with KCl, yielding 1,4-dihydroxy-3-cyanoanthraquinone-2-sulfonic acid (IX) which is readily transformed into 1,4-dihydroxy-3-cyanoanthraquinone (X), m 228-9°, by reductive desulfonation. The constitution of X results from its hydrolysis products, 1,4-dihydroxy-2-anthraquinonecarbamide, m. above 300°, and VIII. Both IX and X are readily converted into II by the action of KCN in alk. soln. It is concluded that the conjugated SO₃H group of I activates the mol. and enables it to add HCN and fix a CN group in position 3. The displaced H atom together with the acid H atom convert the quinone into the leuco form of IX which is desulfonated by the action of the alk. soln and transformed into X. Thus certain substituents such as SO₃H, CN, CO₂H, CO₂R, CONH₂ in the 2-position of III accentuate the state of unsatn of the mol and render it capable of subsequent addn. III acts in an analogous fashion, though more slowly and less definitely, as is shown by the formation of some 1,4-dihydroxy-2,3-dicyanoanthraquinone in the leuco form by the action of alk KCN. It may be supposed that the introduction of 2-substituents may inhibit secondary reactions. The formation of such bimol. substances as the 2,2'-biquinizarins may be due to the unsatd state of III and result from addn reactions. The unsatd nature of III and its derivs was exam'd by the reactions with dienes. In org. solvents, even in a sealed tube at 140°, no normal diene synthesis was observed but I, III, VIII and X reacted with cyclopentadiene in aq. alk media at 70-80°. A similar reaction was observed with naphthazarin. It has been shown that the dinitrile formed by the action of KCN on 1,4-diamino-2-anthraquinone-sulfonic acid is 1,4-diamino-2,3-dicyanoanthraquinone which can be degraded to II by controlled oxidation. VI condenses readily with NH₃, amines and amino carboxylic acids. In the presence of AlCl₃ and Na it reacts with hydroquinone to give a product which is probably a tetrahydroxyphenanthraquinone. C. R. Adnall.

1-Keto-1,2,3,4-tetrahydro-7-hydroxyphenanthrene. Adolf Butenandt and Gerhard Schramm. Ber.

68B, 2083-6(1935); cf. C. A. 28, 2082¹-6-HO-S-1-C₁₀H₇NH₂, fused with KOH at 310°, gave 6-HO-1-C₁₀H₇NH₂, which on treatment with Ac₂O gave 6-HO-C₁₀H₇NHAc (I). I, treated with Me₂SO₄, gave 6-MeOC₁₀H₇NHAc (II). II in EtOH, heated 2 hrs with conc'd HCl, gave 6-MeOC₁₀H₇NH₂ (III), m 205-20° (decompn); 6-MeOC₁₀H₇NH₂, m. 74°. III, treated with NaNO₂ and a mixt. of Cu₂SO₄ and KCN, gave 6-MeOC₁₀H₇CH₂N, m 79°. III, diazotized and treated with KI, gave 6-MeOC₁₀H₇I, b 175-8°, m. 33°. 6-MeOC₁₀H₇I (IV), caused to react with CHO(CH₂)₃CO₂Et, gave 6-MeOC₁₀H₇CH(CH₂)₃CO₂H (V), m 156°, Me ester, m 60°. V, reduced over Pt or Pd, gave 6-MeOC₁₀H₇(CH₂)₃CO₂H (VI), m 149°. VI, treated with SnCl₄ at 105° for 1 hr, gave 7-methoxy-1-keto-1,2,3,4-tetrahydrophenanthrene (VII), m 101°. VII, treated with HOAc and HBr, gave 7-hydroxy-1,2,3,4-tetrahydrophenanthrene (VIII), m 232°. Bz ester, m 212°. VIII was physiologically inactive. IV, treated with CHO(CH₂)₃CO₂Me, gave 6-MeOC₁₀H₇CH(OH)CH₂CH₂CO₂H which formed the lactone (IX), b₁₀ 160-70°, m. 114°. IX, boiled with KOH and treated with MeN₃, gave 7-MeOC₁₀H₇CH(CH₂)₃CO₂Me (X), b₁₀ 140°. X, reduced with Pt or Pd and then sapon'd, gave VI.

Julius White

Dicarboxylic acid esters of tetrahydrofurfuryl alcohol. J. N. Borglin. Ind Eng Chem 28, 35-6(1936).—The tetrahydrofurfuryl esters of the following dicarboxylic acids were prep'd and their values as plasticizers discussed. Tetrahydrofurfuryl alc (I) and terpene-maleic anhydride gave an ester, acid no 66.5, which was further esterified with butanol, reducing the acid no to 45, n_D²⁰ 1.5023. Ester from I and maleic anhydride, acid no 69, n_D²⁰ 1.4897, d₄²⁰ 1.1931. Ester from I and phthalic anhydride, acid no 64.5, n_D²⁰ 1.5250, d 1.2165.

E. W. Tillotson

N-Phenethyl-3-phenyl-5-pyrazolone. E. Votokel and O. Wichterle. Collection Czechoslov Chem Communications 7, 388-91(1935); cf. C. A. 27, 3475.—N-Phenethyl-3-phenyl-5-pyrazolone (I), m 145.5°, was obtained in good yield (75% even with crude hydrazine) by the spontaneous reaction of PhCH₂CH₂NHNH₂ and PhCO-CH₂CO₂Et in aq. EtOH. It was sol in alkalies but not in acids. The 4-isomero derivative (II), m 138-9°, was obtained (90%) by treating I in EtOH with HCl and NaNO₂ (red crystals from AcOH; yellow from EtOH). Reduction of II with Zn in AcOH gave a few colorless crystals which apparently were the 4-amino deriv. of I. These gave an oil with BzH. After they were filtered off, the addn of H₂O to the mother liquor gave a dark red ppt which was probably a homolog of rubazonic acid. CO N-

(CH₂CH₂Ph) . N CPh . CHN C . CPh N N(CH₂CH₂Ph).CO, m 165°. When 10 g I, 10 g MeOH and 10 g

MeI were kept at 110° for 5-8 hrs in a sealed tube, 50-55% pure hydriodide of the 2-Me deriv., PhC CH CO N

(CH₂CH₂Ph) NMe HI, m 174-5°, were formed. The

free base was an oil. John E. Milbery
γ-Tetrahydropyranaldehyde. V. Prelog and E. Cerkovnikov. Collection Czechoslov Chem Communications 7, 430-5(1935).—P and C. desired this comp'd in order to prep long γ-chains in tetrahydropyran. Attempts to prep it by the dry distn of Ba γ-tetrahydropyranate and (HCO₂)₂ Ba gave very poor results, so CH₂ CH₂ O CH₂-

CH₂ CHCOCl was reduced with H₂ and Pd (C. A. 15,

2435) with better, although not always reliable, results. The following is a typical run. To 40 g of the acid chloride in 150 g xylene were added 4.7 g BaSO₄, contg 5% Pd and 235 (?) g quinoline sulfate. This mixt was boiled and H₂ was passed in for 24 hrs. After being filtered the mixt was distilled at 15 mm Hg to give 6.8 g impure aldehyde. A second distn gave pure γ-tetrahydropyranaldehyde (I), b₁₀ 74-7°; phenylhydrazones, m. 63-4°.

2,4-dinitrophenylhydrazones, m. 103°; semicarbazone, m. 101°. The aldehyde was very unstable and rapidly polymerized to the crystalline trimer, m. 221°. When a mixt. of 3 g. I, 3.5 g. rhodanin, 3 g. AcONa, 10 cc. AcOH, and 10 cc. Ac₂O was agitated for an hr. at 100–10°, 3.27 g. of a condensation product, $\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{CH}_2\text{CO}$ —

NHCS₂, m. 234°, was formed. When this product was warmed with 15% NaOH soln *γ*-tetrahydropranyl-thiopyruvic acid, $\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{CH}_2\text{CSCo}_2\text{H}$,

m. 151–2°, was formed. John F. Mulbrey
2-Aminopyridine series III. Salicyl-2-aminopyridine and its electrolytic reduction to *o*-hydroxybenzyl-2-aminopyridine. K. Feist, W. Awe and W. Völksen *Arch. Pharm.* 273, 476–8 (1935).—The studies previously reported in this field (cf. C. A. 28, 3407², 29, 792³) have been continued. Starting with *o*-AcOC₆H₄COCl, salicyl-2-aminopyridine was prep'd and the latter electrolytically reduced to *o*-hydroxybenzyl-2-aminopyridine, C₁₀H₁₀ON, m. 105°, identical with the product obtained from *o*-hydroxybenzylidene-2-aminopyridine (picrate, m. 185–6°). Similar expts. with phthaloyl-2-aminopyridine yielded products indicative of cleavage during reduction. W. O. E.

3-Aminopyridine II (Methylated derivatives, acetylaminopyridine, formylaminopyridine). E. Plazek, A. Marcinkow and Ch. Stammer *Roczniki Chem.* 15, 365–76 (in German 376–7) (1935), cf. C. A. 29, 2535².—The authors found that all derivs. of 3-aminopyridine are chemically more inactive than those of 2-aminopyridine. The following compds. were prep'd: 3-Methylaminopyridine, obtained in 4.6 g. yield by heating in a sealed tube to 125–135° for 20 hrs. 10 g. 3-bromopyridine and 25 cc. 40% aq. MeNH₂ with addn of 1 g. CuSO₄ as catalyst. The product was ext'd with ether and dist'd at 118–120° under 12 mm. pressure. 3-Acetylmethylaminopyridine, obtained in 9 g. yield by boiling 1 hr. 8 g. amine and 11 g. Ac₂O. The product b.p. 145°, when cryst'd from petr. ether, it m. 64°. 2,6-Dibromo-3-methylaminopyridine, obtained in 4.6 g. yield by adding to 1.06 g. amine in 5 g. AcOH 6.1 g. Br in 5 cc. AcOH, cryst'd. from EtOH-H₂O, it m. 69°. 3-Methylnitrosamine, obtained in 4 g. yield by diazotization of 5 g. amine, b.p. 135°. 3-Pyridylmethylhydrazine, obtained by the reduction of the nitro comp'd with Zn powder in AcOH, b.p. 191°. 3-Methylnitrosaminopyridine, obtained in 2.5 g. yield by adding at 0° to 4.5 g. amine in 10 cc. conc'd. H₂SO₄ a mixt. of 3 cc. HNO₃ (d. 1.52) and 5 cc. conc'd. H₂SO₄, m. 54–5°, b.p. 124–5°. 2-Nitro-3-methylaminopyridine, obtained in 2 g. yield by introducing slowly 5 g. 3-methylnitrosamine into 25 cc. conc'd. H₂SO₄ at 0–5°, m. 110°. 3-Methylamino-2-aminopyridine, obtained by reduction of the 2 nitro comp'd with SnCl₂ or by amidation of 3-methylaminopyridine with NaNH₂, m. 124°. 6-Amino-3-methylaminopyridine, obtained by heating at 110–115° for 20 hrs. 6 g. 3-bromo-6-aminopyridine with 15 cc. of 40% aq. MeNH₂ and 0.5 g. CuSO₄ as catalyst, m. 70°. Bromination of 3-dimethylaminopyridine gives 2,6-dibromo-3-dimethylaminopyridine, b.p. 113–15°, and bromo-3-dimethylaminopyridine, m. 64–6°. Formylaminopyridine obtained by boiling for 4 hrs. 5 g. 3-aminopyridine and 10 cc. HCO₂H, b.p. 200° under 25 mm. pressure, m. 90°. There was also obtained 3-acetylaminopyridine nitrate, m. 165°. M. Wojciechowski.

The derivatives of 3,3'-bipyridine. Wanda Brydówna and Władysław Wiszniewski. *Roczniki Chem.* 15, 378–81 (in French 381–2) (1935); cf. C. A. 29, 2535².—The di-*t* ester of 3,3'-bipyridine-2,2'-dicarboxylic acid, obtained in 60% yield by boiling for 2.5 hrs. 7 g. of the neutral salt of this acid with 14 g. of EtI and 10 g. of anhyd. benzene, m. 82–4°. The di-*m* ester, m. 153–5°, was also prep'd. The diamide, obtained in 86% yield by heating in a sealed tube to 135–145° for 8 hrs. 2 g. of the di-*t* ester with 12 cc. of anhyd. EtOH, said with NH₃ at –10°, m. 268.5–70°. The chloride, obtained by boiling 10 g. of the acid and 100 g. of SOCl₂ for 3 hrs., m. 147–

150°. 2,2'-Diamino-3,3'-bipyridine, m. 181.5–2.5°, and 3,3'-bipyridine-2,2'-pyridone-2', m. 366–8°, were also obtained. M. Wojciechowski.

4-Bromopyridine. J. P. Wibaut, J. Overhoff and H. Geldof. *Rec. trav. chim.* 54, 807–12 (1935).—The prep'n of 4-bromopyridine (II) was carried out in 2 ways: 4-hydroxypyridine (γ-pyridone) was heated in PBr₃ and POBr₃ to form I which was isolated as the picrate, decomp. 223°, 4-nitroaminopyridine was mixed with conc'd. HBr soln, cooled to –5°, treated with NaNO₂ (3 mols.) and then heated. I was obtained by steam distn and extn. of the distillate with Et₂O which was evap'd at 15 mm. without heating. I b.p. 27.5–30°, m. 0–1°, n_D²⁰ 1.5679, decomposed on standing in a sealed tube, forming a yellow-brown solid which was possibly a pyridylpyridinium comp'd. I formed a HgCl₂ salt decomp. 270°, and chloroplatinate, and reacted with NH₃ at 200°, forming 4-aminopyridine. E. W. Scott.

Reactions of aromatic mixed ketones with disubstituted derivatives of thiourea containing different aromatic radicals. K. Dzwiewski, L. Gziler and J. Moszew. *Roczniki Chem.* 15, 400–6 (in French 407) (1935).—The following compds. were prep'd: 2-phenyl-4-aminol-6-methylquinoline, obtained in 8 g. yield by heating 20 g. PhCOMe and 40.3 g. phenyl *p*-tolylthiourea at 180–210° for 5 hrs., then a short time at 230°, m. 161°, sol in AcOH. 2-Phenyl-4-nitrosoaminol-6-methylquinoline, yellow, m. 137–8°. 2-Phenyl-4-acetylaminol-6-methylquinoline, m. 142°. 2-Phenyl-4-aminol-6-methylquinoline-Mel, m. 235°. 2-Phenyl-4-phenylmethylaminol-6-methylquinoline, yellow, m. 167°. 2-Phenyl-4-hydroxy-6-methylquinoline, m. 201°. 2-Phenyl-4-β-naphthylamino-5,6-benzoquinoline, obtained by treating 34.8 g. β-naphthylphenylthiourea and 15 g. PhCOMe at 180° for 4 hrs., then at 280° for 0.5 hr., m. 202–3°. The HCl salt, m. 286.7°, picrate, m. 260–1°, and methiodide, m. 293–4°, of 2-phenyl-4-β-naphthylamino-5,6-benzoquinoline were prep'd. 2-Phenyl-4-(β-naphthylacetylaminol)-5,6-benzoquinoline, m. 172–3°. 2-Phenyl-4-(β-naphthylnitrosamino-5,6-benzoquinoline, yellow, m. 250–1°, 2-phenyl-4-hydroxy-5,6-benzoquinoline, m. 280–1°, were also obtained. 2-(*p*-Tolyl)-4-(β-naphthylamino)-5,6-benzoquinoline, obtained by heating at 180–260° for 5 hrs. 140 g. β-naphthylthiourea and 67 g. *p*-MeC₆H₄COMe, then a short time at 290°, m. 226°. 2-*p*-Tolyl-4-(β-naphthylnitrosamino)-5,6-benzoquinoline, yellowish orange, m. 195°, and 2-*p*-tolyl-4-hydroxy-5,6-benzoquinoline, m. 314–15°, were prep'd. M. Wojciechowski.

The preparation of 2,2'-biquinolyl by the catalytic dehydrogenation of quinoline. J. P. Wibaut, H. D. Tjeenk Willink, Jr. and W. E. Nieuwenhuis. *Rec. trav. chim.* 54, 804–7 (1935).—Quinoline, heated in a sealed glass tube to 325–35° in the presence of Ni (suspended on Al₂O₃), was dehydrogenated, forming 2,2'-biquinolyl (I) in 15% yield. I was also formed in very small amts. when I was used as a catalyst. E. W. Scott.

Malaria medicaments. Syntheses in the acridine group. I. Kh. Fed'man and E. L. Kopelovich. *Arch. Pharm.* 273, 488–90 (1935).—In all the acridine compds. described in the literature as possessing antimalarial action the halogen occupies the 6-position. Accordingly, in the present study the authors decided to prep. compds. (1) which possess in the positions 2 and 9 the same radicals as occur in acrinin (atebrin), in which, however, the halogen (Cl) occupies position 6 instead of 7, (2) compds. of the same type, but with the side chain –NHCH₂CH₂CH₂NH₂ in position 9, (3) compds. with 2 halogen (Cl) atoms in positions 6 and 7 of the acridine nucleus. The compds. thus obtained were tested on finches and sparrows, their chemotherapeutic indices were lower than that of acrinin (atebrin), indeed for compds. (1) and (2) 7.5 times, for compds. (3) 2.5 times less. On removal of the Cl atom from position 6 in Magidson and Grigorowski's comp'd the chemotherapeutic action on the malaria plasmodium is completely nullified. Furthermore, it appears that in the transfer of the Cl atom from position 6 to 7, its action is almost completely nullified, the chemotherapeutic index being only 2, instead of 15 for acri-

chim. Not less interesting is the fact that introduction of a 2nd Cl atom in the acricin mol. causes marked diminution in its activity, the index being then only 6 instead of 15. For purposes of this study the following substances were prepd: 2-Methoxyphenyl-4'-chloroanthranic acid, $C_{14}H_9NO_3Cl$, m 185-6°, 2-methoxy-7,9-dichloroacridine, $C_{14}H_7NO_2Cl_2$, m 203-4°, 2-methoxy-7-chloro-9-(2-diethylamino-4-methylbutylamino)acridine-2 HCl, $C_{24}H_{31}N_3O_2Cl$, canary yellow, m 221-2°, 2-methoxy-7-chloro-9-(2-diethylaminopropylamino)acridine-2 HCl, $C_{24}H_{31}N_3O_2Cl$, yellow, m 246-7°, 2,4,5-Trichlorotoluene, $C_7H_3Cl_3$, m 80-1° oxidized with HNO_3 it yields the 2,4,5-trichlorobenzoic acid, m 160-3°, 4-methoxydiphenylamino-3',4'-dichloro-6'-carboxylic acid, $C_{18}H_{11}NO_5Cl_2$, green, m 233-4°, 2-methoxy-6,7,9-trichloroacridine, $C_{14}H_7NO_2Cl_3$, yellowish green, m 192-3°, 2-methoxy-6,7-dichloro-9-(2-diethylaminomethylbutylamino)acridine-2 HCl, orange, m 236-7°.

Arylselenium halides VI Cleavage of ketosulfidocarboxylic acids 2 Otto Behagel and Wilhelm Müller *Ber* 68B, 2164-6(1935), cf *C A* 29, 7960°—In the course of the study of the cleavage of ketosulfidocarboxylic acids, 3 keto 2,3-dihydrobenzo-1,4-selenazine (I) was included as a representative of heterocyclic ketones with 2 hetero atoms. From this the 2 Br deriv was to be prepd by a method analogous to that used by Zahn (*C A* 17, 2425) for the S comp, but with Br or Cl I first gave addn products, $C_{11}H_7NHO_2Cl$, SeX_2 , which on long

standing, rapidly on boiling in PhMe or AcOH, lost HX and formed the 2 halogen derivs of I by migration of the halogen from the Se to the adjacent C atoms. These halogen derivs with $HSCH_2CO_2H$ gave the corresponding ketosulfidocarboxylic acid (II) which was broken down by alkali to I and $HOSCH_2CO_2H$, the latter being hydrolyzed to H_2S , $OHCO_2H$ (or $HOCH_2CO_2H$) and $(CO_2H)_2$. I, m 182°, was prepd by reduction of α -O $_2$ C $_6$ H $_4$ Se-CH $_2$ CO $_2$ H with NaOH-Na $_2$ S, 1,1-Dibromide, yellow-brown, m 211°, 2-Br deriv, m 213-14°, 1,1-Dichloride, yellow brown, m 222°, 2-Cl deriv, m 227-8°. The dibalides boiled with water yield the oxide, m about 160° II, yellowish, m 209 10°.

Alkaloids of the leaves of Jaborandi. Synthesis of plocarpidine N A Preobrazhenskii, A M Polyakova and V A Preobrazhenskii *Compt rend acad sci U S R R [N S]*, 3, 267-9(1935) cf *C A* 29, 4740°—The syntheses of d homopilocarpic acid (I) is complicated by spatial rearrangement during the procedure. Accordingly, the diazo ketone from d plocarpic acid (II) was converted into I by the method of Arndt and Eistert (*C A* 29, 3323°). A mixt of 1 g of II, m 121-2-2°, $[\alpha]_D^{25}$ 54.60°, and an excess of $SOCl_2$ was heated for 5 hrs at 35-40°. The resulting chloroanhydride was dissolved in Et $_2$ O and added to an Et $_2$ O soln of CH_3N_2 prepd from 10 cc of $EtO_2CN(N_2O)Me$. The cooled mixt pptd an almost quant yield of yellowish crystals of diazomethyl d-pilocarpic ketone (III), m 106-8°. A soln of 0.97 g of III in 100 cc of H_2O at 50° was added dropwise to a mixt of 1.03 g of $Na_2S_2O_3$ and 0.68 g of Ag_2O in 35 cc of H_2O . Extn of the reaction mixt. gave 0.78 g of I, $C_{14}H_{19}NO_4$, which was converted into a chloromethyl d-homopilocarpic ketone, m 88.5-9.2° identical with a similar deriv. from I obtained from natural sources.

Mitraphylline Raymond-Hamet and Louis Millat *Bull sci pharmacol* 42, 602-11(1935)—Mitraphylline (I), the alkaloid extd by Michiels from the bark of *Mitragyna stipulosa* O Kuntze, is not identical with mitramerine (II), obtained from the same source. I m 258-67°, II m 206-16°. The α_D of I is -7.7°, its probable formula $C_{24}H_{31}N_3O_4$. Zeisel's method shows 1 OMe group in I and two in II, the latter being probably the methylated deriv of the former.

A Meyer
The constitution of the alkaloid nymphaeae F Bureš and I. Pláček, Jr *Časopis Českoslov Lékarnictva* 15, 223-6(1933)—The alkaloid, nymphaeae, was extd from the dried roots of *Nymphaea alba* L. To 1 kg of dried roots 10 l of 1.5% HCl was added and the material

left to stand for 7-8 days after which the ext. was pressed out of the roots and filtered. To the filtrate a satd soln of Ba(OH) $_2$ was added until a ppt had formed. After standing the clear supernatant liquid was poured off and the remaining ppt. washed with water. This procedure was repeated several times, the ppt. then being placed on a filter, washed several times more and finally dried in air. The finely pulverized material was then extd by petr ether in a Soxhlet app. The exts obtained were combined, almost all the petr ether distd off and the thick soln extd with 5% H_2SO_4 . The acid layer was sepd, decolorized with animal charcoal, made alk with dil ammonia and the nymphaeae which had sepd was filtered off, washed with water and dried. Nymphaeae is a very fluffy amorphous substance easily sol in $CHCl_3$, benzene, ether and AmOH. Its m p is 76-7° and formula is $C_{14}H_{19}NO_4$. Cf *C A* 28, 5460°.

Alkaloids of the Papaver genus I Alkaloids of Papaver armeniacum and Papaver orientale R Kononova, S Yunussov and A Orekhov *Ber* 68B, 2158-63 (1935).—As many as possible of the native species of *Papaver* in Transcaucasia have been collected for study. Those most thoroughly studied thus far are *P. armeniacum*, *P. orientale* and *P. floribundum*. The first, of which only 8.5 kg was available, was the richest in alkaloids (0.65%) of all the species thus far studied. After a quite tedious purification there was isolated an alkaloid $C_{14}H_{19}NO_4N$, for which the name *armepavine* (I) is suggested. It has a phenolic character and contains 1 HO group (Zerevitinov), the other 2 O atoms being present as MeO groups (Viehböck). The N is tertiary and carries a Me group, hence I may be represented by the formula $C_{14}H_{19}(NMe)(OMe)_2O$. A preliminary extn on I treated with $ClCO_2Et$ gave an only product with no basic properties and no optical activity, indicating that I is a tetrahydroisoquinoline deriv.

As the yield of pure I was only about 0.2%, the plant probably contains considerable amts of other bases, in fact, the presence of nonphenolic bases was observed, but they could not be purified for lack of material. In the case of *P. orientale* it was especially desired to establish the structure of Gadamir and Klee's isothebaine (*C A* 5, 2078), but no trace of this base was found in the plant. Instead, the plant, which contained only 0.16% total alkaloids, yielded, along with thebaine, a new phenolic base, *erispavine* (II), $C_{14}H_{19}NO_4N$, with 1 NMe, 1 OMe and 1 OH group; nothing definite can as yet be stated as to the function of the 3rd O atom. From its empirical compn II is also probably a benzyltetrahydroisoquinoline. In the isolation of thebaine and II there also sepd considerable amts of oily and resinous bases whose sepn will be attempted when more material is available. II m 200 1°, $[\alpha]_D$ -211.8° ($CHCl_3$), easily sol in 10% NaOH, when a 1% soln of the HCl salt is made alk with $NaHCO_3$, treated with a drop of alc I and shaken with ether, the ether becomes intensely green and the aq layer pink. HCl salt, m 244-5°, methiodide, m 207.8°, darkens in the light. I, needles with 1 H_2O , m 100°, resolifies and again m 148-9°, $[\alpha]_D$ -118.7°, quite sensitive to light and air, soon turns yellow-brown, is colored bright yellow by concd HNO_3 , HCl salt, m 151-2°, *exaltate*, m 211-12°, methiodide, m 199-200°. *O*-Methylarmepavine-MeI, from I in MeOH refluxed with NaOMe and MeI, m 120-2°, insol in alkalies.

Picrotoxin. XII Degradation of picrotoxin acid, $C_{24}H_{31}O_7$, to the dibasic acids $C_{12}H_{15}O_4$ and $C_{12}H_{15}O_4$, P Hermann and Kurt Thilo *Arch Pharm* 273, 433-45 (1935)—Picrotoxin acid (I) yields with $KMnO_4$ in alk. soln the dibasic acid $C_{12}H_{15}O_4$ (II), this involving oxidation of the Me group to CO_2H . It is shown that the CO_2H group originally present in I is combined with the aromatic nucleus by means of the residue CH_2 . This nucleus carries in addn, a Me as substituent. Dry distn of II causes the elements of CO_2 and H_2O to split off with formation of the ketone $C_{12}H_{15}O_3$ (III), which from its nature must be a cyclic ketone, otherwise oxidation with HNO_3 could not yield a dibasic acid of bkt C and H content, $C_{12}H_{15}O_4$ (IV). The simultaneous formation of the dibasic acid $C_{12}H_{15}O_4$ (V) involves oxidation of the cyclic structure

outside the nucleus. Further degradation of IV to the ketone $C_{10}H_{16}O_2$ leads to ring formation, this compound containing a CH_2 less than the ring of III. This assumption is strengthened by the formation of V through oxidation of IV. The simplest explanation of the constitution of V is that it represents a phthalic acid, since by yielding an anhydride it must be a substituted α -phthalic acid. It differs from the acid II, the 1st oxidation product of I, by the lesser content of C_4H_8 . It appears therefore that in the Hofmann degradation a substituent of I consists of the residue $-C_4H_7CO_2H$. Assuming that the CO_2 group, resulting from oxidation of the Me group and leading to the formation of the dibasic acid II, stands in the α -position to the residue $-C_4H_7CO_2H$, then the rise of a 6-ring ketone with sepn. of CO_2 and H_2O becomes clear, thus

Oxidation of this ketone with HNO_3 attacks the CO group. A considerable portion is oxidized up to the aromatic nucleus, whereby the dibasic acid V results. Simultaneously, there is formed by cleavage of the ring and maintenance of the C and H content the dibasic acid IV, thus.

This acid can in turn by dry distn. be converted through loss of CO_2 and H_2O into the compd.,

which with HNO_3 yields the dibasic acid V. The residual complex in all these acids has the constitution of a dimethylphthalide, characterized by high stability. The KOH-cleavage carried out on I also substantiates this assumption, because it proceeds with sepn. of $AcMe$ and formation of the dibasic acid $C_{10}H_{16}O_2$ (VI), which is to be regarded as a benzenedicarboxylic acid, a compd. still contains the same residues Me and $C_4H_7CO_2H$ peculiar to I. The expts. have further shown that the CO_2H group in the residue $C_4H_7CO_2H$ is in terminal union, and not, as might be concluded from the course of ozonide formation, in medial combination in the chain C_4H_7 . The following constitution for this acid I is therefore suggested

By cleavage of pinolindicarboxylic acid, $C_{10}H_{16}O_4$, with aq. $Ba(OH)_2$, by the action of HCl and P in the usual way, I was obtained in a 64% yield. Phenylhydrazones, $C_{10}H_{16}O_4 \cdot N_2H_4$, m. 185°. The dibasic acid VI in 138° (Ag salt, $C_{10}H_{16}O_4Ag_2$). The ketone III m. 147°, by 225° (semicarbazone, m. 322° (decompn.)); phenylhydrazones, m. 184°; at 187° (decompn.). The oxidation product of III or the dibasic acid IV m. 213° (decompn.) (Ag salt, $C_{10}H_{16}O_4Ag_2$). The

dibasic acid V m. 293° (slow heating), heated more rapidly the substance m. 209-10°, then solidifies immediately and again m. 293° (decompn.) (Ag salt, $C_{10}H_{16}O_4Ag_2$, anhydride, $C_{10}H_{16}O_2$, m. 293° (decompn.)). The ketone, $C_{10}H_{16}O$, from IV by distn., m. 187° (phenylhydrazones, yellow, m. 210°, semicarbazones, m. 356° (decompn.)). The dibasic acid V m. 293° (decompn.) (Ag salt, $C_{10}H_{16}O_4Ag_2$). W. O. E.

A new substitute for the androsterone group. Adolf Butenandt, Kurt Tscherning and Gunter Hamisch. Ber. 68B, 2097-2102 (1935), cf. C. A. 30, 7541.—Isoandrosterone (prepd. from the catalytic reduction of dehydroandrosterone) in $PrOH$ and heated 90 min. with Na gave isoandrostanediol (I), m. 164°, $[a]_D^{25}$ 4.2°, diacetate (II), m. 123-4°. II, saponified and then oxidized with CrO_3 , gave androstan-17 α -3-one (III). Testosterone, treated with H and Pt, gave the semicarbazone of III, m. 237-43°. The mother liquor contained II, m. 178°, $[a]_D^{25}$ 32.4° (in EtOH), acetate m. 157°. III oxidized with CrO_3 , gave androstan-3,17-dione, m. 133°, $[a]_D^{25}$ 111° (in EtOH). Julius White.

The bromination of cholestanone and coprostanone. Δ^1 -Cholestan-3-one. Adolf Butenandt and Alexander Wolff. Ber. 68B, 2091-4 (1935), cf. C. A. 30, 4807.—Cholestanone in HOAc contg. a HBr-HOAc mixt. and treated with Br gave 2-bromocholestanone (I), m. 169-70°. I, suspended in 21% $Ca(OAc)_2$ -HOAc soln. and heated 5 hrs. at 200° in a bomb, gave Δ^1 -cholestenone, m. 111-12°, $[a]_D^{25}$ -31.1° (in EtOH), λ 240 m μ , oxime, m. 146-7°. Coprostanone, similarly brominated, gave 4-bromocoprostanone (II), m. 110-11°. II, heated in C_4H_8 for 12 hrs., gave cholestenone, m. 79-80°, $[a]_D^{25}$ 88.6°. Julius White.

Catalytic hydrogenation of progesterone. Adolf Butenandt and Gerhard Fleischer. Ber. 68B, 2094-7 (1935), cf. preceding abstr.—Progesterone, treated with Pt and H and subsequently oxidized with CrO_3 , gave alopregnanedione (I), monosemicarbazone, m. 245°. The mother liquor of I contained pregnandione. Pregnen-3-ol-20-one acetate, treated with Pt and H and then oxidized, gave I. Julius White.

Sex hormones and related substances. VI. Breakdown of acetyldehydrocholesterol and acetyldehydrocholesterol to β -3-hydroxynorallocholic acid and 3-hydroxynorallocholic acid. Wilhelm Dirscherl. Z. physiol. Chem. 237, 268-72 (1935), cf. C. A. 30, 4834.—Oxidation of the side chain of Δ^4 sterols by CrO_3 is a means of detg. the location of the C at which the terminal branching occurs. Thus, dihydrocholesterol yields β -3-hydroxyallocholic acid, while ergosterol and stigmasterol yield β -3-hydroxynorallocholic acid, with chain lengths of 4 and 3 C, resp. The same procedure is now applied to dihydrocholesterol. Oxidation of acetyldehydrocholesterol and subsequent hydrolysis of the Ac yielded β -3-hydroxynorallocholic acid, m. 226°, $[a]_D^{25}$ 32° (Me ester, by CH_3N , m. 156°), while acetyldehydrocholesterol yielded 3-hydroxynorallocholic acid, 209-10° (Me ester, m. 175-6°), $[a]_D^{25}$ 21.2° (acetate of Me ester, m. 194-5°). The terminal branching in the chinchols therefore occurs on the C fourth removed from the point of attachment. A. W. Dow.

Physiologically active crystalline esters of vitamin A. Sadaaki Hamano. Sci. Papers Inst. Phys. Chem. Research (Tokyo) 28, 69-73 (1935), cf. C. A. 29, 2535.—A soln. of 9 g. of vitamin A concentrate (6000 C. I. O. units) prepd. from *Theragra chalcogramma* liver oil, in 30 cc. anhyd. pyridine was warmed for 30 min. with a soln. of β - $C_{15}H_{31}COCl$ in 30 cc. of benzene in a current of CO_2 . The cooled reaction mixt. was taken up in 300 cc. of Et₂O and freed from pyridine and excess β - $C_{15}H_{31}CO_2H$. The evap. residue crystd. in cold Me_2CO at -40° to -50° and yielded spindle shaped or rhombic crystals of vitamin A β -naphthoate (I), $C_{26}H_{40}O$, m. 26°, hydrolyzed with 10% KOH to pure vitamin A (II), $C_{20}H_{32}O$, reddish-yellow oil, and the K salt of β -naphthoic acid (m. 183°). I has an activity of 7300 C. I. O. units, readily promotes the growth of albino rats and cures xerophthalmia. A 1 in 140,000 mol. soln. in MeOH shows absorption bands at 3505, 3385, 3060, 2920 and 2816, together with a max

at 3225. II also forms an *anthraquinone* β -carboxylate, $C_{14}H_8O_4$, m 124°, with an activity of 6000 C. L. O. units. Activity charts and photographs of I and II are reproduced. C. R. Addinall

Reaction between toluquinone and cinnamaldehyde under the action of light. A. Angeletti, *Atti accad. sci. Torino, Classe sci. fis. mat.* nat. 70, 326-30 (1935).—When a mixt. of cinnamaldehyde and toluquinone in C_6H_6 is exposed to sunlight there are formed cinnamic acid, toluhydroquinone and a cryst. product, m 163°, which was identified as a monocinnamate of toluhydroquinone. With the Me group in the 2 position this compd may be either the 1-cinnamate or the 4-cinnamate (I), with I the more probable because of the hindrance that the Me group may exert over the OH in α -position. No compds corresponding to the 2,5-dihydroxybenzophenone reported by Klinger (C. A. 5, 3458) were found. A. W. Contieri

Selenium derivatives of salicylic acid. R. E. Nelson and G. S. Boase, *Proc. Indiana Acad. Sci.* 44, 135-7 (1934).—Bromination of 5,5'-selenodisalicylic acid in $CHCl_3$ yields 3,5-dibromosalicylic acid, m 223°. Me salicylate (6.5 g) added to 20 g of di-Me 5,5'-selenodisalicylate *Se-dichloride* (I) in the presence of 12 g of anhyd. $AlCl_3$ in anhyd. ether yields 45% of di-Me 5,5'-selenodisalicylate (II), m 188°. Bromination of II in $CHCl_3$ yields the *Se-dibromide*, m 143°. Attempted methylation of II with Me_2SO , gives 5,5'-selenodisalicylic acid, m 272°. I (22.6 g) with 4.9 g of NaCN in 100 cc of H_2O in the cold for 2 hrs gives 15% of 5,5'-selenodisalicylate *Se-dithionamide*, m 137°. W. J. Peterson

Aliphatic hydrocarbons. Studien- und Verwertungsgesellschaft. Fr. 788,286, Oct. 7, 1933. The yield of aliphatic hydrocarbons contg. more than 1 C atom in the mol. by catalytic synthesis from CO and H_2 is increased by transforming the CO and H_2 only incompletely at first, this being effected by using relatively low temps. and (or) insufficient H_2 and (or) high speed of flow. The reaction products are condensed and the remaining gases returned for further treatment.

Purifying hydrocarbons. I. G. Farbenind. A.-G. Fr. 785,831, Aug. 21, 1935. Dienes such as methylcyclopentadiene and cyclopentadiene are removed as addn. compds from hydrocarbons, e. g., crude benzene or cracked products, by treatment with β -quinones, e. g., α -naphthoquinone. Fr. 785,832. Dienes are removed as addn. compds by means of aliphatic carboxylic compds unsatd. in the α - and β -positions, e. g., maleic anhydride. The compds are added in fractions so as to isolate the addn. products separately.

Oxidizing hydrocarbons. Gutehoffnungshütte Oberhausen A.-G. Fr. 788,533, Oct. 11, 1935. Hydrocarbons of the paraffin series contg. more than 1 C atom in the mol. and O_2 or a gas contg. O_2 are passed, along with 1% or less of NO , at 500-800°, over catalysts compnsing elements of the 2nd and 4th group as well as Cr, V, Mo, Al, W, Mn and Co and their oxides and carbonates. Oxidation products such as CH_3O , AcH and $HCOOH$ are obtained.

Catalysts for the hydration of olefins. Geo. F. Horsley and Imperial Chemical Industries Ltd. Brit. 435,769, Sept. 27, 1935. These comprise 1 or 2 mol. proportions of $Al(PO_4)_3$ assocd. with about 1 mol. proportion of a metaphosphate of Ca, Cd, Zn or bivalent Cu, Ni, Sn or

Pb. The hydration is preferably conducted in the vapor phase at 250-300° and 100 atm. or over.

Alcohols from olefins and steam. The Distillers Co. Ltd. Ger. 622,267, Nov. 23, 1935 (Cl. 12s. 5 02). See Brit. 402,613 (C. A. 28, 2723°).

Amino alcohols. I. G. Farbenind. A.-G. (Max Bockmuhl, Gustav Ehrhart and Leonhard Stern, inventors) Ger. 619,332, Sept. 28, 1935 (Cl. 12g. 32.21). Amino alcs. of the formula $RCH(OH)CH_2R''$, where R is a 3,4-ethylenedioxyphenyl residue, which may be substituted in the ethylene group, R' and R'' are H or hydrocarbon groups, and R''' is H or an alkyl group, are prep'd from ketones of the formula $ROCOCH_2R'''$ (1) by halogenation followed by reaction with an amine and reduction or (2) by conversion into an isomeric compd followed by reduction. α -Dihydroxyaryl alkyl ketones may also be used as starting materials, the hydroxy groups being converted into an ethylenedioxy or substituted ethylenedioxy group at a convenient stage in the process. Examples are given in which (1) 3,4-ethylenedioxypropylphenone (I) yields a bromo deriv., b. 180-2°, which by reaction with $PhCH_2NHMe$ yields 3,4-ethylenedioxyphenyl(methylbenzylamino)propanone, m 71-3°, from which (3,4-ethylenedioxyphenyl(methylamino)propanol-HCl, m. 225-7°, is obtained by catalytic hydrogenation, the benzyl group being split off. (2) I is converted into its isomeric compd, m 142-3°, from which (3,4-ethylenedioxyphenyl)aminopropanol, m. 145° (HCl salt, m. 213°), is obtained by catalytic hydrogenation; (3) 3,4-ethylenedioxyacetophenone \rightarrow a bromo compd, m. 114-16°, \rightarrow methylbenzylamino-3,4-ethylenedioxyacetophenone \rightarrow (3,4-ethylenedioxyphenyl(methylamino)ethanol-HCl, m. 125-6°), (4) 3,4-(3'-hydroxypropylene-1',2')dioxyphe-nyl ethyl ketone (II) \rightarrow isomeric compd, m. 141-2°, \rightarrow [3,4-(3'-hydroxypropylene-1',2')dioxyphe-nyl]aminopropanol-HCl, m. 188-90°; (5) 3,4-dihydroxybutylphenone \rightarrow 3,4-ethylenedioxybutylphenone, b. 145°, \rightarrow isomeric compd, m. 125-6°, \rightarrow (3,4-ethylenedioxyphenyl)aminobutanol-HCl, m. 180°. The products affect the uterus and are of therapeutic value. II, b. 210°, is prep'd from 3,4-dihydroxypropylphenone and α , β -dibromopropyl alc.

Aromatic diamino alcohols. Chemische Fabriken Joachim Wiernik & Co. A.-G. (Heinrich Hornstein, inventor) Ger. 619,756, Oct. 5, 1935 (Cl. 12g. 32.21). Addn. to 611,501 (C. A. 29, 6064°). The method of 611,501 for producing diamino alcs. is modified by treating 1-phenyl-2-methylamino-1-propanol with halides or sulfonic acid esters of dialkylamino alcs. other than di-alkylmethanol, or their salts. Thus, epinephrine in C_6H_6 is heated with 1-diethylamino-3-chloropropane for 10 hrs. A crystn. mass of epinephrine-HCl seps. The liquid is sep'd from this and boiled. The liquid is again sep'd from the small amt. of crystals pptd. and the C_6H_6 distd. off. The product is 1-phenyl-2-(methyl)diethylaminopropylamino-1-propanol, b. 165-166°. The prep'n. of 1-phenyl-2-(dimethylaminobutyl)methylamino-1-propanol is also described.

Hydrogenation of aliphatic alcohols and esters. Wilbur A. Lazier (to E. I. du Pont de Nemours & Co.). U. S. 2,027,182, Jan. 7. In a process such as that of satg. the unsatd. alcs., esters and other compds obtained in the high pressure catalytic dehydrogenation of EtOH to form EtOAc, or in converting crotonyl alc. into butanol, the initial material and H are brought into contact with a hydrogenating catalyst at a temp. of 50° or higher and under superatm. pressure. Several examples with details are given.

Converting alcohols to acids. Wm. J. Hale. U. S. 2,027,378, Jan. 14. Reaction such as the conversion of EtOH, PrOH and BuOH to produce HIOAc, propionic acid and butyric acid, resp., are effected by burning the vapors of the alc. and water into contact with a dehydrogenation catalyst such as Cu and a partially hydrolyzable salt of an amphoteric base and an org. acid such as basic acetates of Cu, Mn and Al. Various examples are given.

Substituted aldols. Kurt Biling (to I. G. Farbenind. A.-G.). U. S. 2,027,856, Jan. 14. A homolog of acetalde-

hyde, e.g., butyraldehyde for the production of butyraldohol, is mixed with an aliphatic amine such as diethylamine so that condensation is effected in the presence of the latter. Several examples are given.

Converting aldehydes to acids. Wm J Hale U S 2,027,577, Jan 14. In effecting reactions such as production of HOAc from vapors of acetaldehyde and water, a catalyst is used comprising a hydroxide of Cu, Mn or Cr which may be carried on pumice, and a dehydrogenative metal catalyst such as Cu is also employed. Numerous details and examples are given, including the treatment of both aliphatic and aromatic aldehydes.

Unsaturated aldehydes and ketones. Herbert P A Groll (to N A de Bataafche Petroleum Maatschappij) Brit 435,494, Sept 23, 1935. Unsaturated primary or secondary alks having a branched chain are treated with dehydrogenating catalysts at above 230°. Among examples (1) 2-methyl-1-buten-3-ol is converted into methyl isopropenyl ketone by passage over brass spelter in a Cu tube, and (2) 2-methyl-2-buten-4-ol is converted into β , β -dimethylacrolein in similar manner. The products may be utilized as resin components alone or with aldehydes, ketones, phenols, animes, etc., or may be used to introduce alkyl groups into org. compds by condensation or by the use of organometallic compds, or may be oxidized to the corresponding acids and have varied uses in pharmaceutical chemistry. Cf C A 29, 6606.

Amines. I G Farbenindustrie A-G Brit 435,563, Sept. 23, 1935. Amines are prep'd by causing halogen sulfonic acid esters of aliphatic, cycloaliphatic or mixed aromatic-aliphatic alks with at least 8 C atoms to react with basic-reacting, N-contg. inorg. or org. compds, e.g., NH_3 , N_2H_4 , NH_2OH , aliphatic or cycloaliphatic amines, polypeptides, albuminous substances, tertiary and aromatic amines and substituted amines such as those contg. halogen atoms. Among examples, dodecyl chlorosulfonate, dissolved in Et_2O , is caused to react with liquid NH_3 at -30° to produce a mixt. of the corresponding primary, secondary and tertiary amines, and the same ester is allowed to flow into a soln. of diethylaniline in spirit at 0-5° to give dodecylmethylaniline.

Amines. I G Farbenindustrie A-G Brit 436,214, Sept. 30, 1935. Amines are prep'd from aldehydes or ketones by treatment with H_2 and NH_3 at raised temp. and pressure in the presence of a catalyst comprising an O-contg. or S-contg. compd of a heavy metal, which is practically not red-ox to metal under the working conditions. Amines are prep'd also from oximes or from compds. of the type of Schiff's bases derived from aldehydes or ketones by condensation with primary amines by treatment with H_2 at a raised temp. and pressure in the presence of a catalyst as above but in the presence or absence of NH_3 . Cf C A 29, 6902, 30, 702.

Amines; organic acids. British Celanese Ltd., Horace F. Osley, Edward B. Thomas and Henry Drevfus Brit. 436,224, Oct. 4, 1935. Aliphatic amines or NH_3 are recovered from their salts with org. acids by heating the salts to temps. at which the acidic and basic components are set free, removing 1 of the components concurrently with its liberation and separately removing the other component either simultaneously with or after the removal of the 1st component. The salts may be decomposed in aq. soln. or in suspension in other inert liquids.

Arylamines. Herbert A. Lubs and John F. Cole (to F. I. du Pont de Nemours & Co.) U. S. 2,023,576, Dec 31. 1-Arylaminoarylenethianolines are hydrolyzed to simultaneously produce aryl amines having the formulas XSRNH_2 (I) and R'RNH_2 (II), X being an alkali metal, and the compds. having the formula I are further treated with chloroacetic acid to produce aminoarylmethanecarboxylic acids. E.g., 2,4-dichloroaniline and 2-mercapto-4-chloroaniline are prep'd by hydrolyzing 1-(2,4-dichlorophenyl)-5-chlorobenzenethianol under alk. conditions; and 2-methyl-4-chloroaniline and 2-mercapto-4-chloro-6-methylaniline are similarly obtained from 1-p-chloro-6-tolueno-3-methyl-3-chlorobenzenethianol.

Secondary aromatic amines. Werner M. Lauter (to

Wingfoot Corp.). U. S. 2,028,074, Jan. 14. Reaction under substantially anhyd. conditions and in the presence of an alkali metal bisulfate, pyrosulfate or acid phosphate acting as a dehydrating agent is effected between a hydroxy aromatic compd such as naphthol, hydroxy phenol or alkyl phenol and aniline, an alkyl phenylamine, naphthylamine, cyclohexylamine, furfurylamine, benzylamine, β -phenetidine and amino biphenyl, an amino phenol, a halo naphthylamine or a halo phenylamine, e.g., phenyl- β -naphthylamine is formed from β -naphthol and aniline.

Amines of carboxylic acids containing sulfur. Henkel & Cie G m b H Ger 619,299, Sept. 26, 1935 (Cl. 12a 16). Amines of the formula RCONR'R' , where R is a haloacetylated hydrocarbon radical, R' is an aliphatic radical of at least 6 C atoms or a hydrocarbon radical, and R'' is H or a hydrocarbon radical, which may be the same as R', are treated with thiosulfates or with inorg. or org. derivs. of H_2S , e.g., inorg. sulfides or polysulfides, or aliphatic or aromatic mercaptans. The halogen in the group R is thus replaced by a group contg. S. Examples are given in which (1) $\text{ClCH}_2\text{CONHC}_6\text{H}_5$ (I) and $\text{Na}_2\text{S}_2\text{O}_3$ yield $\text{NaSO}_3\text{SCH}_2\text{CONHC}_6\text{H}_5$, (2) I and PhSH yield $\text{PhSCH}_2\text{CONHC}_6\text{H}_5$, in 47-8%, (3) an amide mixt. of the formula $\text{ClCH}_2\text{CONHC}_6\text{H}_4\text{CH}_3$, where x is 6, 8, 10 and 12, obtained from the amines derivable from cresol-fat alks., is treated with $\text{HSCH}_2\text{COONa}$ to yield a mixt. of products of the formula $\text{NaOOCCH}_2\text{SCH}_2\text{CONHC}_6\text{H}_4\text{CH}_3$, (4) $\text{HSCH}_2\text{CH}_2\text{SO}_3\text{Na}$ and the amide mixt. of (3) yield a mixt. of products of the formula $\text{NaSO}_3\text{CH}_2\text{CH}_2\text{SCH}_2\text{CONHC}_6\text{H}_4\text{CH}_3$, (5) $\text{HSCH}_2\text{CH}_2\text{OH}$ and $\text{HSCH}_2\text{CH}_2\text{SO}_3\text{Na}$ and the amide mixt. of (3) yield a mixt. of products of the formula $\text{SO}_3\text{NaCH}_2\text{CH}_2\text{OHCH}_2\text{SCH}_2\text{CONHC}_6\text{H}_4\text{CH}_3$, CH_3 . Numerous other starting materials are specified. The reactions may be effected in boiling alk. aq. or aq. alk. soln. Such of the products as are water-insol. are useful as softening agents, e.g., in the rubber industry. The water-sol. products have saponaceous properties.

Polynuclear substituted cyclic ketones. Soc. pour l'ind. chim. & Bille Brit 435,553, Sept. 24, 1935. The ketones are prep'd from sterols and bile acids, contg. satd. nuclei, or from derivs. or partial degradation products thereof, by oxidizing derivs. of the parent materials in which the OH group or groups have been protected from oxidation by substitution, e.g., the neutral portion of the oxidation product, isolating the required cyclic ketones from the nonvolatile neutral portion, and, optionally, removing the protecting group to produce OH-substituted cyclic ketones. Among examples, (1) dihydrocholesterol chloride is oxidized in glacial AcOH with CrO_3 and the chloro ketone formed is sep'd from the nonvolatile neutral oxidation product by use of semicarbazide as the ketone reagent, and (2) the semicarbazone of the acetate of the hydroxy ketone resulting from the oxidation of the acetate of α - β -dihydrocholesterol is submitted to a gentle hydrolysis to yield the acetate of the hydroxy ketone.

Cyclic ketones. I G Farbenindustrie A-G. Fr. 753,540, Aug. 12, 1935. Lactones of aliphatic carboxylic acids or the corresponding hydroxy acids or unsat'd acids are treated with dehydrogenating catalysts belonging to the group of activated bleaching earths. Thus, a ketone, b, 105-110° (semicarbazone, m. 156-7°), is prep'd from α -heptyl- γ -methylbutyrolactone, one, b, 110-15° (semicarbazone, m. 155-160°) from the α -heptyl- γ -ethyl compd., one, b, 80-85° (semicarbazone, m. 148-9°) from γ -methylbutyrolactone, heptylphenylone, b, 100-5° (semicarbazone, m. 155-4°) from γ -heptylbutyrolactone, and 2-butyl-4-cyclopenten-1-one, b, 90-5° (semicarbazone, m. 200-1°) from butyraldehyde acid. The ketones have a jasmine perfume.

Ketols. Ivor A. Davies and Imperial Chemical Industries Ltd. Brit. 435,466, Sept. 23, 1935. Ketols are made by causing aldehydes and ketones to react in the presence of a very small amt. of alkali metal hydride, e.g., less than 0.5 cc. of an alk. soln. thereof per l. of reaction mixt. In an example, hydroxyacetone is produced

by adding AcH to Me₂CO rendered just alk to cresol red by a few drops of a MeOH soln of KOH, the temp. being kept at about 30° and N₂ free from CO₂, being passed through the reaction vessel

Ethers F I du Pont de Nemours & Co Brit 435,110, Sept 16, 1935 Halogen or H halide is removed from 1 mol of a halogenated dialkyl ether or from 2 mols of the same or different halogenated dialkyl ethers by means of finely divided metals. The reaction, which may be effected in the liquid or gaseous phase, yields open chain or cyclic ethers, e.g., ethylene oxide, ethylene glycol dimethyl ether, dioxane and homologs thereof. The latter are solvents or plasticizers for cellulose derivatives. In examples, monochlorodimethyl ether is heated with Na and dichlorodimethyl ether with finely divided Cu.

Halo ethers I G Farbenind A-G Fr 788,341, Oct 8, 1935 Alkoxyalkyl halides of the formula RHC(X)OR' (R is H, alkyl, aryl or aralkyl, R' is alkyl, aryl or aralkyl and X is halogen) are caused to react with compounds containing at least 1 olefinic double bond preferably in the presence of a catalyst and, if necessary, solvents. Examples are given of the prepn of 1-phenyl-1-methoxy-5-chloro-3-pentene, b₁₀ 93° (from liquefied butadiene and α -methoxybenzyl chloride, with HgCl₂ as catalyst), 1-methoxy-5-chloro-3-pentene, b₁₁₈ 118°, 1-phenyl-1-methoxy-5-bromo-3-pentene, b₁₁₈ 92°, 1-methoxybenzyl-2-chlorocyclohexane, b₁₁₈ 94.5°, α -methoxybenzyl- (b₁₁₈ 112°) and α -methoxymethylchlorocyclohexane, b₁₁₈ 81°, 1-methoxy-2,3-dimethyl-3- (b₁₁₈ 45-6°) and 1-phenyl-1-methoxy-2,3-dimethyl-3-chlorobutane, b₁₁₈ 133-5°.

Esters of aliphatic alcohols Walter F Lawson (to Canadian Industries Ltd.) Can 3,345,08, Oct 8, 1935 A polycarboxylic acid is heated with a mixt. of alcs. b above 160° and an inert org. solvent. The alc. mixt. is obtained by the catalytic hydrogenation of carbon oxides at an elevated temp. The mixed acid esters which are formed are recovered and heated in a mixt. comprising the mixed acid esters, butyl alc. and an inert org. solvent.

Esters of methacrylic acid E Emmet Reid (to E. I. du Pont de Nemours & Co.) U.S. 2,028,012, Jan 14, 1935 Phosgene or other carbonyl halide is caused to react with C₃H₇ (suitably in an initially formed quantity of chloroisobutyl chloride contg. AlCl₃) to produce β -chloroisobutyl chloride and the latter is treated with an alc. such as Me, Et or Pr alc., ethylene glycol, glycerol or an aromatic alc., cyclic alc. or ether alc. to form a β -chloroisobutyrate which is then dehydrohalogenated to the ester of methacrylic acid. Various other condensation catalysts can be used instead of AlCl₃.

Lactone esters Henne & Co A-G Brit 435,605, Sept 24, 1935 Condensation products are obtained by causing esters of trihalo fatty acids, substituted in the α -position, to react with esters of levulinic acid in the presence of metals, e.g., Zn. Among examples, (1) Et tribromovalerate is condensed with Et levulinate (I) to give the γ -lactone of α -allyl- β -methyl- β -hydroxy adipic ester, and (2) the γ -lactone of α -hexenyl- β -methyl- β -hydroxyadipic ester is obtained from Et tribromocaprylate and I.

Esters of etherified glycolic acids Wolfgang Lübbert and Ernst L. Müller (to Henkel & Cie G.m.b.H.) U.S. 2,027,991, Jan 14, 1935 Esters having the general formula R₁XCH₂COOR' in which X signifies O or S, R' represents a hydroxyethyl or phenyl or carboxymethyl radical, and R₁ represents an alkyl radical having at least 6 C atoms, which possess some emulsifying properties and may be used in the perfume industry or as softening agents are obtained when hydroxy or mercapto fatty acids which are alkylated, cycloalkylated or arylated at the O or S, or their derivs or substitution products, are esterified with aliphatic or hydroaromatic compounds which contain at least one hydroxyl or mercapto group and at least 6 C atoms; e.g., dodecanol, octadecanol, hexadecanol, tetradecanol or their mixts are esterified with phenoxyacetyl chloride, forming esters of wax-like character. Numerous examples with details of procedure are given.

Tetrasulfuric acid ester of leuco-1,2,2',1'-anthraquinonamine Georg Röscher, Josef Haller and Fritz

1 Helwert (to Durand & Huguennin A-G.) U.S. 2,022,218, Nov. 20 The leuco sulfuric acid ester of anthraquinone- β -sulfamic acid, or a salt of this ester, in a neutral or alk. aq. medium, is reacted upon with PhO₂ or a metal ferric cyanide, preferably an alkali metal or alk. earth metal ferric cyanide (various examples and details of procedure being given).

Polyuclear organic compounds I. G. Farbenindustrie A-G Brit. 435,254, Sept. 9, 1935 Unitary org. compounds containing 4 or more nuclei are recovered from the destructive hydrogenation products of bituminous, resinous or ligneous materials other than mineral coal high-temp. tar, and particularly from the high-boiling fractions of these products. The methods of recovery may be those ordinarily used in the recovery of polyuclear compounds from mineral coal high temp. tar, e.g., cooling, pptn., crystn., selective solution and distn., each of which may be fractional, combinations of such methods may also be used, as well as chem. methods, e.g., fusion with KOH, NaNH₂, or alkali metals, or sulfonation. Alternatively, use may be made of methods involving treatment of the destructive hydrogenation products by (1) dehydrogenation, (2) distn. with the addn. of metals or condensing or polymerizing agents, (3) isomerization, (4) removal of asphalts, pitch-forming constituents and paraffin, or (5) combinations of such treatments. Some of the processes may be applied also to the recovery of polyuclear compounds containing 4 or more nuclei, with or without side chains, from the destructive hydrogenation products of mineral coal high-temp. tar and also to the recovery of polyuclear compounds containing less than 4 nuclei, with or without side chains, from the destructive hydrogenation products of bituminous, resinous and ligneous materials generally. Numerous specific methods are described in detail. 26 examples are given. Fluoranthene, pyrene, chrysene, retene, piceene, phenanthrene, fluorene, etc., are recovered.

Stabilizing halogen compounds Chemische Fabrik von Heyden A-G Brit. 436,054, Oct. 3, 1935 See Fr 784,238 (C A 30, 106°). The org. compound is either dissolved or incorporated in the Cl substitution product, which must not be attacked by Cl at ordinary temp. in the absence of catalysts and light.

Phenylated compounds Walther Diltthey (to I. G. Farbenindustrie A-G.) Brit. 435,708, Sept. 26, 1935 See Fr 770,790 (C A 29, 939°).

Polymerized vinyl compounds I. G. Farbenind A-G Fr. 786,984, Sept. 14, 1935 Compds. which at the most are liable to swell in aromatic hydrocarbons but do not dissolve are made by submitting a monomeric vinyl compound containing besides a vinyl group at least one C atom not forming part of an aromatic ring, to a polymerization in the presence of a compound of the formula XRY (X and Y are radicals contg. a vinyl group, R is a hydrocarbon radical of the C₆H₅ series). Such compounds include divinylbenzene, methyldivinylbenzene and vinylisopropenylbenzene. Examples are given of the prepn. of compounds insol in C₆H₆ from vinyl acetate, methyl and butylacrylic ester and indene.

Thiazole compounds Earl E. Beard and Wm. L. Rintelman (to E. I. du Pont de Nemours & Co.) U.S. 2,028,118, Jan 14, 1935 Thiazole derivs of the naphthalene and the anthraquinone series may be prepd. in relatively pure form and in high yields by the reaction of benzaldehyde compounds of the naphthalene or anthraquinone series with S in the presence of at least stoichiometrical amounts of Br, which is present in the reaction in combined form, added in the form of free Br or as S bromides. The amino-naphthalene or aminoanthraquinone compound is first caused to react with benzaldehyde or other aromatic aldehyde such as those of the naphthalene or anthraquinone series to form the azomethine compound. This reaction may be carried out in trichlorobenzene or other inert solvent, and the product so formed may be caused to react without isolation with S monobromide to give the corresponding thiazole. Thus the thiazole is obtained in a very pure form, and may be readily isolated by filtering directly from the reaction mass. Several examples with details of procedure are given.

Addition compounds of biacetyl and glycerol. Vanillin-
Fabrik G. m. b. H. Ger. 619,628, Oct. 11, 1935 (Cl.
12.5 09). Biacetyl and glycerol are allowed to react on
each other for a long time to form compds. of cryst. form
and readily decomposable into the constituents. The
solid addn. products are removed by pressing, washing or
by centrifuge. An example is given. The product is
used in the margarine industry.

Solid diazo compositions I. G. Farbenind. A-G
(Karl Schützpatz, inventor) Ger. 622,306, Nov. 25,
1935 (Cl. 8m 13). The acid diazonium sulfate obtainable
from *m*-nitroaniline is pptd. from aq. soln. by cooling and
(or) salting out, and is mixed directly, without inter-
mediate drying, with a mild alk. substance, e. g., soda,
borax, or Ca(OH)₂, in an amt. sufficient to neutralize the
compd. and any free H₂SO₄ adhering thereto. Solid
dilutants may be added. Sp. compns. are described.

Solid inorganic acid diazonium salts from halo-*o*-
aminodiphenyl ethers. Karl Schützpatz (to General
Aniline Works) U. S. 2,027,066, Jan. 7. Inorg. acid
diazonium salts of halo-*o*-aminodiphenyl ethers are caused
to sep. from their aq. solns. in solid form by adding an
inorg. acid to the soln. Various examples are given of the
production of products such as the solid diazonium chloro-
ride of 4-amino-2,2',5'-trichlorodiphenyl ether and the
solid diazonium sulfate from 4-amino-4'-chlorodiphenyl
ether, etc. Cf. C. A. 30, 110⁶.

Diazo preparations. Soc. pour l'ind. chim. à Bâle.
Brit. 434,158, Aug. 27, 1935. Diazo preps. are made by
salting out from aq. soln. mineral acid salts of diazo
compds. of the formula 4-acyl-NH-5-X-2-Y-C₆H₃N₂OH
in which X and Y are halo, alkyl or alkoxy and the acyl
residue contains an aromatic nucleus. In examples, the
diazo hydrochlorides of the following amines are prepd.:
4-phenoxyacetyl- and -(1'-methylphenoxyacetyl)amino-
and 4-(1'-, 2'- or 3'-chlorophenoxyacetyl)amino-2,5-
dimethoxy- or -diethoxyaniline, 1-amino-2-methoxy-5-
methyl-, 1-amino-2,5-dimethoxy- or -diethoxy-, 1-amino-
2-methoxy-5-chloro- and 1-amino-2-chloro-5-methoxy-4-
benzoylamino benzene, the diazo sulfate of 1-amino-2-
methoxy-5-chloro-4-benzoylamino benzene is also prepd.
Cf. C. A. 29, 4021¹.

Halogenated products of phenyl phenylphenyl ether
Wesley C. Stoesser (to Dow Chemical Co.). U. S. 2,028,
081, Jan. 14. When a phenyl phenylphenyl ether, or a
mixture of isomeric phenyl phenylphenyl ethers, is chlorinat-
ed or brominated, products are obtained which, accord-
ing to their increasing halogen content, vary in phys.
characteristics at room temp. from cryst. materials
through the stage of viscous liquids to that of solid,
noncryst. resins. Even though only a single phenyl
phenylphenyl ether be halogenated, the product usually
consists of an intimate mixture of isomeric and other closely
related compds. Although individual compds. can in
some instances be sep'd. from such mixts., the mixts.
themselves are useful com. products. All of such mixts.
are practically nonflammable, are substantially stable
against decompn. at high temps., e. g., 300-350°, possess
high dielec. constns. as compared with oil, have low elec.
power factors comparable with those of commonly used
condenser oils, and are capable of withstanding excep-
tionally high elec. potentials without breakdown. The liquid
products are suited to use as heat storage and transfer
agents. The resinous products can be used in plastics,
varnishes, etc., e. g., when the final products are to be
employed for elec. insulation purposes, e. g., as varnish
films over elec. wires. Numerous examples with details
of procedure are given.

Reaction products of substituted methyleneanthrones
Trichlar, Ger. 619,246, Sept. 26, 1935 (Cl. 12a. 10).
Methyleneanthrone derivs. substituted in the CH₂ group
are heated with compds. contg. reactive double bonds in
the presence of a mild oxidizing agent. Benzanthrone
derivs., useful as intermediates for dyes, are obtained.
Examples are given in which (1) benzylideneanthrone,
maleic anhydride and PhNO₂ yield a product, m. 208°,
probably *Bz*-3-phenylbenzanthrone-*Bz*-1,2 dicarboxylic
anhydride, (2) 2'-anthraquinonyl-*meso*-methylenean-

throne (I), maleic anhydride and PhNO₂ yield a product, m.
316-17°, probably *Bz*-3-(2'-anthraquinonyl)benzanthrone-
Bz-1,2-dicarboxylic anhydride, (3) benzylideneanthrone,
fumaric acid and *p*-nitrotoluene yield *Bz*-3-phenylbenz-
anthrone-*Bz*-2-carboxylic acid I, m. 279-80°, is prep'd.
from *o*-dichloro-2-methylanthraquinone and anthrone in
alc. soln. in the presence of piperidine.

Condensation products of the oxazine series. Georg Kai-
scher and Werner Zerweck (to General Aniline Works).
U. S. 2,020,651, Nov. 12. Oxazinone compds. of the general
formula

in which both nuclei may be linked with a benzo nucleus,
both nuclei may contain halogen atoms, which products
are intensely colored, are obtained by the condensation of
o-amino phenols of the benzene or naphthalene series contg.
a nitro group, with quinones and halogenated quinones of
the benzene or naphthalene series. 1,4-Quinones, which
may be substituted by halogen in the 2- and 5-positions,
may be caused to react with either one or two mol.
proportions of nitro-*o*-aminophenols. Numerous examples
are given and nitro oxazines thus obtainable in a very good
yield are intensely colored compds. which may be used as
pigment dyes, in part they are intermediates for the pro-
duction of further conversion products, particularly of
sulfur dyes. They can be transformed by usual methods
into the corresponding amino compds. and their *N*-alkyl-,
-aryl-, -aralkyl and -acyl derivs. Their corresponding
diazo compds. are capable of the well-known reactions of
this type, so that the fundamental unsubstituted oxazi-
ones and otherwise substituted ethers are obtainable.

Aromatic hydroxy derivatives. I. G. Farbenind. A-G.
Fr. 788,261, Oct. 7, 1935. Aromatic hydrocarbons and
their derivs. free from O, e. g., C₆H₆, PhCl and toluene,
are converted to OH derivs. by heating them with O or
gases contg. O, in the absence of oxidation catalysts, to a
temp. higher than the upper explosion limit of the mixt.
used, e. g., 650-750°.

Mono-*N*-alkanol derivatives of aromatic diamines and
polyamines. Erich Lehmann (to General Aniline Works).
U. S. 2,022,245, Nov. 26. Mono-*N*-alkanol derivs. of
aromatic di- or polyamines are made by condensation of
equimol. proportions of the amine and a halo alkanol such
as α -monochlorohydrin or β -monochlorohydrin in the
presence of a suitable solvent such as MeOH and an acid-
binding agent such as KOH. Details are given of the
production of *N*-(β , γ -dihydroxypropyl)-*p*-phenylenedi-
amine, *N*-(β , γ -dihydroxypropyl)-chloro-*m*-phenyl-
enediamine, *N*-(β -hydroxyethyl-*m*-tolylene) diamine and
N-(β , γ -dihydroxypropyl)-1,2,4-triazinobenzene and, as
being new compds., claim is made to all compds. of the
general formula X-m-H₂CN₂CH₂NHCH₂C(OH)CH₂OH,
where X means H, halogen, alkyl, *o*-alkyl, NH₂, NO₂,
of basic character, easily sol. in water and alcs., difficultly
sol. in ether and insol. in aliphatic hydrocarbons, and
forming salts with acids which are easily sol. in water.
These compds. may be used as dye intermediates, etc.

Arsenobenzene derivatives. I. G. Farbenind. A-G.
Fr. 787,025, Sept. 16, 1935. Monosulfoxylates of arseno-
benzenes of the formula ZO₂SH₂CN(R¹R²)ASR³NX⁴ (R
and R¹ are benzene rings, R² is alkyl which may contain
at least 1 OH group, X and Y are alkyl which contain
at least 1 OH group and Z is an alkali metal) by introduc-
ing 2 hydroxyalkyl groups by transformation with alkylene
oxide into 1 of the NH₂ groups of a diaminoarsenobenzene
which may also contain other substituents in the C₆H₄
rings, and a hydroxyalkyl or alkyl group and the formalde-
hydesulfoxylate radical into the other NH₂ group. They
may also be obtained by transforming aminobenzenes-
arsonic acids to arsenobenzenes and introducing the other
radicals at any stage of the process. Examples are given
of the prep'n. of the sulfoxylates of 3-hydroxy-4-[bis-
(dihydroxypropyl)amino]-3'-methylamino-, 3-[bis-

(dihydroxypropyl)amino]-4-hydroxy-3'-dihydroxypropylamino-, 3-hydroxy-4-[bis(hydroxyethyl)amino]-3'-methylamino- and 3-[(dihydroxypropyl)-(hydroxyethyl)amino]-4-hydroxy-3'-methylamino-4-hydroxyarsenobenzene and also the prepn of 3-hydroxy-4-[bis(hydroxyethyl)amino]benzene-, 3-hydroxy-4-[bis(hydroxyethyl)amino]benzene- and 3-[(dihydroxypropyl)-(hydroxyethyl)amino]-4-hydroxybenzene-arsonic acid. Cf. C. A. 29, 5241.

Naphthalene derivatives. I. G. Farbernd A-G (Karl Köberle and Kuno Maurach, inventors). Ger. 622,304, Nov. 25, 1931 (Cl. 12q 7). *o*-Amino carboxylic acids of naphthalene (I) are prep'd by heating *o*-nitromethyl derivs of I with alkali hydroxides or equivalent reagents, e. g., alkali alcoholates. Thus, 1-nitro-2-methyl-I, boiled for 12 hrs with aq. KOH, yields 1-amino-1,2-carboxylic acid, m. 198-9°. Other examples are given, the products obtained including 3-, 6- and 7-methyl-1-amino-1,2-carboxylic acids.

4-Aminodiphenylamine derivatives. Arthur Zutscher and Wilhelm Seidenfaden (to General Aniline Works). U. S. 2,028,373, Jan. 21. See Ger. 592,201 (C. A. 28, 3419).

Pyrazolone derivatives. I. G. Farbernd A-G (Herbert Kracker and Richard Schmid, inventors). Ger. 622,113, Nov. 19, 1935 (Cl. 12p 8.01). 1,3-Diaryl-5-pyrazolones, *contg.* at least one COOH or SO₃H group in at least one of the aryl radicals, are prep'd by forming hydrazones from correspondingly substituted aryl acetic esters and aryl hydrazines, and subjecting the hydrazones to ring closure with elimination of an alk. The hydrazone formation is effected in an aq., preferably alk., medium. The ring closure is effected in an aq., preferably alk., medium, and may be effected without intermediate isolation of the hydrazone. In typical examples, (1) Ph-COCH₂COOEt (I) and 2-sulfo-II, where II is PhNHNH₂, yield 1-(2'-sulphenyl)-3-phenyl-5-pyrazolone, (2) 4-carboxy I and II yield 1-phenyl-3-(4'-carboxyphenyl)-5-pyrazolone. Pyrazolones have been prep'd also from the following components: (a) I and 3-sulfo-II, 4-sulfo-II, 2-chloro-4-sulfo-II, 2-chloro-5-sulfo-II, 3,4-dichloro-6-sulfo-II, 2-hydroxy-3-carboxy-5-sulfo-II, 2-methyl-4-sulfo-II, 4-carboxy-II, 3-methyl-4-chloro-6-sulfo-II, 2,5-dichloro-4-sulfo-II, 4'-hydroxy-3-carboxy-4-sulfo-II, 1'-diphenyl sulfone-2-hydrazine, 1-sulfo-2 naphthylhydrazine, 4-nitro-2-sulfo-II, 2-nitro-4-sulfo-II, 2,5-disulfo-II, and 2-methyl-4,5-disulfo-II; (b) 4-carboxy-I and 2-chloro-5-sulfo-II, 4-sulfo-II, 2-sulfo-II, 3-carboxy-II, 2-hydroxy-3-carboxy-5-sulfo-II, 4-nitro-II, and 1-sulfo-2-naphthylhydrazine, (c) 4-chloro I and 3-sulfo-II, (d) 3-nitro-I and 2-sulfo-II; (e) 4-methyl I and 2-chloro-5-sulfo-II, (f) 4-methoxy-I and 3-carboxy-3-hydroxy-5-sulfo-II, (g) 2,4-dichloro-I and 4-sulfo-II, (h) 4-phenyl-I and 3-sulfo-II, (i) 3-chloro-I and 4-nitro-2-sulfo-II, (j) 4-nitro I and 2-nitro-4-sulfo-II; (k) *o*-naphthylacetic ester and 1-sulfo-2 naphthylhydrazine, (l) *o*-naphthylacetic ester and 3,4-dichloro-6-sulfo-II.

N-Substituted amino phenols. Miles A. Dahlen (to E. I. du Pont de Nemours & Co.). U. S. 2,027,002, Jan. 14. In producing compds such as *N*-benzyl-*p*-aminophenol, a nitrophenol such as *p*-nitrophenol is subjected to reduction, as by catalytic hydrogenation, to form the corresponding aminophenol in the presence of an inert solvent such as water, and the resulting soln. is caused to react with an aldehyde such as BzH. Numerous details and examples of similar reactions are given.

Separating mixtures of pentanones. N. V. de Bataafsche Petroleum Maatschappij. Ger. 622,122, Nov. 21, 1935 (Cl. 12o 10). This corresponds to Brit. 417,101 (C. A. 29, 1100?), but gives addnl. examples.

Carbazoles. I. G. Farberndustrie A-G. Brit. 436,110, Oct. 4, 1935. Compds contg. a carbazole radical are prep'd by heating in the absence of H a mixt. of a hydrogenated compd. contg. a carbazole radical and, as substances absorbing H, a phenol, aldehyde, C. oxide or unsat'd aliphatic compd., with the addn. of a hydrogenation catalyst. The hydrogenated carbazole derivs. are completely dehydrogenated in the heterocyclic ring system

Among examples, tetrahydrocarbazole and PhOH are heated in an autoclave at 200-230° in presence of a Ni-bleachine earth catalyst.

Thiazoles substituted by primary alkylamino groups. Treat B. Johnson (to Winthrop Chemical Co.) U. S. 2,020,650, Nov. 12. Thiazole compds of the general formula R¹-[RC(CX)S(CR²)N], where R stands for an

aliphatic radical which may be substituted by a Ph radical, and where X represents either H or alkyl, or benzyl, and where R¹ stands for phenyl, benzyl, lower-alkyl-substituted phenyl, hydroxyphenyl, lower-alkoxyphenyl, alkyl, lower-hydroxy-alkyl or lower-alkoxy-alkyl, m stands for one of the nos. 1 and 2, and R² stands for an alkyl group which contains an NH₂ group, said compds generally being well crystallized in the form of their hydrochloric acid salts, are claimed as a new class of compds and details of procedure are given for the production of 2-phenyl-4-thiazolethylamine (HCl salt, m. 91-2°), β , β '-bis(2-phenyl-4-thiazyl)isopropylamine (HCl salt, m. 235-8°), 2-*p*-hydroxyphenyl-4-thiazolethylamine, and 2-(3,4-dimethoxyphenyl)-4-thiazolethylamine (HCl salt, m. 225-7°).

Benzisothiazolones, etc. Norbert Steiger and Fritz Schulte (to General Aniline Works). U. S. 2,020,622, Nov. 12. A process for producing benzisothiazolones

corresponding to the general formula R.CO.NH.S, where R stands for a phenylene radical substituted by halogen, alkyl or an alkoxy group, comprises acting on substituted phenyl cyanosulfonyl chlorides of the general formula R(CN)SO-Cl, where R has the aforesaid signification, in a nonoxidizing acid medium at temps. below about 60° with an amt. of a metal reducing agent corresponding to about four reactive H atoms, care being taken that the reaction is continued only to a point at which a test just fails to show the known mercaptan reaction. Details are given of the production of 4-ethyl-6-chloro-3-benzisothiazolone, m. 220°, and 6-ethoxy-3-benzisothiazolone, m. 225°, and a general description is given of the manual of a 3-naphthylisothiazolone, m. about 205°.

Polysulfones. I. G. Farbernd A-G (Erich Fischer, Emil Mahler and August Modersohn, inventors). Ger. 622,494, Nov. 29, 1935 (Cl. 12o 23 (3)). Mono- or poly-nitro polysulfones are prep'd by the action of aromatic, hydroaromatic or aliphatic sulfonic acids or their salts on aromatic halonitro or halopolynitro sulfones or on aromatic nitro sulfones contg. a halogenated side chain. Mono- or poly-amino sulfones are obtainable by reducing the products. Thus, 4-chloro-3-nitro-I (I is PhSO₂Ph), boiled in alc. with MeC₄H₉SO₃Na, yields 3-nitro-4-*p*-toluenesulfonyl I, m. 183°, from which 3-amino-4-*p*-toluenesulfonyl-I, m. 185°, is obtainable by reduction with Fe and HCl. Examples are given also of the prepn of 3-nitro-4-benzenesulfonyl-I, m. 162-3°, 3-nitro-4-*p*-methoxybenzenesulfonyl I, m. 199.5°, and the corresponding amine, m. 189-90°, 3-nitro-4-methanesulfonyl-I, m. 210-11°, and the corresponding amine, m. 149-50°, 3-nitro-4-cyclohexanesulfonyl-I, m. 168°, 3,3'-dimitro-4,4'-bis(*p*-toluenesulfonyl)-I, m. 310-11°, 3,3'-dimitro-4,4'-bis(benzenesulfonyl)-I, m. 313-13°, 3,3'-dimitro-4,4'-bis(methanesulfonyl)-I, m. above 327°, 3-nitro-6-benzenesulfonyl I, m. 208-9°, 3-nitro-6-methanesulfonyl-I, m. 211-2°, and the corresponding amine, m. 222°, 3-nitro-4-(*p*-hydroxy-*m*-carboxybenzenesulfonyl) I, m. 270-75°, 3-nitro-3'-sulfo-4-benzenesulfonyl I, 1-nitro-2,5-bis(methylsulfonyl)benzene, m. 209-10°, and the corresponding amine, m. 160°, and 2,4-(NO₂)₂C₆H₃SO₂CH₂SO₂C₆H₃CH₂(-*p*), m. 184-5°.

Alkyl chlorides and bromides. Edward H. Strange and Thomas Kane. Brit. 435,858, Oct. 1, 1935; Fr. 787,340, Sept. 20, 1935. Halogen acids are caused to react with olefins in presence of an adsorbent "hydrous metal oxide gel," i. e., a partially or nearly dehydrated mass obtained from a hydrogel or gelatinous ppt.

Reaction of alkali metals with aromatic hydrocarbons. Norman D. Scott (to E. I. du Pont de Nemours & Co.).

U. S. 2,027,000, Jan. 7. Reactions such as those of Na with biphenyl, phenanthrene, naphthalene and anthracene are effected in a reaction medium contg. an ether such as dimethyl ether, methyl ethyl ether, methyl propyl ether, methyl iso-Pr ether, methylal, glycol dimethyl ether, glycol formal, dioxane, glycerol trimethyl ether, dimethyl-pentaerythritol or glycerol formal methyl ether. By adding CO₂ to the reaction product, carboxylic acids, such as dihydrophenanthrenedicarboxylic acid, are obtained. Cf. C. A. 30, 734¹

Organic disulfides. Luther B. Turner (to Standard Oil Development Co.) U. S. 2,028,303, Jan. 21. Mercaptans, vaporizable without decompn., are subjected in the vapor phase to a limited oxidation (suitably with air and activated charcoal at 225°) and a reaction product contg. corresponding disulfides is withdrawn.

Calcium formate. Chem. Fab. Kalk G. m. b. H. and Hermann Oehrne. Ger. 622,149, Nov. 21, 1935 (Cl. 12o 11). A suspension of Ca(OH)₂ in a satd soln. of (HCOO)₂Ca is treated with CO at a raised temp. and pressure, e. g., 160–200° and 5–25 atm.

Acid calcium citrate. Alexander H. Bennett. U. S. 2,027,204, Jan. 7, Brit. 435,586, Sept. 24, 1935. Successive portions of lime or CaCO₃ are added to a soln. of citric acid and pptn. of acid citrate is effected after each addn., a total addn. being made of about 2/3 the amt. of lime or CaCO₃ which would be required for complete neutralization of the acid in the soln.

Basic titanic oxalate. Sydney F. W. Crundall (to Peter Spence & Sons, Ltd.) U. S. 2,027,812, Jan. 14. An inorg. acid soln. of Ti contg. about 0.6 mols. of acid, expressed as SO₃, for each mol. of TiO₂ is treated with approx. 0.2 mols. of oxalic acid for each mol. of TiO₂ and the soln. is dild. to ppt. basic titanic oxalate (the soln. being maintained at a temp. below 50°).

Tertiary nitriles. I. G. Farbenind. A.-G. Ger. 622,357, Nov. 26, 1935 (Cl. 12o 11). Addn. to 616,876 (C. A. 30, 1111¹). The Na compds. of secondary nitriles, used as intermediates in the process of Ger. 616,876, are made by treating the nitriles with a Na-alkyl compd. which has been prepd. by treating an alkyl halide with Na in the presence of an inert solvent. The Na-alkyl compd. need not be isolated.

Hydrogenated heterocyclic acids. E. I. du Pont de Nemours & Co. Brit. 435,461, Sept. 23, 1935. Alkali salts of mononuclear heterocyclic carboxylic acids are hydrogenated by treatment with H₂, e. g., at 100–250°, and preferably under pressure, in presence of a Ni catalyst in which preferably at least part of the Ni is free. The free hydrogenated acid is obtained from its salt by treating with a mineral acid. In examples, (1) aq. pyromucic acid is neutralized with NaOH and hydrogenated at 110–120° and 2000 lb. pressure with a Ni-kieselguhr catalyst, and (2) aq. Na nicotinate is hydrogenated at 190° and 120–170 atm. with the same catalyst.

Amino acids. Gesellschaft für Kohlenteknik. Brit. 435,839, Sept. 30, 1935. The sepn. of amino acids from their mixts. with (NH₄)₂SO₄ is effected by (1) saltg. an aq. mother lye contg. them with NH₃, sepg. the pptd. (NH₄)₂SO₄ and removing the free NH₃, adding a mixt. of amino acid and (NH₄)₂SO₄ to the filtrate, sepg. the pptd. amino acid and returning the mother lye to the process, or (2) introducing into a mother lye contg. (NH₄)₂SO₄ and amino acid a soln. of the bisulfates of amino acid and NH₃, such as is obtained in the hydrolysis of an amino nitrile, then saltg. with NH₃, removing pptd. (NH₄)₂SO₄, distg. off free NH₃, and the added H₂O, sepg. the pptd. amino acid and returning the mother lye to the process. Examples are given.

Acrylic acid. Rowland Hill (to Imperial Chemical Industries Ltd.) U. S. 2,026,894, Jan. 7. A mixt. contg. an antioxidant, such as Cu or pyrogallol, and ethylene cyanohydrin is treated with H₂SO₄, while stirring and cooling, and water is added to the resulting mixt. and it is heated until reaction is initiated; the input of heat is stopped until the vigorous evolution of exothermic heat has subsided, and the reaction mixt. is subsequently heated until the reaction is substantially complete.

Glycolic acid. Ernest F. Grether and Russell B. Du Vall (to Dow Chemical Co.). U. S. 2,028,064, Jan. 14. Chloroacetic acid is hydrolyzed by heating it with an aq. soln. contg. approx. twice its chem. equiv. of an alkali metal base such as Na₂CO₃ and the hydrolysis mixt. is treated at a temp. above 70° (suitably about the b. p.) with a water-sol. Ca salt such as CaCl₂ in an amt. not greater than the chem. equiv. of the chloroacetic acid hydrolyzed, and the Ca glycolate formed is crystd. from the mixt. while maintaining it at a temp. above 70° so that crystals are obtained in anhyd form.

2-Keto-l-gulonic acid. F. Hoffmann-La Roche & Co. A.-G. Brit. 435,971, Oct. 2, 1935. Addn. to 427,286 (C. A. 29, 5863¹). This is prepd. by a modification of the process of 427,286 by using alicyclic ketones in the same manner as the ketones in general in 427,286. In an example, l-sorbose is treated with cyclohexanone and H₂SO₄ to produce dicyclohexanone-l-sorbose which is oxidized with KMnO₄ in alk. soln. to form K dicyclohexanone-2-keto-l-gulonate which is treated with H₂SO₄ to liberate the acid and finally decomp. by boiling with H₂O to yield 2-keto-l-gulonic acid. Cf. C. A. 30, 111¹.

Quinonic acid. C. F. Boehringer & Soehne G. m. b. H. (Wilhelm Dürschel and Heinrich Thron, inventors). Ger. 619,824, Oct. 7, 1935 (Cl. 12p 1 10). Quinonic acid (6-methoxyquinoline-4-carboxylic acid), is prepd. by oxidizing the noncryst. residues of cinchona bark extr., i. e., the residues after extg. the quinine, cinchonidine, cinchonine and quinidine, with H₂CrO₄ and Mn compds. in acid soln. Thus, the residue contg. quinidine is boiled with H₂SO₄ or AcOH and K₂MnO₄ to give the above.

Sulfonic acids. Henkel & Cie G. m. b. H. Fr. 788,606, Oct. 14, 1935. Aliphatic and cycloaliphatic sulfonic acids of high mol. wt. are prepd. by oxidizing in aq. soln. the corresponding esters of thiosulfuric acid or their salts. Thus, dodecanesulfonic acid is prepd. by oxidizing the Na salt of the ester of dodecylthiosulfuric acid.

Aliphatic acid anhydrides. Carl J. Malm and Webster E. Fisher (to Eastman Kodak Co.). U. S. 2,026,985, Jan. 7. In a process such as the production of butyric or stearic anhydride from butyric or stearic acid, the acid in admixt. with Ac₂O vapor is passed in contact with Mg(ClO₄)₂ in countercurrent through a fractionating column. App. is described.

Chlorinating phthalic anhydride. Michael N. Dvornikoff (to Monsanto Chemical Co.). U. S. 2,028,383, Jan. 21. Cl₂ is introduced into molten phthalic anhydride contg. an Fe salt of a nonoxidizing, strong inorg. acid such as FeCl₃ or Fe₂(SO₄)₃ as a chlorinating catalyst.

Treating methane to produce more easily liquefiable hydrocarbon gases. Henry Renneke. U. S. 2,028,014, Jan. 14. CH₄ is passed, under sub-atm. pressure, through a reaction tube in which a silent elec. discharge is maintained, the flow of gas being such that the contact of the mols. of the gas and the elec. field is less than 0.03 sec. The product contains C₂H₆, etc.

Acetone. Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Hans Walter, inventor). Ger. 622,493, Nov. 29, 1935 (Cl. 12o 10). EtOH or AcH is led with steam at 350–500° over a contact mass contg. porous Cu and a catalyst, e. g., ZnO, CdO, MnO or Fe₂O₃. Compds. derivable from EtOH or AcH, e. g., AcOEt, Et₂O, Me-CH(OAc), MeCOOCH₃ or EtOCH₃, may be treated in the same way.

Dichloroethylene. Compagnie de produits chimiques et électrométallurgiques Alais, Fréges et Camargue. Brit. 436,133, Oct. 4, 1935. See Fr. 786,803 (C. A. 30, 737¹).

Methylamines. I. G. Farbenind. A.-G. (Eduard Lemch, inventor). Ger. 619,754, Oct. 5, 1935 (Cl. 12g 5). In prep. methylamines by heating MeOH and NH₃ or NH₄ salts or urea in a closed vessel, the reaction is carried out in the presence of oxide, chloride or sulfate of Cu or Fe. Acids or alkali salts may also be present if desired. In an example, a suspension of CuO in MeOH is treated with NH₃, till satd. at –10° and heated for 3 hrs. in a closed vessel to 370° and 168 atm. The products are 12.9% monomethylamine, 1.7% di- and tri-methylamine and 85.4% NH₄. Other examples are given.

Ethylenediamine Frederick C Bersworth (to Frank Kottke) U S 2,028,041, Jan 14 Confined liquid NH_3 is heated sufficiently to vaporize it and to generate superatm pressure, and ethylene dichloride is injected into the hot, compressed NH_3 vapor, forming ethylenediamine-HCl

2 Chloro-1,3 butadiene Granville A Perkins (to Carbide and Carbon Chemicals Corp.) U S 2,027,550, Jan 14 Vinyl acetylene is treated with aq HCl in the presence of a Cu_2Cl_2 catalyst and of a water-immiscible inert solvent such as toluene in which the product is dissolved

Chloroethyl chloroethoxyethyl ether. Carbide & Carbon Chemicals Corp Fr 788,281, Oct. 7, 1935. See U S 2,017,811 (C A 29, 8320*)

Cresol and ditolylamine Wm J Hale (to Dow Chemical Co.) U S 2,028,065, Jan 14 Chlorotoluene is heated under superatm pressure to above 260° but below the temp at which the reaction products would decompose (suitably at about 300°) with at least 0.3 its chem equiv of NH_3 , at least 0.2 its chem equiv. of a cuprous compd such as Cu_2O and at least its chem equiv. of a base such as $\text{Ca}(\text{OH})_2$ and with an amt of water at least twice the wt of such base Other aryl chlorides such as PhCl may be similarly decompd to form a phenol and a monoaryl amine

Pyrocatechualdehyde Marion S Carpenter and Eric C Kunz (to Givaudan-Delawanna, Inc.) U S 2,027,148, Jan 7 Heliotropin is treated with anhyd AlCl_3 in the presence of an aliphatic chlorinated hydrocarbon solvent such as ethylene dichloride followed by treatment with an aromatic hydrocarbon such as toluene and with use of sufficient heliotropin to prevent reaction between the solvent and the aromatic hydrocarbon

1,2 Diaminobenzene Soc pour l'ind chim à Bâle Fr 788,348, Oct 8, 1935 This is made by treating 1,2-dichloro- or 1-amino 2-chloro benzene with an aq soln of NH_3 , at about 150° , in the presence of Cu, so that at the end of the reaction the pressure of the NH_3 -water system is at least about 80 atm at 150° The Cu is removed after the reaction as sulfide

Monomethyl p aminophenol Harold von Bramer and Albert C Ruggles Brit 435,721, Sept 26, 1935 NH_3Me is caused to react at elevated temp and pressure, on hydroquinone in an unsatd aq soln The sulfate is obtained by adding H_2SO_4 to the reaction mixt and sepg the product

Cumylphenol Edgar C Britton and Lawrence F.

Martin (to Dow Chemical Co.) U S 2,028,043, Jan 14 This compd, b, about 182° , m about $73-5^\circ$, is made by causing phenol to react with cumyl chloride in the presence of AlCl_3

Naphthalene La Société Industrielle des carburants et solvants Brit. 435,717, Sept. 26, 1935 Crude C_{10}H_8 is purified with a view to subsequent hydrogenation by vaporizing and conveying through 2 purifying chambers in series, of which the 1st contains Fe, Cu, Ni, Co or Cr, disposed so as to afford an extensive contact surface, and the 2nd contains a mixt of porous C and Ca, Fe, Cu, Ni, Co or Cr, advantageously obtained by calcining the compds resulting from the action of CaH_2 on these metals, or of C and the oxides of the said metals, the purifiers being maintained at $250-400^\circ$

3-Aminopyridine Chemische Fabrik von Heyden A-G (Arthur Binz and Otto v. Schickl, inventors) Ger 232,345, Nov. 26, 1935 (Cl 12p, 1 01). When halo 3-nitropyridines are treated with H in the presence of a hydrogenation catalyst 3-aminopyridine is formed The reaction may be effected at atm. temp and pressure

1-Phenyl-3-methyl-5-pyrazolone and related compounds Carbide & Carbon Chemicals Corp. Fr 788,282, Oct. 7, 1935 See U S 2,017,815 (C. A. 29, 8003*)

Diacetylmorphine Hermann Fischer (Anton Baselgia, inventor) Ger 622,231, Nov 23, 1935 (Cl 12p 14)

Morphine is acetylated by reaction with ketene Preferably, a suspension of morphine in a solvent for diacetylmorphine, e g, Et_2O , is treated with a stream of gaseous ketene

Polymerizing monosaccharides such as dextrose and xylose Eduard Farber (to N. V Internationale Suiker en Alcohol Compagnie (International Sugar and Alcohol Co "Isaco")) U S 2,027,904, Jan 14 A monose is melted with materially less than 0.1% (suitably about 0.01-0.02%) its wt of free strong inorg acid such as H_2SO_4 and is heated to remove water, at temps of $120-180^\circ$ below temps which cause material decompn

Objects made from polystyrene. Siemens & Halske A-G Fr. 788,345, Oct. 8, 1935 The surface of the object is rendered mat for making marks thereon or for coloring by treatment with acetone for a short time

Unsaturated aliphatic aldehydes Max Hoffer. Swiss 173,737, Apr 1, 1935 (Cl 36a) H_2O is split off from said aldehydes of the formula RCH_2CHO , secondary org bases or their salts being used as catalysts. Preferably acetates of secondary bases are used In an example, EtCHO is treated with piperidine acetate to give an 80% yield of methylpentenal. Other examples are given

Acid autoclaving of blood albumin at 220° . V. S Sadikov and E V Lindkvist-Russakova *Compt rend acad sci U R S S* [N S], 3, 271-2 (1935), cf C A 29, 5470! —On autoclaving 6 kg of blood albumin with 4% H_2SO_4 for 10 min at 220° the whole protein passed into soln and, on cooling, 54 g of a solid amorphous mass contg cryst cyclopeptides and amorphous substances of the cyclopeptide type sepd out spontaneously This fraction was washed with Et_2O and after 20 recrystns from hot EtOH yielded 3-4 g of a cyclopeptide (I), $\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_5$, m $275-6^\circ$, it contains no $\alpha\text{-NH}_2$ groups Closer investigation showed that I is free from tyrosine, tryptophan, arginine, histidine, lysine, aspartic and glutamic acids, cystine and methionine. The hydrolyzate from the treatment of 0.5 g of I with 25% HCl for 36 hrs was freed from HCl and was pptd by Ag_2O The Ag was removed and the free amino acids were converted into Cu salts which were sepd into sol and insol fractions (leucine salt) Investigation of the sol fraction showed the presence of an isovaline and I is evidently an inactive cycloleucylisovaline with the structure

The same compd occurs in the alc autoclavyolizate of blood albumin C R Addinall

The digestive enzymes of some cephalopods C Romijn *Arch neerland zool* 1, 373-431 (1935), cf C. A. 29, 4782! —The enzymes contained in glycerol exts of the middle digestive tract (liver and pancreas) and of the salivary glands of *Sepia officinalis* (1), *Loligo vulgaris* (2) and *Eledone cirrhosa* (3) were studied The salivary gland exts contained no digestive enzymes The reaction of the gastric juice of (1) changes from slightly acid to neutral The exts of the middle digestive tract and gastric juice contain lipase The liver lipase has a pH optimum of 6.02, the pancreas lipase, 6.35 The liver ext digests native albumin, peptone, chloroacetyl-L-tyrosine, leucylglycine and glycylglycine. The crude ext. is not activated with H_2S , glutathione or enterokinase The pH optimum is 6.1 for casein, 5.6 for gelatin, 6.1 for peptone, 5.5 for chloroacetyl-L-tyrosine, 8.3 for leucylglycine and 8.2 for glycylglycine The crude ext. of the pancreas does not split casein, peptone or chloroacetyl-L-tyrosine, but it does split leucylglycine and glycylglycine After

activation with enterokinase or an ext. from the cecum walls, the ext. can attack casein, peptone and chloroacetyl-L-tyrosine. The pH optimum is 7.7 for leucylglycine and 7.8 for glycylglycine. In gastric juice, the pH optimum is 6.8 for casein, 6.6 for gelatin and 6.2 for peptone. The pH optimum of the peptidases is on the alkali side. Liver ext. and gastric juice contain rennin, pancreas does not (1) and (2) contain amylase, (3) contains amylase, maltase and sucrose. Liver ext. has more action on starch, pancreas ext., more action on glycogen. The pH optimum is 6.7 to 7.0 for the breakdown of starch by gastric juice, liver and pancreas exts., 7.10 for glycogen breakdown in the gastric juice, 6.26 in liver ext. and 6.14 in the pancreas. The biological properties of heavy water. C. H. Libérall. *Rev. chim. farm. (Brazil)* 1, 59-62 (1975). Review. E S G B

Enzymes of fermentation. IV. The specificity of yeast phosphatase. Irwin Bauer, Anton Schaffner and Fritz Krumey. *Z. physiol. Chem.* 237, 191-8 (1975), cf. C. A. 29, 546/57. The specificity of yeast phosphatase for α -in preference to β -glycerophosphoric acid is corroborated by the use of dry preps of Prager and Patzenhofer yeasts. The α is hydrolyzed several times as rapidly as the β -isomer, and about 8 times as rapidly as dihydroxyacetonephosphoric acid. The difference is most striking in the early stages of hydrolysis, where the cleavage ratio may be as high as 10:1. Bottom yeast is richer in phosphatase than top yeast. A W Dux

Liver enzymes. V. The aldehyde dehydrogenase of the liver. Ludwig Reichel and Kristian Løkken. *Z. physiol. Chem.* 237, 214-20 (1975), cf. C. A. 30, 115. The dehydrogenase obtained by dialysis of the dry prep has only slight dismutative activity toward FICHO because the coenzyme has been removed. It becomes active when small quantities of coenzyme are added. The method of prep. also destroys the indophenol oxidase and removes the flavin originally present. For the dehydrogenation process flavoprotein and lactoflavin can function as intermediate acceptors. Of the 4 synthetic flavins tested only 0-d-araboflavin was a H^+ -acceptor. If the acceptor is not present in adequate concn the dehydrogenation is accompanied by dismutation. A W Dux

Activators of glucolysis. II. Hans v. Euler and Gunnar Günther. *Z. physiol. Chem.* 237, 221-6 (1975), cf. C. A. 29, 6908. Reiteration of the previous expts., but with a highly purified and more active coenzyme prep., confirms the observation that heating destroys the activating power toward fermentation while the activation of glucolysis remains unimpaired. The activation of lactic acid formation from glycogen in the presence of hexosediphosphate by heated coenzyme is nearly the same as that by adenylypyrophosphoric acid but less than that by active coenzyme. A W Dux

The dehydrogenation of citric acid and isocitric acid by the dehydrogenase of cucumber seeds. Th. Wagner-Jauregg and H. Rauen. *Z. physiol. Chem.* 237, 227-32 (1975), cf. C. A. 29, 1531. Citric acid dehydrogenase has been considered a typical "anaero-dehydrogenase" since only such substances as $\text{CaH}_2(\text{NO}_3)_2$, methylene blue and certain dyes, but not O_2 , can serve as H^+ -acceptors. It is now shown that the dehydrogenase system after completion by flavin enzyme can take up O_2 . The extent of respiration is dependent on the addn. of flavin enzyme and to a less extent on coenzyme. For each mol of citric acid consumed about 0.5 mol. of O_2 is taken up. Neither $\text{OC}(\text{CH}_3\text{CO}_2\text{H})$, nor MeAc is formed from citric acid by citric dehydrogenase even in the presence of yellow enzyme. In the aerobic breakdown of citric acid $\text{OC}(\text{CH}_3\text{CO}_2\text{H})$ cannot be an intermediate product. Other degradation products of citric acid, such as ketopie, acetoacetic, acetic, itaconic, hydroxylumaric, hydroxymaleic and acetic acids, have no substrate action toward the dehydrogenase. On the other hand, the isomeric isocitric acid, $\text{HO}_2\text{CCH}(\text{OH})\text{CH}_2(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$, is more rapidly dehydrogenated than citric acid itself and the reaction is strongly accelerated by yellow enzyme. Isocitric acid

1 has been found only in blackberries but a much wider distribution may be assumed. A W. Dux

Enzymic dehydrogenation of glycerophosphoric acid. Th. Wagner-Jauregg and H. Rauen. *Z. physiol. Chem.* 237, 233-5 (1975).—Extn. of cucumber seeds with KCl_2PO_4 yields a soln. contg. a dehydrogenase which decolorizes methylene blue in the presence of Na glycerophosphate. The reaction is greatly accelerated by the addn. of flavin enzyme, the decolorization time thereby being diminished from 180 to 12 min., and to 7 min. by the further addn. of coenzyme. Heated flavin enzyme is inactive, and coenzyme alone only slightly active. Even in relatively high concn HCN has no influence on the reaction velocity of the system. The flavin enzyme undoubtedly serves as an intermediate acceptor which transfers H^+ from the substrate to the final acceptor, methylene blue. A W. Dux

Orientation data on the composition of the jelly mass of *Rhizostoma cuvieri*. R. Zeynec and A. Dimer. *Z. physiol. Chem.* 237, 217-53 (1975).—After removal of the structural portions 130 kg. of jellyfish was evaporated and the concd soln. was filtered from the sepd. salts (CaSO_4 , NaCl) and coagulated protein. Pptn. by EtOH then gave a viscous mass of org. nitrogenous substances which dissolved in H_2O at 45° and gelatinized on cooling. Several fractions were obtained by increasing concns of EtOH , but none could be crysd. Redissolved in H_2O they gave ppt. with phosphotungstic and tannic acids, biuret, PbS , xanthoproteic and Millon reactions were pos. $\text{Ba}(\text{OH})_2$ in the cold gave NH_3 and NMe_3 . Hydrolysis by boiling with 3% HCl gave chiefly leucine and isoleucine. Other products identified were valine, alanine, glutamic acid, aspartic acid, phenylalanine, proline, hydroxyproline, considerable lysine, some arginine, histidine, guanine, taurine, lactic acid and probably aminobutyric acid. Glycine and tyrosine were present only in traces, while cysteine, serine and leucine acid were absent. The jelly of jellyfish differs essentially from the gelatin-yielding tissues of higher animals in its greater ease of hydrolysis, its low glycine content and its high S content. A W. Dux

Emulsin. XXV. Coffee emulsin. Burckhardt Hellerich and Fritz Voratz. *Z. physiol. Chem.* 237, 254-60 (1975), cf. C. A. 30, 81. Aq. ext. of raw coffee beans contains an emulsin which hydrolyzes α -d-mannosides, α -d-galactosides and β -d-galactosides. These activities are attributed to sep. enzymes since the proportions vary with different methods of prep. Coffee emulsin is very similar to lucerne emulsin but differs therefrom in its much feebler activity toward α -d-glucosides. The α -d-mannosidase present is much more resistant to moderate heating than is the β -d-galactosidase. Phenol- β -d-galactoside and vanillin- β -d-galactoside are hydrolyzed with equal velocity. The β -d-glucosides of procatechu-aldehyde, caffeine acid and vanillin are hydrolyzed so much more rapidly than phenol- β -d-glucoside or salicin by the β -d-glucosidase of coffee emulsin that their use is proposed for purposes of identification. A W. Dux

α - and β -Thymonucleic acid and the enzyme (nucleogelase) which converts the α - into the β -form. R. Løulgen. *Z. physiol. Chem.* 237, 261-7 (1975).—Com. pancreatin contains an enzyme which depolymerizes α -thymonucleic acid into a β -form which still has the tetranucleotide structure but is no longer capable of gelatinizing. No H_2O_2 is split out in this reaction. Both α - and β -thymonucleic acids yield the same products (guanine, adenine, cytosine and thymine) on hydrolysis, and in the same proportions. The name nucleogelase is proposed for the enzyme. A W. Dux

The chemistry of heparin. Fritz Lipmann and Albert Fischer. *Z. physiol. Chem.* 237, 273-4 (1975).—A S-contg. heparin prep. was obtained from beef lung which showed the same rate of destruction by 0.1 N HCl at 100° as a previous S-free prep. The power of inhibiting blood clotting was destroyed much more rapidly than the H_2SO_4 was liberated by hydrolysis, 70% of the activity having vanished before sulfate could be detected. A W. Dux

The influence of carbon monoxide on the respiration of yeast cells in various substrates. Model experiments in

the physiology of fertilization Åke Öström *Protoplasma* 24, 177-85(1935) —The respiration of unfertilized sea-urchin eggs is hastened by CO₂ but that of the fertilized is arrested. The question is raised if similar relationships are obtained with yeast by a variation of substrates. It was found that the "Eigenatmung" (respiration of the yeast without a substrate) and the "Veratmung" (consumption of the substrate) of the formate is hastened by CO₂ which is similar to the reactions of unfertilized eggs. The "Veratmung" of Na pyruvate, Na lactate, AcONa, AcH and alc is retarded by CO₂. With the exception of alc, all these substrates have retardation curves, which correspond more or less with those of unfertilized eggs. But the retardation curve of each substrate is typical and varies from the others. If the concns in the distribution formula of Warburg are calcd (*C* 22, 4568), values are found which are high at the beginning of the curve but which drop considerably later. Only alc shows a retardation corresponding to Warburg's formula. If the concn of the substrates is varied, another retardation curve is obtained for each concn. Expts with KCN give results similar to those obtained with CO₂. In the discussion, possibilities for clearing up these variations from the formula of Warburg are given. F. L. D.

Ion action and water permeability. A contribution to the conservation theory of the plasma limiting membranes. Iz de Haan *Protoplasma* 24, 186-97(1935) —Literature on the action of salts on H₂O permeability and on the viscosity of protoplasm is discussed. There is much disagreement among the statements. The influence of salts at various concns and with cations of various valences on the H₂O permeability of protoplasm has been studied. Multivalent cations at low concns lower the permeability and have a condensing action on the protoplasm, while higher concns increase the permeability. One salt with a univalent cation (NaNO₃) causes, at all concns studied, an increase in permeability. This salt influence is best explained by the theory of Bungenberg de Jong, according to which an auto-complex system of phosphatides participates in the building up of the protoplasm or its limiting layer. Thirty references. F. L. Dunlap.

The chemistry of cell division. IV. The influence of hydrogen sulfide, hydrocyanic acid, carbon dioxide and some other chemicals on mitosis in *Amoeba proteus*. Carl Voegtlin and H. W. Chalkley. *Protoplasma* 24, 365-83(1935) —The influence of certain chem. agents on mitosis in *Amoeba proteus* was studied by exposing cells at the onset or during the later stages of mitosis to solns contg. these chemicals in subtoxic concns. H₂S and HCN inhibit mitosis. The inhibition is greatest if exposure is made in prophase and decreases rapidly if it is delayed to the later stages of mitosis. The degree of inhibition is a function of the concn of these reagents in the suspension medium. No evidence of any accelerating influence was obtained with any concn used. The inhibition is completely reversible upon withdrawal of the inhibiting agents and mitosis is completed in exactly the same time interval, as if it had not been inhibited. CO₂ fails to modify mitosis in the absence of light and in the presence of all but traces of mol O. The conclusion is reached that mitosis *per se* apparently is independent of cell respiration. EtO causes an inhibition, reversibly if exposure is made in early prophase. The reversibility of this action is complicated by the production of cytoplasmic vacuolization and irregularities in nuclear fission. Under the conditions used, H₂O₂, As₂O₃, methylene blue, CuCl₂ and HgCl₂ exert no inhibiting influence on mitosis. CO₂ inhibits in early prophase, but not appreciably in the later stages. The inhibition is incompletely reversible in the sense that irregularities in the distribution of chromatin occur. The incidental observation was made that sudden and great changes in CO₂ tension cause death, whereas a more gradual adjustment is well tolerated. The possible biochem. mechanism responsible for the modifying influence produced by these agents on mitosis is discussed with particular reference to the function of enzymes concerned in the metabolism of the cell nucleus. F. L. Dunlap.

Cell elongation and the electrical properties of the cell wall. James Bonner and A. N. J. Heyn *Protoplasma* 24, 466-9(1935) —Expts have been carried out to test the hypothesis of the indirect effect of growth substance upon the charges of the micelles constituting the cell wall, by the measurement of the relative charges of cell wall suspensions from the coleoptile of *Avena sativa*. It was impossible to demonstrate any direct or indirect effect of growth substance upon the charges of such suspensions. While these neg. results are not absolutely conclusive, it seems unlikely that large changes of elec. properties of the cell wall play an important role in elongation. F. L. D.

Spectrophotometric studies. II. Preparations from washed blood cells, nitric oxide hemoglobin and sulfhemoglobin. David L. Drabkin and J. Harold Austin. *J. Biol. Chem.* 112, 51-65(1935); cf. *C* 27, 762. —Absorption spectra of oxyhemoglobin (I), hemoglobin (II), CO-hemoglobin and cyanomethemoglobin (III) yielded by solns prep'd from hemolyzed washed erythrocytes are given. Such solns are to be preferred for precise spectrophotometric analysis over corresponding preps from hemolyzed whole blood. Fairly wide variations of pH do not affect the absorption curves. The absorption spectrum of nitric oxide hemoglobin (IV) was obtained under conditions which excluded the presence of O. IV is quantitatively converted into methemoglobin (V) by K₃Fe(CN)₆, and V into III. Hence IV is probably a relatively stable analog of I. Data are given which indicate that the absorption spectra of pure sulfhemoglobin (VI) has not been described heretofore. The curve of VI is extrapolated from data on mixts of II and VI. VI is formed from II only in the presence of O. VI was not convertible to II or III but was readily changed into typical hemochromogens. Solns of II increase in acidity upon exposure to H₂S. The estn of VI was made on the blood of a patient with clinical sulfhemoglobinemia. Sulfmethemoglobin (VII) was obtained from V by treatment with H₂S, and a pigment yielding the spectrum of VII was obtained similarly from III and H₂S. III. Methemoglobin. J. Harold Austin and David L. Drabkin. *Ibid.* 67-83. —Spectrophotometric consts are given for methemoglobin (I), derived from washed, hemolyzed dog erythrocytes treated with K₃Fe(CN)₆, (II) at various pH values and known ionic strengths. From pH 6.0 to 9.4 I undergoes conversion from the acid to alk form, the conversion conforming closely to $pH = pH' + \log I_{alk}/I_{acid}$. The value for pK' at ionic strength 0.10 is 8.120 ± 0.010 and very roughly $\Delta pK' = -0.63\sqrt{\text{ionic strength}}$, at least below ionic strength of 0.154. At about pH 9.4, where 95% of I is in the alk. form, an alteration sets in, which is increased at higher pH values and which progresses with time. Spectrophotometrically this appears to be in the direction of alk. hematin. Between pH 7.0 and 9.2 the change between the acid and alk form of I is reversible. Titration of oxyhemoglobin (III) with II in contact with air shows that III is converted to I completely at pH 6.0 in 20 min. by a mol-to-mol ratio of reductant to oxidant. As the pH rises an excess of II is required to complete the conversion, and for a given ratio of II/III the reaction proceeds more slowly. On treating III solns. with small amts of NaNO₂ (IV) there is a slow reaction in which the IV appears to act only indirectly on the III, the rate of reaction being accelerated at lower pH . IV added in excess of an amt characteristic for a particular prep'n gives immediate conversion to I, 1 mol of III being converted for every 0.5 to 0.7 mols of IV effective in the reaction. With amts of IV in excess of a molar ratio of 4:1 at pH 7.15 the resulting absorption curve is higher at λ 575, 560 and 540 m μ than that obtained with II. The observed curve is not inconsistent with that which would result from a mixt. of I and nitric oxide hemoglobin. At pH 9.2 IV did not convert III in contact with air to I. If I be produced with IV in unbuffered soln and then buffered to pH 9.2 the spectrum is essentially identical with that of I produced with II at pH 9.2. There is a slow reaction between III and small amts of quinone (V) in contact with air, but progressing with the lapse of time to at least

80% conversion at a 1:1 M ratio; a very much more rapid reaction occurs with considerable excess of V. The absorption curve of I produced by V is somewhat higher than that of I produced by II, presumably owing to by-products. Addn. of KCN (VI) produces the curve of cyano-I (VII), also somewhat elevated. III in very dil soln of hemolyzed dog erythrocytes underwent, on standing 48 hrs, partial change into I. Addn. of VI converted this I into VII and during a further 48 hrs conversion of III continued in the presence of VI. Graphs are presented for various mixts of I and III at various pH values which show the ratio of $\frac{A_{520m\mu}/A_{540m\mu}}{A_{520m\mu}/A_{540m\mu}}$ and the summation of changes defined as $\Sigma \frac{A_{520m\mu}}{A_{540m\mu}}$ at λ 620, 575, 540 and 540 m μ . The use and advantages of the latter in the quant estn of I in a mixt with III are discussed. IV Hemochromogens. David L Drabkin and J Harold Austin *Ibid* 89 104.—The absorption spectra of oxidized and reduced hemochromogens are described. Data are given to illustrate the importance of the time factor in conversion of hemoglobin (I) to hemochromogen with NaOH. Solns of I treated with C_4H_9N yield characteristic hemochromogen spectra. The reduced hemochromogen so formed reacts reversibly with CO, and the oxidized form reacts with KCN, presumably yielding under these conditions cyanohemoglobin. The possible significance of the observations is discussed. Nencki and Zaleski's method for prep *chloroformin* has been improved by using washed blood cells, thereby the dilg effect of serum is avoided as well as the presence of serum proteins and lipides, and a 64% yield is obtained. V A technic for the analysis of undiluted blood and concentrated hemoglobin solutions. *Ibid* 105-15.—A new spectroscopic cell, 0.07 mm in depth, is described for the study of very concd solns. It can also be used for the study of solns without exposure to environmental gases. Optical studies have been made upon hemolyzed undil blood, nonhemolyzed blood and upon solns of crystal hemoglobin (I) in concns as high as, or in excess of, those found in red blood cells. Beer's law applies for solns of I in a range of concns from 1 to 0.0001, where 1 = 25.58 millimols per l (42.72 g per 100 cc). It also applies for oxyhemoglobin over considerable range. The absorption of light by I appears to be a function of the Fe-porphyrin; therefore aggregation involving intramolecular rearrangement within the prosthetic groups appears excluded. No conclusions could be drawn as to the possibility of mol assocn involving the large I mol. With respect to the specific absorption of light, even in very concd solns, I resembles a true soln. R C Elderfield.

The renal glucose threshold in terms of the Cushny-Rehberg theory. Delfino Barbieri *Minerva med* 1935, II, 670-82.—The renal glucose threshold was detd in normal persons and diabetics by the alimentary and the Rehberg methods. The results of the two methods were comparable. Helen Lee Gruel.

Biological cell oxidation. A Bertho *Chem Ztg* 59, 953-7 (1935).—A review. E H.

The structure of silk fibroin. II Münch. *Angew Chem* 48, 797-9 (1935).—Investigations on the splitting of natural silk fibroin in various stages of spinning were carried out by means of the enzyme papain in acid soln, which acts specifically upon sericin. The degumming effect is greatly increased by addn. of activators such as $Na_2S_2O_5$ and Na_2SO_4 . A parallelism between cleavability and fiber structure could be established. K. Kammermeyer.

Yeast amylase. IV. Enzyme-chemical properties. Optimum pH and temperature. Kazuki Ono, *J Agr Chem Soc. Japan* 11, 893-7 (1935).—Amylase soln. was prepd from yeast by using $(NH_4)_2HPO_4$. The optimum pH was 6.2-6.6 at 22.5° and 6.0-6.2 at 30°, and the optimum temp was 25-30° at pH 6.4 for the hydrolysis of starch. Y. Kihara.

Crystalline egg albumin. II The fractionation of peptic hydrolysis products. Herbert O Calvery *J Biol. Chem* 112, 171-4 (1935); cf. C. A. 27, 5315.—Cryst. egg albumin was digested with pepsin for 23 days

1 and an equil. was attained in which approx. 1/3 of the peptide linkages had been hydrolyzed in accord with results previously obtained. The digestion products were sep'd. into 5 fractions quite different from each other as shown by chem. and enzymic studies. Fraction A₅ contained only 10% peptide N, indicating that free amino acids were present. Results of the action of a specific dipeptidase indicate also that dipeptides are formed during peptic hydrolysis of egg albumin. A. P. L.

2 Activation of enzymes. III The role of metal ions in the activation of arginase. The hydrolysis of arginine induced by certain metal ions with urease. Leslie Hellerman and Marie E Perkins *J Biol Chem* 112, 175-94 (1935), cf. C. A. 29, 1113.—The arginase prepn used (obtained from freshly excised calf liver) is neither activated nor, after treatment with various oxidizing agents, reactivated by cysteine or other reducing agents that activate papain. It is effectively activated and reactivated by certain metal ions, specifically Co^{++} , Ni^{++} or Mn^{++} (as well as Fe^{++}). Co^{++} brings about almost complete restoration of activity after the enzyme has been inactivated by H_2S and the excess of the latter removed. $RHgX$ compds do not inactivate, ferricyanide ion incompletely suppresses the activity and Cu^{++} , Hg^{++} and Ag^{+} destroy the activity, in part, by pptg the enzyme. The action of HCN is depressant. "On the basis of the results,

4 the arginase mol is visualized as contg a metallic component which may be oxidized or sep'd from the rest of the mol by the action of oxidizing agents or certain other reagents. The observed actions of Co^{++} and other effective ions are interpreted, not as reductions, but rather in terms of the characteristic property of these ions to coordinate with suitable mols or groupings to form complex mols. This suggestion may include an implication regarding the role of the metallic component in the building of an enzyme-substrate compd." Arginine without arginase is hydrolyzed in the presence of Co^{++} , Mn^{++} or Ni^{++} , and under certain conditions Fe^{++} , when urease is also present in the mixt. This effect is suppressed by organometallic suppressors of urease activity. Cyanide diminishes the effect but does not prevent the independent hydrolysis of any urea present since it is a urease activator. The bearing of these results upon analytical operations

5 involving the use of urease in the detn. of urea where arginase and certain metal ions may also be present is obvious. A. P. Lothrop.

The effect of fluorine upon the phosphatase content of plasma, bones and teeth of albino rats. Margaret Cammack Smith and Edith M Lantz, *J Biol Chem*, 112, 303-11 (1935), cf. C. A. 29, 5159.—F does not exert its characteristic damage to the teeth of rats through its effect upon the enzyme involved in tooth and bone calcification and an increase in plasma phosphatase cannot be considered a sensitive indication of fluorosis in rats as reported by Phillips for dairy cows. The phosphatase content of the plasma of normal rats decreases with age up to about 70 days when there is a precipitous drop with little change thereafter. In rats given diets contg. 0.1% NaF there is also a decrease with age but it is slower and the values are lower than those of the controls up to 70 days of age, after which they are slightly higher. The lower values appear to be an indication of less active bone growth and delayed maturity rather than a specific F effect. Phosphatase values of the same order as the controls are shown by rats receiving 0.025% NaF, a concn sufficient to mottle the teeth but not to stunt bone development. The phosphatase content of the incisor teeth of the F-fed rats is less than that of the controls. In bone the phosphatase values in the controls and F-fed litter mates are approx the same up to 70 days after which time they are slightly higher in the latter animals. When detd approx 18 hrs. after the injection of 0.3 cc of a 2.5% soln of NaF, the plasma phosphatase values in adult rats are not significantly different from those of the controls.

7 Derivatives of keratin. David R Goddard and Leonor Michaelis. *J. Biol. Chem.* 112, 301-71 (1935); cf. C. A. 28, 6740.—Keratin is formed from keratin by reduction

8

9

10

with Na thioglycolate. It is oxidized to metakeratin which differs from native keratin by its amorphous character, soly in alkali and digestibility with pepsin or trypsin. Derived proteins, differing distinctly in their solubilities and isoelec. points, can be obtained by substituting the H of the -SH group of kerateine by treatment with iodoacetate, α -bromopropionate, iodoacetamide and iodoethyl alc. forming carboxymethyl-, carboxyethyl-, carbamylmethyl- and hydroxyethylkerateine, resp. All are digested by pepsin or trypsin. No substitution of amino H or loss of S occurs during the reaction. Carboxymethylkerateine is sol enough to permit fractionation with $(\text{NH}_4)_2\text{SO}_4$. Two fractions were obtained, a larger at 35% satn and a smaller at 60% which contained more S and less N and amino N than the original protein. These results indicate that native keratin probably consists of 2 fractions and not that the substitution leads to 2 different products. A. P. Lothrop

The amide nitrogen of ovalbumin. Agnes Shore, Hildegard Wilson and Geo Stueck. *J Biol Chem* 112, 407-13 (1935). —Deins were made of the amt. of NH_2 formed at intervals during the protracted hydrolysis of ovalbumin in 5, 1 and 0.2 M HCl at 100° and 85°. Four sep preps of cryst ovalbumin were used and all gave the same amide N within the exptl error of 1 equiv. per mol in spite of variations in the method of prepn. The probable value for the amide groups is 24 equivs per mole. The hydrolysis of the amide groups is a 1st-order process. The velocity consts are 7.15×10^{-4} at 100° and 1.83×10^{-4} at 85°, natural logs being used and the time measured in secs. A. P. Lothrop

Myoglobin. I. The solubility of myoglobin in concentrated ammonium sulfate solutions. Vincent E. Morgan. *J Biol Chem* 112, 557-63 (1935). —The soly of carboxymyoglobin from horse heart in concd solns of $(\text{NH}_4)_2\text{SO}_4$ at pH 6.6° and 25° is adequately expressed by the equation $\log S = 8.00 - 0.94(\text{r}/2)$, where $\text{r}/2$ is the ionic strength per l. It is quite sol in buffer solns at pH 6.6 up to a phosphate concn. of at least 3 M, in which soln the soly of carboxymyoglobin is less than 1 p p m. The great difference in soly. makes possible a method for their characterization and quant sepn and emphasizes the great difference between these proteins. A. P. Lothrop

Enzymic histochemistry. I. Distribution of arginase activity in rabbit kidney. Leopold Weil and J. Owen Ely. *J Biol Chem* 112, 565-77 (1935), cf C A 28, 6731. —The microarginase method of Linderström-Lang, Wedl and Holter is suitable for histoenzymic studies. The arginase activity of the rabbit kidney is specifically connected with the cells of the proximal convoluted tubules. No correlation was found between arginase activity and cells of the other structural elements of the rabbit kidney. The medulla is entirely free of arginase and does not contain any inhibitor of this enzyme. A. P. Lothrop

The enzyme synthesis from thyroid duodotyrosine peptone of an artificial protein which relieves myxedema. Wm T. Salter and Olof H. Pearson. *J Biol Chem* 112, 579-89 (1935). —"Thyroglobulin from human thyroids was subjected to peptic digestion and, after removal of thyroxine, a soln of duodotyrosine peptone was obtained which was calorimetrically inert in standard dosage. After concg the peptone, it was subjected to a peptic synthesis which reversed the original digestion process. The artificial protein so prepd was an I-contg substance of large mol. size, with chem. properties somewhat resembling the natural thyroid protein. It was found clinically to relieve myxedema as effectively as thyroglobulin in equiv I dosage. As judged by modern analytical methods it contained an appreciable I fraction resembling thyroxine. These results suggest the following conclusions. The 'inactive' duodotyrosine-contg fraction of peptone produced by peptic digestion of thyroglobulin is a potential source of active hormone. From this peptone an artificial protein can be obtained by protease synthesis ('cse' action) which reverses the better-known proteolytic phenomenon (digestion). The artificial protein resembles

1 natural thyroglobulin in its chem and biol. properties." A. P. Lothrop

The chemistry of human epidermis. II. The isoelectric points of the stratum corneum, hair and nails as determined by electrophoresis. Vernon A. Wilkerson. *J Biol Chem* 112, 329-35 (1935), cf C A 29, 1161. —The electrophoretic mobilities of skin, hair and nails suspended in a series of buffers were deid in a modified Northrop-Kunitz microelectrophoresis app. The curves of mobility in μ per sec. per v. per cm plotted against pH were fairly const. From this the following isoelec. points were assigned, skin 3.70, hair 3.67, nails 3.78. It is suggested that "since the isoelec. points were practically the same and the basic amino acids were present in approx the same mol. ratios, possibly the amino acids responsible for the acidic groups were also present in a definite mol ratio in these 3 chemically, physically and embryologically related structures. It is further suggested that the adherence of colloidal particles in suspension to the skin would depend upon the pH of the dispersion medium, the charge that the skin assumed in contact with the colloidal suspension and the charge on the suspended particle." A. P. Lothrop

The influence of phosphorus on fibroblast culture. Kenkichi Saito. *Folia Pharmacol Japon* 21, Opera Orig 187-91, Breviaria 49-50 (1935). —Small doses of P dissolved in gum arabic soln. increased the growth of fibroblast, but large doses decreased the growth, the cells finally drying. Histological changes are discussed. G. H. W. Lucas

Experimental studies on the cumulative action of sublimate, strychnine and arsenous acid on cultures of iris epithelium in vitro and their observed after-effects. Kenkichi Saito. *Folia Pharmacol Japon* 21, Opera Orig 192-206, Breviaria 50-1 (1935). —These poisons when applied to cultivated tissues in weak concn. through 14 passages show that at first the growth is accelerated, but later owing to an accumulative action of the drugs growth is inhibited and the tissue dies. G. H. W. Lucas

The influence of boric acid and borax on the growth of fibroblast as well as iris epithelial cultures, together with an investigation of the morphological changes following the administration of these drugs. Michitada Maeda. *Folia Pharmacol Japon* 21, Opera Orig 213-22, Breviaria 52 (1935). —Boric acid and borax, when given in low concn. first accelerate growth in fibroblast and iris epithelial cultures, but with increase in concn. growth ceases and the cells are damaged. Morphological changes are discussed. G. H. W. Lucas

The chemical mechanism of glucolysis in the brain. F. P. Mazza and C. M. Valeri. *Boll. soc. ital. biol. sper* 10, 725-7 (1935). —The purpose of the investigation was to see whether the principal chem. reactions which characterize glucolysis of muscle and alc. fermentation (Emden, Meyerhof) also occur by the action of brain enzyme exts. Rabbit brain exts were inactivated by allowing them to stand at room temp for 3 hrs and then dialyzed. When added to fructosediphosphoric ester, triosephosphoric esters were produced, thus showing the presence of zymase in the brain. By the action of brain pulp on starch solns in the presence of lactates, and on hexosediphosphates in the presence of fluorides, β -phosphoglyceric acid was formed (isolated as the Ba salt). Therefore, the 2nd reaction in the Emden-Meyerhof mechanism takes place in the brain. Brain exts prepd in a manner similar to that used by Meyerhof for muscle exts act on phosphoglyceric acid by splitting off H_2PO_4 and producing pyruvic acid, if α -glycerophosphoric acid is also present there is a marked production of lactic acid. In the presence of fluorides, the scission of phosphoglyceric acid is inhibited, but if the exts act on a mixt of α -glycerophosphoric acid and pyruvic acid, the latter is transformed completely into lactic acid and the reaction is not inhibited by fluorides. Particularly noticeable is the fact that H_2PO_4 is not liberated. Like the glycolytic enzymes of muscle the enzymes of brain need a coenzyme (the same as that of muscle) brain exts when dialyzed lose their activity. ICH-CO-H partially inhibits the formation of lactic acid when added

to a mixt. of brain exts., phosphoglyceric acid and glycerophosphoric acid or to brain exts., pyruvic acid and phosphoglyceric acid. In the last case, it does not completely inhibit the scission of phosphoglyceric acid with liberation of H_2CO_3 , but does inhibit much more so the production of lactic acid.

Peter Masucci

The proteins of the cowpea (*Vigna sinensis*) William H. Adolph and Hsien-Ching Chiang *Chinese J. Physiol.* 9, 347-54 (1935).—Five protein fractions have been isolated as follows: *viscin* (globulin A) 45%, *glutinin* 25%, *albumin* 15%, *globulin B* 10% and *globulin C* 5%. N distribution studies by the Van Slyke method showed that the globulins and albumin are rich in cystine and that the *glutinin* is rich in lysine.

J. A. Maynard

The isolation of a crystalline protein possessing the properties of aneba-mosaic virus W. M. Stanley *J. Biol. Chem.* 31, 62-3 (1936).—The prepn was obtained by the methods used in the isolation and purification of tobacco mosaic, and the needles are similar. The N content and infectivity remained unchanged after 4 successive crystallizations. The material is between 100 and 1000 times more active than ordinary juice preps.

John T. Myers

A quantitative study of the phytoplankton in the Bay of Fundy and the Gulf of Maine (including observations on hydrography, chemistry and turbidity) H. H. Gran and Trygve Braarud *J. Biol. Board Can.* 1, 279-407 (1935). This investigation was undertaken to determine what effect the construction of dams across the entrances of Passamaquoddy Bay might have upon the production of phytoplankton in the Bay of Fundy. During the summer of 1932 samples were collected monthly from 27 stations, 17 in the Bay of Fundy and 10 in the Gulf of Maine. These were taken at depths of 1, 10, 25, 40 and 75 m. The P and nitrate N contents of the surface waters were higher in the Bay of Fundy than in the Gulf of Maine. In the latter region the waters were supersaturated with O_2 as far down as the photosynthesis of the phytoplankton was predominant, viz., to a depth of about 40 m. offshore and to a lesser depth near the shore. During the same periods waters were subsaturated in the Bay of Fundy. The lower production of phytoplankton in the Bay of Fundy is considered to be due to the high turbidity of the waters caused by the extraordinarily high tides of the region. The construction of the dams would not be expected to affect the productivity of the Bay of Fundy outside of the confined area, whereas regions inside might be benefited. Details are given of phytoplankton population.

J. R. Noller

The permeability of the mammalian erythrocyte to deuterium oxide (heavy water) Arthur K. Parpart *J. Cellular Comparative Physiol.* 7, 153-61 (1935).— D_2O (99.5%) penetrates bull and rat erythrocytes 14% more slowly than H_2O . The 11% lower mobility and 31% higher viscosity of D_2O as compared to H_2O may account for the difference. D_2O in this case appears to have an inhibiting effect on erythrocyte permeability.

T. H. R. Rider

The permeability of erythrocytes to deuterium oxide (heavy water) S. C. Brooks *J. Cellular Comparative Physiol.* 7, 163-71 (1935).—With equal concn gradients D_2O penetrates sheep erythrocytes more slowly than H_2O . This is attributed in large part to fugacity differences, aside from which there may be little difference in intrinsic penetrability.

T. H. Rider

Osmotic properties of the erythrocyte VII The temperature coefficients of certain hemolytic processes M. H. Jacobs, H. N. Glassman and Arthur K. Parpart *J. Cellular Comparative Physiol.* 7, 197-225 (1935).—cf. C. A. 28, 67-72. The rapid hemolysis of erythrocytes of man, rat, mouse, rabbit and guinea pig is strongly retarded by CO_2 and characterized by a low-temp. coeff., while erythrocytes of ox, sheep, horse, pig, dog and cat are slowly hemolyzed without retardation and with high-temp. coeffs. by isotonic glycerol solns. Times for hemolysis by glycerol, ethylene glycol and thionin for different species at const. temp. parallel the resp. temp. coeffs.

T. H. Rider

The effect of x irradiation on auxin and plant growth I. L. Skoog *J. Cellular Comparative Physiol.* 7, 227

70 (1935).—Auxin is inactivated by moderate dosages of hard x-rays, through oxidation resultant upon such irradiation. The inactivation in water requires the presence of O_2 . Similar results are effected by white light in the presence of co-in. Extid. and synthetic hetero auxin (β -indoleacetic acid), auxin A and auxin in the plant are similarly inactivated. Other results indicate that the effect of irradiation on auxin and its formation is the major factor in the immediate inhibition of growth.

The inhibitory action of eserine upon choline esterase in vivo Maxwell S. Jones and Henry Fod *Biochem. J.* 29, 2212-52 (1935).—It was shown by the detn. of choline esterase (I) in the blood of patients after response to eserine (II) injections that II inhibited the action of I on acetylcholine. Pilocarpine and adrenaline caused no lowering of the activity of I. Conclusion: II acts on the parasympathetic by virtue of its inhibition of I, leading to a prolongation of the action of the acetylcholine present.

L. W. Scott

Action of halogenated organic compounds on living cells I. Guryov *Bull. Assoc. diploms. microbial. faculté pharm. Nancy* No. 8, 6-13 (1934).—A review on inhibition of fermentation and toxin action in general, with 24 references.

W. C. Tobie

Action of mass and surface in the phenomena of life G. Bohn *Conf. lab. microbial. faculté pharm. Nancy* No. 6, 20-37 (1934).—An increase in no. of organisms in a soln. may be able to resist the action of poisons to which a smaller no. would succumb, or may succumb more rapidly due to toxic compds. produced by the death of the most susceptible individuals. The effect of hydroquinone on varying concns. of sea-urchin sperm, and of colloidal Ag on varying nos. of frog tadpoles illustrates autoprotection, while the increased mortality of increased nos. of *Coronula* in dil. sea water or KCl soln. illustrates autodestruction.

W. C. Tobie

Inhibitory effect of phlorizin on an enzymic dismutation H. Kalkar *Nature* 136, 872-3 (1935).—cf. C. A. 27, 5425, 28, 3746. The dismutative conversion of triosephosphate into phosphoglyceric acid and glycerophosphoric acid is inhibited 70-100% by phlorizin in concns. of about 0.01 N.

I. D. Walter

Influence of heavy water upon the activity and upon the stability of pancreatic amylase M. L. Caldwell, S. I. Doebbeling and S. H. Mamin *J. Am. Chem. Soc.* 58, 81-7 (1936).—By working with highly purified D_2O and with highly purified preps. of pancreatic amylase (I), it has been found that 100% D_2O has no marked influence upon the hydrolysis of starch by I provided the conditions of the expts. are such as to minimize the deterioration of the enzyme and that the inactivation of I is more rapid and more pronounced when the I is held at 25° in highly purified D_2O than in similarly purified ordinary H_2O .

C. J. West

Emulsin XXIV Glucoside synthesis with emulsin H. Hellerich and U. Lampert *Ber. 68B*, 2050-1 (1935).—cf. C. A. 30, 61. —I've g. glucose in 500 cc. 50% MeOH at 20° with 1 g. almond emulsin which has a glucosidic value of 1.2 g. will reach equl. in 41 days. If the enzyme value is 5, equl. is reached in 13 days. Increase in temp. hastens equl. PhCH₂OH in place of MeOH will allow equl. at 20° in 12 days, at 37°, 9 days. If the enzyme value is 10, equl. will be reached in 1 day. The higher the aliphatic alc. up to C₄ the faster equl. will be reached.

Dioxin solutions as colorimetric standards for the determination of carotene Harry N. Holmes and Werner H. Bromund *J. Biol. Chem.* 112, 47-51 (1936).—cf. C. A. 29, 7322. —Dioxin in C_6H_6 soln. gives a stable color which matches well that given by carotene in C_6H_6 and a color-

metric method for the detn of carotene in C_4H_8 and $CHCl_3$ solns where the Willstätter-Stoll method cannot be used has been devised with bixin as the color standard.

A. P. Lothrop

The microdetermination of ferrocyanide in muscle and urine J. Graham Edwards and Wilson D. Langley *J. Biol. Chem.* 112, 469-75 (1936).—A method is described for the detn of sol ferrocyanide in pure soln and in urine and minced muscle in ams of 1 to 40 mg. About 98% recovery can be made from pure solns, urine and blood and about 90% from muscle. The ferrocyanide is converted into HCN by hydrolysis with H_2SO_4 , the liberated HCN is aerated into a soln of NaOH and titrated with $AgNO_3$ in the presence of KI as the end-point indicator. So far the method has not been applied to the detn. of insol. ferrocyanides

A. P. Lothrop

Indole VI Method for determining free indole in small quantities of blood E. Macchia *Boll. soc. ital. biol. sper.* 10, 723-5 (1935), cf. C. A. 30, 1442.—Add to 2 cc serum, 0.20 cc methanol and 12 cc. purified petr. ether. Agitate vigorously for 2 min., allow to stand until the solvent seps, draw off the solvent and wash it with 2 cc. distd. water. (If the serum is steric, first wash the solvent with a concd. alkali, then 3 or 4 times with distd. water). To 10 cc of the solvent, add 2 cc. of Macchia's reagent prep'd freshly as follows: 0.05 cc of a 1% alc. soln of *p*-dimethylaminobenzaldehyde, 0.20 cc. sulfosalicylic acid 20% soln and 1.75 cc. glacial AcOH. Mix, evap. the solvent on the water bath at 70-80°, cool and bring the colored liquid to 2 cc. with AcOH. Det. indole photometrically or colorimetrically with a series of standard tubes prep'd as follows: agitate 1 cc. of an aq. soln. of indole (1 mg. %) 2 min. with 20 cc. petr. ether. When the liquids sep., transfer 10 cc. of the petr. ether to a test tube and add 2 cc. of Macchia's reagent. Evap. the solvent and make up the colored liquid to 5 cc. with AcOH. Transfer 0.10 cc., 0.20, 0.3, . . . 1.00 cc. to a series of test tubes. Make up each to 2 cc. with AcOH. This technic was used to det. free indole in the blood serum of 60 normal individuals having a normal indican titer. The amt. of free indole found was 0.006 to 0.008 mg. %

Peter Masucci

Hydrochloric acid as reagent for proteins and their derivatives Hugo Köhl *Pharm. Zentralhalle* 76, 625-9 (1935).—The simplest substance yielding the HCl (color) test is furfural, the closely related pyrrole yields the HCl test only with aldehydes contg. a Me group; furfural and pyrrole can be formed through a cleavage of diketone compds., and these products occur, according to protein investigators, among the degradation products of protein aldehydes and ketones in combination with HCl do not give a characteristic violet color, although they cause a change in the color, in the presence of ketones there is a red color, and in the presence of aldehydes there is a brown cast. Although carbohydrates contg. aldehyde and ketone groups yield the color tests of aldehydes and ketones, they give no violet color. The HCl reaction accordingly affords a specific test for derivs. of the proteins which contain certain groups in aldehyde or ketone combination. Six references

Red-violet color indicates indole, blue indicates skatole. The detn. can be made by comparing colorimetrically with a standard

H. L. G.

The lethal dose of the toxins of some anaerobes for sheep J. H. Mason. *Onderstepoort J. Vet. Sci.* 5, 61-4 (1935).—Cultures of *Cl. septicum*, *Cl. oedematis*, *Cl. orestoxus* and *Cl. welchii* type B were grown in Robertson's meat broth at 37°. After filtration, first through pulp and then through a Berkefeld candle, the filtrates were said. with $(NH_4)_2SO_4$, the ppt. was blotted and finally dried in vacuum over H_2SO_4 . Saline solns. contg. 100 mg. of ppt. per 5 cc. were prep'd. and injected into sheep and mice. In the order named, the min. lethal doses for sheep were 3.5, 7.0, 0.1 and 1.2, and for mice 0.2, 0.07, 0.008 and 0.02 mg./kg. of body wt.

K. D. Jacob

The antigenic components of the toxins of *Cl. botulinum*

types C and D. J. H. Mason and E. M. Robinson. *1*
Onderstepoort J. Vet. Sci. 5, 65-75(1935).—Toxic broth
 filtrates of 1 A, 1 B, 6 C and 1 D types of *Cl. botulinum*
 (prepd. as described in the preceding abstr.) and the anti-
 toxins produced by injecting these filtrates into goats
 were tested from the standpoint of working out the anti-
 generic "make up" of the toxins. The results indicated
 that (1) the A and B types are monospecific, (2) the C
 types contain 3 components C_1 , C_2 and D, the last being
 present in only very slight amt. and (3) the D type con-
 tains chiefly the D but also a small quantity of the C
 fraction.

 Study of *B. coli* mutable from an outbreak of diarrhea
 in the newborn. Anna Dean Dulaney and I. D. Michelson
Am. J. Pub. Health 25, 1241-51(1935).—Stable
 lactose-fermenting and unstable nonlactose-fermenting
 (in that lactose-fermenting descendants continued to be
 given off) organisms could be derived from all cultures
 3
 Dissoc. to the lactose-fermenting form occurred under
 simulation of contact with lactose. Lactose exerted a sp
 effect, since no other condition of growth produced the
 same result. Utilization of salicin and raffinose was
 shown to be similar to that of lactose and depended upon
 the development of variants capable of fermenting these
 sugars. Biologically the organisms are closely related to
Es. communior, but no close antigenic relationship was
 demonstrated. All strains of *B. coli* mutable isolated
 from sick babies were found to form a homologous group
 when tested with sera of rabbits immunized with red and
 white forms.

 Fermentation of glycerol by gluconic acid bacteria in
 fruits. The production of dihydroxyacetone, glyceric
 acid, acetic acid, glycolic acid, succinic acid and a sub-
 stance which gives a reddish violet color reaction with
 ferric chloride. Teizo Takahashi and Toshinobu Asai
J. Agr. Chem. Soc. Japan 11, 1008-16(1935).—*Gluc-*
conacetobacter cerinus var. *ammoniacus* f. sp. *unshu* *β*
 was cultured in 4.21 of yeast ext. contg. 210 g of glycerol
 and 105 g of $CaCO_3$ at 20-28° for 90 days. From the
 ether of the fermentation product, succinic acid 1.2 g,
 AcOH (as Ca salt) 20 g and glycolic acid (as Ca salt)
 6.0 g were obtained. Dihydroxyacetone 82.6 g, l-
 glyceric acid (as Ca salt) 32 g and a sirup which gave a
 reddish violet color with $FeCl_3$ were isolated from the
 ether-insol. part. Glycerol may be converted into an
 unknown ketonic acid through dihydroxyacetone, or
 succinic acid or glycolic acid through glyceric acid and
 AcOH.

Y. Kihara
 A specific polysaccharide from the bacillus Calmette-
 Guérin (BCG). Erwin Chargauf and Werner Schaefer
J. Biol. Chem. 112, 393-405(1935).—Two polysaccharides
 giving pptns with anti-BCG horse sera have been
 prepd. from defatted B. Calmette-Guérin (BCG). One
 (A) is a water-sol., d-rotatory (77.4°), weak acid contg.
 77.2% of reducing sugars and 2.9% of amino sugars. Its
 main components are mannose and d-arabinose with a
 small amt. of inositol. The other (S) is insol. in H_2O
 and alkali and sol. in acids. It is a strong adsorption compd.
 between equal parts of a polysaccharide, contg. 94% of
 reducing sugars, and of $Ca_3(PO_4)_2$. A protein was also
 isolated which showed comparatively weak tuberculin
 activity.

 The chemistry of the lipides of tubercle bacilli. XII.
 Studies on phthioic acid. M. A. Spielman and R. J.
 Anderson *J. Biol. Chem.* 112, 750-67(1936), cf. C.
 A. 24, 878; 29, 117.—The Me ester of phthioic acid
 had been purified by fractional distn. until the specific
 rotation reached the const. value of 12.2°. The acid
 prepd. by sapon of the pure ester possesses a branched
 chain, probably Me groups in the α-position and in the
 neighborhood of the 11th C atom. Other branches exist
 but the no and position have not yet been detd. Purified
 phthioic acid is biologically active and produces typical
 tuberculous tissue when injected into normal animals.
 Phthioic acid CaH_2O_2 m. 20-21° and has $[\alpha]_D^{25}$ 12.56°;
 amide m. 45°; methylamide m. 27°.

A. P. Lohrhop
 Microchemical tests on the sulfur bacteria. Achille
 Monti *Boll. soc. ital. biol. sper.* 10, 690-1(1935).—

By immersing colonies of *Beggiatoa* in aq. solns. of $AgNO_3$
 of various concns., the endocellular droplets of S are
 transformed into Ag_2S . The preps. are stable. They
 can be washed, passed through EtOH and xylene without
 changes. They can be stained with safranin to bring
 out the body of the bacteria and the gelatinous magma
 in which the bacteria are engulfed without previous
 fixation in $Na_2S_2O_3$. $AgNO_3$ was found to be superior to
 Pb acetate, $HgCl_2$, $PtCl_4$, osmic acid or a satd. sucrose
 soln.

Peter Masucci
 The fermentation of mannitol by *Escherichia coli* and
Bacillus lactis aerogenes. V. Cianci *Boll. soc. ital.*
biol. sper. 10, 730-2(1935).—The fermentation of mannitol
 by *Es. coli* is influenced quantitatively by the presence of a
 phosphate buffer. Increasing the amt. of buffer increases
 the growth, the rate of growth, the amt. of acid produced
 and the gas-producing activity. *B. lactis aerogenes* shows
 an analogous behavior but after incubation for 8 days at 37°,
 the reaction turns slightly alk. in the buffered cultures.

Peter Masucci
 Reactions of R and S forms of bacteria to the treat-
 ment of Lustig and Galeotti for the extraction of nucleo-
 protein. A. Seppilli and R. Vendramini *Boll. ist.*
sierot. milanese 13, No. 5(1934), *Rev. sud-americana*
endocrinol. inmunol. quimioterap. 18, 760.—While R
 strains respond to the treatment, S resist lysis by KOH.

A. C. Meyer
 Ultrafiltration experiments with the viruses of laryngo-
 tracheitis and coryza of chickens. Charles S. Gibbs
J. Bact. 30, 411-17(1935).—The tracheal and nasal exu-
 dates are triturated with distd. water with powder Pyrex
 glass and 0.01 M citric acid added to the isoelec. point,
 the cellular debris flocculates and settles or can be centri-
 fugal. The supernatant fluid is neutralized with $1/2N$ M
 Na_2CO_3 to thymol blue, and then filtered through graded
 collodion membranes.

John T. Myers
 Dissimulation of glucose by heterofermentative lactic
 acid bacteria. M. E. Nelson and C. H. Werkman. *J. Bact.*
30, 547-57(1935).—Lactic, acetic and carbonic
 acids, alc. and glycerol were the end products of the dis-
 simulation of glucose by 3 representative species of the
 heterofermentative lactic acid bacteria. The millimols
 of CO_2 produced were equiv. to the sum of the AcOH
 and alc.

John T. Myers
 Anaerobic bacteria capable of fermenting sulfite waste
 liquor. A. M. Partansky and B. S. Henry *J. Bact.*
30, 559-71(1935).—The absence of proteolytic action
 and the ability to attack a large no. of carbohydrates, as
 well as the production of butyric acid as one of the end
 products, indicated a relationship of all 5 of the species
 usually grouped under the name of *Clostridium butyricum*.
 However, a new species was found which differed from *Cl.*
butyricum morphologically, culturally and physiologically.

John T. Myers
 Growth stimulants for certain Rhizobia. W. B. Sarles
 and J. J. Reid. *J. Bact.* 30, 651(1935).—Potato ext.
 stimulated growth. Asparagine stimulated growth also
 but to a lesser degree.

John T. Myers
 Activation of the lower fatty acids by propionic acid
 bacteria. R. W. Stone, H. G. Wood and C. H. Werkman
J. Bact. 30, 652-3(1935).

John T. Myers
 The relation of oxidation-reduction potential to the
 growth of an aerobic organism. Wm. B. Wood, Jr.,
 Mary Lee Wood and I. L. Baldwin *J. Bact.* 30, 593-602
 (1935).—Reversible oxidation-reduction indicators posi-
 tive to, and including, methylene blue inhibit the growth
 of *B. megatherium* when in the oxidized form. Indicators
 negative to methylene blue in the electromotive series
 fail to inhibit growth. None of the compds. which in-
 9
 hibited growth in the oxidized form is bacteriostatic when
 reduced. Potentiometric measurements indicate that
 the compds. studied effect growth only during the lag
 phase and sufficient indicator was added to the medium to
 have an appreciable poisoning effect. Suitable amts. of an
 inorg. reducing agent favor the growth of *B. megatherium*.

John T. Myers
 A chemical-biological study of *Escherichia coli* and three
 of its rough variants. Earnest H. Rennebaum. *J. Bact.*

30, 625-38(1935).—Three rough variants of *Es. coli* were developed with marked differences between each other and between them and the parent strain. As a source of energy the parent strain more readily utilized acetic, lactic and malic acids, while the variants preferred tartaric, citric and salicylic acids. The injection of a lethal dose of the parent strain into the ear vein of a rabbit caused a sudden rise in blood sugar with death in a few hrs., while the variants had no effect. It is believed that the fatal agent is a sol. exotoxin, which produces death by making the walls of the lung capillaries suddenly permeable to the noncellular elements of the blood. J. T. M.

Growth and longevity of *Rhizobia* on agar containing various energy sources. J. J. Reid and W. B. Searles. *J. Bact.* 30, 651(1935).—Sucrose was better than mannitol. John T. Myers.

Dissimilation of glycerol by intermediate bacteria of the colon-aerogenes group. Howard Reynolds and C. H. Werkman. *J. Bact.* 30, 652(1935).—The formation of pyruvic acid may be useful in differentiation. John T. Myers.

Dissimilation of glucose by the lactic acid bacteria. M. E. Nelson and C. H. Werkman. *J. Bact.* 31, 4(1936).—Typical heterofermentative lactic acid bacteria yielded CO_2 equiv. to the sum of HOAc and alc. Pyruvic acid was an intermediary in the fermentation of lactic acid. Levulose is reduced to mannitol, AcH to alc. and acetylmethylcarbinol to 2,3-butyleneglycol. Glycerol is probably formed by hydrogenation of a 3-C intermediary. John T. Myers.

Aerobic dissimilation of lactic acid by the propionic acid bacteria. H. G. Wood, Carl Lrb. and C. H. Werkman. *J. Bact.* 31, 5-6(1936).—*Propionibacterium arabinosum* in buffered phosphate media at 30° showed active utilization of O, lactic acid being converted to pyruvic, acetic, propionic and carbonic acids. The C of the lactic acid fermented was completely accounted for in the products. The oxidation-reduction balances were satisfactory, if it is assumed that O is hydrogenated to water. O may function as a H acceptor in the propionic dissimilation. This is added evidence of the intermediary behavior of pyruvic acid in propionic acid dissimilation. John T. Myers.

The similarities between the specificities of disinfectants against a filterable virus and Gram negative organisms. Earnest C. McCulloch. *J. Bact.* 31, 7(1936).—There was close parallelism among the relative efficiencies of phenol, liquor cresolis, HCHO , NaClO , NaOH and several dyes against the virus of fowl pox and against Gram-negative organisms grown in a medium containing fecal debris. John T. Myers.

The relationship of certain respiratory enzymes to the maximum growth temperature of bacteria. O. F. Edwards and L. F. Rettger. *J. Bact.* 31, 12-14(1936).—A thermostable peroxidase was found in each of 106 strains of the genus *Bacillus*. There was no evidence of H_2O_2 . John T. Myers.

Oxidation reduction potentials of certain anaerobic and facultative anaerobic bacteria. I. E. p_n relationship and a possible explanation for the phenomenon of double reversion of potential during the apparent logarithmic phase. II. Preliminary observations on the differentiation of lactobacilli of intestinal and buccal origin. R. W. H. Gillespie and L. F. Rettger. *J. Bact.* 31, 14-15(1936).—A buccal strain grown in unbuffered tomato juice was characterized by a marked activity with respect to growth and acid production and had a reversal of the drift before the final maximum reducing level was reached. Shortly thereafter the negative drift was resumed. This did not occur with two strains of *L. acidophilus*. In a buffered medium of low carbohydrate content, strains of oral and intestinal origin were differentiated by a wide margin of final reduction intensity which if substantiated should make their differentiation by means of the dye indicators practical. John T. Myers.

Metabolic activity and cell volume of *Salmonella galinarum* at various phases of the culture cycle. Evelyn Huntington. *J. Bact.* 31, 15-16(1936).—Rates of CO_2

production per unit vol. of bacterial protoplasm show an increase in the lag and early logarithmic phases over the initial and terminal rates as do the rates calcd. per cell. John T. Myers.

Oxygen consumption by bacterial cultures. C. P. Hegarty. *J. Bact.* 31, 18(1936).—There were considerable differences between the amts. of CO_2 produced by various streptococci and lactobacilli. John T. Myers.

Factors controlling pigment production by *Mycobacterium phlei*. Mary A. Ingraham. *J. Bact.* 31, 18-19(1936).—*M. phlei* may contain as many as 10 carotenoid pigments. A number of sugars, sugar alcs., acids, aldehydes, fats and miscellaneous compds. including phytol, beta-ionone and a vitamin A concentrate all failed to improve pigmentation. Ethylene, salts of Sc, Na, Li, Ca and Mg, the oxidation-reduction potential, light intensity, and temp. of incubation were without sp. effect on pigmentation. John T. Myers.

The fermentation of acetylmethylcarbinol by the *Escherichia-Aerobacter* group and its significance in the Voges-Proskauer reaction. Ralph P. Tittler. *J. Bact.* 31, 21(1936).—The frequent failure to obtain pos. Voges-Proskauer reactions in old cultures of some *Aerobacter aerogenes* and *Aerobacter oxytocum* strains is due to fermentation of the acetylmethylcarbinol. J. T. M.

The nature of the change from slow to rapid lactose utilization by a member of the colon intermediate group. C. K. Wadsworth and E. R. Hitchner. *J. Bact.* 31, 22-3(1936).—The acquisition by the slow lactose fermenters of the ability to use lactose rapidly is abrupt rather than gradual. John T. Myers.

Hydrogen sulfide production as a differential test in the colon group. Reese Vaughn and Max Levine. *J. Bact.* 31, 24(1936).—In the presence of cysteine all strains were positive. The concn. of peptone was not significant. Many more strains were positive in the absence of agar-agar; the cause of this is unknown. John T. Myers.

Reaction of *Escherichia*, *Aerobacter* and *Citrobacter* strains in boric acid and hexamine media. M. T. Bartram and L. A. Black. *J. Bact.* 31, 24-5(1936).—Hexamine did not exert sufficient inhibitive action to be useful. The results with boric acid media agree with those of Levine. John T. Myers.

The effect of sodium selenite on the growth of bacteria and its use as a basis for a new enrichment medium for the isolation of typhoid bacilli from feces, water, milk, etc. Einar Lefson. *J. Bact.* 31, 26-7(1936).—Most organisms except typhoid, cholera, proteus and *Pseudomonas aeruginosa* are inhibited. John T. Myers.

The protein-sparing action of carbohydrates in relation to anaerobic identification. Robb S. Spray and Alfred R. Stanley. *J. Bact.* 31, 27(1936).—Fermentable carbohydrates have a "protein-sparing" action, but individual peculiarities may obscure its action in sp. instances. John T. Myers.

The preparation and properties of silicic acid gels for the pure-culture isolation of bacteria. John H. Hanks and R. W. Wentraub. *J. Bact.* 31, 29-30(1936).—Most effective control of the p_n was secured with 4 times the usual concn. of NH_4 salt and by dialyzing against the salt soln. minus the NH_4 . John T. Myers.

Increase in toxicity due to the action upon the broth constituents by endo-enzymes of the *Salmonella* bacteria. Frances L. Kraft and C. N. Stark. *J. Bact.* 31, 42-3(1936).—Something in the nature of a heat-stable endo-enzyme complex is released by brief subjection to 100° , or by natural autolytic processes, and can act on the broth to produce a gradual increase in p_n and in toxicity. It probably consists of split products from the medium. John T. Myers.

The chemistry of diphtheria toxin. Monroe D. Eaton. *J. Bact.* 31, 64-5(1936).—The toxin appears to be a protein of more complex structure than the proteases in the medium on which it was formed, suggesting that it is synthesized by the bacillus. The immunological and physiol. properties of diphtheria toxin are due to a single substance. John T. Myers.

Further observations on pneumococcal hemolysis and

its inactivation Barnett Cohen and Harry Schwachman *J. Bact.* 31, 67-8(1936).—It may be possible to define a level of oxidation-reduction potential characteristic for pneumococcus (type II) hemolysin, a reversible oxidation system with the characteristics of an enzyme. The lytic activity seems to be assoc. with a thiol grouping.

John T. Myers
Studies on the production of toxin by *Clostridium histolyticum*. Sarah E. Stewart *J. Bact.* 31, 70-1(1936).—Glucose added to the culture broth increased the potency of the toxin by the production of a hemolysin, but the role of the glucose is unknown. The proteolytic enzyme was not increased, and is independent of the exotoxin showing no decrease in nontoxic formalinized toxins.

John T. Myers
Conditions affecting the production of toxin and "porphyrins" by the diphtheria bacillus. Mary W. Wheeler and M. O. L. Crowe *J. Bact.* 31, 73(1936).—Porphyrins were removed from diphtheria toxin without altering its toxicity by adsorption with charcoal but with no other adsorbent tried. They could not be eluted from the charcoal.

John T. Myers
The reducing action of diphtheria bacilli. Otfried Ehrismann *Zentr. Bakt. Parasitenk.* 1 Abt. 135, 56-60 (1935).—The reducibility of dyes depends on chem. constitution as well as soly. *C. diphtheriae* reduces telurites and nitrates. Cyanide does not interfere with these reactions.

John T. Myers
Should the term oxychlorophyll be retained? Ph. Lasseur. *Trar. lab. microbiol. faculté pharm. Nancy* 7, 21-9(1934).—A review on chlorophyll, the green pigment of *Pseudomonas chlororaphis*. Phenazine- α -carbonamide is perhaps a better name for the dehydrogenated form of the pigment than the term oxychlorophyll.

W. C. Tobie
The production of chlorophyll by *Pseudomonas chlororaphis*. Ph. Lasseur. *Trar. lab. microbiol. faculté pharm. Nancy* 7, 31-40(1934).—Washed suspensions of 40-hr. cultures of *Pseudomonas chlororaphis* produce additional crystals of the green pigment chlorophyll after 7 days, especially at pH 6.97 in a layer not over 15 mm deep.

W. C. Tobie
Autolysis of *B. caryocaneus*. Beijerinck-Duparc 1930. Ph. Lasseur and N. Gréjean. *Trar. lab. microbiol. faculté pharm. Nancy* 7, 41-3(1934).—Washed suspensions of *Bacillus caryocaneus* (20 billion per cc.) in dist. water were sealed in Pyrex glass containers and allowed to autolyze for 51 days at 37°. The cond. of the suspensions increased, while the pH fell from above 7.05 to 6.27.

W. C. Tobie
Media for the detn. of the coli-aerogenes group in water analysis (Ruehboft) 14

D—BOTANY

THOMAS G. PHILLIPS

The emission of additional roots by grape vines. L. Hédon. *Compt. rend. acad. agr. France* 21, 867-81 (1935).—The H-ion concn in the vicinity of the meristems plays an important role in the evolution of addnl. roots. The mineral compn. of roots as well as various sections of the stem is given; they show that CaO and K₂O remain in abundance in the roots of the vine (3 yr. old) and the lower twigs have a higher CaO and MgO content than the upper ones. Salts of Ca and Mg favor the development of roots while the salts of K, especially KCl, act especially on the lenticels. In certain combinations (carbonate, nitrate, chloride) and proportions, Ca salts can hinder the development of root hairs of certain plants in a liquid medium.

J. R. Adair
The magnesium content of grasses and legumes and the ratios between this element and the total calcium, phosphorus and nitrogen in these plants. Harlev A. Daniel *J. Am. Soc. Agron.* 27, 922-7(1935).—The av. Mg content of 19 species of mature grass was 0.16% and that of the 45 mature legumes 0.37%. The Mg content of legumes decreased as the plants matured. The Ca/Mg ratio

varied in the mature grasses and legumes from 1.10 to 5.46, the P/Mg ratios from 0.09 to 2.42, and the N/Mg ratios from 2.09 to 22.00. The av. of these ratios was slightly higher in the legume tops collected at different stages of growth than in the roots. Very little relation existed between the chem. compn. of the tops of the plants and that of the roots.

J. R. Adams
Characteristics of the amylase of cabbage. B. A. Rubin and V. E. Trupp. *Compt. rend. acad. sci. U. R. S. S.* [N. S.] 3, 229-32(1935).—Cabbage leaves are 50, 15 and 5 times richer in amylase (I) than beets, onions and carrots. This high activity is of special interest, since the starch content of this vegetable is inconsiderable and it is probable that this so-called amylase is an enzyme that is not characterized by a strictly sp. action or that it is a complex of sp. enzymes. The loss of cellulose in connection with an increased activity of I suggests that in cabbage I is accompanied by an enzyme, cyase (II) capable of hydrolyzing cellulose itself or some of the other carbohydrates forming the cell walls. Studies of the activity of amylase in parallel with that of II established the existence in cabbage of an enzyme capable of hydrolyzing hemicellulose to a reducing sugar. II is considerably less active than I but is comparable to sucrase. Its activity in the leaves and stalks varies and this is connected with the ability of the early variety, No. 1, to "awaken" early and with the general higher toxicity of this variety. Attempts to isolate II are in progress.

C. R. Addinall
Physiology of tanning materials in plant cells. Wilhelm Hauser. *Protoplasma* 24, 219-24(1935).—In order to investigate the mode of action of tanning materials in plasma, the conditions of the expts. must be so controlled that their pptg. action on protein-like substances is prevented. As the weak alk. reaction of plasma in the presence of salts must be considered, a method was chosen for neutralizing the tannin soln. by which its pptg. action on gelatin was prevented. Tannin in this form prevents the aggregation of the particles of a gelatin soln.

F. L. Dunlap
The influence of salts and hydrogen-ion concentration on plasmolysis and deplasmolysis. V. S. P. in *Protoplasma* 24, 296-318(1935).—The leaf epidermis of various plants was plasmolyzed by means of a sucrose soln. At the end of the expts., the concn. rose to 2 g. mol., that is to an osmotic pressure of 121 atm. If the cells were deplasmolyzed in a short time, they remained for the most part alive. If they remained more than 20 hrs. in the plasmolyzing soln., deplasmolysis was much more difficult and with many plants it was impossible. The aim of these expts. was to det. the conditions under which a protoplast could be plasmolyzed strongly and for a long period and yet remain alive. The reaction of the solvent played a very important role.

For the regulation of the H-ion concn., phosphate, citrate, acetate and bicarbonate were used as buffers in the form of their K salts. The plants could be divided into various groups according to their reaction to the soln. Some were rather indifferent to the H-ion concn. and could be deplasmolyzed to the end at a pH of 4.5-5.1. Others could not stand strongly acid solns. but could live in weakly acid, neutral or alk. solns. Others deplasmolyzed only in alk. solns. of a pH of 7.0 and higher. Finally there were plants for which a strongly alk. medium was harmful; these died at a pH of 7.4-8.0 and weak acid or neutral solns. were beneficial. Of greater significance is the presence of inorg. salts and perhaps other supplements. Natural spring water maintains the cells particularly well, while so-called nutrient solns., prep. with dist. H₂O, are considerably more harmful. It is better to obtain a detd. pH with KHCO₃ than with phosphates. Citrates and acetates give better results than phosphates. K salts in great amt. are harmful to many plants, while for others the K ion is not harmful but advantageous, and they deplasmolyze the better. For the majority of plants K ions are relatively harmless and are harmful only in large amts. Some plants react strongly to the Na ion and often a weak concn. such as 0.01 and 0.03 g. mol. will thwart deplasmolysis. Some kinds can stand 0.1-0.2 g. mol. NaCl without harm. Plasmolysis

and deplasmolysis must be carried out through a series of graduated concns. It is recommended that the strengths of the solns be calcd according to their osmotic pressures *in vitro*, rather than in terms of *g. mols*, for the osmotic pressure of the stronger solns increases more rapidly than the *g. mol* concn. This difference varies with different plasmolytic agents and depends on the size of the mols. The duration of the plasmolysis or deplasmolysis plays a very important role. When the exact conditions for plasmolysis and deplasmolysis have been detd, such as the p_H of the soln, chem. compn of the soln, time, difference in concn, etc., it is possible with almost all types of plants to obtain complete deplasmolysis without endangering the tissue in the least. F. L. Dunlap

Death of plant cells in pure and balanced salt solutions. V. S. Il'in *Protoplasma* 24, 409-30 (1935).—Complete death of all cell portions in pure K and Na salt solns does not begin at the highest concns but at some medium or even weaker one, frequently at 0.3 *g. mol*. The cells remain alive in weaker solns, such as 0.05 or 0.1 *g. mol*, and sometimes in stronger, as 1.0, 2.0 and even 5 *g. mol*. With weak and medium-strength solns death can ensue in 5-7 hrs, in stronger ones it can follow after 20 and even after 70 hrs. The described process of the death of all cell portions in Na and K salt solns, is almost typical for all plants. In H_2O or in some weak solns, the cytoplasm appears as a homogeneous mass with hardly noticeable granulation, the nucleus is also without structure. Under the influence of stronger concns, the granulation in the nucleus and cytoplasm increases, this results in coagulation with still stronger concns. The difference in the concns which kill the nucleus and the cytoplasm, and that which kills the tonoplast may be considerable. Death of the nucleus and cytoplasm takes place with great rapidity shortly after placing in the soln when it is concd. The tonoplast lives some days in the strongest solns, such as 5 *g. mol* NaCl. The permeability of the tonoplasts for salts is greater than the permeability of the whole cell. Resistant plants are distinguished by a coagulation of the nucleus and cytoplasm at higher concns which never extends to weaker ones, as is the case with less resistant types. A great difference is noticed among the plants in relation to their reaction toward Ca ions; in some all cell portions remain alive at 0.7, others only at 0.3 *g. mol*, while others die at 0.1 *g. mol*. Sixteen references. F. L. Dunlap

Effect of sulfur dioxide on wheat development. Action at low concentrations. Robert E. Swan and Arthur B. Johnson *Ind. Eng. Chem.* 28, 42-7 (1936).—Wheat plants were grown in nutrient solns in 2 cabinets under duplicate conditions of temp, light intensity, humidity and circulating air vol. They were in darkness for 8 hrs and under artificial illumination for 16 hrs daily. SO_2 in concns below those at which typical foliar markings are produced (0.14-0.46 p. p. m. was used) was added to the air several hrs daily. No visible injury was produced. Growth was not retarded. In plants carried through to maturity the yield of grain was slightly greater than that of the control plants. L. E. Gilson

Study of the bark of Aspidosperma quarandii Hassler. Luis Fiorani *Rev. centro estud. farm. bioquim.* 25, 373-94, 423-47 (1935).—A botanical description and proximate analysis are given. In addn to resins, tannins and other common extractives the bark contains a saponin, provisionally named *quarandii saponin*, and the following alkaloids: aspidospermine, aspidosamine, 2 new cryst. alkaloids, *haslerine* m. 237° and *quarandine* m. 218° and 4 other alkaloids not yet sepd. in pure form. Aspidospermicine is not present. The lethal dose of the mixt. of total alkaloids for rabbits is 2.3-3.4 mg/kg. when given intravenously and about 10 times as much when given subcutaneously. The mixt. produces muscular paralysis and kills by causing asphyxia. L. E. Gilson

The vital role of chemistry in determining essential materials in plants. W. A. Leukel *Citrus Ind.* 16, No. 11, 6-7 (1935).—A brief discussion of plants as sources of important chem. compds. K. D. Jacob

Further investigations on the bunchy-top disease of tomato. A. P. D. McClean *Union S. Africa Dept. Agr., Sci. Bull.* 139, 46 pp (1935).—In aq. ext. the bunchy-top virus was rapidly destroyed when exposed for 10 min to temps. above 70°. Some destruction of the virus occurred between 60° and 70°, but temps. below 60° had no appreciable effect. The virus was short lived in extd. juice and died out rapidly after 12 hrs. No appreciable loss of infective power occurred when the juice was exposed for 1 hr. to alc. in concns up to 30%. Higher concns of alc. appeared to cause some destruction of the virus. K. D. Jacob

Enzymes of grain. III. The relation between the action of the starch liquefying enzyme of rice and p_H . Gohri Yamaguchi *J. Agr. Chem. Soc. Japan* 11, 825-35 (1935).—The action of starch-liquefying enzyme was estd. by the viscosity. The optimum p_H varied with the conditions. The optimum p_H of the H_2O ext. of the unhulled rice was 5.2-5.4 and that of the unhulled rice, the rice bran and the embryo was 4.8. When polished rice was extd. with salt soln. such as 1 *M* NaCl, 1 *M* KCl and 0.1 *M* K_2SO_4 , the optimum p_H was 6.1-6.2. When polished rice was extd. with salt soln. such as 1 *M* NaCl, 1 *M* KCl and 0.1 *M* K_2SO_4 , the optimum p_H was 6.1-6.2. When the polished rice was extd. with 1% papayotin soln., the optimum p_H was 4.8. When the enzyme soln. was obtained from the aq. soln. and the salt ext. of the unhulled rice by dialysis, the optimum p_H values were 4.9 and 5.0, resp. It was not changed by the addn. of NaCl to this soln. Y. Kihara

Chemical constituents of kaohang. Sugao Hirao *J. Agr. Chem. Soc. Japan* 11, 921-4 (1935).—The kaohang was extd. with H_2O at 80-90°. Pb acetate was added to the ext. The ppt. obtained stood overnight. The supernatant liquor was sepd. and 10% NaOH was added. A yellow ppt. was obtained. The ppt. was suspended in H_2O and decomposed by H_2S . The filtrate was extd. with ether. Succinic acid and 2 kinds of white crystals, resp. m. 240-2° and 98-100°, were isolated from the ether ext. The ether-insol. part was further extd. with acetic ether. A yellow glucoside, m. 249-250°, was obtained. It was identified with quercitrin, quercetin monoglucoside. Y. Kihara

Unsataponifiable matter of algae fats. I. Sterol Kiyoshi Shirahama *J. Agr. Chem. Soc. Japan* 11, 980-4 (1935).—*Pelvetia wrightii* Yendo was extd. with ether. The ether-sol. portion was again extd. with petroleum ether b. 40-50°. The ext. was saponified with 10% alc. KOH soln. Colorless needles were obtained from the unsaponifiable matter. Crystals m. 125° were obtained after several recrystns. $[\alpha]_D^{20} = -39.0^\circ$ (0.2055 *g.* in 5 cc. of $CHCl_3$). It was designated as *peresterol*. The reaction for ergosterol was negative. It gave no color reaction with $SnCl_4$ in $CHCl_3$. The acetate, colorless hexagonal plates m. 118°, with $[\alpha]_D^{20} = -44.1^\circ$ (0.2497 *g.* in 5 cc. of $CHCl_3$); propionate, colorless plates m. 104°, benzoate, colorless rectangular plates m. 114°, and bromide, a white powder decomposing at 132°, were prepd. *Peresterol* was also isolated from *Fucus vesiculosus* Ag. and *Laminaria longissima* Miyabe. *Codium fragile* (Sutner) Hariot contains a sterol having sitosterol-like properties, m. 130°. Y. Kihara

Leaf starch: its isolation and some of its properties. H. A. Speer and Harold W. Milner. *J. Biol. Chem.* 111, 679-87 (1935).—Leaves collected after they had been exposed to bright light on a warm day were exposed to $CHCl_3$ vapors to prevent depletion of the starch. After drying in a stream of air at 50° for 2 to 24 hrs, the leaves were ground and passed through a 60 mesh sieve to sep. the stem and fibers and the material was then ground in a pebble mill for 3 hrs. Repeated extn. with $EtOH$ at room temp. for 5 to 15 hrs. and alternate extn. with $EtOH$ and petr. ether in the last 3 or 4 extns. removed chlorophyll and other sol. substances. Gums, pectic substances and salts were removed by repeated extn. with H_2O at room temp. until the wash H_2O was almost colorless. The starch was then extd. with hot H_2O by heating in a boiling

water bath for 1 hr and heating at 120° for an hr. The soln remaining after removal of the insol. residue was kept at -8° for 3-4 days and the starch pptd. out on thawing and was removed by centrifuging and filtration on silk. When thoroughly dried from 3 to 18% of the sepd. starch is insol. even after heating to 120° with H₂O but is hydrolyzable with 1% HCl. There is also always present a small and variable amt of insol. material other than starch (in some cases largely SiO₂ in part at least from the pebble mill). Detns. of specific rotation and prepn of osazones indicate that glucose is the chief product of the hydrolysis of the leaf starch. Max. reducing power is obtained only after 4-5 hrs. of hydrolysis as retrograded starch (pptd. by freezing and then thawing) is more slowly hydrolyzed than "standard" potato starch. A. P. L.

The plastid pigments of the marsh dodder, *G. MacLunney* *J. Biol. Chem.* 112, 421-4 (1935).—Two species of dodder, *Cuscuta subinclusa* and *salina*, were examd. Chlorophyll is present in low concn., except possibly in sharply localized regions. α -, β - and γ -Carotenes, lycopene and rubixanthine have also been isolated. Rigorous purification of the various components is difficult on account of the unusually high concn. of unsaponifiable colorless material. The marsh dodder (*salina*) is the richest source of γ -carotene known to M., readily available in Cal. A detailed study of *Cuscuta subinclusa* was impossible but there is apparently no major difference in the pigment complex of the 2 species. A. P. Lothrop

The chemistry of the lipides of yeast. III. Lecithin and cephalin. L. F. Salsbury and R. J. Anderson *J. Biol. Chem.* 112, 541-50 (1936), cf. *C. A.* 27, 5779.—Lecithin and cephalin from yeast phosphatides have been purified so that the lecithin was free from amino N and all of the N of the cephalin was in the NH₂ form. Both yield about 64% of fatty acids on hydrolysis and the component acids of both are very similar, consisting of 84-6% of liquid acids. These on catalytic reduction give a mixt. of palmitic and stearic acids. Palmitic and stearic acids are the sole components of the solid acids. Optically active glycerophosphoric acid and choline comprise the water-sol. portion of the hydrolysis products of the lecithin and optically inactive glycerophosphoric acid and aminoethyl alc. from the cephalin. A. P. Lothrop

The action of growth substance on parallelotopic plant organs. A. Th. Czaja *Ber. deut. botan. Ges.* 53, 478-90 (1935); cf. *C. A.* 30, 507¹.—Growth substance produces only an increase in cell size, any increase in cell no. resulting is secondary. Lawrence P. Miller

Nutrient-solution purification for removal of heavy metals in deficiency investigations with *Aspergillus niger*. Robert A. Steinberg. *J. Agr. Research* 51, 413-24 (1935), cf. *C. A.* 29, 2197¹.—Purification of nutrient soln. for the removal of heavy metals can be accomplished by treating the soln. with CaCO₃ and filtering while hot. The method gives good results with Fe, Zn, Cu and Mn under a wide variety of conditions and procedures. The removal of heavy metals appears to be dependent on their copptn. with an alk. earth as phosphate, carbonate or hydroxide by a decrease in acidity. The use of absorbent charcoal to supplement the action of an alk. earth purificant is unnecessary and causes a decrease in extn. precision. Extn. of the spores of *Aspergillus niger* with alk. solns. effects partial removal of Fe, Cu and Mn stored in the spores for subsequent growth, and so leads to an accentuation of deficiency effects with these metals. W. H. Ross

The synthesis of reserve carbohydrate by yeast. II. The effect of fluoride. Rachel A. McNally and Ida Smedley-MacLean. *Biochem. J.* 29, 2236-41 (1935); cf. *C. A.* 29, 8059¹.—The addn. of fluoride (0.0024-0.0071 M) to glucose or maltose solns. in which yeast was incubated caused a marked inhibition of the glycogen storage. The addn. of fluoride in 0.0024 M concn. caused an increase in glycogen storage when glucose-phosphate was used. Higher concns. caused a fall. When maltose-phosphate was used, the inhibiting action of fluoride was marked only at the higher concns. In 48-hr. fermentations, the addn. of phosphate increased the decompn. of

glucose, but had no effect on the maltose solns. The effect of fluoride on the sugar solns. could be counteracted by the addn. of phosphate. There appeared to be a definite correlation between the wet weight of the yeast and its total carbohydrate content. E. W. Scott

The influence of the anions of the nutrient salts on decomposition and diseases of the potato. Karl Böning *Angew. Botan.* 17, 323-35 (1935).—Potato plants which received K as chloride developed more severe symptoms of leaf roll and streak disease than did those which received K as nitrate or sulfate. J. T. Sullivan

Transformation of sugars in plants. M. Nurmia. *Ann. Acad. Sci. Fennicae* 44A, No. 8, 105 pp (1935); cf. *C. A.* 29, 2998¹, 3371¹.—*Triticum sativum*, *Avena sativa*, *Trifolium pratense* and *Vicia faba* were placed in the dark to reduce their sugar content, then cut and immersed for 24 hours in a sugar soln. in the dark. Leaves and stems

were then analyzed separately. When glucose (I) or fructose (II) was fed they were readily converted into one another in the plant, and the interconversion was accompanied by a synthesis of sucrose (III). III was synthesized from I, II, galactose and maltose but not from dihydroxyacetone, xylose or glycerol. Interconversion of I and II and synthesis of III took place more readily in the stem than in the leaves. When III was fed, part was hydrolyzed in the stems, and the remainder accumulated in high concn. in the leaves. Changes were not affected by toluene. Part of I disappeared, probably by respiration, especially when fresh plants were placed in darkness, but also in feeding expts. Addn. of KCN retarded this only slightly. In *V. faba* lactic acid content was low, changes were not proportional to changes in pH of cell sap, and increase was not affected by feeding with I or II, ascorbic acid was not increased by feeding with III. Invertase activity of expts. from *V. faba* and *T. pratense* was 15-20 times greater in case of stems than leaves. When midribs were removed from leaves, invertase activity of leaves was almost nil. Since the leaf is capable of synthesizing III, it is assumed that the chem. nature of leaf invertase is different from that of stems and petioles. Attempts to accomplish interconversion of I and II and synthesis of III *in vitro* by plant exts. were unsuccessful. The method of detg. II was to oxidize I with I₂ and NaOH, clear with Pb(OAc)₂ and det. the reducing power of the residual soln.

J. T. Sullivan

Chemistry of mold tissue. X. The phospholipides of *Aspergillus sydowii*. D. M. Woolley, F. M. Strong, W. H. Peterson and E. A. Prill *J. Am. Chem. Soc.* 57, 2589-91 (1935); cf. *C. A.* 28, 3105¹.—The Et₂O-sol. phospholipides of *Aspergillus sydowii* consist of a mixt. of lecithin and cephalin. From the mycelium 0.4-0.7% of the lipides was isolated. Glycerophosphoric acid, choline, choline and oleic acid were identified as the chief hydrolytic products. Stearic, palmitic and a more unsatd. acid were also probably present in small amts. C. J. West

Photochemical responses of the wheat plant to spectral region E. J. Lease and W. E. Tottingham *J. Am. Chem. Soc.* 57, 2613-16 (1935).—Elimination of wave lengths shorter than about 3900 or 5200 Å. from radiation resembling sunlight decreased the assimilation of nitrate and conserved carbohydrates in young wheat plants. The primary factors to which increased reducing power under shorter radiation could be attributed were increased tissue contents of chlorophylls and sulphydryl compds. Paths are indicated by way of which these factors could function as trigger mechanisms in the reduction of nitrate. Depression of pentosan formation was assoc. with increased assimilation of nitrate. Most of the compositional effects in the tissue could be attributed to variations in the proportion of blue-violet light but the reduction of nitrate to nitrite was more distinctly assoc. with long ultraviolet radiation. Apparently the high proportion in sunlight of radiation from 3900 to 4920 Å. and the low proportion above 8000 Å. in comparison with the light sources here tested favor the assimilation of nitrates by plants. Analyses are given of wheat tops from water and soil cultures and of press sap from plants 3 weeks old. Pigment contents are also given. C. J. West

E—NUTRITION

PHILIP B. HAWK

The effect of ingested fat on the sterol metabolism of the white rat. H. C. Eckstein and Carleton R. Treadwell. *J. Biol. Chem.* 112, 373-8 (1935).—The amts of sterol in the livers of growing white rats are greater when the percentage of corn or soybean oil in the diet is increased but these larger amts cannot be ascribed to sterol mobilization because the sterol contents of the remaining tissues of the rats on the high fat diets were as great if not greater than the amts found in the remaining tissues of their litter mates on low-fat rations. It is impossible to state whether the larger amts of sterols in the livers were due to ingested sterols, fats or both.

A. P. Lothrop

The extraction and stabilities of vitamin B (B₁) and of lactoflavin. Bertha Bisbey and H. C. Sherman. *J. Biol. Chem.* 112, 415-20 (1935).—Practically all of the vitamin B₁ in the form found in spray-dried skim milk is extd. by 80% alc. and practically none of it by abs. alc. The solvent effect of the alc. is not enhanced by acidulation with 1% glacial AcOH. Additive results are obtained with mixts of ext. and residue, indicating no vitiation of the feeding method by lack of any "new" or unknown factor. The extns. and dryings were done under an atm. of N₂. The vitamin G or flavin value was somewhat less conserved than that of vitamin B₁, probably because of the combined effects of the visible light which penetrated the glass containers in which the extns. were performed, the small amt. of residual O₂ and possibly a slight influence of the alc. present. The flavin value of milk powder is not measurably extd. by abs. alc. at room temp.; by 80% alc. (neutral or acidulated) it is less completely extd. than is the vitamin B₁ value, about equal amts. of the flavin appearing in the ext. and residue. Quant. feeding exps. with mixts of ext. and residue give no indication of any measurable sepn. of essential factors and indicate that measurements of vitamin G hitherto made by the Bourquim (C. A. 25, 5996) method are essentially measures of flavin values, whether of the natural food or of prepd. exts. and residues.

A. P. Lothrop

The utilization of d-mannoheptulose (d-mannoketose) by adult rabbits. Joseph H. Roe and C. S. Hudson. *J. Biol. Chem.* 112, 443-9 (1935).—Mannoheptulose in rabbits gives rise to a yeast-fermentable, C-reducing substance in the blood, the removal of which is stimulated by insulin. Since these properties correspond with those of glucose and fructose, the metabolic transformation of a 7-C sugar into one of lower C content seems a possibility. Rabbits have a high tolerance for this sugar. The identity of the metabolite is being investigated.

A. P. Lothrop

The production of a deficiency involving cystine and methionine by the administration of cholic acid. Abraham White. *J. Biol. Chem.* 112, 503-9 (1935).—Male rats were fed a diet contg. a limited amt. of the S-contg. amino acids (6% casein) to accentuate the effects of the administered cholic acid and a nutritional deficiency was produced by the addn. of cholic acid to this diet. The deficiency was relieved by the addn. of extra cystine or methionine to the diet, taurine was without effect. The results may be due to the demand of the organism for taurine for the synthesis of taurocholic acid but the neg. results with taurine and the complete inability of glycine to alleviate the deficiency through a synthesis of glycocholic acid suggest that there is a direct detoxication of cholic acid by a mechanism involving cystine or methionine or both with the formation of a product other than the bile acid. Cholic acid is somewhat toxic but the stimulation or cessation of growth was exactly coincident with the addn. or withdrawal of the extra cystine or methionine so that its effect on growth can only in part be related to the toxicity of cholic acid.

A. P. Lothrop

Phosphatase content of blood serum and tissues in the rat following administration of vitamins D and A. Paul D. Crenn and J. W. Strayer. *J. Biol. Chem.* 112, 511-15 (1935).—Approx. 20 times the amt. of phosphatase usually found in human serum is present in the serum of

rats of various ages (40-11 units per 100 cc.). A marked reduction in blood and kidney and a great increase in the small intestine occur in rats made toxic with viosterol. Findings on the effect of viosterol on bone phosphatase content were variable but there was no demonstrable effect on the small amts. present in the liver and spleen. Vitamin A-deficient rats and those fed high doses of vitamin A showed reductions of phosphatase in the serum, these were due apparently to the greatly impaired nutrition of the animals since the presence or absence of vitamin A had little or no effect on phosphatase. A. P. Lothrop

Vitamin A content of sour-cream butter, sweet-cream butter and margarine (Hathaway, Davis) 12. Physiologically active cryst. esters of vitamin A (Hamano) 10.

F—PHYSIOLOGY

HOMER W. SMITH

Influence of quinine on the realization of the morphogenetic effect of the thyroid hormone. R. I. Belkin and A. A. Votkevich. *Compt. rend. acad. sci. U. R. S. S. [N.S.]*, 3, 233-8 (1935).—To test the restricting effect of quinine (I) on the activity of the thyroid hormone (II) a group of young pigeons in the 1st molting phase and a 2nd group in an advanced stage of molt were treated with the di-HCl salt of I in daily oral doses of 50, 100 and 200 g., with 300 mg. of II and with combinations. The main feathers were counted daily for 13 days and at the end of the runs the thyroid glands were dissected out to permit an examn. of their histological picture and functional condition. The biol. activity of the glands was estd. by implantation of I-mg. portions in tadpoles. It was demonstrated that I and II decrease the functional activity of the thyroid gland and that their effect is synergistic. The increased protein metabolism resulting from molting is reduced by the administration of I and consequently the need of the organism for thyroid is lessened. Similarly the administration of II reduces the necessity for glandular action and a typical hypofunctional picture results. I reduces the oxidative effect of II and this has its influence as is shown by the restriction of the morphogenetic effect in molting as demonstrated by the results when I and II are administered together in contrast to those obtained by treatment with II alone.

C. R. Addall

Distribution of chlorine and urea in the blood and bile. Oscar Miseta. *Rev. med. quiv. patol. feminae* 5, 69-124 (1935).—The concn. of urea in the blood was found to be between 0.24 and 0.49 g. per l.; in the bile, between 0.19 and 0.44. Chlorides in the blood oscillated between 4.0 and 4.8 g. per l., in the bile, between 4.8 and 5.6.

E. S. G. Barron

Glukagon (the hyperglucemia-raising substance of the pancreas). M. Burger and W. Brandt. *Z. ges. exp. Med.* 95, 375-97 (1935).—Glukagon is in its chem. and phys. properties similar to insulin. It is a protein, contains C, H, N and S, and is isoelec. about where insulin is. It is sol. in H₂O, alc. and org. solvents. Its salts are sol. in H₂O, dil. alc. and dil. MeCO. It is nondialyzable. It is not inactivated by dil. NaOH or cysteine as insulin is. The most effective prepn. obtained raises the blood sugar of rabbits (about 2 kg.) by injection of 20 γ per kg. about 50% for a period of 40 to 60 min. Eleanor W. J. Butz

The influence of fat metabolism hormones of the anterior hypophysis on the acetone body secretions of rats under different experimental conditions. Chr. Sievert. *Z. ges. exp. Med.* 96, 429-41 (1935).—The injection of fat metabolism hormone in female rats held on a butter diet did not influence the daily AcMe excretion. The injection of anterior hypophysis ext. into hungry rats causes an increase in AcMe in the urine. Test animals (starved rats) were fed daily with a detd. amt. of NaCl to increase the urine output. The influence of the blood ketogenic substances after fat feeding on the AcMe excretion was then studied. The substance producing fat metabolism is the same as the hormone isolated from anterior hypophysis described by Anselmino and Hoffman (C. A. 26, 2229).

Eleanor W. J. Butz

Liver and nitrogen metabolism. F. Goebel. *Z. ges.*

exptl. Med. 96, 468-77 (1935).—N metabolism was studied in dogs with Eck fistula. The disturbance of the normal relation of the urea N and NH_3 to total N is a result of the disturbance of the urea synthesis. The acid base equil. was not disturbed. The amt. of Et_2O -sol. substance increased in the urine.

Fat metabolism in depancreatized dogs. A. I. Lewin *Z. ges. exptl. Med.* 96, 548-60 (1935).—Pancreatectomy in dogs produced a considerable increase in blood lipoids, a decrease in peripherally stored fat and infiltration of fat into some organs. Both blood cholesterol and lipid P increased. Administration of pancreatic juice did not alter the picture so the changes are to be attributed to insulin lack. Administration of insulin restored the fat metabolism to normal. Feeding of cholesterol in oil with simultaneous administration of pancreatic juice prolonged the life of the operated dogs to 110 days, decreasing the hyperglucemia and glucosuria, and preventing acetonuria.

The influence of cations of fluorescein salts on the absorption by the intestine. (Study with living frog and mouse intestine in ultraviolet light) Josef Pick and Fritz Zuckerkandl *Z. ges. exptl. Med.* 96, 747-51 (1935).—K, Mg and Na fluorescein were absorbed by the epithelium, first by the cytoplasm and later by the nucleus. The rates in decreasing order were K, Mg and Na. The Na salt remained concd in the epithelium, the Mg was detected in the blood and the K concd in the lymph channels.

The oxalic acid content of blood. Axel Thomsen *Z. physiol. Chem.* 237, 199-213 (1935).—The method of Merz and Maugeri (C. A. 26, 488) for detg. oxalic acid in blood and serum is unreliable because $\text{Ca}(\text{OH})_2$ ppt. other reducing substances which react with KMnO_4 and gives values far too high. The same objection applies to Izumi's CeCl_3 method (C. A. 28, 1372). The method recommended consists in satg. the serum with Na_2SO_4 or $(\text{NH}_4)_2\text{SO}_4$, acidify with H_2SO_4 , extg. with Et_2O and converting the Et_2O ext. into CaC_2O_4 . The oxalic acid content of beef serum is thus shown to be 1 mg. % at the most. After feeding a rabbit with spinach, which contains oxalic acid, the serum contained only 1.1 mg. %. Small quantities were found also in the liver and kidneys. Samples of beef blood which gave zero value by the Et_2O extn. method gave as high as 8 mg. % by the Merz and Maugeri method.

The p_H of muscle. W. O. Fenn and F. W. Maurer. *Protoplasma* 24, 337-45 (1935).—Frog muscle in the body is in equil. with plasma which contains 2.6 times as much bicarbonate. After the bicarbonate contained in the tissue spaces is allowed for, a p_H of 6.9 for the interior of the fibers is calcd. by the Henderson-Hasselbalch equation, while the outside of the fibers is bathed in a soln. of p_H 7.34. A micro-method is described for extg. from muscles minute quantities of extracellular fluid which is shown to be alk. in reaction (p_H 7.4). Fluid obtained from a site of injury is acid (p_H 6.27) and this acidity persists to a lesser degree (p_H 7.07) even after lactic acid production has been stopped by iodoacetic acid, which indicates intracellular acidity. When muscles are brought into equil. with Ringer soln. this wide difference in p_H between the inside and the outside of the fibers tends to disappear, but some small excess outside remains even after 5 hrs. except in the most acid solns. In alk. solns. the muscle tends to gain bicarbonate and this takes place to some extent even when the muscle is immersed after dissection in blood of the same frog. Histological examn. of muscles from which extracellular fluid had been drawn in capillary tubes presents evidence that the fluid is purely extracellular and not a mixt. of extra- and intracellular material. This evidence was obtained by studying the path of the capillary through the muscle by means of a hair which had been inserted in the tube before puncturing the muscle and which was allowed to remain in the muscle after withdrawal of the tube. Seventeen sections taken at random from a gastrocnemius muscle so treated showed no broken muscle cells. Thirty-five references.

Differential reduction of Janus green during develop-

ment of the chick. Olin Rulon. *Protoplasma* 24, 346-64 (1935).—Chick embryos, from the primitive streak stage to the 8th day of incubation, were stained with oxidized Janus green and placed under conditions of low O. The rate, intensity and regions of reduction of the dye were noted. The differentials in reduction of the dye correspond closely to the disintegration gradients of Hyman (*Biol. Bull.* 52, 1-38, 39-50) and Hinrichs (C. A. 22, 994). Nineteen references.

The validity of fractional gastric analysis. Frances A. Hellebrandt and Elizabeth Brogdon *Am. J. Digestive Diseases Nutrition* 2, 402-8 (1935).—Gastric fractional analyses were repeated from 8 to 21 times on 3 normal subjects after stimulation by oatmeal gruel, 7% alc. and by histamine. From the results of 105 expts it is concluded that the secretory response of the stomach is highly variable in the normal subject, irrespective of the quant. reproducibility of the stimulant used. Although fractional gastric analysis is of questionable value for quant. studies of gastric function, it remains the method of choice for detections of gastric acidity and for approximations of secretory capacity.

The pancreas and general metabolism. W. N. Boldyreff *Am. J. Digestive Diseases Nutrition* 2, 413-15 (1935).—Carbohydrate, fat and protein metabolism in the whole body as well as in each separate cell are effected with the aid of certain pancreatic enzymes which are being secreted in the pancreatic juice and are absorbed into the blood (and hence into the cells) during digestion and in fasting. There is evidence to support the view that the pancreas is the main agent of all general chem. processes in the organism.

The autoregulation of the gastric secretion. J. J. Day and D. R. Webster *Am. J. Digestive Diseases Nutrition* 2, 527-31 (1935).—Introduction into the duodenum of 0.25% HCl or of gastric juice dil. 2 to 4 times inhibits the gastric secretion stimulated (a) through the parasympathetic nervous system or (b) by the presence in the intestine of food substances or the products of their digestion. The theory is advanced that the passage of the acid chyme from the stomach into the duodenum causes the gastric secretion to diminish, this being an important factor in regulating the activity of the gastric glands.

Influence on carbohydrate metabolism of experimentally induced hepatic changes. IV. Block of the reticulo-endothelial system with special reference to the Kupffer cell. T. L. Althausen, B. E. Blomquist and E. F. Whedon. *Am. J. Digestive Diseases Nutrition* 2, 532-40 (1935), cf. C. A. 27, 2209.—Partial block of intravascular reticulo-endothelial cells causes lowering of the blood sugar, increased tolerance to dextrose, decreased mobilization of blood sugar by adrenaline and reduction in the glycogen content of the liver and muscles. The authors believe that one of the functions of the Kupffer cells is the transmission of precursors of glycogen from the blood stream to the liver, this transfer is interfered with by blocking, which results in decreased gluconeogenesis and consequent internal deficiency of carbohydrates.

The lysozyme content of tears. Wm. M. James. *Am. J. Ophthalmol.* 18, 1109-13 (1935).—Tears were collected with capillary pipets from 100 clinically normal persons and the bacteriolytic titer was detd. under standard conditions, with *Jf. lysodenthus* as the test organism. No relationship could be established between the titer variations and the age, sex or race of the subject.

Acid-base balance of the blood. IV. Characterization and interpretation of displacement of the acid-base balance. Nathan W. Shock and A. Baur Hastings. *J. Biol. Chem.* 112, 239-62 (1935), cf. C. A. 28, 3464. By use of methods and notation previously described (C. A. 28, 3434) the details of variations in the acid-base balance of the blood of normal individuals and the rate of elimination of fixed alkali and acid have been studied. Ingestion of NH_4Cl (I) caused displacement of the balance toward decreased p_H and (BHCO_3) , without much change in $p\text{CO}_2$. Max. displacement occurred 2-5 hrs. after giving 1 (10 g.). After this a period of decreasing $p\text{CO}_2$ and increasing p_H , followed. The return to normal, somewhat

slower than the time of max. displacement, showed increasing p_{H_2} , (BHC O_2) and pCO_2 . Ingestion of NaHCO $_3$ (20 g) caused an increase in pCO_2 after the max. p_{H_2} and (BHC O_2), were attained, which occurred in 1-1.5 hrs. Return to normal showed decreasing (BHC O_2), pCO_2 and p_{H_2} in 2 to 3 hrs. The line of displacement was linear and tended to remain parallel to the const. pCO_2 lines. Excess CO_2 as attained by re-breathing gave results similar to those obtained by CO_2 titration of normal blood. CO_2 deficiency attained by over-breathing followed the CO_2 titration curve during the early stages, but later a rather persistent increase in fixed acid of the blood occurred. Four major paths of displacement and recovery of the acid-base balance have been found experimentally, corresponding to those derived on theoretical grounds, which are sufficiently distinct to permit characterization of deviation from the normal condition. This permits pathol. conditions affecting the acid-base balance to be classified under *metabolic acidosis*, *metabolic alkalosis*, *respiratory acidosis* and *respiratory alkalosis*. R. C. E.

Growth and development with respect to domestic animals XXXVII Interrelations between protein intake, endogenous nitrogen excretion and biological value of protein. Ural S. Ashworth. Mo. Agr. Expt. Sta., *Research Bull.* No. 228, 3-14 (1935); cf. C. A. 29, 54971. By use of the paired rat technique on 20 pairs of rats, A. detd. that the nature of the protein fed affected but slightly the endogenous N excretion when short exptl. periods were used. However, when the reserve protein supply of the body was reduced to a low level by long periods on N-free diets an effect of the nature of the protein fed on endogenous N excretion did appear. The results suggest the use of a short exptl. period to avoid the effect of the nature of the protein fed on the endogenous N excretion, but short exptl. periods increase the variability of (1) the amt. of reserve protein present in the body, (2) the endogenous N excretion and (3) the biol. values of the protein. Thus, short exptl. periods cannot be used to det. small differences in biol. values of proteins. Before these small differences can be detd. with reliability, a method of securing more consistent values for the endogenous N excretion must be devised. C. R. Fellers

Further examinations on the chemical structure of the salts of the bones. Jozsef Marek, Oszkar Wellmann and László Urbányi. *Math. naturw. Ans. ungar. Akad. Wiss.* 52, 734-8 (1935). — See C. A. 29, 80823. S. S. de F.

Action of male hormone on the genital organs of young dogs. Maso Itho and Tsungiro Kon. *Compt. rend. soc. biol.* 120, 678-81 (1935). — Intramuscular injections of 50 units per day for 3-6 weeks caused a marked increase in the size and wt. of the prostate, seminal canal, epididymus, penis and seminal vesicles but not the testicles.

L. E. Gilson
Phosphatase of human serum during pregnancy. J. Cayla and F. Fabre. *Compt. rend. soc. biol.* 120, 748-50 (1935). — In 13 cases, 6-9 months pregnant, serum phosphatase was increased to 1.5-3 times the normal value.

L. E. Gilson
Absence of bacteria-inhibiting substances in human saliva. A. Roney and J. Fricker. *Compt. rend. soc. biol.* 120, 887-90 (1935).

L. E. Gilson
Adrenal cortex extract. Edward C. Kendall. *J. Am. Med. Assoc.* 105, 1486-9 (1935). — A review with 23 references.

F. P. Griffiths
Blood-sugar concentration and the external secretion of the pancreatic gland. B. P. Babkin. *J. Am. Med. Assoc.* 105, 1659-62 (1935). — The concn. of dextrose in the blood affects directly the concn. of enzymes in the pancreatic juice. Twenty-seven references.

F. P. Griffiths
Preliminary blood survey of Masai cattle in drought periods. M. H. French. Tanganyika Territory, *Ann. Rept. Dept. Vet. Sci.* 1934, 65-8. — Long intervals without water had no significant effect on the contents of Ca, K, Na and inorg. P in the blood of Masai stock. A large intake of water after a 3 days' thirst caused a slight decrease in the hemoglobin content of the blood but had no effect on the inorg. P.

K. D. Jacob
A new phosphorus fraction in blood and tissues. Tauno

1 Kalaja. *Suomen Kemistilehti* 8B, 41-2 (1935) (in English). — The blood of man, cow, rabbit and cat contains some P compd. which spontaneously undergoes a rapid hydrolysis in protein-free filtrates. In the blood the labile compd. is present in the red blood cells, since no liberation of inorg. P was observed in serum filtrates. The liver and muscles of rat and rabbit contain a similar P compd. At 37° the rate of hydrolysis is much higher than at room temp. The compd. undergoes hydrolysis both in acid and alk. soln. while it is fairly stable in neutral soln. Detn. of blood-inorg. P by the usual colorimetric method must be made immediately after filtering. E. E. J.

The influence of the ingestion of raw pancreas upon the blood lipides of completely depancreatized dogs maintained with insulin. I. L. Chalkoff and A. Kaplan. *J. Biol. Chem.* 112, 155-65 (1935); cf. C. A. 28, 68237; 29, 11479. — A fall in the lipide concn. of the blood occurs in completely depancreatized dogs maintained with insulin as early as 12 days after pancreaectomy. In 8 dogs cholesterol esters were reduced to between 0 and 3 mg % at intervals of 20 to 122 days following pancreatectomy while in 3 others 7 to 14 mg % were still found in whole blood as late as 96 to 202 days. When raw pancreas is added to the diet there is a rise instead of a fall in whole blood lipides and the rise is particularly striking in the cholesterol esters (in 1 animal from 5 to 129 mg % in 23 days). The total fatty acids rose from preoperative or normal levels of 324 to 352 to 412 to 633 mg % and cholesterol esters from 28 to 43 to 73 to 152 mg %. The removal of the raw pancreas from the diet after the high lipide levels had been produced resulted in a rapid and pronounced drop in blood lipides, all participating in the fall as they had in the rise. The high values are found only so long as raw pancreas is being ingested.

A. P. Lothrop
Some reactions of ammonolyzed parathyroid hormone. Richard G. Roberts, Wilbur R. Tweedy and Geo. H. Smullen. *J. Biol. Chem.* 112, 209-14 (1935). — Parathyroid hormone has no prosthetic group with or without Fe that has a catalytic effect, such as shown by hematin, for the action of Na on liquid NH $_3$. It reacts as a typical protein with Na in liquid NH $_3$. The activity is lessened by the action of liquid NH $_3$ alone and is not dependent on disulfide linkages or any other linkages that are strongly reduced by Na in liquid NH $_3$. Its activity appears to be a function of a part of the acidic H liberated and varies inversely with the liberation of this H which most probably comes from imide groups as indicated by its slow evolution.

A. P. Lothrop
Chemical studies on the pituitary gonadotropic hormone. L. C. Maxwell and Fritz Bischoff. *J. Biol. Chem.* 112, 215-21 (1935). — Amino, imino or OH groups or their S analogs may be concerned with the physiol. activity of pituitary gonadotropic preps since reagents known to react with these groups cause a partial to a complete inactivation of the hormone. Its activity is completely destroyed by strong oxidizing agents but is unaffected by mild oxidizing agents or by reducing agents. Complete inactivation occurs in 0.1 N NaOH and partial inactivation in N/30 NaOH in 3 hrs at 37°. Partial inactivation occurs in 0.1 N HCl in 3 hrs. Denaturation of the protein aggregate may produce the same physiol. effect as slowed tissue resorption of the original product, evidence against the dual hormone theory of gonadotropic preps.

A. P. Lothrop
The phosphorus metabolism of invertebrate nerve. Geo. L. Engel and R. W. Gerard. *J. Biol. Chem.* 112, 379-92 (1935). — Expts. were conducted on lobster claw nerves and ganglia and crab nerves. "During rest in O $_2$ the phosphoarginine decomposed during dissection (and attendant stimulation and injury) is rebuilt, apparently by direct reaction with adenylypyrophosphate which decomposes. This, in turn, is subsequently resynthesized, the lactic acid intermediates probably serving in part as phosphate donors. During anoxia there is an extensive hydrolysis of both phosphoarginine (up to 100%) and adenylypyrophosphate with an attendant rise in the inorg. fraction. Subsequent exposure to O $_2$ results in full resynthesis of arginine phosphate in 5 hrs; and of 1/2 of the adenyly-

pyrophosphate within an hr. with no further change. Both substances are probably decreased by stimulation. The stable fraction (hexosephosphate, etc.) regularly shows a loss of bound P after several hrs., greater during or following the absence of O_2 . There is no evidence that the P of any acid-insol compounds (phosphoproteins, phospholipids, nucleoproteins, etc.) is involved in the aerobic metabolism of these nerves." A. P. Lothrop

The question of the utilization of tryptophan administered subcutaneously. Vincent du Vigneaud, Robert R. Sealock and Cecil Van Eppen. *J. Biol. Chem.* 112, 451-6 (1936); cf. *C. A.* 27, 530.—Tryptophan injected subcutaneously is definitely utilized. From these findings there is apparently no explicit evidence to support the theories of protein metabolism promulgated by Acock (*C. A.* 29, 1859⁴), based on the nonutilization of injected tryptophan. A. P. Lothrop

Study of the serum lipides by a microgravimetric technique. Wm. R. Wilson and Arild L. Hansen. *J. Biol. Chem.* 112, 457-68 (1936).—A method is described for the sepn. of the saponifiable and unsaponifiable fractions of the blood lipides which is an adaptation of an early method of Bloor (*C. A.* 10, 1664). The quant. microgravimetric technique is similar to that used by Wilson and Hanner (*C. A.* 28, 6798⁷) for the total lipides. Analyses of 17 normal serum gave the following av. values per 100 cc. total lipides: 657 mg.; unsaponifiable fraction 260 mg. with an I no. of 63.4; saponifiable fraction 362 mg. with an av. mol. wt. of 291 and an I no. of 108 equis. to 1.23 double bonds per mol., figures suggesting that while 18 C unsat. acids predominate in human blood, there are appreciable quantities of longer-chain unsat. acids. The lipid P of the saponifiable fraction averaged about 81% of the total lipid P, indicating 2 types of phospholipide in the blood, one of them saponifiable and the other not. A. P. L.

The effect of changes in the concentration of plasma electrolytes on the concentration of electrolytes in the red blood cells of dogs, monkeys and rabbits. Herman Yarnet, Daniel C. Darrow and M. Katherine Cary. *J. Biol. Chem.* 112, 477-88 (1936).—In a series of 30 expts (15 on dogs, 8 on monkeys and 7 on rabbits) changes in the concn. of plasma electrolytes were produced by intraperitoneal injection of 8% glucose soln. or 1.8% NaCl soln. There is a high degree of correlation between the univalent cations of the red cells and plasma and a given change in concn. of these cations in serum is accompanied by an equiv. change in the cations of the red cells, results fitting the generally accepted concepts of osmotic equil. in body fluids. Shift of H_2O across the red cell membrane constitutes the chief, if not the only, mechanism of adjusting osmotic equil. in monkeys and rabbits but in the dog there is in addn. passage of NaCl across the membrane. Erythrocytes contg. Na as the preponderant base are permeable to Na but a similar permeability of red cells contg. K has not been demonstrated. A. P. Lothrop

The adenine nucleotide content of human blood. Mary V. Buell. *J. Biol. Chem.* 112, 523-30 (1936); cf. *C. A.* 29, 1473⁴.—There is in human blood a significant correlation between the adenine nucleotide and hemoglobin contents of the erythrocytes. If this correlation indicates a primary assoc. between nucleotide and hemoglobin, the observed correlation between nucleotide and both hematocrit and erythrocyte count follows logically. It cannot be concluded from the observations, however, whether both compounds are regulated by the same unknown factors or whether the occurrence of one fundamentally affects the other." A. P. Lothrop

The blood cholesterol in the carotid artery, venae cavae and portal vein. Frederick H. Shillito, Emul H. Bidwell and Kenneth B. Turner. *J. Biol. Chem.* 112, 351-6 (1936).—The cholesterol content of blood in the carotid artery, superior and inferior venae cavae and portal vein is the same for a given animal (cats and dogs) irrespective of whether whole blood or serum is used and whether or not cholesterol was administered before operation. No variation in the distribution of cholesterol is produced by administration of large doses of KI (1 g. daily) for 2-14 days. Passage through the lungs has no demonstrable

effect upon the blood cholesterol although the claim has been made that such is the case. Twenty-four references. A. P. Lothrop

Lipide composition and physiological activity in the ovaries of pregnant guinea pigs. Ildon M. Boyd. *J. Biol. Chem.* 112, 591-5 (1936), cf. *C. A.* 29, 4064³.—The phospholipide content of the ovaries of nonpregnant control guinea pigs at the proestrus stage averaged 1250 mg. % and there was no significant variation during pregnancy. At proestrus the ovary contained a mean of approx. 300 mg. % of free cholesterol which again did not significantly vary during pregnancy. These results were correlated with the fact that guinea pigs may be castrated in the litter half or 1/4 of pregnancy without abortion ensuing which indicates that no increase in physical activity occurs in the ovaries of gravid guinea pigs. A. P. L.

Respiratory metabolism in infancy and childhood. XVI. Effect of intravenous infusions of fat on the energy exchange of infants. Harry Gordon and S. Z. Levine. *Am. J. Diseases Children* 50, 894-912 (1935), cf. *C. A.* 29, 8071⁴.—Parenterally administered fats can apparently be oxidized by normal infants when the control level of the R. Q. is 0.9-1.0. Intravenous infusions of emulsified human fat, olive oil or a com. prepn. of fat, Yanol, depressed the R. Q. by 0.03-0.07. An increase in heat production due entirely to increased oxidation of fat was observed. When the control level of the R. Q. was 0.8, the combustion of fat was not increased even if the emulsified fat was given by mouth. Parenterally administered fat had no effect on the R. Q. in the myxomatous infant. An increase in heat production was observed, but could be only partially accounted for by the oxidation of fat. F. R. Main

The influence of dextrose ingestion on amino acid nitrogen, urea nitrogen and hemoglobin concentration of the blood. E. G. Schmidt and J. S. Eastland. *J. Lab. Clin. Med.* 21, 1-12 (1935).—During the course of dextrose tolerance tests, the av. max. decrease in amino acid N was 12.91% in normal persons, 10.22% in arthritis and rheumatoid conditions, 14.68% in infections and 11.51% in diabetes mellitus. The av. max. decrease in urea N was 13.55% in normal cases, 14.78% in arthritis, 15.02% in infections and 11.00% in diabetes. The degree of hyperglycemia attained during the test did not appear to be correlated with the decrease in amino acid and urea N or with the changes in blood vol. as detd. by the relative concns. of hemoglobin. E. R. M.

The morphologic sugar metabolism in the human leucocyte culture. Günter Wallbach. *J. Lab. Clin. Med.* 21, 163-8 (1935).—Normal human leucocytes cultivated in human plasma showed glycogen deposits in the first 2 days of growth but none was found after the 3rd day. After the addn. of glycogen or glycerol to the culture medium a marked increase in glycogen deposition was observed. Little or no glycogen was synthesized after the addn. of glucose, fructose, galactose, dextrin, maltose, starch or 1.0H. After the addn. of insulin or tophenin, a transient storage was observed on the 2nd day. The addn. of insulin and glucose or Hefpene (a lecithin emulsion) and glucose caused a pronounced increase in glycogen storage. Thyroxine and adrenaline did not increase glycogen storage. E. R. M.

The influence of sucrose ingestion on amino acid nitrogen and urea nitrogen concentration of the blood. E. G. Schmidt and J. S. Eastland. *J. Lab. Clin. Med.* 21, 233-5 (1935).—The ingestion of sucrose caused a somewhat smaller reduction in amino acid and urea N than the ingestion of glucose. The av. max. decrease in amino acid N was 8.07% and that of urea N, 8.74%. E. R. M.

Preliminary attempts and results obtained with cultures of the female genital apparatus in vitro with folliculin. Francesco Guerriero and Romano Arnone. *Boll. Soc. Ital. Biol. Sper.* 10, 622-4 (1935).—The prolonged treatment of female rabbits with folliculin (1000 U per day) produced in certain animals changes in the hormones which influenced the genital app. in such a manner that pieces of this tissue, especially epithelial tissue, when cultivated in vitro developed more vigorously. Peter Masucci

The isolated ameboid cells in cultures of adult rabbit uterine tissue in vitro treated with gonadotropic hormone and with folliculin Francesco Guercio *Boll. soc. ital. biol. sper.* 10, 624-6(1935).—After prolonged treatment with prolactin numerous, large, actively ameboid, isolated cells were observed on cultivating adult rabbit uterine mucosa. The cells seemed to be not epithelial but histogenic.

Suprarenal capsules and gaseous metabolism. I. Michele Gagliardi *Boll. soc. ital. biol. sper.* 10, 628-31 (1935).—The suprarenal capsules of albino rats were extirpated. The gaseous metabolism of those animals which died soon after the operation decreased, that of the animals which survived 36 hrs or longer increased. II. The influence of pilocarpine on the gaseous metabolism of rats whose suprarenal capsules had been extirpated. *Ibid.* 631-33.—The injection of pilocarpine produced no increase in the O consumption of albino rats whose suprarenal capsules had been extirpated. Peter Masucci.

Preliminary observations on the variations of the ascorbic acid titer in the puerperal state. I. Technical considerations and plan of attack. Francesco Guercio, Giuseppe Piccinelli and H. Hamburger *Boll. soc. ital. biol. sper.* 10, 640-3(1935).—Data were made on pregnant women in various periods of gestation and in labor, healthy subjects kept on the same diet were used as controls. A gradual increase in the ascorbic acid titer of the serum was noted, reaching figures which were markedly higher than the initial and the normal controls at the end of gestation. There were no significant variations in the titer during labor. Peter Masucci.

The calcium content of human milk as influenced by administration of calcium, irradiated ergosterol and parathyroid hormone. L. Rossi *Clinica pediatrica*, 16, No 10 (1934), *Rev. sudamericana endocrinol. inmunol. ginecoterap.* 18, 812.—Ca feeding has no influence on the Ca content of the milk. Irradiated ergosterol causes a slight, parathormone a considerable, increase. A. E. Meyer.

Further studies on the thymus and pineal glands. L. G. Rowntree, J. H. Clark, A. Stenberg, A. M. Hanson, N. H. Emborn and W. A. Shannon *Ann. Internal Med.*, 9, 359-75(1935), cf. C. A. 29, 7427.—Thymus ext. accelerated the rate of growth and development and hastened the onset of adolescence in the offspring of treated rats. Thymusectomy of parent rats retarded the growth of young. Pineal ext. retarded the rate of growth and accelerated the onset of adolescence. John T. Myers.

The assay of fat-soluble androsteroneol Vladimir Korenchewsky and Marjorie Dennison. *Biochem. J.* 29, 2122-30(1935), cf. C. A. 29, 7437.—Pure androsteroneol (I) prep. by Ruzicka was assayed by K. and D's method on rats. I in amts of about 21 γ and 19 γ gave one rat unit of "comb-growth activity" and of "whole male sexual activity," resp. Thus, I measured on capons had 3 times the activity of androsterone (II), on rats 8 times the activity of the II. Compared to II, I stimulated the growth of the seminal vesicles more than that of the prostate and had a greater effect on the penis and the preputial glands. E. W. Scott.

The effects of water-soluble preparations of androsterone and androsteroneol on castrated rats. Vladimir Korenchewsky, Marjorie Dennison and Samuel Levy Simpson. *Biochem. J.* 29, 2131-42(1935).—The Li salts of androsterone- and androsteroneol-mono succinic acid esters (I and II, resp.) were assayed on rats and the results compared to those obtained with androsterone (III) and androsteroneol (IV) in olive oil. The chief effects of I and III, and of II and IV were the same. The rat unit of "comb growth activity" was contained in about 1600 γ of I and 67 γ of II. The ratio of the rat unit of III to that of I was 1.9, and of IV to III was 1.3. While on capons II showed twice the activity of I, on rats II was 25 times as active as I. E. W. Scott.

Fat metabolism. I. The oxidation of butyric, crotonic and β -hydroxybutyric acids in the presence of guinea pig liver slices. Maurice Jowett and Juda Hirsch Quastel. *Biochem. J.* 29, 2143-58(1935).—The rates of oxidation of butyric (I), crotonic (II) and β -hydroxybutyric (III)

acids to acetoacetic acid (IV) were studied. The rate of formation of IV ($Q_{0.5}$) was a function of substrate concn with I and II but passed through a max. value with III. The $Q_{0.5}$ from I and II varied with the K- and Ca-ion concns of the medium passing through a max. The optimum pH value was close to the physiol. value for I and III, but was higher (7.7-9) for II. The $Q_{0.5}$ decreased in the order I, II and III. There was definite correlation between the increase in respiration and the increase in $Q_{0.5}$ caused by these acids. Mixts. of I and II showed competition for oxidation, but mixts. of I or II with III gave partial additivity. $BzOH$, $PhCH$, $CHClO_2H$ and $PhCH_2CH_2CO_2H$ strongly inhibited the oxidation of I and II to IV, but the oxidation of III was inhibited to a much smaller extent. The evidence produced supported the theory that I and II were directly oxidized to IV by the same enzyme and that III was the reversibly reduced form of IV and not an intermediary in the oxidation of I and II. II. The oxidation of normal saturated fatty acids in the presence of liver slices. *Ibid.* 2159-80.—The formation of III and IV by the oxidation of normal said acids of 2-10 C atoms in the presence of rat and guinea-pig liver slices was investigated. IV was the only β -keto acid produced in significant amts. Acids of 4, 6 and 8 C atoms produced IV most rapidly, decanoic acid slightly less rapidly and $AcOH$ only slowly. Acids of 5, 7 and 9 C atoms produced

IV at small but significant rates with guinea-pig liver. Propionic acid produced no IV. The greater increase in the liver respiration caused by the odd-numbered acids suggested that they were more completely burned to CO_2 and H_2O than the even-numbered acids. With guinea-pig liver, hexanoic and octanoic acids produced about 1 mol of ketone bodies, decanoic acid less than 1 mol, and butyric acid much less. With all fatty acids higher than valeric, oxidation resulted in the formation of fixed acid, more with the even-numbered than with the odd numbered acids, which was not III or IV. The oxidation of propionic and valeric acids caused a decrease of this fixed acid. $BzONa$ inhibited the ketone body formation from I, but its effect lessened as the no. of C atoms in the substrate was increased. J. and Q. point out that the theory of successive β -oxidation of fatty acids does not adequately explain the facts. A theory of "multiple alternate oxidation" was suggested in which the fatty acids are supposed to be oxidized at alternate C atoms along the whole chain before the breakdown to acetoacetic and other acids takes place. III. The formation and breakdown of acetoacetic acid in animal tissues. *Ibid.* 2181-91.—Kidney, spleen and testis produced IV in small amts from fatty acids, but the brain produced none. All these tissues produced IV from III. In the absence of K and Ca ions, the kidney produced IV most rapidly. These tissues and liver destroyed IV in the presence of O. IV was also removed anaerobically by kidney. Na malonate inhibited the oxidation by the liver of $AcOH$, propionic and I and the breakdown of IV. Atorol, in esterase inhibiting concn, inhibited the spontaneous formation of IV by the liver. This fact led to the tentative conclusion that the formation of IV is due to the oxidation of fatty acids liberated by hydrolysis from fats in the tissue. E. W. Scott.

Uric acid synthesis in pigeons. I. Reginald B. Fisher. *Biochem. J.* 29, 2192-7(1935).—About 24 hrs elapsed between the ingestion of food N by blue-bar pigeons and the corresponding uric acid excretion. The amt of N ingested showed a linear relation to the uric acid excretion. Observations on birds fed with mixed corn and on whole wheat led to the conclusion that 42-50% of the ingested N was excreted as uric acid and in addn. a constant amt of 25-40 mg of uric acid was excreted per diem. II. *Ibid.* 2198-2207.—Daily doses of 50-100 mg of Na d -lactate and l-lactate were given homer pigeons. By a statistical analysis of the data obtained on the uric acid excretion, I showed that Na l-(+)-lactate caused a significant increase in uric acid excretion while Na d-(-)-lactate had no effect. Similar treatment of Wiener's data [*Bertr. chem. Physiol. Path.* 2, 42(1902)] showed that the increased uric acid excretions observed by W. when hens were fed lactate, malonate or tartaric acid were not significant. E. W. S.

The oxytocic hormone of the posterior lobe of the pituitary gland VII. A.—Ultraviolet absorption spectra. John M. Gulland and Nathaniel S. Lucas. *Biochem J.* 29, 2209-11(1935), cf. *C. A.* 29, 4814.—The ultraviolet absorption spectra of posterior lobe exts. and of purified hormones solns corresponded to those of proteoses and peptones and were not characteristic of the hormone itself B and C—Adsorption and electroanalysis. Mavis Freeman, John M. Gulland and Sydney B. Randall. *Ibid.* 2211-20.—The purer hormone solns available could not be purified further by adsorption on silica gel, Al hydroxide, C, fuller's earth, acid-treated talc, ignited talc, asbestos or purified norite. A new technique was described for purifying whole aq. exts. of the posterior lobe by adsorption on fuller's earth and norite. The hormone was inactivated by Ac_2O . At pH greater than 8, the hormone remained in the center portion of the electroanalysis cell, at pH 6 or less it migrated to the cathode. Removal of the proteose material decreased the stability of the hormone to alkalis. The oxytocic and pressor hormones were not sepd at pH 10-11 by electroanalysis. E. W. Scott.

Glucoicid metabolism in pregnancy. Bernat J. Moragues. *Dia med.* 6, 497(1934), *Anal. asoc. quim. Argentina* 23, 23B(1935).—In pregnancy, there are factors capable of altering normal glucoicid regulation, distinct from those observed out of gestation. Marked hypoglucoemia is due to latent or apparent hepatic insufficiency.

E. M. Symmes
Phosphorus content of the blood. G. C. Heringa and J. Hoekstra. *Acta Brevis Neerland. Physiol., Pharmacol., Microbiol.* 5, 117(1935).—Lipoid P increases slightly after compression of the blood vessels, while the total P remains the same. The fluctuations in the percentage of lipid P are greater and occur more quickly in ovalated blood collected from compressed blood vessels than from those not compressed. E. D. Walter.

Xylose clearance as a test of renal function in children. K. de Leeuw. *Acta Brevis Neerland. Physiol., Pharmacol., Microbiol.* 5, 129-31(1935), cf. *C. A.* 26, 5141; 27, 2467. E. D. Walter.

The specific nature of the inhibition of the coagulating effect exerted by tissue extract on plasma resulting from incubation of tissue extract with blood serum. C. Moore, V. Sunitzoff and Leo Loeb. *Am. J. Physiol.* 114, 1-18(1935), cf. *C. A.* 16, 1800.—The effects of tissue exts. and blood serum of dogs and birds on the coagulation of dog heparin plasma and of bird plasma were tested. A sp. adaptation exists between the tissue exts. and the plasma. The effects exerted on coagulation depend on whether the 2 substances when combined are derived from homologous or heterologous species or classes of animals. With blood serums a corresponding sp. adaptation cannot be demonstrated. E. D. Walter.

The inhibiting action of cattle and sheep serum on kidney extracts of cattle and sheep. Eric W. Thurston, J. E. Smadel and Leo Loeb. *Am. J. Physiol.* 114, 19-24(1935), cf. preceding abstr.—In mixts. of sheep or cattle serum and ext., which under ordinary conditions produce a rapid coagulation of heparin dog plasma, even after long-continued incubation, the typical curve of inhibition can be obtained through addn. of either heparin or a Ca-inactivating substance. The curve indicating increased inhibition of coagulation of plasma, with increased incubation of the mixt. of serum and ext., is presumably due to the inactivation of tissue coagulin by a substance in the serum, and to the destruction of thrombin, which progresses with increasing time of incubation. E. D. W.

The secretory metabolism of the salivary glands. David Northrup. *Am. J. Physiol.* 114, 46-52(1935), cf. Bergonzi, *C. A.* 26, 1023.—Simultaneous stimulation of sympathetic and parasympathetic nerves to the submaxillary gland of the dog causes an av. decrease in glycogen of 41.4%, an av. increase in lactic acid of 128%, and an av. decrease in creatine phosphate P of 63.4%. Exhaustive stimulation of only the parasympathetic nerves to the gland causes an av. decrease in glycogen of 16.1%, and an av. increase in lactic acid of 16.1%. Exhaustive stimulation of the sympathetic nerves to the gland causes an av.

1 decrease in glycogen of 26.3%, and an av. increase in lactic acid of 65%. The lesser changes during parasympathetic than sympathetic stimulation may be due to vasodilatation during the former, and a consequent increase in the rate at which recovery processes involving oxidation can occur. It is suggested that the creatine phosphate-glycogen mechanism may be a rather general one for the release of energy in various tissues where work is done. E. D. W.

2 The chemical transmission of vagal effects to the small intestine. Henry Bunting, Walter J. Meek and C. A. Maaske. *Am. J. Physiol.* 114, 100-6(1935), cf. *C. A.* 28, 4471.—By the use of an intestinal loop in an intact animal as an indicator, the production of an acetylcholine-like substance was shown to arise in the splanchnic area during vagal stimulation. Both the frog heart and the eviscerated leech responded to tests on the perfusate from the small intestine in a manner typical for acetylcholine. The action of the material was almost entirely abolished by atropine and it disappeared on standing. E. D. W.

3 "Hunger diabetes" and the utilization of glucose in the fasting dog. Samuel Soskin and I. A. Mirsky. *Am. J. Physiol.* 114, 106-9(1935), cf. *C. A.* 29, 5171.—As judged by the utilization of sugar after evisceration, there is no suppression of carbohydrate oxidation in the normal fasting as compared to the normal fed animal. The low R. Q. of fasting as well as the other manifestations of "hunger diabetes" is not due to a lack of carbohydrate utilization, but probably result from an increased gluconeogenesis. The need for a reinterpretation of the R. Q. is emphasized. E. D. Walter.

Influence of hypophysectomy on gluconeogenesis in the normal and depancreatized dog. Samuel Soskin, I. A. Mirsky, Leo M. Zimmerman and Nathan Crohn. *Am. J. Physiol.* 114, 110-19(1935), cf. preceding abstr.—The hypophysectomized animal differs from the normal in that the latter derives sugar from both protein and fat, while the former is unable to convert the fat and, when its carbohydrate stores are depleted and exogenous carbohydrate is not available, derives its blood sugar from protein alone. E. D. Walter.

Synthesis in the sex-hormone group A. Cohen. *Nature* 136, 869-70(1935), cf. *C. A.* 29, 4371, 4372.—A description of the synthesis and structure of compds. of maleic anhydride and vinylnaphthalenes. These compds. are being extended and will be described in detail elsewhere. These compds. may be of use in the synthesis of sex hormones of the equilenin and estrin type. E. D. Walter.

Isolation and identification of a paraffin hydrocarbon from urine of pregnancy. Wm. Foris Hart and M. Allen Northrup. *J. Am. Chem. Soc.* 57, 2726-7(1935).—Details are given of the isolation of 1.4 g. of hydrocarbons from 12 l. acidified urine (of pregnancy) by adsorption on fuller's earth, sepd by MeOH into heptacosane and probably pentacosane. If these hydrocarbons occur in non-pregnant female urine and male urine they must do so in an amt. far less than in urine of pregnancy. C. J. W.

The fluorine content of bone and teeth. Robert Klement. *Ber.* 68B, 2012-19(1935), cf. *C. A.* 27, 2090.—Land-living sucking animals and human beings have a F content of bone and teeth of 0.03%. There is no difference between F content of dentine and enamel. Sea-living sucking animals have a F content of the bone of 0.55%. Bones of land birds have 0.11% F, sea birds, 0.32%, fresh-water fish, 0.03%, ocean fish, 0.43%. F replaces some of the H_2O groups in hydroxyapatite to give a mixt. of crystals. Julius White.

Formation of xanthurenic acid. Experiments on man. Francesco M. Chiancone. *Boll. soc. ital. biol. sper.* 10, 578-80(1935).—Specimens of urine taken every 3 hrs. for 24 hrs. after the administration per os of 3 g. tryptophan gave no evidence of its transformation into xanthurenic acid. Helen Lee Gruehl.

Several chemical growth substances which cause initiation of roots and other responses in plants. P. W. Zimmerman and Frank Wilcox. *Contrib. Boyce Thompson Inst.* 7, 209-29(1935), cf. *C. A.* 27, 5780; 26, 172.—The growth substances tested for response upon 10 varieties of plants are α - and β -naphthaleneacetic, 5-acenaph-

theneacetic, indolebutyric, phenylacetic, fluoreneacetic and anthraceneacetic acids, and α -naphthaleneacetonitrile. Substances were injected into plants through capillary tubes, admitted through an overhanging slit stem or applied in a lanolin paste. Plant responses include local initiation of adventitious roots on stem and leaves, proliferations, swelling and bending of stems, acceleration of growth and epinasty of leaves. α -Naphthaleneacetic acid and indolebutyric acid were the most effective root-producing substances and indoleacetic acid was most effective for epinasty of leaves. Both responses indicate that the chemical moved upward and downward in plants for several inches. Results indicated that plants can use α -naphthaleneacetonitrile to make growth substance. Production of emanations (C_2H_4) from growing plants is increased by growth substances. N M Naylor

Sex hormones and related substances (Dirschel) 10

G—PATHOLOGY

H GIDEON WELLS

The importance of sugar, protein and water metabolisms in the study of obstructive jaundice. C F Cárrega Cassañón and Luis M. Dott. *Rev. asoc. med. argentina* 49, 1261-4 (1935).—Clinical. E S G. Barron. Phenolsulfonophthalein in hepatic cirrhosis. Gabriel Peco and Francisco I. Ferreira. *Rev. asoc. med. argentina* 49, 1265-8 (1935).—In some cases of disturbances of the liver the renal elimination of phenolsulfonophthalein is diminished. E S G. Barron.

Kidney and bladder stone formation and dietetic treatment. Ikuro Mizuno. *Arch. klin. Chir.* 182, 375-91 (1935).—Stone soly urats occurred in 25% of cases on a Ca-free diet and 68.6% on P-free diets. Addn. of MgSO_4 to basic Ca-free, P-free and salt free diets increased the percentage of stone soly. Eleanor W. J. Butz

Gastrointestinal manifestations of hyperinsulinism. Seale Harris. *Am. J. Digestive Diseases Nutrition* 2, 557-67 (1935).—Case reports of hyperinsulinism indicate that gastrointestinal manifestations of this new disease entity are important. Dietary management or resection of the pancreas and removal of insulinomas have produced clinical cures. Studies of fasting blood sugar, dextrose-tolerance tests and glucemia detns during attacks in gastrointestinal patients may reveal hypoglycemia as the underlying factor in many cases. Edward Eagle

Gout and water supplies in Holland. J. F. Reith. *Water* 17, 1-13 (1935). *U S Pub Health Eng. Abstracts* 15, W, 104 (Oct 5, 1935), cf. C. A. 29, 7832.—Investigations carried on since 1924 show that I deficiency is the cause of endemic gout. There was a reciprocal relationship between gout frequency and the I content of foods, water supplies and soils. By using common salt to which 10 mg of KI per kg has been added, about 80 parts per billion of I per day, or 30 mg per year, can be consumed without danger of I poisoning. The possible addn. of I to Dutch water supplies is discussed. C. R. Fellers

Flocculation and dispersion of colloidal hydrosols by blood serums. P. Legrand. *Bull. biol. pharm.* 1935, 407-10, et seq.—Discussion. L. E. Gilson

Lipase content of the liver in normal persons and in fatty degeneration of the liver. Noel Fiesinger and Alfred Gaydos. *Compt. rend. soc. biol.* 120, 766-8 (1935), cf. C. A. 28, 6478.—In fatty degeneration the lipase of the liver and blood serum is greatly decreased. L. E. Gilson

Glutathione of the erythrocytes in hyper- and hypothyroidism. Alberto R. Beaux. *Rev. soc. argentina biol.* 11, 489-99 (1935). *Compt. rend. soc. biol.* 120, 822-3 (1935).—In dogs the normal glutathionemia undergoes wide fluctuations due to unknown factors. After thyroidectomy the glutathione increases and in exptl. hyperthyroidism it decreases. Results of expts with rats and guinea pigs were too irregular to permit definite conclusions. In human hyperthyroidism corpuscle glutathione decreases. After thyroidectomy it slowly increases to a little above normal. L. E. Gilson

Mechanism of the rapid production of an intense and lasting allergy in guinea pigs by the ingestion of dead

tubercle bacilli mixed with liquid petrolatum. A. Saenz. *Compt. rend. soc. biol.* 120, 870-3 (1935). L. E. Gilson

The reactions to the nonspecific protein treatment of infectious diseases. Ludwig Hektoen. *J. Am. Med. Assoc.* 105, 1765-7 (1935).—The effects of nonspecific proteins in infectious diseases appear due to the activation of nonspecific as well as specific antimicrobial body processes. F. P. Griffiths

Nonspecific protein therapy. Russell L. Cecil. *J. Am. Med. Assoc.* 105, 1846-54 (1935); cf. preceding abstr.—A review of the mechanism, reactions and clinical applications of therapy by injection of protein material in the treatment of disease. One hundred references. F. P. Griffiths

Behavior of serum proteins in pathological conditions of pregnancy and puerperium. R. Olivetti and G. Valle. *Minerva med.* 1935, 1, 777-83.—In normal physiological pregnancies and puerperium the total proteins were generally within low normal limits with a slight displacement of the albumin/globulin ratio. There were no particular changes in the serum proteins during various pathological conditions and in cases with edema the calcn. of the colloid-osmotic pressure by Govaert's formula showed a const. ratio. Helen Lee Gruel

Carbohydrate exchange in hypophyseal conditions and diagnostic value of the glucemic curve. G. C. Dogliotti. *Minerva med.* 1935, 1, 783-5.—The glucose-tolerance test was made in 5 patients with normal glucemia after fasting. In 2 hypopituitary patients the glucemic curve rose above 2 mg/100 soon after ingestion of glucose, then fell gradually to slightly above normal after the third hr. In 3 hypopituitary patients there was a slight hyperglucemia in the first hr., followed by a slight hypoglycemia with return to normal after the third hr. Too few cases were studied to enable definite conclusions. H. L. Gruel

Experimental studies on some biological effects of ascorbic acid. II. Antigenic power of mixed diphtheria toxin and ascorbic acid. Eugenio Schwarz and Ferdinando Cislaghi. *Minerva med.* 1935, II, 521-2; cf. C. A. 29, 7482.—Guinea pigs injected with a mixt. of diphtheria toxin and ascorbic acid developed no immunity toward the toxin, although expts. *in vitro* showed that such a mixt. lost its toxicity and pptg. power. III. The effect of ascorbic acid on anaphylactic shock. *Ibid.* 522-4.—Ascorbic acid injected simultaneously with, or 5 min. before, the shock injection of horse serum into sensitized guinea pigs apparently manifested no influence on the development of shock. Helen Lee Gruel

Nitrogen and mineral metabolism in Trypanosoma congolense disease. M. H. French. Tanganyika Territory, *Ann. Rept. Dept. Vet. Sci.* 1934, 59-64.—Infection of cattle with *T. congolense* results in an increased rate of excretion of N, Ca, K and P. Mg balances do not appear to be disturbed. The effect on Na and Cl metabolism appears to be dependent upon the level of intake, retention occurs on an adequate consumption but a neg. balance results on a low intake. Any pica which develops during the course of the disease is the result of the animal attempting to correct the excessive loss of minerals from the body and to neutralize the acidosis which develops. K. D. J.

Immunological application of placental extracts. Elhott S. Robinson and Charles F. McKhann. *Am. J. Pub. Health* 25, 1353-8 (1935). J. A. Kennedy

Studies on the minimal threshold of the dental sign of chronic endemic fluorosis (mottled enamel). H. Trendley Dean and Elias Elvove. *U S Pub Health Repts.* 50, 1719-29 (1935).—The "mottled enamel index" of Colorado Springs, Colo. is "slight." A milder type is endemic in Monmouth and Galesburg, Ill. In Pueblo, Colo., the index is "neg." The mean annual F content, based on monthly exams of the municipal water of Colorado Springs, Colo., between Nov., 1933 and Oct., 1934, was close to 2.5 p.p.m. The corresponding mean annual F contents of the municipal waters of Monmouth, Ill., Galesburg, Ill., and Pueblo, Colo., were close to 1.7, 1.8 and 0.6 p.p.m., resp. Eight references. J. A. K.

The icterus index in the newborn infant. Barnett E. Bonar. *Am. J. Diseases Children* 50, 1143-5 (1935).—

Hyperbilirubinemia in infants exists at birth and continues through the first 12 days regardless of the presence of clinical jaundice, which may not be detected until the icterus index reaches 30. The av. icterus index of the blood of the umbilical cord is 12 and that of the infants blood shortly after birth is 13. During the first 5 days the index rises to 53 and gradually decreases to 25 by the 12th day. In infants with clinical jaundice the curves showed the same general trend with a slightly higher index at birth and a higher max value reached 2 days later than the max in nonicteric infants

E. R. Main
Phosphorus of blood IV. Phosphorus partition in the blood of children with disease Genevieve Stearns and Edna Warweg *Am. J. Diseases Children* 50, 1164-72 (1935); cf. C. A. 29, 2581*—In infants with tetany, the changes in the blood P were similar to those observed in rickets, viz., a decrease in the ester P of the corpuscles and an increase in plasma phosphatase In malnutrition and in osteoporosis, the ester P of the corpuscles was lowered although not to the degree observed in rickets The ester P of the serum was markedly increased and that of the corpuscles was often decreased in osteomyelitis In acute renal disturbance, alterations in all forms of P were observed No characteristic changes in blood P were observed in children with hypercalcemia, hyperthyroidism, mild diabetes, dwarfism or osteopetrosis E. R. M.

The quinine test for hyperthyroidism Israel Bram *J. Lab. Clin. Med.* 21, 123-7 (1935)—Patients with hyperthyroidism can apparently tolerate large quantities of quinine. The tolerance varies in direct proportion with the height of the basal metabolic rate Dosages of 30-90 grains of quinine sulfate per day can be tolerated without evidences of cinchonism, while normal persons can tolerate only 3-12 grains per day. The diagnostic test consists in the administration of 30 grains per day and is considered pos. if after 4 days there are no evidences of cinchonism. The test does not differentiate between toxic adenoma and exophthalmic goiter.

E. R. Main
The incidence of nondiabetic glucosuria B. V. Glassberg, *J. Lab. Clin. Med.* 21, 152-6 (1935)—There appears to be no relation between the level of sugar in the blood and its appearance in the urine. In nondiabetic glucosuria the blood-sugar content is less than 100 mg. % and sugar is found in the urine 3 hrs. after the ingestion of 100 g. of glucose, while in diabetes the blood sugar content is usually greater than 150 mg. % after 3 hrs. Of 238 cases with a tentative diagnosis of diabetes or glucosuria, 13% were nondiabetic.

E. R. Main
A chemical study of the alum-diphtheria toxoid precipitate Edward Buxbaum and Charles K. Greenwald *J. Lab. Clin. Med.* 21, 157-63 (1935)—Toxoids prepd. from bacto-veal broth require alum in a concn of 2% for the max. pptn. Those prepd. from fresh veal broth require a concn. of 1.5%. The toxoid should be heated to 40° before the pptn. The concd. toxoid prepd. from fresh veal broth contains a greater no. of L₁ units per mg. of N and appears to have more desirable phys. characteristics

E. R. Main
Gonadotropic hormone (prolan) in relation to carcinoma of the cervix. James A. Halsted *New Engl. J. Med.* 213, 503-5 (1935).—An increased content of gonadotropic hormone in the urine was observed in 4 of 15 cases of carcinoma of the cervix uncomplicated by ovarian deficiency. This incidence does not appear to be large enough to be of diagnostic value.

E. R. Main
Reticulocyte responses in the pigeon produced by maternal effective and noneffective in pernicious anemia with description of histologically different reactions of bone marrow Gullt Lindh Muller, *New Engl. J. Med.* 213, 1221-6 (1935)—The injection of active, purified liver exts. into pigeons maintained under standard lab. conditions causes an increase in reticulocytes. Changes in the megaloblastic bone marrow similar to those in pernicious anemia patients treated with liver ext. are observed. The intravenous injection of lysine or leucine causes a similar reticulocyte response and a histologic change in the bone marrow consisting of growth and extension of erythroblastic tissue

E. R. Main

1 Investigation of a method for testing the therapeutic effectiveness of substances in carcinoma. IV. Proteins, albumoses and amino acids B. Lustig and H. Wachtel *Z. Krebsforsch.* 42, 397-409 (1935); cf. C. A. 29, 3029*—Casein, protoalbumoses and deuterolalbumoses do not protect cancer cells against soln. by normal serum. In vivo, these substances tend to prolong the life of tumor-bearing animals. Almost all amino acids have some anti-carcinogenic action either in vitro or in vivo. V. Amines and amino alcohols *Ibid* 409-16—Many aliphatic and aromatic amines tend to inhibit the growth of tumors and to prolong the lives of tumor-bearing animals. Indole, skatole, 1-methylindole, 2-methylindole, 7-methylindole and 3-indolepropionic acid tend to inhibit the growth of mouse tumors. Indole and the isomeric methylindoles exert a protective action on cancer cells in vitro

E. R. Main
2 Preliminary observations on the indole and skatole contents of blood in nephropathies Mario Zappacosta *Boll. soc. stat. biol. sper.* 10, 708-10 (1935)—In acute glomerulonephritis and in nephritis, indole and skatole do not increase, in renal sclerosis and in uremia, the increase is very moderate from 0.030 mg. % to 0.10 mg. % The increase is neither const. nor proportional to the degree of renal injury. The conclusion is that these bodies contribute little if any to uremic poisoning P. Masucci

3 Gastric acidity in chronic arthritis Edward F. Hartung and Otto Steinbrocker *Ann. Internal Med.* 9, 252-7 (1935)—In 70 patients with chronic arthritis, achlorhydria occurred in 26% of the cases with rheumatoid arthritis, and in 25.6% of the cases with osteoarthritis. Hypochlorhydria was detected in 17% of the former and 3% of the latter. Subacidity is an important factor in the chem. picture of chronic arthritis. J. T. Myers
4 Von Gierke's glycogen disease Lionel M. Lindsay, Alan Ross, and F. W. Wigglesworth, *Ann. Internal Med.* 9, 274-81 (1935)—Although sufficient amylase is present in the liver, blood and urine, it cannot liberate glucose from glycogen. Either the glycogen in this condition is resistant to the enzyme or there is some barrier between the glycogen and the enzyme J. T. Myers

Immunological applications of placental extracts; effectiveness by oral administration C. F. McKhann, A. A. Green, L. E. Eckles and J. A. B. Davies *Ann. Internal Med.* 9, 388-97 (1935).—Protein exts. composed of globulins from human placenta contain diphtheria and scarlet fever antitoxins, and antibodies which neutralize polio-myelitis virus, and protect susceptible children against measles. There have been some moderately severe reactions after injection. Oral administration seemed to protect against measles and there was no reaction

John T. Myers
5 Blood cholesterol in disturbances of the basal metabolic rate Lemuel C. McGee, *Ann. Internal Med.* 9, 728-38 (1935)—The figures for fasting plasma cholesterol in 52 normal adults ranged from 150 to 228 mg. %, the av. being 193. In 145 patients there was no correlation between blood cholesterol and basal metabolic rate, or the condition of the patient. Thyroid disease is accompanied by blood cholesterol changes and plasma detns. may be of value in following the progress of treatment in an individual.

John T. Myers
The mechanism of healing in collapse therapy. Max Pinner, *Ann. Internal Med.* 9, 501-15 (1935).—A reduction of O tension and increase in CO₂ tension may produce conditions less favorable to the tubercle bacillus.

John T. Myers
Attempts at vitamin C therapy in experimental poliomyelitis Claus W. Jungeblut, *J. Biol. Sci.* 31, 34-5 (1936), cf. C. A. 29, 8127*—There is a probability that vitamin C injected subcutaneously in the proper dose has therapeutic value in exptl. poliomyelitis John T. Myers

The action of formalized virus as a preventive of experimental equine encephalomyelitis in guinea pigs Herald R. Cox and Peter K. Ohtsky, *J. Biol. Sci.* 31, 38 (1936).—The virus in contact with 0.4% formalin for 2 to 4 days immunized guinea pigs. John T. Myers

The effect of combination with diazo compounds on the immunological reactivity of antibodies. Harry Eagle, Dorothy J. J. glesston Smith and Percy Vickers. *J. Bact.* 31, 65-6 (1936).—Sufficient coupling with diazo compounds eventually destroyed the reactivity of all antisera studied. This was due to the progressive and simultaneous decrease in the reactivity of all antibody moieties, rather than to the inactivation of an increasing number of moieties. The groups in protein which participate in its reaction with diazo compounds probably include aliphatic amines, the NH groups of histidine, tryptophan, proline and hydroxylamine and the tyrosine OH. John T. Myers

The immunological properties of an artificial carbohydrate protein antigen containing glucuronic acid. Walter F. Goebel. *J. Bact.* 31, 60 (1936).—An artificial glucuronic acid-protein antigen, prepared by combining the diazonium salt of the *p*-aminobenzyl glucoside of glucuronic acid with foreign protein, will react in dilutions 1:1,000,000 with antipneumococcus horse serum, types III and VIII. A corresponding antigen control, glucose is serologically inert. It is suggested that the chem. basis for the immunological cross reactions of these pneumococci resides in the configuration of the uronic acid constituents of the sp. sol. substances. The immunological activity of the artificial antigen may be due to the interaction of uronic acid antibodies, elicited by the highly polar uronic acid constituents of the bacterial polysaccharides, with the uronic acid radical of the artificial antigen. John T. Myers

Hydrogen ion concentration in the preparation of tuberculin protein antigen. I. Ernest B. Hanan and Sophia Zuretti. *J. Bact.* 31, 64-7 (1936).—The optimum pH for the extn. of the tuberculin proteins from the organism without serious deterioration of antigenic power was 7. The optimum pH for pptn. of the protein was 2.8 with a range between 2.6 and 4.6. John T. Myers

A preliminary study of the absorption spectra of antigens. M. O. L. Crowe. *J. Bact.* 31, 67 (1936).—Differences occur between the curves of 3 types of beef heart antigen and between 2 samples of one of the types. John T. Myers

Chemical and immunological properties of bacterial proteins. Michael Hechtelberger, Arthur E. O. Menzel and Forrest E. Kendall. *J. Bact.* 31, 68 (1936). J. T. M.

Is immunological aggregation (flocculation) specific? Sanford B. Hooker. *J. Bact.* 31, 69-70 (1936).—In a mixt. of 2 pptg. antigen-antibody systems, the antibody-coated moieties of each antigen seem to enter indifferently into the formation of the mixed ppt. John T. Myers

A new method of preparing antigen for serological tests in syphilis. Augustus Wadsworth and Rachael Brown. *J. Bact.* 31, 72-3 (1936).—Fresh ground beef heart was infused at 55° with 20% NaCl soln., treated with acetone, filtered, pressed and dried in a current of air. The NaCl reduced bacterial decompos. and so altered the tissue that it could be extd. directly with alc. without preliminary ether extn. John T. Myers

The influence of snake venom on coagulability of blood. Th. Lunk. *Zentr. Bakt. Parasitenk.* 1 Abt. 135, 160-1 (1935).—Some venoms contain a substance which hinders coagulation, some increase it, some have both factors and others have neither. John T. Myers

Staphylocoxin. W. Seifert. *Zentr. Bakt. Parasitenk.* 1 Abt. 135, 100-8 (1935).—The toxin should be considered, not in terms of receptors, toxophore groups, etc., but in chem. and physiol. terms. Staphylococcus toxin is considered to be a lipid sp. enzyme. Cytolysis naturally follows lipid binding and a disturbed regulatory mechanism of the ions in cells and serum. Susceptibility to staphylococcus depends not on salt but on fat metabolism. The frequency of staphylococcus infections in bone marrow may be due to its high fat content. John T. Myers

Lipase of the blood serum, and diastase of the urine in diseases of the pancreas and of the liver. W. Hülcher. *Acta Brevia Neerland. Physiol., Pharmacol., Microbiol.* 5, 129 (219.5).—A discussion. F. D. Walter

II—PHARMACOLOGY

A. N. RICHARDS

A review of burn therapy. L. Stambovsky. *Drug and Cosmetic Ind.* 37, 743-7 (1935); cf. C. A. 29, 747P.

H. M. Burlage

Poisons and first aid in the cases of poisoning. Max Grünwald. *Pharm. Post* 68, 550-2 (1935). H. M. B.

Chronic carbon tetrachloride poisoning. Julius Löwy. *Arch. gewerbepath. gewerbephys.* 6, 157-9 (1935).—Symptoms in 20 cases are described. Liver function is impaired. Eleanor W. J. Butz

The effect of sulfur in experimental carbon monoxide poisoning. K. Volt and H. H. Schmidt. *Munch. Med. Wochschr.* 82, 1393-5 (1935).—The effect of S injection into CO-poisoned guinea pigs was studied. Hyperglucemia did not develop. Eleanor W. J. Butz

Substituted naphthalenesulfonic acids with regard to blood coagulation, staining and tumor affinity. K. Kottman. *Schweiz. med. Wochschr.* 65, 533-5 (1935).—The compounds tested were 1,8-aminonaphthol-3,6-disulfonic acid (I), 1,8-iodonaphthol-3,6-disulfonic acid (II), 1-cholalylamino-8-naphthol-3,6-disulfonic acid (III), diazotized I coupled to I, diazotized I coupled to cholalyl and diazotized I coupled to iodonaphthol-3,6-disulfonic acid I and II inhibit *in vitro* coagulation of blood completely in 1% soln. III inhibits in 0.5% concn. The azo compounds are up to 10 times as effective. Injected into rabbits, these compounds proved inhibitory. These preps inhibit pepsin, rennet, oxidase and reductase. They exert an anticomplementary effect with Wassermann-positive sera. The naphthalenesulfonic acids cause rouleau formation and blood sedimentation. Tumor-tissue affinity was demonstrated with mouse carcinoma. E. W. J. B.

The influence of insulin on experimental hyperlipemia. A. I. Lewin. *Z. ges. exp. Med.* 96, 532-47 (1935).—Feeding cholesterol in oil to rabbits raised the blood cholesterol (I) considerably, and the sep. fat fractions and lipid P of the blood to a less extent. This hypercholesterolemia disappeared when feeding of I was stopped. The lipocyte coeff. increased, probably because of storage of I by the tissues. Insulin accelerated the assimilation and storage of I, the hypercholesterolemia appearing more slowly and the development of atherosclerotic changes being suppressed. Blood sugar was unchanged during the hypercholesterolemia. No conversion of fat to carbohydrate could be detected. Eleanor W. J. Butz

The action of narcotics on the condition of living substance. The infrared effect in the narcosis of the transversely striated muscles. P. J. Jundé. *Protoplasma* 24, 268-80 (1935).—The so-called muscle Raman spectra can serve as an indicator of muscle swelling, for these spectra can be extinguished in a characteristic fashion in Ringer as well as in Ringer plus narcotic. Swelling in both these media is looked on as an equiv. phenomenon. The normal sartorius muscle of the frog was investigated by swelling in Ringer and in Ringer plus narcotic. It has been shown that even in narcosis, there is no increase in the infrared effect. Model expts. on colloidal media showed that each lessening of dispersion or any coagulation is accompanied by an increase in the infrared effect. From this it may be concluded that the congelation of living substance in narcosis is not conditioned by a coagulation. J. is of the opinion that one is dealing here with a structural change in the living substance, which is to be explained by the thixotropic nature of protoplasma. Twenty eight references. F. L. Dunlap

Action of vegetative adjuvants on emulsions. Gustav Bayer and Theodor Wense. *Protoplasma* 24, 281-5 (1935); cf. C. A. 28, 7356P. F. L. Dunlap

Histidine in the treatment of peptic ulcer. John T. Eads. *Am. J. Digestive Diseases Nutrition* 2, 426-30 (1935).—A preliminary report on the histidine injection treatment of peptic ulcers. Gastric ulcers appear to show more rapid improvement than do duodenal. F. B.

The treatment of amebiasis with iodohydroxyquinoline-sulfonic acid. I. W. O'Connor and C. R. Hulse. *Am. J. Digestive Diseases Nutrition* 2, 448-9 (1935).—From studies

on 152 cases of *Endostrongylus histolytica* infection, treatment with iodoxyquinolinesulfonic acid (anayodin) seems to be effective in stopping severe symptoms rapidly and curing acute and carrier cases. I. Edward Fagle

Action of β -aminophenylsulfamide in experimental streptococcus infections of mice and rabbits. J. Tréhou, Mme J. Tréhou, F. Nitti and D. Boyet. *Compt. rend. soc. biol.* 120, 756-8 (1935).—Death of the infected animals was delayed several days by ingestion or injection of the compound. L. F. Gilson

Effects of alkaline extract of the anterior hypophysis on the mineral constituents of the blood plasma. R. Gerschlager and A. D. Marenzi. *Rev. soc. argentina biol.* 11, 580-8 (1935). *Compt. rend. soc. biol.* 120, 817-20 (1935), cf. C. A. 29, 33-5. In normal and thyroidectomized dogs injection of large doses of the ext. causes an increase in combined CO₂, glucose, Ca, Mg and inorg. P and a decrease in Cl and Na. The hypercalcemia produced by the ext. occurs after hypophysectomy or thyroidectomy but not after thyroparathyroidectomy, indicating that the ext. stimulates the parathyroids. L. I. G.

Diuretic action of potassium salts. Norman M. Kenh and Melvin W. Binger. *J. Am. Med. Assoc.* 105, 1584-91 (1935).—The diuretic effects of KNO₃, KCl, K₂HPO₄, KOAc and K₂CO₃ are reported. Of these of edema an increased urinary output was observed in 49. Dosage was usually 6-12 g. of KNO₃ or its equiv. daily. Thirty-five references. I. P. Griffiths

The use of unsaturated fat acids in the treatment of eczema. S. J. Taub and S. J. Zakon. *J. Am. Med. Assoc.* 105, 1675-8 (1935). Daily ingestion of 15-30 cc. of purified linseed oil did not benefit patients suffering from eczema. Allergy was noted in one instance. Use of the oil is discouraged. I. P. Griffiths

The treatment of acute alcoholism with ten percent carbon dioxide and ninety percent oxygen inhalation. L. J. Robinson and Sydney Selesnick. *J. Am. Med. Assoc.* 105, 1734-8 (1935).—Administration of the gases for a period of time (30 min. or more) sufficient to re-establish and maintain normal respiration may prevent death in cases of acute alk. coma and cyanosis. Twenty-three references. I. P. Griffiths

Diuretic action of intravenous (administration of) sodium dehydrocholate. Franklin A. Wiegand. *J. Am. Med. Assoc.* 105, 2031-40 (1935).—Sodium dehydrocholate, formed by the oxidation of cholic acid, is relatively nonhemolytic and nontoxic. Administration of 10 ml. of a 20% soln. in combination with salyrgan, 0.25-10 ml., resulted in increased diuresis in 8 patients. Twenty references. I. P. Griffiths

Ether oil rectal analgesia in obstetrics. Modified technique. J. T. Gwathmey and C. O. McCormick. *J. Am. Med. Assoc.* 105, 2044-7 (1935).—The rectal mixt. now used consists of quinine alkaloid 1.3 g., EtOH 3 ml., paraldehyde 8 ml., 1 i, 10 75 ml., and enough liquid paraffin or olive oil to make 120 ml. Details of technique are given. Twenty-two references. I. P. G.

The use of benzedrine for the treatment of narcolepsy. M. Prinzmetal and W. Bloomberg. *J. Am. Med. Assoc.* 105, 2051-4 (1935).—Benzedrine, a phenylisopropylamine, was found 2-5 times more effective than ephedrine in the prevention and cure of sleep attacks and cataplexy. I. P. G.

Effect of posterior hypophysis extract on inorganic phosphorus of blood and urine. Giorgio Dodero. *Arch. farmacol. sper.* 60, 422-9 (1935).—Tonephin injected subcutaneously or intravenously into rabbits produced a hyperphosphatemia but no increase in phosphatemia. Helen Lee Gruehl

Action of amino acids (tryptophan) in experimental anemia. Angelina Levi. *Arch. farmacol. sper.* 60, 437-48 (1935).—Doses of 0.100 g. per kg. injected on alternate days for several months markedly improved exptl. anemia in rabbits and caused a return of red cells and hemoglobin to near normal values. H. I. G.

Tri tetrathylammonium phosphate in therapy. Angelo Spanio. *Minerva med.* 1935, II, 582-4. In 8 patients with various malaises tri tetrathylammonium phosphate was

well tolerated and manifested a beneficial effect, stimulating heart and circulation and producing a marked tonic effect on the nervous system. Helen Lee Gruehl

Parallel between adrenaline and hypophyseal vasopressin administered intravenously in man. S. Deleamari, I. S. Arica and C. D'Arrigo. *Minerva med.* 1935, II, 584-602. Adrenaline and tonephin produced parallel effects of splenocontraction, hyperleucemia and oliguria but contrasting effects on heart and blood vol. Adrenaline caused erythrocytosis, leucocytosis, hyperplasmia and hyperglobulia whereas tonephin produced a slight diminution in erythrocytes and hemoglobin and a leucocytosis. Helen Lee Gruehl

Action of arsenobenzene on transplanted tumors. Leopoldo Bertellotti. *Minerva med.* 1935, II, 602-5. Daily subcutaneous injections of 0.2 mg. arsenobenzene had no effect on the development of adenocarcinoma of the Ehrlich type in mice. In rats daily subcutaneous injections of 2 mg. favored the development of the Galliera type of tumor. Arsenic could be detected chemically in both types of tumors. Helen Lee Gruehl

The nature of the resistance to treatment shown by some cases of bovine trypanosomiasis. H. I. Hornby. *Tanganyika Territory, Ann. Rep. Dept. Vet. Sci.* 1934, 37-9, cf. C. A. 28, 11031. In the treatment of *T. congolense* infection of bovines with Sb compds. it is unlikely that the drug succeeds in reaching and killing all the trypanosomes within the body. Complete sterilization is, therefore, dependent on subsequent antibody action. Unusual refractoriness to treatment is more often due to the failure of the host to produce the antibody than special resistance to the drug on the part of the parasite. K. D. Jacob

The action of β -phenylenediamine on the chemical processes in striated muscle. V. Parshin. *Compt. rend. acad. sci. (I. R. S. S.) [N. S.]*, 3, 113-16 (1935).—The only effect of injection of β -phenylenediamine (I) into frogs on the chem. processes in striated muscle is a derangement of the lactic acid-formation process. So much lactic acid is formed due to the poisoning effect of I that there is little detectable difference in the amt. found in working and resting muscle. C. E. P. Jeffreys

The effect of hydrazine in the production of acetone bodies in the phlorizin-intoxicated animal. Max Greenberg. *J. Biol. Chem.* 112, 431-6 (1936).—Phlorizinized fasting rats excrete less acetone bodies after hydrazine intoxication than before and this decrease is independent of any decrease in deamination of ketogenic amino acids or any increase in the metabolism of glucose or protein. A. P. Lothrop

Multiple sclerosis. Effect of typhoid vaccine and adrenaline on coagulation of the blood. Benjamin Simon and Philip Solomon. *Arch. Neurol. and Psychiat.* 34, 1296 (1935).—In patients with multiple sclerosis and in normal subjects, the drop in clotting time was about the same when typhoid vaccine was given, but the duration of the drop was about 2 1/4 times as long in cases of multiple sclerosis as in the normal. When adrenaline was given the drop was 5 times as long and the duration 3.7 times as long for cases of multiple sclerosis as for normal people. G. H. W. Lucas

The colloidal metal absorption by tissue cells. I. The influence of serum, serum albumin, as well as serum globulin, on the metal absorption by the surviving rabbit liver. Kap-Soo Lee. *Folia Pharmacol. Japon.* 21, Opera Orig. 1-9 (1935).—The surviving rabbit liver was perfused with 0.02% collagol in 0.85% NaCl soln. to which was added rabbit serum, serum albumin or serum globulin. The presence of these lyophilic colloids decreased to about one half the quantity of Ag remaining in the liver tissues, as compared with that found when the soln. of collagol alone was used. II. The influence of various lyophilic colloids on the metal absorption of tissue cells in the surviving rabbit liver. *Ibid.* Opera Orig. 11-20 (1935).—The surviving rabbit liver was perfused with 0.02% collagol soln. ontg. 1% Witte's pepton, 1% egg white protein, 1% egg albumin, 0.5-1% gelatin, starch or gum arabic. The presence of these colloids de-

creased the Ag remaining in the liver practically the same as previously shown, except that the addn. of starch was almost without effect. The up-take of metal was less with gum arabic than the other colloids. III The influence of various lyophilic colloids on the metal absorption of the tissue cells of the surviving spleen and kidney. *Ibid* Opera Orig 33-40 (1935).—Spleen or kidney perfused with a simple collagol or with collagol in the presence of serum, egg white or gelatin shows that the presence of the lyophilic colloid decreases the amt. of metal absorbed by the tissue. The serum afforded a greater protection against the up-take of the metal than did the other colloids. Histological changes are discussed. G H W Lucas

The influence of the thymus hormone on the poisonous action of opium alkaloid. Kaoru Arima, *Folia Pharmacol Japon* 21, Opera Orig 41-7 (1935).—Morphine, heroine and codeine were given subcutaneously in suitable doses to young suckling rabbits, some of which were given thymus ext. and some from which the thymus gland was extirpated. The removal of the thymus rendered the animals a little less sensitive to these alkaloids, but the injection of thymus ext. greatly increased their sensitiveness to the drugs. G H W Lucas

The action of β - γ hexenol, a constituent of the raw leaves of *Tea sinensis Japonica*, together with a comparison of this substance with hexyl alcohol. II The action on the vessels, skeletal muscles and motor nerve endings. Seisaku Murakami, *Folia Pharmacol Japon* 21, Opera Orig 165-74, Breviaria 48 (1935), cf C A 30, 768.—By use of a prepn. of β - γ -hexenol 97-98% pure, it was found that because of a depression of muscle activity the visceral vessels in the toad were greatly dilated. In a nerve muscle prepn. of the frog gastrocnemius both the muscle and motor nerve were depressed. The action resembles that of hexyl alc., but is stronger. G H W Lucas

Pharmacological studies on the automatic movement of the rabbit testicle. II The influence of the thyroid and pancreas on the sensitivity of the testicle against acetylcholine and adrenaline. Reiji Uchihashi, *Folia Pharmacol Japon* 21, Opera Orig 175-89, Breviaria 49 (1935).—The day following thyroidectomy the sensitivity of the musculature of the rabbit testicle is increased to adrenaline and acetylcholine and then gradually approaches the normal. In animals repeatedly injected with thyroxine, the sensitivity to acetylcholine is very marked, while to adrenaline it is generally weaker. A decrease in sensitivity follows when very large doses of either poison are given. After repeated insulin injections, the sensitivity to acetylcholine is increased, but that to adrenaline may be unchanged or weaker. The thyroid and pancreas may play a role for maintaining the tonus of the motor nerves for the testicle. G H W Lucas

Changes in the blood or serum viscosity of the rabbit under the influence of alcohol. Hitoshi Wakai, *Folia Pharmacol Japon* 21, Opera Orig 207-12, Breviaria 51 (1935), cf C A 30, 767.—When dil. alc. (100 cc. in 3% EtOH per kg.) was given rabbits orally, a diuresis followed, accompanied by a decrease in serum and blood viscosity. No change in specific viscosity was apparent. If the same dose of 50% EtOH were given, which set up a deep narcosis, the protein concn. of the serum diminished while the blood viscosity and specific viscosity of the serum increased slightly. The albumin-globulin quotient increased at the same time. G H W Lucas

The diuretic action of tobacco smoke. Adolph Venusch and Rudolf Schöller, *Med. Klin* 31, 1336 (1935).—Tobacco smoking raises the blood pressure and causes a diuresis. G H W Lucas

Dilaudid as a pain depressant in obstetrics. G Steigelmann, *Med. Klin* 31, 1337 (1935).—Dilaudid may be used in obstetrics as a pain depressant intramuscularly or per os in combination with such drugs as scopolamine or picroton, without danger to mother or child. G H W Lucas

Two cases of thallium poisoning. Hans Heinz Brenneke, *Med. Klin* 31, 1494-5 (1935).—A report on 2

cases of poisoning by Tl, one medicinal and the other suicide, by use of a rat poison contg. Tl sulfate.

G H W Lucas
Damage to heart muscle through insulin. E. Schonbrunner, *Med. Klin* 31, 1571-2 (1935).—Insulin appears to be contraindicated in diabetics who have angina.

G H W Lucas
Health risks through carbon monoxide. Spitta, *Med. Klin* 31, 1595-9 (1935).—A review. G H W Lucas
Hypnotics and sedatives in circulatory conditions. Robert Weiss, *Med. Klin* 31, 1665-7 (1935).—A review. G H W Lucas

Chemotherapy in leucosis of fowls. J. Engelbreth-Holm, A. Rothe Meyer and E. Uhl, *Acta Path. Microbiol. Scand* 12, 491-510 (1935).—Neither the Pb compd., R 237b, nor plasmochin, administered intravenously, had any effect on the development, duration or degree of erythroblastosis in fowls. Rhodogone caused a reduction in the no. of takes in animals inoculated with a pure erythroleucosis strain but had no effect on those inoculated with a combined erythroblastosis-sarcoma strain. The active principle is inactivated *in vitro* by Rhodogone but is unaffected by R 237b or plasmochin. E. R. Main

Cataracts and dinitrophenol. David G. Cogan and Frances C. Cogan, *New Engl. J. Med.* 213, 854-6 (1935).—A review of 20 reported cases of cataract following the use of dinitrophenol in therapeutic dosage. The formation of the cataracts appears to be caused by tissue anoxemia with consequent damage to the lens epithelium. E. R. Main

The action of certain chemical stimuli on cultures *in vitro*. I Benzene. Francesco Guerico and Rosario Arnone, *Boll. soc. ital. biol. sper.* 10, 621-2 (1935).—Benzene was emulsified in plasma, dild. with NaCl soln., and added to cultures of rabbit bone marrow *in vitro*. The results were neg.; there was no difference between the cultures with benzene and those without. The results also were neg. with cultures of the rabbit genital app. *in vitro* previously stimulated with prolactin. P. M.

Pharmacologic studies on nupercaine. I The action on the isolated heart of the frog. Comparison with cocaine. Antagonism with adrenaline. R. Santi and B. Zweifel, *Boll. soc. ital. biol. sper.* 10, 648-52 (1935).—The min. active concn. of nupercaine is 1.4-5 million on the isolated heart of *R. esculenta*. If the period of contact is long, the drug is active even in greater dilns. The drug is fixed by the cardiac muscle and accumulates until an active dose is reached. The action is reversible only after repeated washings with fresh perfusion liquid. The concn. of the drug is not as important as the time it has acted in bringing about reversibility. The min. active concn. of cocaine is about 40 times and the min. paralyzing concn. about 25 times greater than those of nupercaine. The action of cocaine is much more readily reversible than that of nupercaine. Atropine sulfate, atropine and cocaine do not influence noticeably the action of nupercaine. Adrenaline has a marked effect. When the adrenaline is allowed to act before or simultaneously with nupercaine, the functional changes caused by nupercaine appear more slowly and are very weak, when adrenaline acts after the nupercaine, the pulsations become more regular with a simultaneous increase in amplitude and frequency. Fresh perfusion liquid washes away the adrenaline more readily than the nupercaine. II The action on the isolated heart of the rabbit. Comparison with cocaine. Antagonism with adrenaline. *Ibid.* 652-5.—Even in a diln. of 1.5 million after 20 min. contact nupercaine has a definite action. On substitution of fresh, pure perfusion liquid, reversibility is very slow. For cocaine, the phenomena are the same but not so intense and reversibility is more rapid. The min. active dose is about 1,200,000, the min. paralyzing dose is between 10,000 and 140,000. Atropine has no marked influence on the action of either nupercaine or cocaine, although it does retard the appearance of irregularity in pulsations and incoordination. The antagonism between adrenaline and nupercaine and adrenaline and cocaine is very evident. Peter Masucci

Radioactivity, iodine and thyroid stroma. Giacomo

Pighini. *Boll. soc. ital. biol. sper.* 10, 661-3(1935).—Radioactive water with and without the addn. of I_2 was administered to rats which were later (2 to 120 days after) sacrificed, and the thyroid was removed and examd histologically. The animals treated with the radioactive water alone showed from the beginning more or less marked thyroid alterations. The animals which received the radioactive water plus I_2 showed a thyroid with a normal structure.

Peter Masucci. The action of physical and pharmacological stimuli on blood vessels without nerves (chick embryonic vessels). Mario Volterra. *Boll. soc. ital. biol. sper.* 10, 667-9 (1935).—Adrenaline, acetylcholine, atropine and ephephorone are pharmacologically active when brought into direct contact with the walls of the minute vessels forming the chick embryonic vascular system, even though the vessels are without nerves or junctions.

Insulin and weight. I. Variations in the body weight, glycogen content and iodine number of adipose tissue. F. Boeri, G. Scorz and P. Baer. *Boll. soc. ital. biol. sper.* 10, 680-2(1935).—Data obtained on rats and dogs induce the authors to formulate the hypothesis that insulin injected into animals produces an increase in body wt. by stimulating in the adipose tissue the transformation of carbohydrates into fats. II. Variations in the composition of the adipose tissue in animals treated with insulin. P. Baer, G. Scorz and F. Boeri. *Ibid.* 682-5.—Rats received 0.5 unit and dogs 2-4 units of insulin daily; 2 rats were sacrificed daily so that the first 2 animals received 1 injection, the last 2 animals, 16 injections of insulin. Samples of adipose tissue were removed from the dogs before and during treatment. During the first 5-10 days of treatment, the adipose tissue showed a gradual increase in the percentage of water, a corresponding decrease in the percentage of fats and an increase in total solids. Later, the picture changed. The water in the adipose tissue decreased while the fats increased in body wt.; a marked increase in the I_2 no. of the adipose fat also took place. This process continued for 10 days when the increase in body wt. ceased and the amt. of glycogen and the I_2 no. of the adipose tissue returned to normal.

Peter Masucci. The action of thyroxine on the body weight and on the weight and nitrogen content of certain internal organs of the rat. G. Scorz and P. L. Micheli. *Boll. soc. ital. biol. sper.* 10, 687-9(1935).—Whatever the action of thyroxine on the body wt. of rats, the wet wt. and the dry wt. of the liver, kidneys and spleen are greater than the control animals. The increase in the dry wt. of the liver and kidneys is greater than the increase in the wet wt. The percentage N of the organs of the treated animals is equal to that of the controls.

Death by hemorrhage. II. The quantity of blood contained in the viscera on death by hemorrhage. F. Domencini. *Boll. soc. ital. biol. sper.* 10, 691-3(1935). III. The influence of adrenaline and of morphine on the return circulation. *Ibid.* 693-4.—Animals which died from hemorrhage from the femoral vein but which were previously treated with morphine gave a larger percentage loss of blood than those treated with adrenaline. Nevertheless, the blood content of the 4 organs examd. was as a whole greater than that of the organs of the adrenaline-treated animals.

Peter Masucci. The influence of ascorbic acid on the coagulation of the blood (time of coagulation) in normal and pathological conditions (hemorrhagic diathesis). L. Cott. *Boll. soc. ital. biol. sper.* 10, 697-700(1935).—Ascorbic acid injected intravenously into hemophilic subjects produces a noticeable action on the coagulation of the blood manifested by a decrease in the coagulation time and a general improvement in the clinical picture.

Peter Masucci. The behavior of ascorbic acid and of glutathione in the organs of guinea pigs treated with bacterial poisons. I. Diphtheria toxin. P. Nuzzi. *Boll. soc. ital. biol. sper.* 10, 710-14(1935).—Guinea pigs were injected with (a) 1 m.l. d. and (b) 0.50 m.l. d. of diphtheria toxin. The animals were killed (a) after 24 hrs.; (b) after 3 or 5 days. The organs were removed and extd. with 2%

CCl_3COOH . Ascorbic acid and glutathione were detd. The results show no noticeable variations in either the ascorbic acid or glutathione content of the organs of the treated animals compared with the values found in the organs of the control animals. II. Tetanus toxin. *Ibid.* 714-15.—There was no noticeable variation in the ascorbic acid content of the organs of guinea pigs treated with tetanus toxin, there was a marked decrease in glutathione in the lungs and suprarenals. III. Old tuberculin. *Ibid.* 715-17.—Guinea pigs were injected daily for 1 month with 1 cc 1 10 old tuberculin. The animals were then killed. The lungs and suprarenals showed a slight decrease in ascorbic acid and in glutathione. The spleen showed a marked increase in glutathione.

Peter Masucci. Indole IV. The indican-indole index of the blood in various experimental conditions. E. Macchia. *Boll. soc. ital. biol. sper.* 10, 717-20(1935), cf. C. A. 29, 81414.—After the intravenous injection of 0.50 mg. indole per kg. body wt. into normal dogs, indole is found in the blood in appreciable quantities, 0.013 mg. % after 30 min., 0.006 mg. % after 60 min. The time-concn. curve is not materially changed after the removal of a portion of the intestine, changes slightly (0.031 mg. % after 60 min.) after ligating the renal peduncles, but undergoes very marked changes after ligating the hepatic peduncle.

In the last case, the indican-indole index is always less than unity. V. The indican-indole index of the blood in individuals with a normal liver and in individuals with hepatic lesions. *Ibid.* 720-2.—The indican-indole index in individuals with a normal liver does not descend below 10 (10 min. after the intravenous injection of 0.50 mg. indole per kg. body wt.). In individuals with hepatic lesions, the index is lowered in some serious cases to figures less than unity. In individuals with renal lesions or with renal and intestinal lesions, the index rises above 10.
